

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

## P R E F A C E

BY THE AMERICAN EDITOR.

---

GEOGRAPHY is one of the most interesting, useful, and practical of the sciences. To survey the natural features and physical condition of the globe which we inhabit—its continents and islands, its oceans and seas, its rivers and lakes, its mountains, and other natural features, and its soil and productions, cannot but afford much entertainment to an inquisitive mind. But an acquaintance with its inhabitants, in all their vast variety from barbarism to refinement, and the various means by which they have made nature subservient to human comfort, is still more interesting and important. To survey the toil and privations of savage life; to see how much human happiness is advanced by the progress of civilization, by the arts and sciences, by the intercourse of nations, by means of commerce, rendering a single country the storehouse of the conveniences and comforts of the world; to see how, by human contrivance and exertion, the earth has been subdued and rendered fertile, and overspread with cultivated fields and with convenient dwellings; how towns and cities have been reared, and social and civil institutions have contributed to the perfection of human society and to the promotion of individual enjoyment, and how the inferior creation have been made to alleviate the toil and to minister to the support of man, is indeed a most rational and interesting employment of the human faculties. It is no wonder, then, that geography is a science so universally popular, that it interests the minds of the young, and loses none of its attractions in mature years. Nothing has contributed more to that general intelligence by which the people of the United States are so eminently distinguished, and by which the perpetuity of their free institutions is so effectually secured, than the universal study of geography in all our schools. The mind is thus early sent abroad over the world, and led to survey man in his physical and moral condition, and receives an expansion which no other study could equally afford; and it returns to its own highly favoured country with a higher appreciation of its peculiar privileges. But the elementary treatises on geography, though they may lay an important foundation, are not sufficient to rear the superstructure; they are entirely inadequate to the advancing intelligence of mature life. Something more in detail is necessary to gratify the appetite thus early created, and systematic, scientific, and extended geographies and gazetteers are demanded by the wants and the taste of the community.

A good universal gazetteer is at present a desideratum in the United States. While there is much in a good gazetteer that is permanent, yet so frequent and extensive are the changes which are taking place in the world, that there is much which, within a limited period, becomes obsolete and incorrect. The principal existing gazetteers have become, in a measure, antiquated; and some which have been recently published have been constructed on the basis of those which were produced many years since; and whatever effort may have been made to accommodate them to the present time, they necessarily partake, to a great extent, in the imperfection of their origin. An old house may be so repaired as to put on a very fair exterior, and a superficial observer might regard it as in no way inferior to a new structure; but on a more careful examination it would be found that there were many things in its materials, its plan and its construction, to render it inferior to an entirely new erection. Hence, in preference to costly repairs, most wise persons prefer to demolish an old house entirely, and to erect a new one on its ruins, and to introduce improvements which any other course would preclude. The same principle will apply to the con-

\*Charles T. Harbeck

struction of a gazetteer. The new structure will involve more labour and expense, but it will amply compensate for them in the end.

The most splendid gazetteer recently issued in Great Britain is that by McCulloch, the well-known author of the Commercial Dictionary, which latter work has enjoyed an extensive and deserved popularity; and the American publishers believe that they are performing an important service to their fellow-citizens by presenting to them his valuable gazetteer, with all the matter of the English edition, with its splendid maps, and greatly improved and extended in the part which relates to the United States, at less than one third of the expense of the original work.

The author of this gazetteer wisely determined to build a new house, and not to repair an old one. Hence this work is constructed upon the basis of no former similar work, and it is "drawn up from original sources, and with as much care and discrimination as possible."

"Systematical works, or those in which the various details with respect to the physical, moral, and political state of a country or district are arranged in their natural order, in a consecutive narrative, are probably best adapted for the use of the student and scientific reader. But dictionaries are decidedly more convenient, and better fitted for public use. When arranged in alphabetical order, they are easy of consultation; and, if properly compiled, the articles in them are not connected and mixed up with others, but are separately complete, supplying the inquirer with independent, and, at the same time, precise and well-authenticated information. Such works seem, from the extreme diversity and interest of the subjects treated of, peculiarly fitted to 'excite curiosity by their variety, to encourage diligence by their facility, and to reward application by their usefulness.' We need not, therefore, wonder that they have generally, even when their execution has been very indifferent, enjoyed a large share of popularity."

It is impossible that a work of this kind, without being immoderately extended, should name every place in the world: many places are of too little importance to encumber such a work, and even the mention of them would curtail very unprofitably the description of important places. Every gazetteer which is what it should be, will be constructed upon the principle of selection, and the value of the work will depend very much upon the judgment exercised in the choice of its materials. It is presumed that this work will satisfy its readers in this respect; for while it is particularly full in its principal articles, affording a large fund of general geographical information, and adapted to extensive reading, it will be found to be sufficiently particular in regard to minor and unimportant places. A gazetteer ought to dwell with most particularity on the places in which those for whose use it is prepared feel the deepest interest. On this account, the articles in this work relating to the British dominions are particularly full and complete; while, at the same time, there will be found to be no cause of complaint in regard to other portions of the world. This can be no objection to it with the citizens of the United States, for there is no country except their own, respecting which they desire so particular information as the parent country.

But the American publishers are sensible that this work, splendid and complete as it is in regard to other portions of the world, needs material improvement in regard to the United States, and that the articles respecting this country require to be greatly multiplied and extended, and generally re-written, to meet the wants of their fellow-citizens. This will be done, and the latest and most authentic information will be embodied in it, to as great an extent as its limits will permit. It is hoped that, by the labour and care of the American editor, the part which relates to the United States will be found equally satisfactory with the other parts of the work.

With respect to the English edition, the author remarks: "Without neglecting

\* Those portions marked as quotations are extracted from the preface to the English edition. This seemed preferable to giving the whole original preface, and subjoining a separate preface to the American edition.

the *physical* geography of the different countries and places, we have directed our principal attention to what may be called their *political* geography: that is, their industry, institutions, and the condition of their inhabitants. Neither have we attempted to confine ourselves within what might, perhaps, be called the limits of a strictly geographical and statistical work. Whenever the occasion seemed to justify it, we have not scrupled to commend and censure, as well as to describe; and have endeavoured to appreciate the influence of institutions and habits on national welfare. The historical notices are necessarily brief, and, unless in the more important articles, are mostly restricted to an enumeration of leading events. It did not enter into our plan systematically to notice countries or places as they existed in antiquity; but, whenever it was supposed that such notices would be likely to interest the general reader, we have not hesitated to introduce them. Our object, in fact, was not so much to compile a dictionary on strictly scientific principles, and that should be perfectly homogeneous in its parts, as to produce one that might be relied on, and should omit few articles of importance, and that ordinary readers should find generally instructive and interesting.

"None can be more fully satisfied than we are of the extreme difficulty of accomplishing even this much. In a work embracing so great a variety of statements, many of them relating to matters in regard to which it is all but impossible to acquire correct information, perfect accuracy need not be looked for. But we can honestly say that we have spared no pains to make our work worthy of the reader's confidence, and would fain hope that its errors are not such as sensibly to detract from its utility.

"The maps which accompany this work have been carefully compiled from the latest and best authorities, and are entitled to rank with the first of that class of publications. Those of Asia, of the inland navigation, railways, &c., of Great Britain and Ireland, and of the British possessions in North America, will be found to be particularly valuable." In the American edition, the latter will be much improved by being more full and complete in regard to the New-England States, and portions of the other American States included in it, and the original will be corrected by the insertion of the recent divisions of the Canadas, which have been constituted since the publication of the English edition. The original work contains no separate map of the United States, an omission which will be supplied by a new and complete map of this country, prepared expressly for this work, which will exhibit the railroads and canals which have been completed and are in operation. "To prevent misapprehension, it may be well to add, that the distances between one place and another are always, unless where the contrary is stated, *direct*. They have been mostly measured on the best maps, or deduced from other good authorities." With respect to the world at large, this is the only practicable course; but, were it possible, it would be better to give distances according to the nearest travelled route, as people can never go from one place to another in a direct line. In the United States, the distances will be given according to the nearest post route; and these distances, by means of contracts for transporting the mail, have been settled by the Postoffice book, recently revised and issued by the department, with great correctness.

It is common to use abbreviations in such a work for the sake of condensation, and this has been done in the original work, without any list of these abbreviations and an explanation of them. Their import is, in general, sufficiently obvious, and similar abbreviations will be used in the part relating to the United States, and they will be generally left to explain themselves. There are a few exceptions to this remark which require to be specified, as use is divided in regard to these abbreviations. The distance and bearing of each place will be given from the capital of the state in which it is located, and from Washington, the capital of the United States. The name of the state capital will be given in full, and the distance from Washington will be denoted by a capital W. subjoin-

ed to the distance. The abbreviation *t.* denotes township, and if there is a post-office in it of the same name, it is denoted by the abbreviation *p. t.* The letter *v.* denotes a village or collection of dwellings compactly built, and if it has a postoffice of the same name, it is expressed by *p. v.* attached to it.

In the Northern States, every county is divided into *townships*, generally from four to six miles square, incorporated with certain rights and privileges, and generally called towns. They are also divided into parishes, which is an ecclesiastical division. In New-England, the principal village generally takes the name of the township in which it is situated; but latterly, in many instances, villages have risen up which have received a name different from that of the township, but generally at some distance from the centre. In the State of New-York, villages have frequently an incorporation distinct from that of the township in which they are found, sometimes taking the same name, but more commonly a different one. In New-Jersey, Pennsylvania, Ohio, and Indiana, the villages, which are often called towns, generally take different names from the townships in which they are situated. In the states south of Pennsylvania and the Ohio River, no such division as that of townships exists, and what are there usually denominated towns denote only a cluster of houses, generally without including an incorporated district or territory. In Pennsylvania, the incorporated villages are generally denominated boroughs, which will be denoted by the letter *b.*; and if they contain a postoffice of the same name, by *p. b.* In South Carolina, *districts* denote a territory which answers to counties in the other states; and the same is true of *parishes* in Louisiana, the abbreviations of which, in this work, will be readily understood. In the new states, and the newer parts of some of the older states, where the lands have been surveyed by the United States, the territory has been divided into townships of six miles square, denoted by ranges and numbers; but it is questionable whether these townships will ever generally receive distinct names as in New-England, as the tendency seems to be to follow the example of the Southern States, by adopting only the designations of counties and villages or cities.

In the English edition, the sources are generally given whence the information contained in the several articles is derived, and the same is done with respect to the articles which relate to the United States. This will be done in the American edition, excepting in the articles on the United States, as these references will be valuable to those who are disposed to pursue their inquiries beyond the bounds of a gazetteer; but, as we hope to present a more complete and correct account of this country than can be derived from the authorities quoted by the author, many of which are very valuable, but some of which have ceased to be at present correct, we shall omit a mention of the sources of our information, which would exceedingly encumber the work. In the construction of this part of the work, fifty volumes, and as many state or other local maps, containing the latest and most authentic information, have been consulted, besides a written correspondence from intelligent men in all parts of the country. The late very valuable United States census and statistics have contributed very much to enrich this work. To encumber the work by attaching to each article the sources whence the information has been derived, would, it is believed, be unprofitable, as they are numerous. No fact has been stated but upon what is considered the best authority. Our aim has been to present to the citizens of the United States a work, in regard to their country, on which entire reliance can be placed. A faultless work, involving so many particular facts, it would be difficult, and perhaps impossible, to produce.

If extensive and accurate information with respect to the present condition of the world is desired, it is believed that this great work, with its improvements, will afford the opportunity of obtaining it, with least possible expense of time, trouble, and means; and that it will be a source of extensive improvement and the most substantial gratification to many minds.

# UNIVERSAL GAZETTEER,

OR

## DICTIONARY,

GEOGRAPHICAL, STATISTICAL, AND HISTORICAL.

### AA.

**AA**, the name of some small rivers in France, Switzerland, the Netherlands, Hanover, Saxony, &c. The wide diffusion of the name seems to prove, as has been judiciously remarked, that it has some general signification applicable to all the rivers to which it belongs. Probably it may be derived from the Celtic *Aak* or *Ae*, water. There are, indeed, two small German rivers, one of which falls into the lake of Constance, and the other into the Iller, that are called *Aach*.

**AALBORG**, an old town of Denmark, cap. diocese and balliwick, and the principal town in Jutland, situated about 17 m. from the sea, on the E. side of the channel of the Lyndorf, or great internal gulf, entering from the Cattegat, near where it begins to expand into an extensive lake. Lat. 57° 2 28' N., long. 9° 58' 41' E. Pop. 7050. It is intersected by two small rivers, and surrounded by ditches; it is the seat of a bishopric, has a gymnasium or college, an episcopal library with 11,000 vols., a school of navigation, and an hospital and two workhouses. Exclusive of distilleries and breweries, it has manufactures of soap, fish-oil, fire-arms, refined sugar, leather, silk, &c., with a considerable amount of shipping and trade: principal exports corn, flour, fish, butter, spirits, &c. Formerly it was accessible to large vessels; but owing to the gradual filling up of the channel of the Lyndorf, it is now accessible only to the smaller class of merchantmen, or those not drawing more than nine or ten feet water.—(*Catégorie, Tableau des Etats Danois*, tom. I., p. 88.) *Aalborg* means *Eeltown*; a name derived from the immense number of eels that are found in the rivers in its vicinity.

**AALÉN**, a town of Württemberg, circ. Jact, cap. balliwick, formerly a free imperial city, on the Kocher, 49 m. E. Stuttgart. Pop. 2400. It is surrounded by walls flanked with high towers; has manufactures of wool and cotton, and breweries. There are extensive forests in the environs, and iron mines.

**AALSMEER**, a village of Holland, E. side of the sea of Haarlem, 10 miles S.W. Amsterdam. Pop. 1800.

**AALTEN**, a village of the Netherlands, Guelderland, 7½ miles S.W. Gronelo. Pop. 3390.

**AAR**, a river of Switzerland, the most considerable in that country after the Rhone and Rhine. Its principal sources are in the glaciers of the Schreckhorn and Grimsel mountains in Bern, near the source of the Rhone. Having united its different arms near Meyringen, it flows thence through the lakes of Brienz and Thun. Escaping from the latter, it takes a northerly direction till it reaches Bern; it then turns W. till having received its tributary, the Saane; it flows N.E. by Arberg, Soleure, Aarau, &c., till it unites with the Rhine, opposite to Waldshut. Its most important tributaries are, on the right, the Emme, Reuss, and Limmat; and on the left, the Saane, already noticed, and the Thiele. Its course is about 170 m. It becomes navigable on emerging from lake Thun. In the upper part of its course it dashes along with great fury, and is precipitated over several waterfalls. This also is the name of two small rivers in Waldeck.—(*Cass's Switzerland*, Letters 29, 30, &c.)

**AARAU**, or **ARAU**, a town of Switzerland, cap. cant. Aargau, on the Aar, 140 feet above the level of the sea, 23 m. E. Basle, lat. 47° 22' 35' N., long. 6° 3' 55' E. Pop. 3100. It is well built, has a gymnasium, a school of art, a seminary or normal school for the instruction of teachers, a public or national library, a society of national instruction, &c., with manufactures of silk and cotton, a cannon foundry, and bleach-works. The peace, which terminated the civil war of 1713, was concluded here.

**AARGAU**, or **ARGOVIA**, one of the Swiss cantons, sep-

### AATYL.

arated by the Rhine from Baden, having the canton of Zurich on the E., that of Lucern on the S., and Soleure and Basle on the W. Area 502 sq. m. Pop. (1836) 182,755, having increased from 144,003 in 1803. The mountains in this canton do not attain to any very great height, and it possesses a very considerable extent of fertile land. It is traversed by the Aar, whence it derives its name, and by its important tributaries the Reuss and Limmat. The country is well cultivated, and the produce of wheat and other grain exceeds the consumption: there are numerous vineyards, but the wine is inferior; with abundance of garden and orchard fruit. The rearing of cattle and sheep is not found to be productive, but they are advantageously fattened in the meadows, which are both extensive and excellent. Manufactures have made great progress. The principal is that of cotton, next to it is silk, and then follow linen, straw-plaiting, &c. Cottons are not woven by power-looms, but mostly in the cottages of the peasants, or small labouring farmers, as has been the case with linen in Ireland. But though this sort of double employment has hitherto afforded a considerable degree of security against the injurious influence of the vicissitudes incident to agriculture and manufactures, the presumption is, that the rapid progress of mechanical improvements in other countries will force its abandonment, and that the Swiss will have to employ machinery in the weaving as well as in the spinning of cotton, or be compelled to abandon the former department. This canton is especially distinguished by the attention it has paid to education. Every district of 190 children must have at least one primary and one superior school. In every circle (*Bezirk*), the population being from 15,000 to 30,000, there are from five to six secondary schools. There is also in the capital a gymnasium, a school of arts, and a normal school for the instruction of teachers. The expense of the schools is defrayed partly by the communes and partly by the state funds. In the gymnasium and school of arts the state provides for the payment of fourteen professors and their assistants. About 3-5ths of the population are Catholics and 2-5ths Protestants. The public revenue amounts to about £45,000 a year; but as nearly the half is derived from state property, interest, &c., it is immediately seen that taxation is very light. The cantonal contingent to the diet is fixed at 2410 men, and 52,312 Swiss fr. For an account of the government, see art. SWITZERLAND. Principal towns Aarau, Laufenberg, Baden, Zolingen, &c.—(*Bearing on the Commerce of Switzerland*, p. 80.)

**AARHUS**, a sea-port town of Denmark, cap. diocese and balliwick of the same name, on the E. coast of Jutland, lat. 60° 9' 35' N., long. 10° 14' E. Pop. 6765. It is pretty well built, has a large cathedral founded in 1301, a library, a museum of antiquities, and a valuable diocesan library. Its commerce and industry have increased considerably of late years. The exports consist principally of agricultural produce, with spirits and beer the produce of its distilleries and breweries; and cloth and gloves. Considerable sums have recently been expended on the improvement of its port, which has been rendered one of the best in Jutland. Packets sail regularly between it and Callundberg, on the west coast of Zealand.

**AARHUSBURG**, p. v., Hains t. Centre co., Pa., 89 m. N.W. Harrisburg, 181 W. It contains a Lutheran church, two stores, eighty dwellings, and about 450 inhabitants.

**AASZY**, the *Oreates* of Greek geographers, which see.

**AATYL**, a town or village of Syria, in the Hauran or Great Plain, extending S. from Damascus and E. from the

## ABADEH.

mountains beyond Jordan, lat.  $33^{\circ} 15' N.$ , long.  $36^{\circ} 33' E.$  The inhabitants consist of Druses (see *Lébanus and Syrie*), of the number probably of 900 or 300. Though now insignificant, the remains of ancient grandeur in its vicinity prove that Aady was once a place of importance. These remains occupy a circuit of a mile, and in many instances are inhabited by the present population. W. of the town a perfect arch of very fine workmanship, with broken pillars and friezes, marks the site of a small but elegant temple. On the S. another temple, almost entire, with a portico of four columns and an entrance beautifully and elaborately carved, has been converted into a private residence.

Aady is 54 m. (direct distance) S.E. Damascus, and 48 m. E. lake of Tabaria, the Genesareth of the Bible.—(*Robinson's Travels in Palestine and Syria*, vol. ii., p. 155, 156.)

ABADEH, a town of Persia, prov. Fars. 115 m. N. Shiraz. Pop. 5000. It is surrounded by walls in a state of decay; and is defended by a large square fort, now containing the whole population. It has suffered severely from the frequent contests for the Persian throne during the 18th century; but it is still envied by gardens, and sends fruit to Shiraz.

ABAKAN, a river of Siberia, an affluent of the Jenissei, which it joins, 16 miles S. Abakansk.

ABAKANSK, a town of Siberia, gov. Jenisseisk, on the Abakan near the Jenissei. The climate is mild; but it is, notwithstanding, a poor miserable place, and would be wholly unworthy notice were it not that on mount Isk, and other places in its environs, are found some of the most remarkable of those singular remains of former civilization that are met with in many places of Southern Siberia. They consist principally of tumuli or tombs, which frequently contain earrings, bracelets, and other ornaments and utensils of gold, silver, and copper, with iron stirrups, &c. Near Abakansk are statues of men from seven to nine feet high, and covered with hieroglyphics, of which unfortunately no explanation has yet been given.—(*Mémoires Russes*, vol. 1837, p. 806; *Gazette. Voyage en Sibirie*, cap. 63, 64, &c.)

ABANCAY, cap. prov. of same name in Peru, 60 miles N.W. Cuzco.

ABANO or ALBANO, a village of Austria Italy, prov. Padua, 10 m. S.W. Padua. Pop. 3000. This village derives its entire celebrity from its hot springs and *muda*. It is situated near the Euganean hills, in a place marked with some low eminences, whence issue copious springs of water capable at their source of boiling an egg quite hard. The waters are partly employed to prepare and soften mud, partly to supply the baths, and partly go to waste, or turn a mill which revolves amid volumes of smoke. They are supposed to be efficacious in cases of palsy, rheumatism, and a variety of complaints. The mud is applied hot to the affected part, somewhat after the manner of taking a stucco cast; and the baths are regarded principally as an auxiliary to the "dirty" application. The season is in the heat of summer; and, according to Mr. Rose, the accommodations for company are very deficient.

These baths were well known to, and much used by, the Romans. They were called *Paterinae Aquae*, the principal source being distinguished by the name of *Apenus fons*, whence their modern name has evidently been derived.

*Apoeni terris ubi famiger exit.*

*Lucan*, vii., l. 194.

There is a very full account of these baths in *Rose's Letters on Northern Italy*, l. p. 36-70; see also *Cramer's Ancient Italy*, l. p. 152.

ABAZIA, a country in the region of Caucasus, in the Russian gov. of that name, which see.

ABR, a town of Arabia, in the Dejebel, or mountain land of Yemen, lat.  $13^{\circ} 55' N.$ , long.  $44^{\circ} 15' E.$  95 m. S. Sanaa, 73 m. N.E. Mocha, and 104 m. N.W. Aden. Number of houses said to be about 800, which at an average of six individuals to each gives a pop. of nearly 5000. It is built on the summit of a mountain; is surrounded by a strong and well-built wall; and overlooks a well-watered (for Arabia) and extremely fertile country. Houses (as usual in the mountain towns of Yemen) of stone; streets well paved, which, in this country, is very uncommon. An aqueduct conveys water from a mountain at a little distance on the N. to a large reservoir in front of the principal mosque.—(*Voyageur. Des. de l'Arabie*, par. 8, p. 208.)

ABBEVILLE, a thriving, industrious town, in the N.W. of France, dep. Somme, cap. arrond. on the navigable river of that name, 25 m. N.W. Amiens, lat.  $50^{\circ} 7' 41'' N.$ , long.  $10^{\circ} 59' 58'' E.$  Pop. 13,842. It is neat and well built; is regularly fortified on the system of Vauban; and has, exclusive of the old Gothic church of St. Vulfstan, several public buildings worthy of notice, and a public library. A fine cloth manufactory was established here in 1668, by a Dutchman of the name of Van Robais, under the auspices of Colbert; and Abbeville has since continued to be distinguished as one of the most industrious towns in France. Besides black cloths

## ABERDEEN.

of the best quality, with serges, barracans, &c., there are produced calicoes and stockings, sackings, packthread, cordage, jewellery, &c. It has also establishments for the spinning of wool, print-works and bleaching-works, tanneries, soap-works, a glass-work, a paper manufactory, &c. The tide rises in the *Somme* about 7 feet, and vessels of from 100 to 150 tons come up to town. Being situated in the centre of a fruitful country, and communicating by canals and roads with all the surrounding district, Abbeville has a considerable commerce.—(*Hugo, France Pittoresque, Dep. Somme*.)

ABBEVILLE, district, S. C., situated in the W. part of the state, and contains 960 sq. m. It has Beluda river on the N.E. and Savannah river on the S.W. Drained by branches of the Savannah river. It had in 1840, 28,642 neat cattle, 12,973 sheep, 54,939 swine. There were produced 93,104 bushels of wheat, 1,135,524 of Indian corn, and 8,528,482 pounds of cotton. It contained twelve commercial and commission houses engaged in foreign trade, sixteen retail stores, ten flouring-mills, forty-two grist-mills, twenty-four saw-mills, eleven academies, with 419 students, fifty schools, with 1115 scholars. Pop. whites 13,680, slaves 15,148, free coloured 323; total, 29,151. Capital, Abbeville.

ABBEVILLE, p. v., capital of Abbeville dist., S. C., 97 m. W. Columbia, 350 W. Situated on a branch of Little river, and contains a court-house, jail, an arsenal, a magazine and a number of stores and dwellings.

ABBEVILLE, p. v., capital of Henry co., Ala., 211 m. S.E. Tuscaloosa, 537 W. It contains a court-house, jail, and about 400 inhabitants.

ABBATEGRASSO, a town of Venetian Lombardy, prov. Pavia, on the canal of Bereguardo, 14 m. W.S.W. Milan. Pop. 4600. It is fortified; and its position has made it be always regarded of considerable importance in a military point of view.

ABBOT, p. t., Piscataquis co., Me., 70 m. N. by E. Augusta, 130 N. by E. Portland, 674 W. Watered by Piscataquis river. Incorporated in 1827, and has twelve schools, 314 scholars. Pop. 661.

ABBOTTSTOWN, p. v., Berwick t., Adams co., Pa., 29 m. S. Harrisburg, 88 W. Situated on Beaver creek, and contains two churches, three stores, and seventy-five dwellings.

ABB'S HEAD (ST.), a promontory on the E. coast of Scotland, being the most southerly point of the Frith of Forth, lat.  $56^{\circ} 54' 30'' N.$ , long.  $3^{\circ} 8' 30'' W.$

ABELA, ABIL, or ABILA, a town of Syria, in the Haouran, on the *Shariat-el-Mandhour* (anc. *Hieromax*), one of the largest affluents of the Jordan, lat.  $34^{\circ} 47' N.$ , long.  $36^{\circ} E.$  It is now in a ruinous and dilapidated state, having probably not more than from 100 to 150 inhabitants; but formerly it was a place of considerable importance, being the capital of and giving its name to one of the six departments (*Ashkane*) into which the Romans divided the country E. of Jordan. Some broken pillars and overthrown columns evince its ancient grandeur; but none of its old buildings remain entire, and it is preserved from desertion only by its vicinity to the water, which renders it a desirable residence for the few Arab families by whom it is still occupied.—(*Robinson, Travels in Palestine and Syria*, ii., 122, 214.)

ABENOJA, a town of Spain, prov. La Mancha, 90 m. S.W. Ciudad Real.

ABER, a sea-port and village of Wales, Caernarvon, where there is a ferry to the island of Anglesey, 9 m. Conway. Pop. 532.

ABERBROTHOCK, or ARBROATH, a sea-port and manufacturing town of Scotland, co. Angus or Forfar, at the mouth of the Brothock water, lat.  $56^{\circ} 34' N.$ , long.  $3^{\circ} 35' W.$  Pop. of borough and parish in 1841, 14,581. Number of £10 houses in borough 184; Parl. constituency in 1837, 445. Arbroath unites with Brechin, Bervie, and Montrose, in returning a m. to H. of C. It has a parish church and two chapels of ease, with churches for Episcopalians, Seceders, Methodists, and Independents. The other public buildings are the town-house, the trades-hall, the public schools, and the signal tower, which communicates with the Bell-Rock lighthouse, distant about 12 miles. The harbour is secure, though small, and of difficult entrance. The town, which is rapidly increasing, owes all its prosperity to the flax manufactory; nearly half the population being employed in the spinning, dressing, weaving, and bleaching of coarse linen goods. Some of the mills are driven by the little rivulet that intersects the town; but steam-mills are numerous, both in the town and the vicinity. Here are the ruins of an abbey, founded in honour of Thomas à Becket, in 1178, by William the Lion, king of Scotland, who, on his death in 1314 was interred within its precincts. It was destroyed in 1590.

ABERCONWAY, or CONWAY. See CONWAY.

ABERDEEN, a maritime co., Scotland, bounded N. and E. by the German Ocean, S. by the co. of Perth, Forfar, and Kincardine, and W. by Banff, Elgin, and Inverness. Extreme length 86 m. from N. to S., and 42 from E. to W. Area 1,290,500 acres. In the southwestern district, called the district of Mar, are some of the highest mountains of

## ABERDEEN.

Scotland. Ben Macdui rises to the height of 4327 feet above the level of the sea, being only 43 feet lower than Ben Nevis; and several of the other mountains are but little inferior in altitude. About a fifth part of the surface consists of high mountainous tracts; and these, with hills, extensive moors, mosses, and waste lands, occupy nearly two thirds of the entire country. The arable land lies principally in the eastern parts. Principal rivers Dee and Don; and besides these are the Deveron, Bogie, Ullien, Urie, Ugie, &c. Limestone abounds in various places; there are quarries of excellent slate; and millstones are found of good quality. Vast quantities of granite are shipped at Aberdeen, particularly for London, where it is used in paving the streets. The mountains of Braemar contain numbers of coloured crystals, or cateniforms; and some real topazes have been met with. The winters, owing to the great extent of sea-coast, are mild; but the summers are usually short and cold. Agriculture is prosecuted with much more spirit and success than might have been supposed. Oats is the principal crop, about 100,000 acres being supposed to be sown with that grain; barley is also raised; and some, though only a little, wheat. The culture of turnips and potatoes is extensively carried on. Several thousand acres of land in the vicinity of Aberdeen have been trenched. The practice is not, however, confined to that district, and large additions are being constantly made to the arable land. Farm-houses and offices are now, with few exceptions, comfortable and commodious. A greater number of cattle are bred in this than in any other Scotch country: the native breed is preferred. They have increased much in size during the last thirty years; and are said, indeed, to have doubled in weight since the introduction of turnips: They are commonly black, but there are many red or brindled. Sheep comparatively few, and of a mixed breed. There are some large estates, but property is, notwithstanding, a good deal subdivided. Great diversity in the size of farms. It is usual for mechanics to occupy an acre or two. The woods, which are very extensive, afford shelter to the red deer. Average rent of land 4s. an acre. The woolen, cotton, and linen manufactures are carried on to a considerable extent, principally at Aberdeen. There are considerable fisheries on the coast and in the rivers, particularly in the Dee. Principal towns Aberdeen, Peterhead, and Fraserburgh. Parishes eighty-eight. Pop. in 1841, 192,983; in 1846, 231,193. Returns one member to the H. of Commons. Parl. constituency in 1837, 3086. Valued rental £235,065 Scotch. Annual value of real property in 1815, £325,918 sterling.

ABERDEEN, the capital of the above co., an ancient, distinguished, and flourishing royal borough, situated mostly on rising ground on the N. bank of the Dee, near its mouth; lat. (of Marischal College Observatory) 57° 8' 38" N., long. 9° 5' 41" W. Pop. in 1821, 44,790; in 1841, 62,090. It acquired trade and importance at a very early period, and made a conspicuous appearance in many of the stormy scenes of Scottish history. The earliest preserved charter is one granted by King William the Lion, about 1179; and the journals of the magistrates and town council have been preserved very nearly entire since 1306. King Robert Bruce bestowed much property upon it: in the civil wars, during the reign of Charles I. it made a conspicuous figure, and suffered greatly. It remained in a nearly stationary state for about two centuries previously to 1750, when it began to increase. It has since been signal improved, especially during the present century, by the extension of its manufactures and trade, and the formation of many new streets, which have superseded many of its old narrow and winding thoroughfares. From the S. Aberdeen is approached by two bridges across the Dee; one of 7 arches of stone, first erected in 1520-6, and rebuilt in 1719-23; the other a suspension bridge of iron, opened in 1830. The roads from these bridges conduct to Union Street, which, with Union Place, and Castle Street, in the same straight line, form a grand entrance of about a mile in length, the houses all of white granite, finely dressed: in one part this street crosses a deep and partly wooded ravine by a bridge of granite of one arch of 130 feet span, opened in 1804. Among the public buildings may be mentioned the assembly rooms, the town-house, court-house and new jail; the E. and W. churches of St. Nicholas; the N. church and others of late erection; St. Andrew's church of the Scottish Episcopalians; the barracks, placed on the castle hill, which in former times was the site of a fort; Gordon's hospital, the bridewell, theatre, infirmary, medical hall, and the new edifice of Marischal college. Besides the latter seminary, there are many public and private academies and schools, among which is the grammar school, established before 1418, the masters of which are appointed by comparative trial. The establishment of a regular post to Edinburgh dates from 1607; a printing press was set up in 1621, and the first almanachs published in Scotland commenced here in 1677. The number of charitable establishments and endowments is great; upwards of seventy being under the management of the magistrates, of

## ABERDEEN (OLD).

which the net annual revenue, in 1836, was £3064 12s. 4d. Gordon's hospital supports and educates 140 boys, and has an annual revenue of about £3000; and there are besides an infirmary; a lunatic asylum erected a few years ago at an expense of upwards of £10,000; an institution for deaf and dumb persons; a large hospital for girls about to be opened, and one for the education and support of the blind. An assessment for the poor, after having been long postponed, commenced a few years since in the six parishes of the city and the adjoining one of Old Machar.

Aberdeen occupies a distinguished place in the manufactures and commerce as well as in the literature of Scotland. The town and adjoining country were, during the last century, distinguished for the manufacture of knit woollen stockings, which were exported to the Continent; but the late war, and the introduction of machinery, superseded this branch of industry. There are very large establishments for the spinning of cotton, flax, and wool, in most of which steam power is employed; great quantities of the wool of the country are made into carpets; the cotton manufacture, introduced in 1778, employs nearly 3,000 hands; that of flax about 4,000; in 1838, there were imported 1,390½ tons of cotton, 3,400 of flax, and 1,657½ of wool. Extensive iron works have been established where steam-engines, anchors, chain-cables, and spinning machinery are produced. Ship-building is carried on to a considerable extent, and there are rope-works and sail-cloth manufactories: in the vicinity are paper mills, with tanneries, soap and candle works, distilleries of spirits, and brewhouses which export much porter. The natural productions exported are salmon, which is sent to London in ice, granite, of which the export in 1836 was 16,880 tons, eggs, butter, pork, corn, and live cattle, of which the number exported in 1836 by steam was 7001. The value of the exports coastwise and to foreign parts may be estimated at from a million and a half to two millions sterling; it is increasing steadily and rapidly. On the first of January, 1836, there belonged to the port 350 vessels of the burden of 41,743 tons, navigated by 3,065 men. There is a constant communication by steam ships with London, Leith, Peterhead, Inverness, and the Orkneys. The amount of customs duties in 1835 was £45,134, of postage in 1836, £9,536. There is a canal to Inverury, 18½ miles in length, which conveys chiefly agricultural produce, manure and coal. The harbour of Aberdeen has great natural capabilities, the Dee forming a considerable estuary; it has been in a train of improvement for the last sixty years. There being a bar at the mouth of the river, which sometimes shifts, great exertions have been made to remedy this defect, by the erection of a pier of about 1500 feet in length, projecting into the ocean on the N. side of the river, by a breakwater on the opposite shore, and various subsidiary works. Still, however, the harbour is a tide one, only entered when there is sufficient water on the bar, which has 12 feet at neap, and 16 or 17 at spring tides. The bay affords safe anchorage with off-shore winds, but not with those from the E. A light house has been erected on Girdle Ness, the S. point of the bay. In the interior of the harbour the quays have been greatly extended, the channel of the Dee confined by a massive embankment, and there is in progress the conversion of part of the tide estuary into a wet dock, of large dimensions. The revenue of the harbour, which is managed by a board of trustees, was for the year 1837-8, £15,976 5s. 4d.; the ordinary expenditure £2713 5s.; the expenditure on works in progress £9236 5s. 10d. From 1810 to 1836 inclusive, there have been expended on the harbour £456,016 16s. 10d., of which sum the interest of money borrowed amounted to £136,406 16s. 6d. From the great expenditure on new streets, and the harbour, the affairs of the burgh became involved in 1817, and a disfranchisement ensued, but no permanent loss was sustained, and for many years it has been in good credit. In 1838 the revenue was £17,507 10s. 6d.; the expenditure £16,061 5s. 8d., of which about £7500 was for the interest of borrowed money. In 1833, the number of houses was 5288, of which 1990 were of the value of £10 and upwards; since that year, Aberdeen returns one m. to the H. of C. being no longer associated with Arbroath, Brechin, Bervie, and Montrose. In 1837 the constituency was 2530, having increased from 2106 in 1834.

ABERDEEN (OLD), an ancient city, situated about a mile N. of Aberdeen, with which it is nearly connected by a village called Spital. In former times it was the seat of a bishopric, the see of Mortlach having been removed to it in 1154. In 1408 it received a charter from James IV., under which are elected a provost and eighteen other members; in 1715, it became disfranchised, and again in 1723. It is a small place consisting merely of a single street, has no trade, and very little property, its importance depending entirely upon its university. Population in 1831, 1483. The revenue in 1832 was about £43 5s., the expenditure £14 6s. 6d., and there was no debt, but a surplus. Seven trades are incorporated. The chief edifices are the college, cathedral, and bridges across the Don, near which the place is situated.

## ABERDEEN.

The buildings of King's College have an antique appearance, and are of different periods; from recent additions and alterations they are in good repair, about £8000 having been expended upon them. The library and chapel are attached to a lofty square tower, surmounted by an imperial crown of open stone work. The cathedral of St. Machar, or Macarius, after whom the parish is named, is an ancient Gothic edifice, chiefly of granite, commenced in the fourteenth century; the choir, transept, and great central tower have been demolished or fallen down upwards of a century ago; the nave remains, and is used as the parish church; at the west end are two finely proportioned stone spires; the roof of the interior also presents a curious relic. Near its mouth the Don forms a small haven, which does not admit any vessels but of a few tons' burden; a little above is the ancient bridge, erected by King Robert Bruce, of one Gothic arch, 70 feet in span, crossing the rocky and woody ravine in which the river flows; between it and the sea is a new bridge of five arches, opened in 1830, the expense of which was defrayed from the funds of the old and less convenient structure.

The Universities of Aberdeen are two in number, in each of which one college has been founded. The most ancient is that of Old Aberdeen, founded by Bishop William Elphinstone in 1494, under a papal bull of Pope Alexander VI.; its buildings have been noticed above. It early received the name of King's College, instead of that of the Virgin Mary, to whom it was originally dedicated. The other and later seminary was established in 1563, and is called Marischal College, from its founder, George Keith, Earl Marischal. King's College has a principal, sub-principal, and nine professorships. A sum of about £1770 arising from charitable foundations, is annually distributed in different proportions among 134 students, who are called bursars. Marischal College has a principal, ten professors, and two lecturers on humanity and Scots law; in it are also taught medical classes, by five lecturers, appointed by both colleges. About £1900 is appropriated to bursaries, distributed in various amounts, among 107 students. The attendance of students at each college is about equal; those of divinity bear prelections in both, the distance between them being a few yards more than a mile. In session 1837-8, the aggregate number of students in arts, divinity, law, and medicine, was about 700. Both universities have chancellors and rectors and exercise their powers independently of each other; various efforts have been made to unite them into one establishment, but as yet without success. Although their bursaries are numerous, their other revenues are very small. Formerly the university of Aberdeen was entitled to copies of all works entered at Stationers' Hall; but in 1836 they relinquished the privilege for an annual payment of £348 14s. At present their libraries are exceedingly defective; in Marischal College there is a small museum, an observatory, and an extensive apparatus for teaching natural philosophy. The education given in these seminaries has been highly useful in disseminating knowledge over the N. of Scotland and raising its intellectual state; particularly in improving the character of the parochial schoolmasters, who having been all at college, are superior to many of their brethren in the southern parts of the country. The cheapness of the education, and the number of bursaries, most of which are given by comparative trial, are inducements to attend; the fees paid by a student who is not a bursar do not amount to more than about £6 yearly, on the average of four years' study in the curriculum of arts; and respectable board may be obtained for about £25 or £30 during the session, which commences in the last Monday of October and ends at the beginning of April, without vacations. Many eminent men have been professors in these universities; among whom may be mentioned Dr. Reid, the author of the *Inquiry into the Human Mind*; Dr. Gerard; Principal Campbell, author of the *Philosophy of Rhetoric*, and the new Translation of the Gospels; Dr. Beattie, the bard of the Minstrel; and Dr. Hamilton, author of the celebrated *Essay on the National Debt*. The new buildings now raising for Marischal College, in order to replace very ineffective and ruinous ones, are on an extensive and elegant plan; government, through the agency of M. Bannerman, M. P. for the city, granted £15,000 towards their erection, and £7500 have been raised by subscription among the alumni and friends of the establishment. It is expected that their completion will lead the way to such additions to the university, and such improvements in teaching science and philosophy as will materially conduce to the benefit of this part of the Empire. (We are indebted for these valuable articles to a gentleman of distinction in Aberdeen.)

ABERDEEN, p. v. Brown co., O. 123 m. S.W. Columbus, 460 W. Situated on Ohio river, opposite to Mayaville, Ky., and contains six stores and sixty dwellings.

ABERDOUR, a parish and village of Scotland, in Fifeshire, on the N. shore of the Firth of Forth, 10 m. N.W. Edinburgh. Pop. 1751.

## ABO.

ABERFOYLE, in Scotland, a parish, and a celebrated pass or narrow valley leading into the Highlands, in the district of Monteith, in the S.W. part of Perthshire. The village or clachan of Aberfoyle in this pass is the scene of some of the most interesting adventures in the novel of *Rob Roy*. Pop. of parish 680.

ABERGAVENNY, a town of England, co. Monmouth, at the confluence of the Gavenny with the Usk, 14 m. S.W. Monmouth, 120 m. W. by N. London. Pop. of parish 4220. It is built in a straggling manner; has a fine bridge of fifteen arches over the Usk, and some branches of the woolen manufacture. There are very extensive iron works in the vicinity. On an eminence, near the S. end of the town, are the ruins of its ancient castle.

ABERGELEY, a sea-port and m. town of Wales, co. Denbigh, hund. Iddelias, considerably resorted to of late years for bathing.

ABERNETHY, a parish of Scotland, partly in Fife and partly in Perthshire. It was once the seat of an archiepiscopal see, removed to St. Andrew's in the ninth century. All that now remains of its ancient structures is a round tower 75 feet high, and 16 in diameter. The modern village of Abernethy is small, and the houses mean. Pop. of parish, 1776.

ABERYSTWYTH, a sea-port town of Wales, co. Cardigan, at the mouth of the Ystwith, over which is a neat bridge, 178 m. W.N.W. London. Pop. 4128. It stands on an eminence overlooking the bay; and the streets, though well paved and macadamised, are steep and uneven. It is a place of considerable trade, exporting lead, calamine, oak bark, flannels, &c., mostly to Liverpool; but owing to the shallowness of the water, it is accessible only to small vessels. As there is no market town within 18 m. it has the supply of a considerable adjacent territory. Latterly it has been extensively resorted to in summer for sea-bathing. Public rooms were opened for the accommodation of visitors in 1820, and a new theatre in 1833. It seems to have been once strongly fortified. Its castle, of which some vestiges still exist, was rebuilt by Edward I. in 1277. A considerable extent of fen land to the N. of the town has recently been recovered from the sea.—(*Municipal Boundary Reports*, &c.)

ABERYSTWYTH, a parochial chapelry, hund. Abergavenny, co. Monmouth, celebrated for its collieries and iron works, which have greatly increased during the last 20 years.

ABRIAD (BAHR EL). See NILE.

ABINGDON, an ancient town of England, co. Berks, at the confluence of the Ock with the Isis, and at the junction of the Berkshire canal with the latter, 351 m. W.N.W. London. Pop. 5259. It has several well-paved streets terminating in a spacious market-place, having a market-house in the centre. It has two churches with places of worship for Dissenters, a well-endowed grammar school, and sundry almshouses and charitable endowments. It has a considerable corn market: some trade is carried on in malting, hemp-dressing, &c. During the late war a good deal of business was done in the manufacture of canvass, sack, and such like coarse articles; but since the peace this employment has materially diminished. It returns one m. to the H. of Commons. No. of houses in 1831, 1114, of which 451 were estimated at £10 a year and upwards. Constituency in 1836, 292. This was formerly a scot and lot borough; every inhabitant answered to the poor rates exercising the elective franchise.—(*Boundary Reps.*, l. p. 27.)

ABINGDON, p. v., Harford co., Md., 32 m. N.E. Annapolis, 63 W. It contains two Methodist churches and an academy. Pop. 120.

ABINGDON, p. v. capital of Washington co., Va., 304 m. S.W. Richmond, 373 W. It contains a court-house, jail, four churches, two Presbyterian and two Methodist, one male and one female academy, twelve stores, one flouring mill, one woolen factory, two cotton factories, and 200 dwellings. Pop. about 1000.

ABINGTON, p. L., Plymouth co., Mass., 20 m. S.E. Boston, 438 W. It contains three Congregational churches, twenty acres, various manufactures, employing a capital of \$163,650, ten schools, with 673 scholars. Pop. 3214.

ABINGWORTH, p. L., Montgomery co., Pa., 109 m. E. Harrisburg, 149 W. It contains a Presbyterian and a Friends' church, two stores, one flouring-mill, four grist-mills, two saw-mills, three academies, 171 students. Pop. 1704.

ABINGWORTH, p. L., Wayne co., Ia., 72 m. E. Indianapolis, 505 W. Situated on the W. side of the E. fork of White river. Pop. 923.

ABINGWORTH, p. L., Wyoming co., Pa., 151 m. N.E. Harrisburg, 257 W. Drained by the S. branch of Tunkhannock creek, flowing into Susquehanna river. It has five stores, two grist-mills, nine saw-mills. Pop. 1770.

ABO, the ancient capital of Finland, near the extremity of the promontory formed by the gulfs of Bothnia and Finland, on the river Aurajoki, by which it is intersected, lat.

## ABOITE.

**49° 35' 38" N., long. 22° 17' 15" E.** It was the seat of a university, and has a considerable trade. But in 1827 it suffered severely from a fire, which destroyed the university and above 700 private houses. The university has been since removed to Helsingfors, now the capital of the province. Previously to the fire the town contained about 15,000 inhabitants. It has a gymnasium, a bank, and some unimportant manufactures. A treaty was concluded here in 1743 between Russia and Sweden.

**ABOITE, p. t., Allen co., Ia.,** 130 m. N.E. Indianopolis, 355 W. It contains two schools, thirty-eight scholars. Pop. 325.

**ABOMEY, cap. of the kingdom of Dahomey, in Africa,** nearly 100 m. N. from the sea, lat. 7° 30' N., long. 9° 17' E. Pop. said to be 24,000.

**ABOUKIR, a village of Egypt, with a citadel, on a promontory, about 10 m. N.E. of Alexandria, being supposed by some to occupy the site of the ancient Canopus, lat. 31° 15' 44" N., long. 30° 7' 16" E.**

**ABOUKIR BAY, on the north coast of Egypt, formed on the west side by the point of land on which Aboukir is situated, and on the east by that which lies at the mouth of the Rosetta branch of the Nile.** Here, on the 1st of August, 1798, was fought the famous battle of the Nile, when the French fleet that had conveyed Napoleon to Egypt was totally defeated by the British fleet under Lord Nelson; and here also, on the 7th of March, 1801, the English army, under Sir Ralph Abercromby, effected its disembarkation.

**ABOUSAMBUL. See ISRAEBUL.**

**ABRANTES, a fortified town of Portugal, prov. Estremadura, lat. 39° 28' N., long. 9° 15' W., at the E. extremity of a ridge that trends S.W. from the great range dividing the valleys of the Douro and Tagus. Pop. 4514.** Its position affords it admirably for a military station; and Sir A. Wellesley availed himself of its local advantages by resisting there the progress of the French in 1808. (See *Napier, li. 317, &c.*) It is about 4 m. from the right bank of the Tagus and 78 m. above Lisbon. The hill-side on which the town is built, as well as the hills about, bear vines, olive, peach, and other fruit trees, while the plain eastward produces pumpkins, water-melons, and other vegetables: all these products are carried down the river in barges to the capital, with which this town has very considerable traffic. The trade, now occupying above 100 barges, would be much increased if the navigation were improved. A few small craft go 24 m. higher, as far as Villabolla; but the stream is rapid, and the bed much impeded with sand and rocks. The church of San Vincente is the largest and finest in Portugal.—(*Misane, Napier.*)

**ABRUZZO, an extensive territory of Italy, forming the N.E. portion of the Neapolitan dominions, between 41° 50' and 43° 55' N. lat.; bounded E. (a distance of about 80 m.) by the Adriatic, N. and W. by the Papal dominions, and S. by other provinces of Naples.** It is divided into the provs. of Abruzzo Ultra I., Abruzzo Citra, and Abruzzo Ultra II., so called from their position with respect to Naples. The first two, lying along the Adriatic, are divided by the Pescara, and occupy the whole country to the E. of Monte Corno and Monte Prata. Abruzzo Ultra II. is an interior prov., and comprises the whole country included between the others and the Papal states. Their extent, population, and revenue, ordinary and extraordinary, in 1831, were as follows:

|                   | Area.<br>Sq. m. | Population. |          |         | Revenue. |         |
|-------------------|-----------------|-------------|----------|---------|----------|---------|
|                   |                 | Males.      | Females. | Total.  | Duc.     | Grasil. |
| Abruzzo Ultra I.  | 978             | 94,378      | 95,040   | 190,918 | 107,371  | 80      |

The country presents every variety of soil and surface; but the greater part is mountainous, rugged, and occupied by extensive forests. It is traversed throughout its whole extent by the Apennines, and has some of their highest summits. Monte Corno, surnamed *Il Gran Sasso*, or the Great Rock, rises to the height of 9537 feet above the level of the sea. Monte Majella to about 5500, and Monte Vellino to 5397. It is watered by many rivers, most of which fall into the Adriatic; and in Abruzzo Ultra II. is the celebrated Lago Celano, the *Lacus Fucinus* of the ancients (see CELANO, LAKES &c.). The climate differs with the elevation of the soil; but though very cold on the mountains, and comparatively hot in the low grounds, it is, speaking generally, temperate and healthy. Along the Adriatic, and in the valleys and plains, the soil is very productive; and large

\* These are Italian sq. m., 60 to the degree, and are equivalent to 5970 Eng. sq. m., 36 to the degree.

## ABYDOS.

quantities of corn, oil, wine, silk, liquorice, almonds, &c., are produced. Saffron used to be very extensively cultivated in the valley of Aquila, but the quantity raised is now very much restricted. The inhabitants of the mountainous districts are principally engaged in the rearing of sheep and cattle. The upper regions and recesses of the mountains, which cover by far the larger portion of Abruzzo Ultra II., are depastured in the summer season by vast flocks of sheep, brought from the Capitanata and other level provinces more to the S. Their migrations are regulated by law, and are similar to those that take place in Spain and in the S.E. depts. of France. The migratory sheep are supposed to amount, at present, to between 500,000 and 600,000, having been formerly much more considerable. The inhabitants are stout, well-made, healthy, and industrious. The occupiers and labourers, who form the vast majority of the population, are mostly poor, living in miserably dirty huts, feeding principally on Indian corn, and drinking a poor wine. Many thousands of the peasants emigrate every autumn to seek for employment in the Roman and Tuscan Maremma. Manufactures have made but little progress; but woollens, silks, earthenware, &c., are produced. An extensive contraband trade is carried on with the Papal dominions; and the coasting and foreign trade would be much more extensive than it is, were it not that the entire coast is without a single good port. Principal towns, Chieti, Aquila, Teramo, Sulmona, Avezzano, &c. (See the 3d vol. of the *Descrizione, Topografia, Fisica, &c. del Regno delle Due Sicilie*, Napoli, 1835, which is entirely occupied by an account of the Abruzzi; see also Mr. Keppel Craven's *Excursions in the Abruzzi*, 2 vols., Lond., 1838; and Sir R. O. Hoare's *Classical Tour*, 4to, 1819.)

**ABSECUM, v.** Galloway t., Atlantic co. N. J., 95 m. S. Trenton, 105 W. Situated on Absecum creek, 3 m. above Absecum bay, and contains one store and eight or ten dwellings.

**ABU-ARIECH, a petty state in the S.W. of Arabia, on the borders of the Red Sea, between 15° 50' and 17° 40' N. lat. and 41° 30' and 43° E. long., consisting of the narrow strip of low land which lies between the coast and the mountain district of Haeschid-u-Bakel.** On the N. it is separated from *El-Hodja* by a small district inhabited by wandering tribes of peculiar manners; and on the S. it borders upon the state of *Lahia*. Its extreme length is about 130 m., and its greatest width from 70 to 80 m. It forms part of the *Tekama* or low lands of *Yemen*, being almost wholly a sandy plain (see ARABIA), extremely hot and dry, destitute of permanent water courses, and preserved from utter sterility only by the abundant rains in the neighbouring mountains, which periodically inundate its otherwise waterless soil. Its principal products are dhohrah or barley, which forms the principal food of the inhabitants, and a peculiar and highly esteemed breed of asses.

**ABU-ARIECH, a town of Arabia, cap. of the above state, and the residence of the sheriff, lat. 16° 40' N., long. 42° 20' E.** It occupies the centre of the principality, being midway between the Red Sea and the mountains, and between its N. and S. boundaries. It is walled; and though its population be not certainly known, it may be safely estimated at from 4000 to 5000. In 1809 its strength and resources deterred the Wahabees from attempting its capture, after the battle in which they defeated the sheriff. Some rocky hills in the neighbourhood yield salt, which is exported.

It seems probable that Abu-Arieich, which at present is 34 m. from the sea, was formerly much nearer to it, if, indeed, it were not once what Gheran now is, the port of this part of Arabia. This is rendered probable as well from the appearance of the surrounding country as from the well-known fact mentioned by Niebuhr, that the coast here is constantly and rapidly gaining on the water.—(*Niabuk, Des. de l'Ar.*, par. ii., p. 333; *Voy. en Ar.*, li. p. 56.)

**ABURY. See AVABURY.**

**ABUTIGE, a considerable town of Upper Egypt, on the site of the ancient Abotis, lat. 27° 2' N., long. 31° 23' E.** It is the seat of a Coptic bishop, and is celebrated for its opium.

**ABYDOS, an ancient city, founded by the Thracians, and subsequently occupied by a colony of Milesians, on the Asiatic side of the Hellespont, where it is narrowest, bearing nearly S. from Sestos on the European side of the strait.** It had a commodious harbour, and was strongly fortified. It was here that Xerxes constructed the bridge of boats by which he conveyed his ill-fated host across the Hellespont; and it is distinguished in ancient history for the desperate resistance made by its inhabitants to Philip of Macedon, who, however, partly by force and partly by treachery, succeeded in taking it. But Abydos, and also Sestos, are mainly indebted for their imperishable celebrity to the story of the loves of Hero and Leander, and the melancholy fate of the latter. *Abydos magni quondam amoris commercio insignis est.*—(*Ann. Marcellianus*, lib. i., a. 19.) It was de-

## ABYSSINIA.

stroyed by the Turks; and the fact that the materials were carried 3 m. S. to assist in building the *Sultania Kassei*, or old castle of Asia, the strongest fort on the Dardanellies, and its contiguous town, accounts for low ruins being found at Abydos. The modern fort of Nagara occupies its site.—(Mammert, *Géographie*; Tournier, *Voyage du Levant*, &c.)

**ABYSSINIA**, an extensive country of Eastern Africa, of which the boundaries are not well defined, but which may be regarded as occupying the space included between 9° and 15° 40' N. lat. and 20° E. long. and the Red Sea; having E. the latter, N. Senaar and Nubia, and on the W. and S. Senaar, Kordofan, and other barbarous and nearly unknown countries. It is supposed to include in all above 300,000 Eng. sq. m.

**Name.**—Abyssinia was included in the Ethiopia (from *aitiois*, a man burned by the sun, or of a dark colour) of the ancients. The name Abyssinia, or more properly Habeshina, from the Arabic *Habesch*, signifying a mixture or confusion, has been given to the country by the Arabic and Portuguese geographers, and indicates the supposed Arabic origin of the people, and their subsequent intermixture with the Africans. The Abyssinians do not use this name; and either assume that of the provinces in which they live, or call themselves *Ijipians*, and their country *Manghast*, *Ijopia*, or kingdom of Ethiopia, a name given it by the Greeks during their ascendancy at Axum.

**Face of the Country.**—Abyssinia presents great inequalities of surface. It consists principally of a series of plateaus, intersected and separated by mountain ridges. Rifting classes the plateaus under three great divisions. Setting out from the coast of the Red Sea, and traversing the low arid ground by which it is bordered, and ascending the heights or mountains of Taranta, we arrive at the first plateau, or country of the Baharenegah, lying between the Taranta on the E. and the river Mareb on the W. Passing through the Baharenegah and making another ascent, we arrive at the great plateau of Tigre, between the Mareb on the E. and the Tacazeze on the W.; but including to the south the mountain regions of Enderia, Wajjerat, Lasta, &c. The last-mentioned country contains the sources of the Tacazeze, one of the principal affluents of the Nile. The towns of Adowah and the ancient Axum (see the names), are situated in the middle of the plateau of Tigre. Antolow lies more to the south, in the province of Enderia. The mountains of Samen, on the W. side of the plateau of Tigre, are the highest in Abyssinia, and form, with those of Lamalmon and Lasta, a great but not continuous chain, running N.E. and S.W., and separating the high lands of Tigre from the still more elevated plateau or alpine country of the Habesch or Amhara, including the provinces or countries of Dembea, Gogam, Damot, &c. This region, the highest in Abyssinia, and the nucleus and centre, as it were, of the old empire, contains the sources of the Bahr-el-Azrek, or eastern arm of the Nile, and the great lake of Tzana or Dembea. It has a mean elevation of about 8000 feet, and is fenced and intersected by mountain ridges, of which those of Gogam, from their containing the sources of the E. Nile, are the most celebrated. Gondar, the capital of Amhara, and formerly the residence of the Negus or emperor of Abyssinia, lies a little to the N. of the lake. From this plateau the country shelves down on the W. to the barbarous and unknown regions already alluded to.

The provinces of Efat and Schoa, which now form, with their dependant territories, the most powerful of the Abyssinian states, lie to the S.E. and S. of Amhara. The first is very elevated, part of its waters flowing westward to the Nile, and part eastward to the Hawash. Its chief town is Ankeber. The province of Schoa, lying along the southern side of the Nile, is comparatively low, and is renowned for its magnificent pastures and fruitful valleys. It has several towns and some celebrated monasteries. Salt is inclined to think that the Ethiopic language and literature, and the ancient manners of the Abyssinians are preserved in a purer state in these provinces than in any of the others; but they are very imperfectly known.

Exclusive of the above, there is a vast and but little known country in the S.E. part of Abyssinia, between Efat and Lasta, and the Red Sea and the sea of Bab-el-mundeb. It is almost entirely occupied by tribes of Gallas, some of them the most brutified of any to be found in Abyssinia. The country of Nana, at the sources of the Maleg, S.W. from the province of Damot, is one of the most elevated of the African plateaus. Its inhabitants are said to be nearly as white as the Spaniards and Neapolitans.

On the S.E. of Tigre, between it and the low country or province of the Dankali, lying along the Red Sea, and between the fourteenth and fifteenth degrees of latitude, is an extensive salt plain, having, in most parts, the appearance of ice covered with partially thawed snow. The salt is perfectly pure and hard for about two feet deep; but that lying beneath is coarser and softer till purified by exposure to the air. It is cut into pieces with a hatchet, and not

only serves to season and preserve food, but even circulates as money. The salt is carried off by caravans, or companies, consisting of from 300 to 600 beasts of burden, and its digging is not unaccompanied by danger from the attacks of the savage Gallas.

**Mountains.**—Those of Abyssinia have not been accurately measured. They were represented by the early Portuguese travellers and the Jesuits as being of such vast height that, compared with them, the Alps and Pyrenees were mere hillocks! But these exaggerated representations have been since reduced to their proper value. Bruce states, that during his residence he saw no snow in any part of the country, and he even affirms that it is there totally unknown. This, however, was a rash and unwarrantable assertion. It is doubtful, indeed, whether snow be not always to be found on the highest summits and crevices of the mountains of Samen, at all events, Mr. Pearce was overtaken by a snow storm when passing them in the middle of October, and Mr. Sult saw snow on them from a great distance on the 8th of May. It is clear, therefore, that if the highest summits of the Samen do not attain, they approach closely to the line of perpetual congelation, so that their elevation may be fairly estimated at from 12,000 to 12,000 feet. The mountains of Gogam are of very inferior altitude, and are cultivated to the summits. Generally the Abyssinian mountains have a peculiarly abrupt and precipitous appearance. Sometimes they form what are called *ambas* or hill forts, consisting of steep, rocky, and all but inaccessible sides, having on the summit a level surface covered with trees and verdure. The most celebrated of these hill forts is that of Ambu Geshm, formerly used as a place of confinement for the princes of Abyssinia.

**Rivers.**—Of these the Bahr-el-Azrek, Blue River, or eastern branch of the Nile, is by far the most famous. It rises from two mountains near Geshm in Gogam, being, according to Bruce, in lat. 10° 50' 25" N., long. 30° 55' 30" E., and at an elevation of 10,000 feet above the level of the sea. Its course is thence N. to the lake Dembea, a large sheet of water, which receives many other streams; but the Nile is said to preserve its waters with but little intermixture with those of the lake, across which its current is always visible. Escaping from this lake it sweeps in a southerly direction round the E. frontier of the provinces of Gogam and Damot, till, between the ninth and tenth degrees lat., it takes a N.W. direction, which it preserves till, at Halfaia, near the sixteenth degree lat., it unites with its other and more important branch, the Bahr-el-Abiad, or White River, flowing from the S.W. (see NILE). The next most important stream is the Tacazeze, whose source has been already noticed. It drains the mountains of Samen and Tigre; and pursuing a pretty direct N.N.W. course through Senaar, falls into the Nile near the eighteenth degree lat. The Mareb, which rises in the heights of Taranta, runs nearly parallel to the Tacazeze. In the dry season it flows itself in the sand; but Bruce says that in the rainy season it continues its course till it unites with the Tacazeze. The Hamazo and Hawash run E. in the direction of the Red Sea; but the latter is swallowed up in the sands before meeting it. Exclusive of the great lake of Dembea or Tzana, already referred to, the lake of Ashangee, on the E. side of the Samen, is also of very considerable size.

**Mineralogy.**—This is very imperfectly known. Granite and schistus or slate seem to have been extensively observed; and it is probable that these primitive rocks occupy a large portion of the principal chains. In Tigre, the strata are chiefly vertical; but in the mountains of Samen they incline more to a horizontal position. They seem remarkably destitute of metals; the gold which passes through Abyssinia is brought from the barbarous countries on the S. and W.

**Climate.**—This necessarily differs with the elevation of the country, the direction of the mountains, &c. In the deep valleys and low grounds (*kollas*) the heats are frequently excessive; and this, combined with excess of moisture, renders them unhealthy. But the climate of the plateaus is extremely fine, particularly that of Amhara, which is said to enjoy a perpetual spring, *ver æternum*. The Portuguese found it quite as temperate as that of their own country. According to Ludolph, the natives often stain, in that happy climate, to the age of 100 years and upwards! The climate of Tigre is not quite so mild; but there, also, the great extent of pasturage and of verdant plains shows that the country is not visited by the extreme of heat. The plateau of the Baharenegah is the hottest. In March, Mr. Salt found its air hot and dry, and the beds of the rivers without water. The year is sometimes divided into four, but more properly into three, seasons. Winter (*brams*) is the season of rain, which always falls in great quantities, and often with much violence, rendering rivers and even brooks quite impassable. Harvest (*tsadan*) follows winter; the rest of the year consisting of summer (*agrat*), or the season of heat and drought.

## ABYSSINIA.

**Race—Population.**—The inhabitants of Abyssinia comprise a variety of tribes. They all, however, closely resemble each other in their physical character and manners; and, in respect of bodily conformation, are entirely distinct both from the Negroes and the Arabians. They belong to what has been called the Ethiopic variety of the human race; and their most prominent characteristics will be found described in the article *AFRICA*, to which the reader is referred. Of the different tribes, the principal are the Tigras, or inhabitants of Tigré; the Amharas, or inhabitants of Amhara; the Agows, inhabiting the province of Damot; the Efiats, occupying the southern bank of the Nile; the Gongs and Enarens, still farther E.; and the Falashas, occupying the mountains of Semon, &c., who profess Judaism, and pretend, though it is believed on no very good grounds, to deduce their origin from Palestine. These tribes are easily distinguished by their language; but it is not clear whether their idioms be really distinct languages, or, which is most probable, only dialect varieties of a much smaller number of mother-tongues.—(*Fricker's on Asia*, vol. ii., p. 138, 3d ed.)

The Gallas, or savage tribes, by which large portions of Abyssinia have been overrun, are said to have made their first appearance on the southern frontier in 1537. No doubt they belonged originally to the central parts of the African continent. They have a brown complexion, with long black hair; and their tribes are all independent of, and often at war with, each other. Most of them have adopted the Mohammedan faith, and have partially conformed to the manners of the Abyssinians. They are still, however, distinguished by their greater ferocity. In proof of this, it is sufficient to mention that the young men are denied certain privileges, and are, in fact, contemned by the women, as well as their saviors of the same sex, till they have given proof of their manhood by killing an enemy.

No measure exists by which to form any probable estimate of the number of people in Abyssinia. Mr. Salt could obtain no accurate information on the subject. If the country were tranquil, it could hardly fail, owing to the fruitfulness of the soil and the general benignity of the climate, to be exceedingly populous; but the anarchy and civil war in which it is constantly involved more than neutralize these advantages, and keep the population far below its natural level. Its total amount is estimated, in the *Wahr Almanac*, at 4,500,000; and this, perhaps, is as good a guess as can be made.

**Language.**—The Gheez, or Ethiopic, a language akin to the Arabic and Hebrew, was the language of Axum, and of the subjects of the Axumite sovereign, at the era of their conversion to Christianity in the 4th century. It is now extant only as a dead language, consecrated to literature and religious uses. The Amharic, or modern Abyssinian, is not a dialect of the Gheez, though it has adopted from it a great number of words, but a totally distinct language. It is probably an ancient African language, and the original idiom of the inhabitants of the south-eastern provinces of Abyssinia. As regards literature and learning, the Abyssinians are at the lowest ebb. The clergy are ignorant, and have no taste for learning. Mr. Gobat thinks that in the country where Amharic is spoken about one fifth part of the male population can read a little, and in Tigré about one twelfth part.

**Productions.**—The country is very fertile, and has a vast variety of products; among which are, wheat, barley, millet, and other grain. On the high grounds wheat is raised in considerable quantities; but in the low grounds the heat is too strong for it. Barley (*Akourra*) is raised in large quantities; but the principal dependence of the country is on the *teff* (*Poa Abyssinica*), which grows on every soil, except the very lowest, and affords the bread in general use. The plant is herbaceous. From a number of weak leaves rises a stalk about 36 inches in length, and not much thicker than that of a carnation. Out of the top spring a number of branches, which contain the seed or fruit inclosed in a species of capsule. The grains are not larger than the head of the smallest pin, yet so numerous as to constitute on the whole a bulky crop. But the lowest grounds (*halla*) are unfit even for the production of teff; and on these is raised a species of corn called *taccusa*, which yields a black bread, the food of the lowest classes. There are at least two harvests in the year; and in the same place may at once be seen in progress the operations of ploughing and reaping, with corn in every different stage of advancement. Among the other vegetable products are cotton, of which clothes are usually made; senna, myrrh, &c. The stack of the *enets*, a species of palm, the banana of Abyssinia, is said, when stripped of its green covering, to be the very best of all vegetable food. It is found in great abundance. Various species of figs, some of them of a very large size, as the *Ficus syriaca*, are also very plentiful. Citrons, oranges, and sugar-canes are met with in the low grounds, but not on the elevated plateaus. Dates and vines are met with, but

neither are supposed to be indigenous. Both are believed to have been imported and cultivated by the Portuguese. At present the vine is grown only in the district of Enfras, on the E. side of lake Demben, where it produces magnificent grapes. The Abyssinians do not use wine except for the communion table. Tellez says expressly, that in his time the vine was unknown in Abyssinia. The *papyrus*, so celebrated for its furnishing the principal species of paper used by the ancients, is abundant in the lakes and rivers; and Bruce contends that it was thence transplanted to Egypt.

The domestic animals of Abyssinia do not differ materially from those of Europe. The horses, which are the principal wealth of the inhabitants of the plateaus, are strong and active. They are used in war and the chase, mules and asses being used principally as beasts of draught and burden. Oxen are very abundant. The most remarkable species is a native of the low grounds, and has horns of an enormous magnitude, Mr. Salt having seen one 4 feet long, and 31 inches round at the base. It is called the Galls ox, from its being brought to Tigré by the Gallas. Of the wild animals, the most numerous and characteristic is the hyena, called here the *dashet*, exceedingly fierce and untamable. In most parts of the country they are found in vast numbers, place travellers in continual danger, and even enter houses. They are not naturally gregarious, yet sometimes assemble in vast troops, attracted by some common object, particularly the scent of dead bodies, which, according to the barbarous custom of the country, are often left unburied. Bruce contradicts the common report of their digging into sepulchres. They are protected by the superstitious belief of the people, who regard them as a species of enchanted men! The elephant and rhinoceros are numerous in the low grounds, and in places full of moisture. They are hunted by the Shan-gallas, who use their teeth as an article of commerce, and feed upon their flesh. It is a mistake to suppose that any of them have ever been tamed in this country, or, indeed, in any part of Africa. There is a species of rhinoceros with two horns, found only in a few districts. Its horns have no connection with the bone; its skin, which has no folds, is used for shields; the horns for handles for swords, and also as a lining to drinking vessels. The antelope species, which is very numerous, is seldom found in the cultivated districts, but chiefly appears on broken ground near the rivers. The buffalo, domesticated in Egypt and elsewhere, is here one of the most ferocious of animals; he lodges himself in deep and sultry valleys, under the shade of the tallest trees, and near the largest and clearest rivers. The hippopotamus, called *gembu* by the natives, is abundant in the lake of Demben; but Ladoif affirms that this lake contains no crocodiles. They are both, however, found in the deep pools of the Nile, Taccusa, and other rivers. The crocodiles in the latter are of an enormous size, of a greenish colour, and are more dreaded by the natives than the hippopotamus. The torped is found in the rivers and lakes. The lion is found only occasionally. There are several species of leopard. The zebra is frequent in the southern provinces, where its mane adorns the collars of war horses. A small animal, the jerboa, about the size of a rat, burrows in the fields both here and in Barbary.

The feathered creation in Abyssinia bears more than its usual proportion to the other species. The vast profusion of insects, grains, and plants, even the waste and destruction attending continual war, afford them an abundant supply of food. The nimer, or golden eagle, perhaps the largest bird of the old continent, and a beautiful species called the black eagle, are particularly noticed by Bruce. To these Salt adds a new species called goodie-goodie, the size of the common falcon. Storks, partridges, mipes, pigeons, and swallows, occur in great number and variety. Bruce never saw a woodcock, sparrow, magpie, or bat; and ostriches are not found in Abyssinia Proper.

Among insects the most numerous and useful are bees. Honey constitutes everywhere an important article of food. Several provinces used to pay a large proportion of their tribute in this article. The honey assumes different appearances, sometimes black, sometimes blood-red, according to the plant on which the insect feeds. Of a very different character is the locust, which commits here ravages quite as terrible as in the other countries of Northern Africa. It sometimes depopulates whole provinces. In the sublime language of the prophet, "*A fire discovereth before them, and behind them a flame consumeth: the land is before them as the Garden of Eden, and behind them a desolate wilderness; yea, and nothing escapeth them.*"

**Government—Political Division.**—The former government of Abyssinia, or that which existed in it when it became known to the Portuguese and the Jesuits, was an absolute and despotic monarchy, in which the emperors, restrained by no written laws, popular assemblies, or privileged classes, had full power to dispose at pleasure of the lives and property of their subjects. But this ancient government

## ABYSSINIA.

may now be said to be totally extinct. The force of the central government was gradually weakened, partly by the rebellion of the governors of the different provinces, and partly by the irruption of the Gallas and other savage hordes, who have subjugated some of its finest countries. Salt has ingeniously compared the state of Abyssinia in a political point of view to that of England during the heptarchy; and since he visited it anarchy seems to have made a still more rapid progress. The whole country is now split into an endless variety of states, the limits of which are perpetually changing, and between which the most deadly animosities and interminable contests constantly prevail. The kingdoms of Amhara, Tigre, including the country between the Red Sea and the Tacazza, with the provinces of Enderta, Wogjerat, &c., and Shoa, including Efat, are supposed to be at this moment (1837) the most powerful of these states. But we have no exact information as to their boundaries, organization, or condition. They have this in common, that they are all despotisms, and anarchy and bloodshed prevail in them all to a greater or less extent. Shoa, which is now entirely separated from the rest of the country, is said by Mr. Gobat to be less devastated by civil war than either of the others, and to be, in consequence, the least depopulated and most flourishing part of Abyssinia.

*Manners and Customs.*—This perpetual state of civil war and confusion, and not any peculiar cruelty of disposition, seems to be the main cause of that barbarism and brutality by which the manners of the Abyssinians are characterized. All the feelings by which man is restrained from shedding the blood of his fellows seem entirely blunted. Human life is scarcely more respected than that of brutes. Bruce seldom went out at Gondar without seeing dead bodies lying in the streets, left to be devoured by dogs and hyenas, without being even allowed the rights of sepulture. To show the indifference usually felt on such occasions, he mentions that one day, passing along the streets, he saw an officer of rank about to execute three men who had offended the sovereign. This person, calling to Bruce, begged him to stop till he had despatched this business, as he wished to have a short conversation with him. But the circumstance which seems to place the Abyssinians below even the most savage tribes, is the extreme coarseness of their festive indulgences. Their *brinde* (raw beef) feast has excited the astonishment of all travellers. Alvarez, who visited the country as ambassador from Portugal in 1590, and remained there for six years, describes it as a thing "of which he dare not in a manner speak." Being invited to a feast, he was much surprised, instead of the usual dishes, to see brought in "pieces of raw flesh, with warm blood." The landlord, on seeing his guests show no favour to this savoury dish, ordered other food better suited to their tastes; but immediately began eagerly to devour the flesh, "as if it had been marchpane or comfits." The lady of the house did not appear at dinner; but, in drinking, she "bravely seconded" the rest of the company. Bruce and Salt have furnished still more particular descriptions. The table, which is low, is first covered with successive piles of tuff cakes, serving to the guests at once as food and as towels with which to wipe their fingers. The company being then seated, the next process is the slaughter of the cattle, which are standing at the door, and the cutting warm steaks from their flesh. Bruce says that these are extracted while the animal is yet alive, and bellowing under the pain of the wound. But this disgusting circumstance is not mentioned by any of the earlier writers, and Mr. Salt affirms that the head is separated from the body before the operation of slicing commences. Salt, however, as well as Bruce, admits that the luxury of an Abyssinian feast consists in having the pieces brought in while the blood is yet warm and the fibres palpitating. The female who sits next to each chief then wraps up the slice in a tuff cake, and thrusts into his mouth as large a quantity as it is capable of containing, which is greedily devoured. All parties drink copiously of hydromel, and bouza, the beer of the country. Having satisfied themselves, they rise, and give place to another company of inferior rank, and these to a third, till all is consumed. The gross indecencies which Bruce represents as perpetrated on these occasions, and which he has described with such revolting minuteness, have been denied by Mr. Salt, and it is hardly possible to suppose that they can be other than rare occurrences. Mr. Gobat, the missionary, admits that a feast such as that described by Bruce may have taken place among the most shameless libertines; but he adds, that "excesses of that kind are not customary either as to their cruelty or indecency." The practice reported by Bruce, and which subjected him to no little ridicule, of cutting steaks from a living animal on a journey, and then closing up the wound and driving it on, appeared at first quite unfounded to Mr. Salt; but in his second journey he witnessed it, and found that it was called by a peculiar name—cutting the *Skulada*; which certainly goes a good way to prove its frequency, though that also is

disputed by Mr. Gobat, who denies its occurrence, unless, perhaps, in cases of extreme hunger.

Justice in Abyssinia is altogether barbarous, venal, and corrupt. When a person accused of a criminal offence is found guilty, he is detained in prison till he has made satisfaction to the accuser; or, if he have committed murder, till he be disposed of by the relations of the deceased, who may either put him to death or accept a ransom. The latter is generally fixed at 250 dollars for a man, but the relations are under no obligation to accept it. Mr. Gobat says that the Tacazza is never passed on either side in pursuit of murderers; so that they must very frequently escape without even the pretence of a trial. When a murdered person has no relations, the priests take upon themselves the office of avengers of blood.

Marriage in Abyssinia is a very slight connexion, formed and dissolved at pleasure. The most formal mode of concluding it is, when the lover, having made certain engagements to the parents, and obtained their consent (for that of the bride is seldom asked), seizes her and carries her home on his shoulders. A magnificent feast is then given of bride and bouza; and at a fixed period of twenty or thirty days afterwards, they go to church and take the sacrament together. It is in a few rare instances only that even this slight ceremony is used. In most cases, mutual consent, and a plentiful administration of raw meat and bouza, form the only preliminaries. The will of either party, or of both, is at any time sufficient to dissolve the connexion. If they have several children they divide them; if they have but one, and he is under seven years of age, he belongs to the mother; if above seven, to the father. Gobat says that after a third divorce they cannot contract another regular marriage, nor partake of the communion *unless they become monks*; Bruce, however, mentions being in company at Gondar, where there was a lady present, with six persons, each of whom had been successively her husband, although none of them stood in this relation to her at the time; nor do either party consider themselves bound to observe with rigid fidelity this slight engagement, even while it lasts. Manners may be considered, in this respect, as in a state of almost total dissolution. Slaves are common in all parts of Abyssinia. They consist of Shangallas, a race of savage Negroes inhabiting the low countries on the N.N.W. and N.E. frontiers. They are very numerous in Gondar and other places of Amhara, and also in Tigre; are well treated, and escape many of the privations to which they are subject in their wild state.

The only display of architectural magnificence in Abyssinia is in the churches. They are built on eminences; are of a circular form, with conical summits and thatched roofs; and are surrounded with pillars of cedar, within which is an arcade, which produces an agreeable coolness. The houses of the sovereigns and grandes are also large and commodious; though, in this warlike country, the camp is considered as their more proper residence. All the houses are mere hovels of a conical form, with a thatched roof. Their dress consists chiefly of a piece of cotton cloth, 24 cubits long by 1½ in breadth, which they wrap round them like a mantle, with close drawers reaching to the middle of the thigh, and a girdle of cloth. Their food consists of the different species of grain already enumerated, fish, fruits, honey, and raw meat at festivals. The most general drink is bouza, a species of sour beer, made from the fermentation of their cakes, particularly those left at entertainments. Toccuso, the coarsest grain, produces bouza equal or superior to any of the others. Hydromel is also made in great quantities. Agriculture, the only art much cultivated, is very far behind the perfection which it has attained even in the most backward parts of Europe. The ploughs, of the rudest construction, from the root or branch of a tree, are drawn by oxen. The land is twice ploughed; after which women are employed to break the clods. In the course of ripening, the corn is carefully weeded. As previously stated, there are two or three crops in the year. The worst grain is commonly used for seed. In general, every family cultivates for itself, and little is brought to market. The poor people live miserably on black tuff and toccuso, and even persons of consideration use little except tuff and bouza.

The Abyssinians profess Christianity, but it has little influence over their conduct. At present they are split into three parties, violently opposed to each other. They retain a great number of Judaical observances, abstaining from the meats prohibited by the Mosaic law, practising circumcision, keeping both the Saturday and Sunday as Sabbaths, and regarding fasts as essential. But their fasts, though apparently long and rigorous, are dispensed with on payment of a sum of money, according to the rank and wealth of the party. The Coptic patriarch of Cairo continues still to be the nominal head of the church, from whom the Abuna, the resident head, receives his investiture. They have monasteries, both of monks and nuns, who are far, however, from professing

## ABYSSINIA.

that rigid austerity which is the boast of the Romish church. Their veneration for the virgin is unbounded; and the Catholic missionaries found that they completely outdid in this respect their own ultra seal. Their aims are extremely numerous, and surpass, in miraculous power, even those of the Romish calendar. They represent them by paintings, with which their churches are lavishly adorned; but they do not admit any figures in relief. The clergy do not attempt to prohibit divorce, or even polygamy, the propensity to which in the nation is probably too powerful to render any prohibition effectual.

Mohammedans, as well as Jews, are also found in Abyssinia. The former appear to have increased since Bruce's visit; at present they are most numerous in Adowah and its vicinity. Few of them have any knowledge of the Koran. They engage more in traffic than the Christians, and have more money. They are said to engross the whole traffic in slaves; the Christians, according to Mr. Gobat, never taking any part in it.

Though low, as compared with Europe, the manufactures of Abyssinia occupy a prominent place among most of the African nations. It supplies itself with all the most indispensable articles. Cotton cloths, the universal dress of the country, are made in large quantities, the fine sort at Gondar, and the coarse at Adowa. Being unable to dye their favourite dark blue colour, they unravel the blue Surat cloths, and weave them again into their own webs. Coarse cloth circulates as money. Manufactures of iron and brass are also considerable, the material being procured from Sennaar, Wakayit, and Berbera; knives are made at Adowah and spears at Antalaw. The business of tanning is well understood in Tigré; and at Axum sheepskins are made into parchment. Saddles, and all sorts of horse furniture, are good. The foreign commerce of Abyssinia is carried on entirely by way of Massauah, whence the communication with the interior is maintained by the channel of Adowa. The imports are chiefly lead, black tin, gold foil, Persian carpets, raw silk from China, velvets, French broad cloths, coloured silks from Egypt, glass beads and decanters from Venice. The exports consist of gold, ivory, and slaves. The slaves are reckoned more beautiful than those which come from the interior of Africa.

*Progress of Discovery.*—The ancients never acquired any accurate knowledge of Abyssinia. To it, along with Sennaar, they, in a peculiar sense, applied the comprehensive name of Ethiopia; for though that term was made to extend generally to the interior of Africa, and even to a great part of Asia, yet *Ethiopia sub Ægypto* was regarded as the proper Ethiopia. Descriptions of Ethiopian nations are given by the ancients at considerable length; but they serve chiefly to show the imperfection of their knowledge, and are tainted with a large admixture of fable. Rennell supposes, seemingly on good grounds, that the Macrobian, or long-lived Ethiopians, said to live farther to the south than the others, belong to Abyssinia. The ancients had no distinct knowledge of more than two Ethiopian kingdoms: the first and only one known to the earliest writers is Merop, or the Peninsula, which they erroneously supposed to be an island formed by the successive union of the Nile with the Atamboras and the Astapus (Blue River and Taccaze). The chief city of Merop was placed by them on the Nile, in lat. 16° 26'; and Bruce, in passing through Sennaar, saw, near Chendi, immense ruins, which probably belonged to this celebrated capital of Ethiopia. The other kingdom became known after the Greeks, under the successors of Alexander, extended their navigation along the eastern coast of Africa. It was that of the Axumites, situated upon the Red Sea, and occupying part of Tigré. Its capital, Axum, still remains, and though in a state of decay, exhibits remains so vast as simply to attest its former greatness. The inscriptions discovered here by Salt show that the Axumites had received amongst them the religion and the arts of foreigners, and that they made use of the Grecian language in the inscriptions on their monuments. The port of Axum, Adulis, was the channel by which the finest ivory then known was exported, and a commercial intercourse maintained with the coasts both of the Red Sea and the Indian Ocean. Salt, though unable to visit it, seems to have ascertained its situation near Masouah.

Prior to the middle of the fourth century, Abyssinia was converted to Christianity, which it has ever since nominally professed.

After the rise and rapid spread of Islamism, those of the Egyptians who were reluctant to change their faith being compelled to fly southwards before the sword of the Saracens, Nubia and Abyssinia became filled with Jewish and Christian refugees. And as both these countries were at that time Christian, the Arabian geographers, who have fully described other parts of the continent, make a very slight mention of them; so that Abyssinia remained almost unknown till near the era of modern naval discovery. In 1445, the emperor of Abyssinia sent an ambassador to the senate

## ACAPULCO.

of Florence, and wrote a famous letter to the priests his subjects at Jerusalem. This, and the favourable reports of the Abyssinian priests now referred to, gave rise to the most exaggerated reports. It was said that a Christian prince, to whom the Portuguese gave the fantastical name of *Prester or Presbyter John*, ruled over a vast, highly civilised, and rich empire, in the centre and E. of Africa. This statement inflamed at once the spirit of discovery and of religious zeal, the two ruling principles in that age. The Portuguese monarchs, who took the lead in exploring the eastern world, immediately devised measures for acquiring a knowledge of so remarkable a region. The passage to India by the Cape of Good Hope had not yet been discovered; Abyssinia was therefore viewed as a tract through which the commerce of India might be conducted. Two envoys, Covilhã and De Paiva, were therefore sent, under the direction of Prince Henry, upon a mission to explore it. They went by way of Alexandria, and descended the Red Sea. De Paiva perished by some unknown accident; but Covilhã, after visiting different parts of India and Eastern Africa, entered Abyssinia, and arrived, in 1490, at the court of the emperor, residing then in Schoa. Being brought before the sovereign, he was received with that favour which novelty, when there is nothing to be feared from it, usually secures; and being a man of address and ability, he contrived to maintain this friendly disposition. The reports which he transmitted of the country were favourable; and having prevailed on the empress-mother to send an Armenian as an ambassador to Portugal, whose arrival excited a great sensation in that country, the Portuguese sent out several other embassies. Of these the most remarkable is that described by Alvares, in 1590. He remained six years in the country, and traversed it from north to south, visiting the provinces of Amhara, Schoa, and Efat. Paes, Almeida, Lobo, and several others successively undertook journeys into Abyssinia. Paes, who resided in the country from 1603 till his death in 1632, visited, in 1618, the sources of the Bahr-el-Azrek or eastern arm of the Nile, and describes them nearly in the same terms as Bruce, who absurdly claims the honour of being their discoverer. From the accounts of these and other missions, Telles first (1680), and afterwards Ludolph (1681), principally compiled their histories and descriptions of Ethiopia. Ludolph, who was well versed in the language, derived a considerable part of his information from the communications of Gregory, an Abyssinian monk of the province of Amhara, then in Europe.

Public curiosity, however, with respect to Abyssinia, gradually subsided, till, towards the close of last century (1790), it was revived by the publication of Mr. Bruce's Travels. Many of the circumstances he relates are so very extraordinary as to give to his descriptions a good deal of the appearance of romance. The authenticity of his work was in consequence very generally doubted; and it must be admitted that some of his statements have been shown to be unfounded, and that others are of very questionable authority. But the accuracy of the leading features of his work has been fully established by Mr. Salt and other late travellers.

Our limits will not permit of our attempting to lay before the reader any sketch of the history of Abyssinia; and though we had abundance of space, the subject is too uninteresting to attract attention. Dr. Lee has prefixed a short notice of the church or Abyssinia to the Journal of Mr. Gobat's Residence in that country. An excellent summary of the information as to Abyssinia, contained in the earlier travellers and historians, will be found in the Modern Universal History, vol. xv., p. 1-204, 8vo ed. Besides it, we have consulted, in drawing up this article, the Travels of Bruce, Salt, and Lord Valentia; Mr. Gobat's Journal; the account of Abyssinia in Ritter's Geography; Frichard's Researches on Man, &c., p. 125-164, 3d ed., &c.

ACAPULCO, a celebrated sea-port and town of Mexico, in the intensity of that name, on the coast of the Pacific Ocean, 190 m. S. E. W. Mexico, lat. 16° 50' 25" N., long. 99° 46' W. Pop. 4000 (†). The harbour is one of the finest in the world. "It is familiar," says Captain Hall, "to the memory of most people, from its being the port whence the rich Spanish galleons of former days took their departure to spread the wealth of the Western over the Eastern world. It is celebrated, also, in Anson's delightful Voyage, and occupies a conspicuous place in the very interesting accounts of the Buccaneers: to a sailor, therefore, it is classic ground in every sense. I cannot express the universal professional admiration excited by a sight of this celebrated port, which is, moreover, the very *beau-ideal* of a harbour. It is easy of access; very capacious; the water not too deep; the holding ground good; quite free from hidden dangers; and as secure as the basin in the centre of Portsmouth dock-yard. From the interior of the harbour the sea cannot be discovered,

\* This is not quite accurate. There is one shoal of limited extent on which a vessel was lost in 1781. But, being mentioned in the charts, it is easily avoided.—*Journal of the Voyage of the Spanish Ship, &c.*, p. 24.

## ACCOMAC.

and a stranger, coming to the spot by land, would imagine he was looking over a sequestered mountain lake."—(*South America*, ii. p. 172.) There are two entrances to this splendid basin, one on each side of the small island of Eoqueta or Grifo, the broadest being nearly 1½ m. across, and the other from 700 to 800 feet. The town, commanded by the "extensive and formidable" (Hall) castle of San Carlos, is poor and mean. Since it ceased to be the resort of the galleons, it has ceased to be of any considerable importance; and when visited by Captain Hall, had only thirty houses, with a large suburb of huts built of reeds, walled in open basket work to give admission to the air. The climate is exceedingly hot and pestilential. To give a freer circulation to the air, an artificial cut was made through the chain of rocks by which the town is surrounded. But, though this has been of considerable service, it still continues to be very unhealthy. Its natural insularity is increased by the poisonous vapours exhaled from a marsh situated to the E. of the town. The annual desiccation of the stagnant water of this marsh occasions the death of innumerable small fishes; which, decaying in heaps under a tropical sun, diffuse their noxious emanations through the neighbouring air, and are justly considered a principal cause of the putrid bilious fevers that then prevail along the coast. Some trade is carried on between Acapulco and Guayaquil, Callao, &c.; but, owing to the extreme tediousness and difficulty of the voyage from Acapulco to Callao, the intercourse between Mexico and Peru is confined within very narrow bounds.—(*Hall*, loc. cit.; *Humboldt*, *Nouveau Voyage*, 2d. ed., iv., p. 88.)

ACCOMAC, county, Va. Situated in the S.E. part of the state, on the E. shore of Chesapeake bay, and contains 480 sq. m. With Northampton co. on the S., it constitutes the eastern shore of Virginia. The soil is mostly sandy, and it contains several islands in Chesapeake bay. It had in 1840, 12,576 neat cattle, 10,251 sheep, and 26,549 swine. It produced 14,479 bushels of wheat, 643,623 of Indian corn, and 4261 pounds of cotton. It has forty-seven stores, forty-nine grist-mills, six tanneries, twenty-four schools with 751 scholars. Pop. whites 9518, slaves 4630, free coloured 2948; total 17,069.

ACCOMAC, p. v., capital of Accomac co., Va., 193 E. by N. Richmond, 197 W. It contains a Methodist church, three stores, three grist-mills, and forty dwellings.

ACERENZA (an. *Acherentia*), a small and very ancient archiepiscopal city of Naples, prov. Basilicata, 14 m. N.E. Potenza. Pop. 3600. It is situated, according to the description of Horace (*Od. lib. iii., car. 4, l. 14*), on an almost inaccessible hill, *Nidus calce Acherentia*, the foot of which is washed by the Brandano. It has a castle, a cathedral, two convents, a grammar school, and an hospital. The archbishop resides at Matera. This town was looked upon by the Romans as one of the bulwarks of Apulia and Lucania.

ACERNO, a town of Naples, prov. Principato Citra, 16 m. N. of E. Salerno. Pop. 2500. It has a cathedral, a parish church, a *mont de piété*, which makes advances of seed to indigent cultivators, a fabric of paper, and a forge.

ACERRA, a town of Naples, prov. Terra di Lavoro, 9 m. N.E. Naples. Pop. 6300. It has a cathedral, a seminary, and a *mont de piété*. The country is fruitful, but unhealthy. This is a very ancient town. In the second Punic war it was destroyed by Hannibal, the inhabitants having deserted it on his approach. (*Liv. lib. xxiii., a. 17*.) Under Augustus it received a Roman colony.

ACHEEN, a principality occupying the north-west extremity of the island of Sumatra (which see).

ACHER, the capital of the above principality, situated near the N.W. extremity of Sumatra, on a river, about 3 miles from the sea, lat. 5° 35' N., long. 95° 45' E. It is very populous, being said to contain 8,000 houses built of bamboo and rough timber, and raised on posts, to secure them from inundations. A good deal of trade is carried on with Singapore, Batavia, Bengal, &c. Owing to a bar at the mouth of the river, none but small vessels pass up to the city.

ACHERN, a town of the G. of Baden, on the Achern, 14 miles N.E. Kehl. Pop. 3000. Within a short distance of Achern is the village of Bismbach, contiguous to which is a granite monument, erected at the expense of the French government in 1830, on the spot where the Marshal de Turenne, one of the greatest generals of modern times, was killed by a random shot on the 27th July, 1675. His bowels were interred in the chapel of St. Nicholas at Achern.—(*Schreiber's Rhine*; *Biographie Universelle*, art. "Turenne.")

ACHIL, or EAGLE ISLAND, an island on the W. coast of Ireland, co. Mayo, separated from the main land by a narrow channel. It is about 30 m. in circumference, and contains above 32,000 acres. Pop. 3577. It is mountainous; and eagles—whence its name—breed in its inaccessible fastnesses. The inhabitants speak the Irish language, and are in an extremely deplorable, miserable condition.

ACHMIN, or ECHMIN, a town of Upper Egypt, on the right bank of the Nile, 230 m. S. Cairo. Pop. 3000. Streets well disposed, broad, and straight, which is very unusual in Egypt; so that this would be a handsome town, were the

## ACRE.

houses built of better materials than baked bricks cemented with clay. It was anciently called Panopolis, or Chemmis; the former being the Greek, the latter the Egyptian name. It contains a church of some antiquity, and held in much veneration; but its chief ornament is the granite pillars taken from the ruins of Panopolis.

ACHMUNEIN, a large village of central Egypt, prov. Minyeh, on the site of the an. *Hermopolis Magna*, lat. 27° 43' N., lon. 30° 53' E. In the environs is the portico of an ancient temple, covered with hieroglyphics, and regarded as one of the finest remains of Egyptian architecture.

ACHONEY, a parish of Ireland, co. Sligo, which gives name to a bishopric, now united to Kiliala. 16 m. W. Sligo. Pop. of parish 15,357.

ACI-REALE, a sea-port town of Sicily, prov. Catania, cap. cant., at the foot of Mount Etna, 9 m. N.E. Catania. Pop. 19,702, incl. cant., of which the town may have about 15,000. It stands on a vast mass of basaltic lava, about 800 feet above its port, the *Marina di Aci*, and is supported on arches constructed with great labour and expense through ten alternate strata of lava and earth. The situation is healthy; the town is regularly built, clean, with many churches, convents, and public buildings, the whole giving evidence of a thriving and industrious population. A considerable trade is carried on, particularly during the fair in July, in wine, fruit, gold, silver-work, cotton, flax, and diaper, the last being bleached in great quantities in the plain below the town on the banks of the Acque Grande. The port is small; the mole is formed out of a mass of lava, and there are some good warehouses. During the servile war Aci-Reale was the head quarters of the consul Aquilino, who succeeded in suppressing that dangerous revolt, anno 101 B.C.—(*Smyth's Sicily*, p. 132, &c.)

ACKEN, a town and castle of the Prussian states, prov. Saxony, on the Elbe, 10 m. E.S.E. Calbe. Pop. 3000. It has manufactures of cloth and tobacco, and tanneries.

ACONCAGUA, a province of Chili (which see). This also is the name of the cap. of the same prov., a town containing about 5000 inhab.—(*Miers' Chili*, p. 420.)

ACQUA, a village of Tuscany, 15 m. E. of Leghorn, celebrated for its baths.

ACQUAPENDENTE, a small ill-built town of the Papal dominions, 15 m. W. Orvieto. Pop. 3400. It has a cathedral and five churches.

ACQUA-VIVA, town of Naples, prov. Terra di Bari, 18 m. S. Bari. Pop. 3300. It is surrounded by walls, has a handsome parish church, some convents, two hospitals, and a *mont de piété*.

ACQUACANONCE, p. L. Passaic co., N.J., 10 m. N. Newark, 79 N.E. Trenton, 236 W. Passaic river runs in a semi-ellipse on its N.W., N.E., and E. border. It has eight stores, one cotton-factory with 1000 spindles, one grist-mill, three saw-mills, one brewery, one academy with 34 students, three schools, 130 scholars. Pop. 2463. The village is at the head of tide-water on Passaic river, and is the outport of Paterson. It contains two Dutch Reformed churches and about eighty dwellings.

ACQUI, or AQUI, a town of the Sardinian States, cap. prov. same name on the left bank of the Bornide, 47 m. E. S.E. Turin. Pop. 6700. It has a citadel, a cathedral, two churches, and a seminary; and is celebrated for its warm sulphurous baths. The inhabitants are principally employed in the silk manufacture.

ACRA, a small district on the Gold coast of Africa, belonging to the Ashantees, nearly under the meridian of Greenwich. The English, Dutch and Danes have forts at Acra.

ACRE, AKKA, or ST. JEAN D'ACRE, a town of Syria, cap. pachalla of same name, on the coast of the Mediterranean, lat. 32° 54' 35" N., long. 35° 9' 51" E., 33 m. S.E. W. Tyour (an. Tyrus), and 35 m. W. lake Tabaria or Genezareth. It is situated on a promontory, forming the N.E. limit of a fine semicircular bay (the Bay of Acre) opening to the N., bounded N.W. by cape Carmel, at the extremity of the mountain of that name. The harbour of Acre, on the S. side of the town, within the bay is shallow, and accessible only to vessels drawing little water; but opposite to Calpha, a small town at the foot of Mount Carmel, on the W. side of the bay, there is good anchorage ground in deep water. Few towns are more advantageously situated as a centre of commerce or seat of political power; but these advantages, by making its possession of importance, have served to expose it over and over again to hostile attacks. The climate is unhealthy; the winter rains, descending in torrents from the mountains, fill the adjacent plain with stagnant lakes, from which, and the decomposition of vegetable remains, constant malarial is produced, forming a striking contrast to the healthy atmosphere of the neighbouring mountain land. Cotton and corn are the chief products of the plain of Acre, and these form its staple exports.

Previously to 1833 the population of Acre was loosely estimated at from 15,000 to 20,000; but the siege of that year having ended in its almost total destruction, it is impossible to state the number of its present inhabitants. The same

## ACRE.

cannot operate to make an account of the place historical, rather than descriptive of its existing state. Even before the period alluded to, a few broken columns of granite, and other dilapidated and neglected relics, were the only remains of antiquity; but of the Gothic age there were, at this epoch, the cathedral churches of St. Andrew and St. John. The mosque of Djemzar Pacha was a fine quadrangular building, paved with white marble, and surmounted by a cupola supported on pillars brought from the ruins of Caesarea. The same governor also constructed a large fountain, of incalculable advantage to the town.\* The bazaars were numerous and good, being arched over, and well supplied with commodities. Houses built of stone, and flat-roofed, the terraces on their tops forming agreeable promenades; the more useful, as the streets were extremely narrow. At present, however, Acre is, or at all events within a year or two was, little better than a mass of ruins; of all its buildings, public or private, the fountain of Djemzar was the only one that escaped unharmed from the effects of the siege by the Egyptians in 1832.

Although the modern town be of comparatively recent date, its site has been occupied by buildings from the remotest antiquity. Here stood a Hebrew, or perhaps a Phœnician city, called Acccho. Being improved and enlarged by the Greek sovereigns of Egypt, they gave it the name of Ptolemais; and it was justly regarded by them and their Roman successors as a port of great importance. Syria was one of the first conquests of the Mohammedans (see ARABIA), into whose hands Ptolemais fell, A.D. 636. It then received the name of Akko, which continues to be its Saracenic appellation. In 1104 it was captured by the first crusaders, and formed for eighty years part of the kingdom of Jerusalem, when it was taken by the famous sultan Saladin. About four years afterwards Richard Cour de Lion and Philip Augustus appeared before its walls, and after a siege of twenty-two months it surrendered to their arms in 1191. It subsequently remained in the possession of the Christians exactly a century; and under the government of the Knights Hospitallers of St. John attained considerable importance and prosperity. It derived from the magnificent cathedral erected by these soldier monks to their patron saint its common western name of St. Jean d'Acre. In 1291, however, the knights were driven from Syria, and Acre was the spot on which their last desperate but useless struggle took place. From 1291 till 1517, it formed part of the Caliphate, when it passed, with the last paltry wrecks of that once mighty power, into the hands of the Turks. Neglected by the government, and exposed to the depredations of every wandering tribe, it continued to decay, till, in the beginning of the 17th century, it was seized by Fakr-el-din, the celebrated emir of the Druses, under whose wise and energetic government it began to show symptoms of returning prosperity; but in the latter part of his life Fakr-el-din, apprehending a Turkish invasion, destroyed the harbour, and thus left the place in a worse condition than that in which he found it. Another century of decay and misery ensued, till, in 1749, the Bedouin Arab Dahar expelled the Turkish age, and made Acre the capital of a territory which for more than twenty years was virtually independent of the Porte. Dahar partially fortified Acre, partly cleared its ruins, and settled colonies of Greek and Mussulman farmers, harassed and despoiled in the neighbouring countries, in the surrounding plain. On Dahar's fall in 1775, Acre reverted to the dominion of the Turks. For once, however, the change of masters was not productive of ruin. Djemzar, who was immediately appointed pacha, how inferior soever to Dahar in personal character, seems to have resembled him in his political energy, promptness, and decision. He strengthened the fortifications, and embellished the town. The determined and successful resistance which it made in 1799 to the arms of Napoleon has rendered it famous in modern history. There is, indeed, good reason to think that the termination of the siege had a powerful influence over the future fortune of that extraordinary person, and consequently of the world. (See *Voyage du Maréchal Marmont*, iii, p. 76, &c.) Acre continued to prosper till 1832. Though fettered by imposts and monopolies, it carried on a considerable foreign trade, and had resident consuls from most of the great states of Europe. During its siege by Ibrahim Pacha in 1832, which lasted five months and twenty-one days, its private and public buildings were mostly destroyed. But its great importance to its Egyptian masters has already made

## ADAMS.

them repair its fortifications, and render them stronger than ever; and no doubt also its streets and houses will be again re-opened and rebuilt.—(*Viney's Travels in Syria*, ii, p. 201; *Robinson's Travels in Palestine and Syria*, ii, p. 291; *Hogg's Visit to Alexandria*, ii, 150-173; *Russell's Palestine*, 317-357; *Voyage du Maréchal Marmont*, iii, p. 76-83.)

ACRI, a town of Naples, prov. Calabria Citra, cap. cant. on the Muccone, in a healthy situation, 13 m. N.E. Cosenza. Pop. 7000. It has six parish churches and an hospital. The surrounding country is very fruitful.

ACTIUM. See ARFA, GULF OF.

ACTON, a village and parish of England, formerly resorted to for its mineral waters. Pop. 1939, 5 m. from London.

ACTON, p. t., York co., Me., 91 m. S.W. Augusta, 580 W. Salmon Falls River bounds it on the W. It has three stores, four grist-mills, five saw-mills, and 489 scholars in schools. Pop. 1401.

ACTON, t. Windham co., Vt., 18 m. N.W. Brattleboro, 90 S. Montpelier. It has four schools with 51 scholars. Pop. 170.

ACTON, p. t., Middlesex co., Mass., 29 m. N.W. Boston, 463 W. Watered by Assabet River. Incorporated in 1735, and has two churches, one Congregational and one Unitarian, four stores, one flouring-mill, two grist-mills, three saw-mills, five schools, 337 scholars. Pop. 1131.

ACUL, an inconsiderable seaport town of Hayti, on its N. coast. Lat. 19° 47' 40" N., long. 73° 27' 13" W. It was called St. Thomas by Columbus.

ACWORTH, p. t., Sullivan co., N. H., 46 m. W. Concord, 460 W. Watered by Cold river. Incorporated in 1713, and contains two stores, one woollen factory, and has 520 scholars in schools. Pop. 1150.

ADA, p. t., Kent co., Mich., 158 m. N.W. Detroit, 630 W. Watered by Thornapple river, flowing into Grand river, which crosses its N.E. corner. The v. is situated on Thornapple river, which affords water power near its entrance into Grand river.

ADAIR county, Kentucky, situated centrally in the south part of the state, and contains 440 sq. m. Drained by Green river and its branches. It had in 1840, 9108 neat cattle, 12,963 sheep, and 31,199 swine, and produced 37,888 bushels of wheat, 308,103 of Indian corn, and 1,030,116 pounds of tobacco. It has ten stores, ten tanneries, nineteen distilleries, five flouring-mills, nineteen grist-mills, twelve saw-mills, eleven schools, and 313 scholars. Pop. whites 6769, slaves 1605, free coloured 92; total 8466. Capital, Columbia.

ADAIR county, Mo., situated in the N. part of the state, and contains 567 sq. m. Drained by Chariton river. Erected in 1840. Capital, Hopkinton.

ADALIA, or SATALIEH, a sea-port town of Turkey in Asia, Anatolia, cap. Sangiac Teké-illi, on the gulf of the same name, near the mouth of the Doudenou, lat. 36° 52' 15" N., long. 30° 45' 3" E. Pop. 8000 (?) two thirds Turks and one third Greeks. It is finely situated, being built amphitheatre-wise round a small harbour on the declivity of a hill, the summit of which is surmounted by a castle. It is enclosed by a ditch, a double wall, and a series of square towers about fifty yards apart. Streets narrow, and houses mostly of wood. It is the residence of a pacha and of a Greek archbishop; and has numerous mosques, churches, baths, caravansaries, &c. The surrounding country is beautiful, and the soil deep and fertile.

Adalis is supposed to occupy the site of the ancient Olibis; and the fragments of columns and other remains of antiquity found within its walls attest its former flourishing state. (*Bosquet's Karamania*, p. 136; *Dict. Géographique*, &c.)

ADAMS, cape, the S. point of land at the mouth of the Columbia river, on the Pacific. A sand-bar, five m. across, extends from it to within a mile of Cape Disappointment, which is seven m. N.W. This bar renders the entrance of the river dangerous.

ADAMS county, Pa., situated in the S. part of the state, and contains 523 sq. m. The surface is uneven; soil fertile. It contained in 1840, 19,343 neat cattle, 19,140 sheep, and 31,583 swine. There were produced 916,606 bushels of wheat, 390,734 of Indian corn, and 374,960 of oats, and considerable buckwheat, barley, and potatoes. It has fifty-nine stores, three furnaces, five woollen-factories, twenty-eight tanneries, eighteen distilleries, two breweries, forty-two flouring-mills, forty grist-mills, seventy-six saw-mills, five printing-offices, two colleges, 190 students, one academy, 43 students, ninety-seven schools, 4065 scholars. Pop. 23,044. Capital, Gettysburg.

ADAMS county, Miss., situated in the S.W. part of the state, and contains 440 sq. m. Mississippi river bounds it on the N.W. It had in 1840, 22,033 neat cattle, 4741 sheep, and 4553 swine. There were produced 196,596 bushels of Indian corn, and 90,392,470 pounds of cotton, with considerable oats, potatoes, &c. It has eighteen foreign commercial and commission houses, 113 retail stores, four

\* However bloodthirsty and selfish, it is evident, from the accounts of those who were little inclined to partiality, that Djemzar (the butcher) Pacha possessed many of the qualities that constitute an able and energetic ruler. Under his firm, though iron sway, the probable rise to an importance which made it be respected alike by the Porte and by all the warring spirits in the neighbourhood. When his own passions did not interfere, he was clearly and strenuously the ally of the interests of those beneath his government, as the public buildings he erected and his steady encouragement of European trade sufficiently evince. His subjects, too, were made from all countries to respect his own; a species of security which, though little valued in Europe, is no light matter in many parts of the East.

## ADAMS.

saw-mills, two printing-offices, at which are issued two daily, two weekly, and one semi-weekly newspapers; one college, ninety students; seven academies, 311 students; thirteen schools, 399 scholars. Pop. whites 5010, slaves 14,941, free coloured 253; total, 19,434. Capital, Natchez.

ADAMS county, O., situated in the south part of the state, on the Ohio river, and contains 550 sq. m. Watered by the Brush river, along which is iron ore. It had in 1840, 17,639 neat cattle, 20,550 sheep, and 17,470 swine. There were produced 130,393 bushels of wheat, 211,048 of Indian corn, 102,545 of oats, and 32,510 pounds of sugar. It has fifty-two stores, two furnaces, six tanneries, six flouring-mills, ten grist-mills, ten saw-mills, ten schools, 284 scholars. Pop. 13,183. Capital, West Union.

ADAMS county, Ia., situated in the E. part of the state, and contains 336 sq. m. Watered by Wabash and St. Mary's rivers. It had in 1840, 2194 neat cattle, and 4319 swine. There were produced 3948 bushels of wheat, 36,688 of Indian corn, and 15,536 pounds of sugar. It has three stores, one grist-mill, two saw-mills, three schools, 35 scholars. Capital, Decatur. Pop. 3264.

ADAMS county, Ill., situated in the W. part of the state, and contains 769 sq. m. Bounded W. by Mississippi river. It had in 1840, 19,312 neat cattle, 13,063 sheep, and 49,391 swine. There were produced 143,865 bushels of wheat, 721,565 of Indian corn, 154,577 of oats, and 7989 pounds of tobacco. It has four commission houses, fifty-six stores, four flouring-mills, fourteen grist-mills, twenty-four saw-mills, one woolen-factory, two breweries, four printing-offices and one weekly newspaper. One academy, 60 students, 101 schools, 3754 scholars. Capital, Quincy. Pop. 14,478.

ADAMS, p. t., Berkshire co., Mass. 20 m. N. Pittsfield, 132 W.N.W. Boston. 392 W. It has two villages. The N. village contains three churches, one Congregational, one Baptist, and one Methodist, and a bank. The S. village has three churches, one Baptist, one Friends, and one free to all denominations. Hoosac river affords great water power, with 18,399 spindles, one furnace, five tanneries, two grist-mills, six saw-mills, one academy, 45 students, eighteen schools, 735 scholars. Pop. 3705. There is a curious natural bridge over Hudson's brook, a branch of Hoosac river.

ADAMS, p. t., Jefferson co., N.Y. 162 m. N.W. Albany. 403 W. Watered by Sandy creek, which has a fall of fifteen feet, producing a good water power. It has ten stores, one woolen factory, one flouring-mill, two grist-mills, three saw-mills, fifteen schools, 581 scholars. Pop. 2066. The village contains one Methodist and one Presbyterian church, a female seminary, and about 190 dwellings.

ADAMS, t., Conhocton co., O. It contains one grist-mill, two saw-mills, one school, 25 scholars. Pop. 838.

ADAMS, t., Guernsey co., O. Pop. 867.

ADAMS, t., Henry co., O. It has two schools, 34 scholars. Pop. 188.

ADAMS, t., Washington co., O. Watered by Muskingum river. It has six schools, 200 scholars. Pop. 792.

ADAMS, t., Beneca co., O. It has two stores. Pop. 1250.

ADAMS, t., Allen co., O. It has two schools, 35 scholars. Pop. 363.

ADAMS, t., Monroe co., O. Pop. 898.

ADAMS, t., Muskingum co., O. Pop. 998.

ADAMS, t., Darke co., O. Pop. 867.

ADAMS, t., Champaign co., O. It has one store, two saw-mills, five schools, 93 scholars. Pop. 970.

ADAMS, p. t., Hillsdale co., Mich. 93 m. S.W. Detroit, 533 W. It has four schools, 174 scholars. Pop. 534.

ADAMS, p. t., Decatur co., Ia. 54 m. S.E. by E. Indianapolis, 557 W.

ADAMS, t., Hamilton co., Ia. Pop. 519.

ADAM'S PEAK, the highest mountain in the island of Ceylon, altitude 6139 feet; 45 m. E.S.E. Colombo. It has a sugar-loaf shape; and its summit, supposed to be the point where Buddha ascended to heaven, is esteemed sacred, and is resorted to by pilgrims.

ADANA, a town of Asia Minor, the capital of a district or government of the same name on the Euxine (Sarus), about 85 m. above where it falls into the sea, lat. 36° 55' N., long. 39° 16' E. Pop. 10,000. It is very ancient, stands on a declivity, surrounded on all sides by groves of fruit-trees and vineyards, is large, well-built; has a castle; a bridge over the river, said to have been built by Justinian; and a most noble portico in the middle of the bazaar. It carries on a considerable trade in wine, fruits, and corn. In summer it is rather unhealthy, and the majority of the inhabitants retire to the country. (*Kianetir's Asia Minor, &c.*, p. 131.)

ADANAD, a town or place of Hindostan, prov. Malabar, div. Bhirnada, the residence of a class of Brahmins called Nambaries. This sect refuse to eat or drink with other Brahmins. The elder sons marry as many wives as they can support, and live with them; but the younger sons of

## ADELSBERG.

the family seldom marry, in order to prevent the decline of their dignity by their becoming too numerous.

ADARE, an ancient town of Ireland, co. Limerick, with some fine ruins, now very much decayed, situated on the Meig, over which it has a bridge of nine arches; 130 m. S.W. Dublin. Pop. 786.

ADDA, a celebrated river of Italy, formed by the junction of several rivulets near Bormio, in the Valteline. Having traversed the province, it passes Sondrio, enters the lake of Como near its northern and issues from its southern extremity, and passing Lodi and Pizzighettone, falls into the Po six m. W. Cremona.

ADDISON, county, Vt., situated in the W. part of the state, and containing 700 sq. m. Lake Champlain bounds it on the W. Watered by Otter cr. and its tributaries. This river is navigable 7 m. from the lake, and affords excellent water power. There were in the co. in 1840, 961,010 sheep, 30,718 neat cattle, and 14,305 swine; and there were produced 31,323 bushels of wheat and 95,304 of Indian corn; 449,079 of potatoes, besides considerable rye, buckwheat, and 132,013 pounds of sugar; has seventy stores, one furnace, eight forges, twenty fulling-mills, seven woolen factories, one cotton factory, with 3890 spindles, one glass factory, seventeen grist-mills, sixty-three saw-mills, one paper-mill, three printing-offices and three weekly newspapers, one college, 62 students, five academies, 134 students, 177 schools, 6449 scholars. Pop. 23,583. Cap. Middlebury.

ADDISON, p. t., Washington co., Me. 136 m. E. by N. Augusta, 720 W. It has thirty stores, one grist-mill, two saw-mills, six schools, 450 scholars. Pop. 1053.

ADDISON, p. t., Addison co., Vt. 12 m. W.N.W. Middlebury, 75 S.W. Montpelier, 483 W. The surface is level; soil fertile. Bounded W. by lake Champlain. It contains a Congregational church, two stores, one fulling-mill, one grist-mill, one saw-mill, ten schools, 309 scholars. Pop. 1933.

ADDISON, p. t., Steuben co., N. Y. 18 m. S. Bath, 327 W. by S. Albany, 922 W. It has two stores, one printing-office, issuing a weekly newspaper, one academy, 190 students, ten schools, 463 scholars. Pop. 1090.

ADDISON, p. t., Somerset co., Pa. 153 m. S.W. Harrisburg, 170 W. Watered by Youghiogheny river, and contains ten stores, one grist-mill, eight saw-mills, three distilleries, three tanneries, two schools, thirty scholars. Pop. 1301.

ADDISON, p. t., Gallia co., O. 107 m. S. by E. Columbus, 354 W. Bounded S.E. by Ohio river. Pop. 693.

ADDISON, t., Oakland co., Mich. It has one store, one flouring-mill, one grist-mill, one saw-mill, five schools, 125 scholars. Pop. 537.

ADELSBERG, a village and cavern in Illyria, about half way between Laybach and Trieste. The cavern is decided by the most magnificent and extensive hitherto discovered in Europe. It has been explored to a distance of between 1 and 2 miles (1310 fathoms) from the entrance, and is terminated by a lake. It is believed however, that this is not the end of these vast hollows, and that were it carefully examined, its extent would be found to be much greater. The cavern is placed under the care of an officer in the adjoining village, who appoints guides to conduct strangers through it. It is easily accessible, and may be visited without any risk. The entrance is situated about a mile from the village, in the face of a cliff, below a ruined castle. At this point the river Poik, after winding through the plain, disappears beneath the mountain, sinking into the rock below a natural penthouse formed by the slope of the limestone strata. The entrance for visitors is a small hole above this, closed by a door. At a distance of 180 yards from the mouth, a noise of rushing water is heard, and the Poik may be seen, by the light of the taper, struggling along at a considerable depth below; and, on a sudden, a vast hall 160 feet high, and more than 300 long, called the Dome, is entered. The river, having dived under the wall of rock on the outside, here re-appears for a short space, and is then lost in the bowels of the mountain. It is believed to be identical with the Unz, which bursts forth at Plantina; planks of wood, thrown into the stream of the cavern, appear there, it is said, six or ten or twelve hours.

The Dome was seen, a party of the cavern known down to 1819, when a labourer, working in the cave, accidentally broke through a screen of stalactite, and discovered that this was to use the words of Ruesel, "but the vestibule of the most magnificent of all the temples which nature has built for herself in the region of the night." Rude steps, cut in the rock, lead down the sloping sides of this chamber to the level of the river, which is crossed by a wooden bridge; and the opposite wall is faced by means of a similar flight of steps. Here the visitor enters the newly-discovered part of the cavern, consisting of a range of chambers varying in size, but by far the most interesting, from the variety, beautiful purity, and quantity of their stalactites. Sometimes uniting with the stalagmite below, they form a pillar worthy to support a cathedral; at others a crop of minute spiculate rises from the floor; now a cluster of slender columns re-

## ADEN.

minds one of the tracery of a Gothic chapel, or of the twirls or interlacings of the ascending and descending branches of the banyan tree. The fantastic shapes of some masses have given rise to various names, applied by the guides, according to the likeness which they imagine they can trace in them to real objects; such as the throne, the pulpit, the butcher's shop, the two hearts, the bell, which resounds almost like metal, and the curtain (Vorhang), a very singular mass about an inch thick, spreading out to an extent of several square yards, perfectly resembling a piece of drapery, and beautifully transparent. The stalactical matter pervades almost every part of the cavern; it paves the floor, hangs in pendants from the roof, coats and plasters the wall, cements together fallen masses of rock, forms screens, partitions, and pillars. The only sound in the remote chambers is produced by the fall of the drops of water charged with lime, which are found, on examination, to tip each pendant mass, forming an ascendant spire, or stalagmite, on the spot where it descends. One of the long suite of chambers, larger and loftier than the rest, and with a more even floor, is converted once a year (in May) into a ball-room. On that occasion the peasant lads and ladies assemble from miles around, and the gloomy vaults re-echo with sound of mirth and music. — (*Murray's Handbook for Southern Germany*, p. 229.)

ADEN, a small state of S. Arabia in Yemen, lying between 12° 32' and 13° 3' N. lat. and between 43° 30' and 45° 30' E. long. It extends from E. to W. about 115 m., its greatest width being about 30. The mountains in this part of Arabia are close upon the sea, and, for an Arabic district, it is well supplied with water; and from both these causes the heat of the climate is considerably mitigated, and vegetation flourishes upon a more extended scale than in most other parts of the peninsula. It has a considerable forest. The cultivated parts produce wheat, dhourah, and cotton; the woods consist of mangoes, acamores, and pomegranates, and the surface of the whole country is interspersed with date trees. Wellsted (*Travels*, ii., 408) states that in purity of atmosphere, richness of soil and verdure, nature of vegetation, and proximity of production and desolation, this country resembles Egypt. The barren parts are represented as peculiarly so; but they occur in comparatively small patches, and in the midst of fertility. The inhabitants are mostly agriculturists; but such is the miserable state of the country, that the husbandman never goes to his labour without being armed, and resorts to the towns for security during the night. The town inhabitants of the interior carry on an extensive trade with the Bedouins, who bring to market their ghee (butter), frankincense, and milk, receiving in return grain and cloth. Manufactures limited to a fine striped cloth or silk, used for the dresses of the superior classes, the weaving of which occupies about thirty looms in the town of Lahedjed. — (*Niebuhr, Descr. del' Ar.*, par. ii., p. 221, 222; *Voy. en Ar.*, ii., p. 32, 33; *Wellsted's Travels in Arabia*, ii., 400-411.)

ADEN, a sea-port south of Arabia, cap. of the above state, on the Indian Ocean, lat. 12° 45' N., long. 45° E. It stands upon a lofty promontory, called the *Peninsula of Aden*, connected with the main land by an isthmus about 200 yards in breadth. When Salt was here, in 1808, this isthmus was overflowed at every high tide, and constant communication between Aden and the main land was preserved only by a large causeway of seven arches. A striking proof of the rapidity with which buildings vanish and coast lines change, in Arabia, is afforded by the fact, that on Wellsted's visit to the same spot in 1835, the causeway existed only in an "old map;" the isthmus was never under water, but a narrow channel, still farther to the S., separating Aden from the rocky belt of Sirah, became dry at every ebb tide. On the N. and W. the town is overhung by a steep and craggy mountain, on the pinnacles of which are several towers, now all but inaccessible, the decaying nature of the rock having made the ascent much more precipitous and abrupt than it was when they were built. The E. or outward harbour of Aden, formerly (and apparently at a recent period) large and commodious, is now nearly filled up with sand; but the water which washes the W. and N. sides of the promontory, called "*Aden Back Bay*," affords a convenient and secure haven. From this the approach to the town, situated 2½ m. S., is over a low ridge of the mountain, and in some parts is cut through the solid rock. Strong fortifications formerly existed, now buried in sand, or falling into rapid decay; and some enormous guns, which once formed an impregnable battery towards the sea, now serve only as memorials of departed strength and greatness. In the 17th century Aden had a population of 30,000; at present the inhabitants do not probably exceed 800, of whom 250 or 300 are Jews, and about half that number Banian Indians.

About 100 houses, with some wretched huts and three or four minarets, the mosques belonging to which have fallen, are the only buildings remaining in Aden; the rest of its area is occupied by heaps of rubbish, tombs, mounds, and

## ADIRONDACK MOUNTAINS.

the roofless walls of older dwellings. In 1707, De la Roche noticed some spacious baths, lined with jasper, and surmounted by domes; but these have entirely vanished. There are reservoirs, however, of solid masonry, sixty-eight feet long and twenty deep; cisterns cut in the solid rock, three of which are eighty feet square; and aqueducts to bring the water from the upper parts of the mountains, all evincing that Aden was once the home of industry, wealth, and science.

This town, or one occupying its site, was known to the Greeks as the channel through which the treasures of India were conveyed to the coast of Egypt. Some time after the direct passage across the Indian Ocean had been achieved by Hippalus, A.D. 50, the Romans, to secure the monopoly of the Indian trade, caused Aden to be destroyed. When or by whom it was rebuilt is unknown; but from the 11th till the 16th century it was the great, or rather the exclusive, entrepôt of Eastern commerce. The discovery of the passage by the Cape of Good Hope was the first great blow to its importance; and simultaneously with the appearance of the Portuguese in India, the Turks under Solymann the Magnificent took possession of many Arabic ports, Aden among the number. The Turks erected the fortifications, the ruins of which excite the admiration of every traveller, and which repelled the attacks of the famous Portuguese general Albuquerque. From this date, however, Aden has declined; nor did the expulsion of the Turks, which took place in the middle of last century, retard its downfall. Its ruin seems more complete than could have been anticipated; for its convenient harbours and plentiful supply of water make it a desirable port. But, though it be still the chief mart for the myrrh, aloes, libanum, mastich, and other commodities brought by the Soumalee traders from the N.E. coast of Africa, not more than twenty families are engaged in commerce; the rest gain a miserable subsistence by supplying the shipping and Hadj boats with wood and water, or by fishing. The exports consist of rice, tobacco, and cloth, brought by the Hadj boats. The African trade is carried on wholly in Soumalee bottoms (see AASATA), and nearly all the resident merchants are Banians.

We have been thus particular in noticing the past and present state of Aden, because it is most probably destined again to become of very material importance. It is understood that the town, and the peninsula on which it is built, have been ceded to the E. I. Company, who intend making it a depot and halting-place for the steamers employed in the passage between Bombay and Suez. It is admirably situated for such a purpose. And its natural strength, the excellence of its ports, and its convenient situation for commerce, will no doubt render it, when under British rule, a flourishing emporium. It is quite as well situated as Mocha for carrying on the trade in coffee; of which it will, most likely, come to be the centre.

One of the few perennial streams of Arabia, the Melden, is in the state of Aden, and falls into the sea at Sheik Ahmed, 5 m. W. of the town. Niebuhr describes this river, but doubts have since been entertained with regard to its existence. The recent visit of Mr. Wellsted has, however, established the perfect accuracy of Niebuhr's statement.

But the abundant supply of water, for which Aden is remarkable among Arabic towns, is drawn, not from this river, but from the ravines and gulleys of the surrounding mountains; and from the land springs, which are abundant on the sea shore.

Aden is 180 m. S.S.E. Sanaa, and 140 m. E.S.E. Mocha. — (*Niebuhr, Descr. del' Ar.*, par. ii., p. 221, 222; *Voy. en Ar.*, ii., 51, 32; *Salt, Voy. to Abyss.*, p. 105-111; *Wellsted*, ii., 393-399.)

ADJYGHUR, a town of Hindostan, prov. Allahabad, lat. 24° 30' N., long. 80° 3' E. It has a fortress at the top of a steep hill, that was taken by the British in 1809, after a stout resistance.

ADIGE, a large river of Italy, the *Atesius* or *Athesis* of the ancients. It is formed by several rivulets which have their sources in the Rhetian Alps, and unite near Glurns; thence it flows E. till near Bolzano it is joined by its important tributary, the Eisack. It then takes a southerly course past Trent, where it becomes navigable to Roveredo and Pontone. It then changes its course to the E., and passing Verona, Legnago, and Aquileia, falls into the Adriatic 20 miles S. Venice. It is deep, rapid (*Feloz Athesis*, Claud.), and is usually navigated with difficulty. In spring, on the melting of the snow in the mountains, it is liable to sudden floods, to prevent the injurious influence of which in the Polesino of Rovigo and other low grounds, it is fenced by strong banks, while a part of the surplus water is carried off by canals. Exclusive of the Eisack, its principal affluents are the Noce, Avisio, and Arno.

ADIRONDACK MOUNTAINS, N. Y., lying S. W. of Lake Champlain, and are nearly as high as the White Mountains. N. H., Mount Marcy, the highest peak, being 5467 feet above tide-water in the Hudson river.

## ADMIRALTY ISLAND.

ADMIRALTY ISLAND, an island on the W. coast of America, between George the Third's Archipelago and the continent, about 90 m. long and 25 broad. Lat.  $57^{\circ}3'$  to  $59^{\circ}24'$  N., long.  $232^{\circ}10'$  to  $239^{\circ}31'$  E.

ADMIRALTY ISLANDS, a cluster of twenty or thirty islands in the South Pacific Ocean, of which the largest, called Great Admiralty Island, is 35 to 80 m. in length: in about  $8^{\circ}10'$  S. lat., and from  $126^{\circ}$  to  $129^{\circ}$  E. long. They were discovered by the Hollanders in 1616, and are inhabited.

ADORF, a town of Saxony, on the Elster, 15 m. S. E. by S. Plauen. Pop. 2500. It manufactures all sorts of musical instruments, with cloth and cotton stuffs.

ADOUE, a considerable river in the S.W. of France. It has its source in the Pyrenees, 6 m. E. Bareges, whence it flows N. by Bagneres and Tarbes to Oise; here it takes an easterly course, and passing St. Sever, Dax, and Bayonne, falls into the sea a little below the latter. It is navigable to St. Sever. The Oleron and the Pau are the most considerable of its affluents.

ADOWA, the capital of Tigré, in Abyssinia, partly on the side and partly at the foot of a hill, commanding a magnificent view of the mountains of Tigré. Lat.  $14^{\circ}12'30''$  N., long.  $39^{\circ}5'$  E. The houses are all of a conical form, pretty regularly disposed into streets or alleys, interspersed with trees and small gardens. Pop. probably 8000. It has manufactures of cotton cloths, and an extensive trade in cattle, corn, salt, and slaves.

ADRA, a sea-port town of Spain, cap. district same name, prov. Granada on the Mediterranean, 45 m. S. E. Granada. It is situated near the mouth of the Adra. In its vicinity are some of the richest lead mines in the world, the produce of which constitutes the principal article of export from the town.

ADRAMYT, a town of Turkey in Asia, Anatolia, about 4 m. from the E. extremity of the gulf of the same name, 78 m. N. Smyrna, lat.  $39^{\circ}29'$  N., long.  $29^{\circ}57'15''$  E. Pop. 5000 (?); streets narrow, ill paved, and filthy; houses, with few exceptions, mean, and miserably built. The olives produced in the adjoining territory, with large quantities of wool from the interior, are principally shipped for Constantinople; little except galls being shipped for other parts of Europe.—(Turner's *Levant*, iii., p. 265.)

ADRIA (an. *Atvia* or *Hatria*), a town of Austrian Italy, deleg. (formerly the *Polesko* of) Rovigo on the Castagnano, between the Po and the Adige, 12 m. E. Rovigo. Lat.  $45^{\circ}9'37''$  N., long.  $12^{\circ}3'35''$  E. Pop. circa 10,000. This is a very ancient city, being supposed to be of Greek origin, and having afterwards formed part of the dominions of the Etruscans. It was originally a sea-port of such magnitude and importance as to be able to give its own name to the great arm of the Mediterranean on which it stood; but owing to the gradual extension of the land, in consequence of the mud and other deposits brought down by the rivers, the port of Adria has been long since filled up, and it is now an inland town 18 or 19 m. from the sea. When Strabo wrote, it had become a comparatively unimportant place, and it subsequently suffered much from inundations and war, particularly from the attacks of the barbarians. During the twelfth century it began to revive. Its climate, which had become very unhealthy, and its environs, have both been materially improved by the drainage effected by opening the canal of Portovico. It is the seat of a bishopric, has a fine collection of Etruscan and Roman antiquities found in the vicinity, with manufactures of silk, leather, &c. The surrounding country is productive of corn, wine, and cheese.—(Cresser's *Ancient Italy*, i., p. 116, Balbi Abregé ed., 1837.)

ADRIAMPATAM, a town of Hindostan, on the sea-coast of Tanjore 37 m. S.E. Tanjore, long.  $79^{\circ}30'$  E., lat.  $10^{\circ}20'$  N.

ADRIAN, p. v. Logan t., capital of Lenawee co., Mich., 67 m. S.W. Detroit, 501 W., situated on Raisin river, and contains three churches—One Methodist, one Baptist, and one Presbyterian—twenty-seven stores, three grist-mills, six saw-mills, two printing-offices, two weekly newspapers, sixteen schools, 671 scholars. Pop. 2498. It is connected with Toledo by a railroad, and is one of the most flourishing villages in the state.

ADRIANOPLE (called *Edirnek* by the Turks), a celebrated city of Turkey in Europe, prov. Roumelia, on the Mariza (an. *Hæmus*), where it is joined by the Tongs and the Arda, 134 m. N. W. Constantinople, lat.  $41^{\circ}48'$  N., long.  $26^{\circ}29'15''$  E. Pop. variously estimated at from 80,000 to 140,000. According to the Hon. Mr. Keppel it contains 23,000 houses and 90,000 inhabitants, of whom 45,000 are Turks, 30,000 Greeks and Bulgarians, and the remainder Armenians and Jews. It is beautifully situated in one of the richest and finest plains in the world, on the sides and base of a low hill, and when viewed from a distance has a magnificent appearance; but, as is the case in most Turkish towns, the illusion vanishes on entering. The streets are narrow, crooked, and filthy; and in certain periods of the

## AFFGHANISTAN.

year it is unhealthy. Some of the houses are three stories high, and their shelving roofs project so much as to meet those on the opposite side. In the centre of the town an old wall, supported by massive towers, the work of the sovereigns of the Lower Empire, encloses a space occupied by the rayah population. Originally it may have been the citadel; but it is now useless as a defence. Among the public buildings, the most distinguished are, the ancient palace of the sultans, in a state of decay; the famous bazaar of Ali Pacha, appropriated to the warehousing and sale of various descriptions of commodities; and the numerous mosques. Of the latter, the one erected by Selim II. is the most splendid; and ranks, indeed, among the finest Mohammedan temples. There are numerous booths and retail shops stored with all sorts of merchandise. There are also numerous baths and fountains supplied with water conveyed into the city by an aqueduct. A medrasah, or superior school, is attached to the mosque of Sultan Selim, and there are a number of other schools. The Maritza is navigable up to the city during winter and spring; but in summer the sea craft only ascend as high as Demotica. Enos, at the mouth of the Maritza, is properly the sea-port of Adrianople. It formerly admitted large vessels; but owing to the carelessness of the Turks, who have allowed a sand-bank to accumulate, it is now accessible only to vessels of comparatively small burden. With the exception of tanning, which is rather extensively carried on, manufactures are inconsiderable. It has, however, a pretty extensive commerce. The exports consist principally of the raw products of the adjacent country, comprising excellent wool, cotton, silk, good wine, otto of roses, fruits, berries for dyeing, &c. The imports consist principally of manufactured goods; as cottons and hardware from England, woollen stuffs from Germany, &c. The trade is principally carried on by Greek merchants. It is the seat of a Greek archbishop.

In early times Adrianople was the capital of the Bessi, a people of Thrace, and was then called *Usakadama*. It derives its present name from the emperor Adrian, by whom it was improved and embellished. The Turks took it in 1360; and it continued to be the seat of their government from 1366 till the taking of Constantinople in 1453. It was occupied by the Russians in 1829; but was evacuated on a treaty being concluded between them and the Turks in September that year.—(Keppel's *Journey across the Balkans*, i., p. 250-563; Macmichael's *Journey from Moscow to Constantinople*, p. 158; Walsh's *Journey from Constantinople to England*, p. 144; *Dict. Geographique*, art. "Adrianople," &c.)

ADRIATIC SEA, or GULF OF VENICE (*Mare Adriaticum* or *Superum*), is that great arm of the Mediterranean extending S.E. and N.W. between the coasts of Italy on the W. and those of Illyria and Albania on the E., from about  $40^{\circ}$  to  $45^{\circ}55'$  N. lat. Its southern extremities are the Capo di Leuca, or St. Mary's, in Naples, and the Isle of Fano to the N. of Corfu; and its northern extremity the bottom of the gulf of Trieste. It derived its ancient name from the once flourishing sea-port town of Adria (which see), now 18 m. from the shore, and its modern name from Venice. Its W. or Italian shore is deficient in harbours, is generally low, and from the entrance to Riminal has deep water; but from the latter northward it has been partially filled up by the deposits brought down by the Po and the Adige, and is edged by lagoons, marshes, and shoals. On the E. side its coasts are generally high, steep, and rocky, and are broken into deep bays and gulfs formed by the numerous islands by which it is fenced. With the exception of those already mentioned, it receives no river of any considerable magnitude; and the saltness of its waters is said to exceed that of the ocean. The ebb and flow are considerable at Venice and other places. The bore or N.E. wind is the most formidable obstacle to its safe navigation. It comes on in sudden and impetuous squalls, which generally continue for three days, and in an advanced season from nine to fifteen or more. A vessel overtaken by it should always make for a port or anchorage ground on the E. coast, those on the W. being open and unsafe. The S.E. wind throws up a heavy sea; but is not dangerous, as vessels may easily get to an anchorage on the E. shore. Venice, Trieste, Ancona, and Fiume are the principal trading ports on the Adriatic. (*Dict. Geographique*; *Purdy's Directions for the Gulf of Venice*, &c., p. 23, &c.)

AERSCHOT, a town of Belgium, prov. S. Brabant, on the Demer, 9 m. N.E. Louvain. Pop. 3723. It was formerly fortified; and has some breweries and distilleries.

AFFGHANISTAN, the name applied to a country of Central Asia inhabited by the Afghan nation; and, sometimes, to a kingdom of which that country formed the principal part. In the latter sense, the boundaries of Afghanistan have been subjected to the same political changes which have affected other Asiatic states. In the former, considered as the country of the Afghan people, it may be described as extending from the 30th to the 35th degree of N

## AFFGHANISTAN.

latitude, and from the 66d to the 71st degree of east longitude; having the Indus on the E., the crest of the Hindūsh or Hindoo-Cooch, and part of the Paropamisan or Goor mountains on the N.; the districts of Bee-weestan, Cutch Gundava, and Sareewan, with part of the desert of Beloochistan on the S.; part of Belistan, with Ghoriān of Khorasan on the west; and Morghāh, and the Hazareh country on the N.W. This rather indefinite bounding line will exclude the Eymaak country, as well as the Hazareh, neither of these tribes being of Afghan descent; while it includes Herāt and its dependencies, which are entirely inhabited by genuine Affghans.

*History and Political Changes.*—Afghanistan having, from the remotest period of authentic record, followed the fortunes of its more powerful neighbours, or formed but the centre of a greater whole, cannot correctly lay claim to any history of its own, until after the death of Nader Shah. For though several dynasties sprang from its soil, they never erected there a separate kingdom of any duration, unless perhaps in the instance of Subutogean, father of the celebrated Mahmood of Ghiznee, who resided at that city before the rise of his son's power—a power which extended over great part of Asia. On the murder of Nader, in Khorasan, Ahmed Khan Abdallee, after an indecisive conflict with the Persian troops of that conqueror's army, fought his way with 3000 Affghan horse to Kandahar, where, seizing on a convoy of treasure on its way to Nader's camp, he assumed the ensigns of royalty; and, at the age of twenty-three, in October, 1747, was crowned as king, the Doorānee, Kuzilbash, Beloochee, and Hazara chiefs assisting at the ceremony. Wise and prudent beyond his years, Ahmed consolidated the discordant mass of the Affghan tribes by employing them in the congenial occupations of foreign conquest and plunder; in which he was so successful that, before his death, in June, 1773, after a reign of twenty-six years, his dominions extended from Nishapour of Khorasan to Sirhind of the Punjab, and from the Oxus to the Indian ocean. He was succeeded by his son Timour Shah, a weak and indolent prince, who died in 1793.

Zemaun Shah, the son of Timour, who was placed on the throne by a faction headed by the queen, began his reign with a promise of energy and talent which the event but ill redeemed; for after a seven years' reign of ill-directed enterprises, domestic rebellions, and dark conspiracies, he fell a victim to the revenge of a chief whom he had provoked, and who first opposed, then seized the Shah, and delivered him to Mahmood, his half-brother and most formidable competitor, who blinded the unfortunate Zemaun.

Mahmood, however, was in his turn soon opposed by Shujah-ool-Moolk, full brother of Zemaun, who, seizing the treasury at Peshawur, proclaimed himself king. But his prosperity was short-lived. Mahmood, who had been made prisoner, escaped, and joining with Futeh Khan, the able chief of the Bauritzehes, who had caused the ruin of Zemaun, raised a rebellion against Shujah. At this period the British mission under Mr. Elphinstone arrived at Peshawur; and before it had well quitted the country, the ill-fated Shujah was forced to fly and seek a refuge with Runjeet Sing, chief of the Sikhs, from whose persecutions he afterwards with difficulty escaped to throw himself on the protection of the British government at Loodheana. Mahmood, a king only in name, became a pageant in the hands of Futeh Khan. This minister, turning his arms westward, seized Herāt, but soon after fell a victim to treachery and the feelings of disgust which his arrogance had excited in the mind of his royal dependant, being first blinded and then put to death by order of Mahmood and his son Camran Meerza. His numerous brothers alarmed at this act, fled to their various governments and strongholds, exciting discontent and rebellion throughout the kingdom, until nothing of his dominions remained to Mahmood, save Herāt and its immediate dependencies. Since then, till the present day, the affairs of Afghanistan present but a series of civil broils, crimes, and murders, with scarcely a fact worth recording, except the advance of the Sikh chief Runjeet Sing, who has stripped it of Cashmere and subdued Peshawur, with the country between it and the Indus. The remaining Affghan country is now principally in the hands of three chiefs; Dost Mahomed Khan, brother of the murdered Futeh Khan, who possesses Causal and its dependencies; Khon Dil Khan, another brother, who holds Kandahar, with a smaller territory; and Camran, son of the late Mahmood Shah (who died a few years ago), who still holds possession of Herāt and the district belonging to it, in spite of the efforts of the Shah of Persia, who has made more than one attempt to annex it to his own territories.

*Divisions and Aspect of the Country.*—The former depending rather upon natural features and formation than upon political or artificial arrangement, will best be noticed in describing the latter. This, so far as is known, presents an aggregation of mountainous groups and ranges, diverging

from certain principal points, and thus becomes divided into numerous valleys of greater or lesser size, which are watered by streams of corresponding magnitudes, and which sometimes stretch out into plains of considerable extent. The south face of the Hindoo-Cooch is furrowed by a variety of subordinate glens and ravines, which carry their waters to the Causal river. This stream, which rises near Ghiznee, but drains also the highlands of Kohistan, runs in a large and frequently very broad valley from that city to the Indus, which it enters at Attock. It separates the mountains of Hindoo-Cooch from those to the southward, which, originating in the huge peak of Spengur or Suffed-koh (White Mountains), spread east and west, confining the Causal valley on the south, and stretch in a variety of huge ranges in that direction: one of these uniting with that of the Tucht-e-Solymaun, extends to Dereh Ghazeeekhan; another enters Bee-weestan; and another, tending more to the westward, by Shawl and Plabeen, sinks into the deserts of Beloochistan and Belistan.

The Causal valley is the most important of the natural divisions thus constituted. It contains the largest river, the finest plains, and the principal cities of the country, including the ancient town of Ghiznee; and extends from the westward of Baumian to the Indus, a distance of more than 300 miles. It is subdivided into several sections, of which the western is formed by Kohistan or "the Highlands," comprising the valleys and lowlands of Nijrow, Panjshir, Ghorebund, Tugrow, and Oosbeeh, which are all blessed with a delightful climate, embellished with the finest scenery, produce the finest fruits in abundance, and are well watered and cultivated.

Lugmaun, also on the north side of the river, comprehends the valleys of Atingar and Ailsheng, with numerous subordinate glens, all equally rich and beautiful. The fertile plains of Jelallabad afford the produce of both torrid and temperate climates. The Dell of Coonnur forms but a bed for the rapid river of Kaskhar, which traversing Kafferistan, here pierces the Hindūsh range to join that of Causal. The small valleys of Panjcoora and Bajour pour their streams into the more extensive and very fertile district of Swaut, where forest, pasture, and cultivated land are found admirably blended, and every valuable fruit and grain is produced. The same description will apply to Boonera, Choomla, and all the glens that discharge their waters into the Causal or Indus rivers from the north. Peshawur, the lower division of the great Causal valley, is divided from the plains of Jelallabad by a range of small hills, which stretch from the Hindoo-Cooch across to the Suffed-koh. It is well watered and extremely rich, but suffers from heat in summer.

Demaun, which signifies the "skirt," and is the tract between the foot of the Solymaun mountains and the river Indus, is poorly cultivated and thinly inhabited; being chiefly hard, tenacious clay, scantily covered with tamarisk and thorny shrubs. It is bounded on the north by the Salt range of the Khutuk country, and stretches southward to Dereh Ghazee Khan. A wide extent of mountains intervenes between this district and the valleys which furrow the western face of the Solymaun range; but even in this wild region we hear of fertile tracts. The plain of Boree, for instance, is compared by the natives to that of Peshawur for extent and richness; the rivers Zhoobe and Goomul water some fine valleys; and Tuli, Chooteelee, and Furrah are mentioned as well peopled and cultivated.

Among the valleys opening westward, those of Shawl, Burshore, Plabeen, Yessoon, Saleh, Urgheesman, Guashih, are described as interspersed with well cultivated spots, but as more generally suited to pasture than agriculture; but the two first are stated to be rich and productive. Beyond these, to the northwest, the river Turuk, rising near Ghiznee, but on the southern slope of the country, runs through a poorly watered and ill cultivated district, till, to the westward of Kandahar, it is joined by the Urgundul, and both fall into the great river Helmand. The district of Kandahar is fertile and highly cultivated, but is circumscribed within narrow limits by the desert. In like manner the valley of Herāt, which may be 30 miles long by 15 wide, constitutes the most important portion of that district.

A vast and varied surface, such as has been described, must naturally exhibit much diversity of aspect and fertility. Of the mountainous tracts, some are covered with deep forests of pine and wild olive trees; others afford excellent pasture for sheep and cattle, while others again are bare, rocky, and sterile. Of the valleys, as we have seen, many are fertile, well watered and wooded, especially those which pierce the Hindoo-Cooch range; while others, particularly to the south, are bare, or covered only with tamarisk and thorny shrubs.

*Mountains.*—These have been already mentioned. The chief ranges are those of Hindoo-Cooch, or Hindūsh; the Spengur or Suffedkoh, called Rajgul by Captain Burnes, a branch from which joins the Solymaun range; and perhaps that of Khojeh Amra, which seems to be the prolongation

## AFGHANISTAN.

of a spur from the last-mentioned range. The Hindoo-Cooch, or Himáláh, is described by Mr. Elphinstone as rising above the level of Peshawur in four distinct ridges, the lowest of which, clear of snow on the 24th of February, was clothed with forests of oak, pine, and wild olive, and a profuse variety of fruit-trees, and graceful herbs and flowers. The second was still more densely wooded; the third was at that time white with snow; and beyond rose the glittering and stupendous crest of the true Himáláh, springing into sharp peaks and bold masses.

Captain Burnes states that the term Hindoo-Cooch, though applied generally to this chain, which is a continuation of the Himáláh, belongs properly to one single peak, forming the western buttress of the range, which beyond that point declines in height, and is lost in the Paropamisian or Ghôr mountains. The peak of Koh-e-Baba, estimated by him at 18,000 feet high, is the only one covered with perpetual snow to the westward of the passes. Little is known of the height of the other ranges, but the Sufiedkoh obtains its name from its snowy cap. The Tucht-e-Solymaun is estimated at 12,000 feet in height; and there is a very lofty peak to the southwest, named Kund.

**Rivers.**—The principal of these have also been mentioned. They are the Cabul, the Helmand, the Turuk, and Urguandáb; the Goomul, the Zhobe, the Lora, the courses of the three last are little known, and their waters are lost in the sand, excepting in the time of floods. The river of Kaskhar (called Kanna in Arrowsmith's map to Captain Burnes' Travels), which comes from the northeast, running by Chitral, can be only considered as partially belonging to this country: the same may be said of the Helmand.

There are no lakes of any consequence known to exist in Afghanistan.

**Climate and Soil.**—These, as remarked in the general description, vary in an extreme degree, according to locality. In the eastern part of the Cabul valley and in those to the south, bordering on Cutch Gumdava, the heat is sufficient to mature all the products of India, such as the sugar-cane, indigo, and some of the tropical fruits; while the northern valleys abound in the productions of cold regions, and the mountains are covered with forests of pines. The plain of Peshawur must, according to Captain Burnes, be one of the most fertile regions of the earth, and wants only industry to become one of the richest and most productive. "The soil," says he, "is a rich mould; it is intersected with water on all sides; and, it is said, continues green during the whole year. It yields a succession of three crops annually; and if we reckon the barley (which is cut twice before it ears, and given to horses), we have no fewer than five returns in the year!" (*Travels*, iii., p. 258, 12mo ed.) After this statement we need not be surprised to learn that wheat is sold in Peshawur for less than 1s. 6d. a bushel, and barley for less than 1s. In like manner with regard to fertility, the plains of Jelalabád, Swat, Booner, Boree, Shavi, &c., are composed of rich loam and alluvium, yielding the most abundant crops; but the baked clay of Damau is almost impracticable to the plough; and the vast tracts of secondary mountains and undulating plains to the west, are only suited for grazing lands, and are lost in the sandy deserts of Belistan.

**Mineral products.**—The mineralogy, as well as the geology, of Afghanistan, is but little known; but enough is known to render it probable that the mineral riches of its mountains are great. Gold, copper, iron, and antimony have been already produced. Burnes tells us of two sorts of sulphur, of wells of petroleum or naphtha; and, above all, of what may prove still more valuable, of coal, which exists in the district of Cohat, below Peshawur. This, with the discovery of the same mineral in Cutch, may, by facilitating steam navigation, have a powerful effect on the condition of Central Asia.

**Agriculture** is in the same rude state as in Persia and most Asiatic countries. The soil is broken by a crooked log of wood, sometimes shod with iron, which is generally dragged by oxen; and irrigation is resorted to wherever rain does not fall in sufficient abundance to bring forward the crops. Only the richest and most promising tracts are thus employed; so that, as the seasons are usually regular, the harvest afforded, even by so rude a process, is for the most part abundant. Wheat, barley, rice, maize, form the produce of the more temperate regions; while in the warmer, the smaller grains common to India, as *moongy, channa, joar, dal, &c.*, with the sugar-cane, cotton, tobacco, indigo, madder, &c., reward the farmer's labours. Horticulture is carried to a considerable extent in the neighbourhood of the principal towns; and to the fruits of Europe in high perfection, are added grapes, pomegranates, figs, the mango, orange, lemon, guavas, plantains, and other fruits of India. Vegetables are also reared in great abundance, and of excellent quality; of these two, the rhubarb (*ruwais*) and the *asafoetida* plant, deserve mention: the former is used when young and tender, blanched artificially, and is eaten both raw and dressed in great

quantities, as a very wholesome delicacy; the latter is not only cultivated for its valuable gum, but is eaten roasted, when it springs young from the earth, like the flower of a cauliflower in appearance. It is esteemed a great delicacy; but it smells so strong, that to those unaccustomed to its odour, one head of it, while being cooked, is enough to poison the air of a whole camp.

**Manufactures** are confined to home-made stuffs of cotton and wool, and a little silk, which serve for the dress of the inhabitants: little or nothing is manufactured for export.

**Commerce.**—The disturbed state of the country for a succession of years has been unfavourable to trade; and the large and valuable caravans which formerly carried the rich productions of India and Cashmere to Cabul and Herat, for the consumption of the courts at these cities, or for transit, by Yez, into Persia, now no longer venture to traverse lands where robbery and extortion combine to ruin the merchant. There is still, however, a less extensive traffic carried on, chiefly by a pastoral tribe called the Lohanees, occupying much of the country between the Indus and Ghiznee, who at certain periods of the year repair to India to make their purchases, or receive goods from those who have brought them from thence, at the ferry of Kaberee. With these they return, carrying them on their own camels, through their own country, by the Golairee pass, and the valley of the Goomul, not only to Ghiznee and Cabul, but northward, across the mountains, to Berkhara. Captain Burnes tells us, that a thousand camel-loads of English and Indian chintzes, calicoes and muslins, broads, shawls, Punjab turbans, spices, &c., are yearly consumed in Cabul; in return for which are sent back horses in great numbers, madder, saffron, asafoetida, and fruit, both fresh and dried, in large quantities, &c. This trade is increasing, and will probably continue to do so, provided tranquillity and security of property be established in the country, and the present moderate scale of duties levied at Cabul be not increased; and the expected opening of the river Indus for trade, a channel which, with the Cabul river, will enable goods to be conveyed into the heart of Asia, cannot fail to stimulate the commercial propensities of the people, and give rise to a vast increase of civilization as well as traffic.

**Population.**—There are no data on which to ground a tolerably accurate estimate of the population of this country. It must vary greatly in different districts. The rich tracts bordering the Cabul river, and the fertile plains that penetrate the Hindoo-Cooch, are certainly more densely peopled than the high, and bleak pastoral countries to the west. Mr. Elphinstone, from the best information he could obtain, has mentioned the supposed numbers of several of the principal clans; but it is to be feared that these are not to be depended on. Thus the *Eusufzai*, who occupy a very small district at the extreme N. E. corner of the country, are set down as 700,000 souls at least; and the whole of the *Berdoranees*, a collection of tribes including the *Eusufzais*, who inhabit a country of about 15,000 sq. m., are estimated at nearly 1,400,000, or 90 to the sq. m. The *Doranees*, on the contrary, who occupy at least 50,000 sq. m., are said to amount to only 800,000 or a million, being from 17½ to 19½ per sq. m. The *Ghiljees*, in like manner, from 500,000 to 600,000 souls, are spread over 1500 sq. m., or about 40 per sq. m. This is on a calculation of five individuals to a family, which is too little in these countries.

Now the whole of Afghanistan as here defined does not quite amount to 170,000 sq. m. of surface, of which suppose the richer parts, such as, and including the,

|                                                                                          | sq. m.  | per sq. m. | Pop.      |
|------------------------------------------------------------------------------------------|---------|------------|-----------|
| Berdoranees country, to be . . . . .                                                     | 30,000  | at 50      | 1,500,000 |
| Country of secondary fertility . . . . .                                                 | 90,000  | 40         | 3,600,000 |
| Poor high land, such as much of the Doranees country . . . . .                           | 80,000  | 18         | 1,440,000 |
| The remainder, taken at a low average . . . . .                                          | 60,000  | 30         | 1,800,000 |
|                                                                                          | 170,000 |            | 5,780,000 |
| Add estimated amount of Taxjiks, &c., scattered over the country and in cities . . . . . |         |            | 1,800,000 |
|                                                                                          |         |            | 7,580,000 |

And this is independent of Hindoos, &c., who are stated to be numerous.

This estimate, founded on the vague numbers stated above, would give to Afghanistan a population of more than 7 millions, or nearly 43 to the sq. m., which, taking into account the vast tracts of high and unproductive lands on the west of the Sulaiman range, and north of Kundahar and Zemeendawur, is undoubtedly far beyond the truth. The rate of population in Persia does not most probably exceed 10 per sq. m.; and if double be assigned to Afghanistan, it may be received as an ample rate for that country, notwithstanding the large extent of desert in the former and the many fertile districts in the latter. Upon grounds of analogy and probability, therefore, rather than from any existing data, the population of Afghanistan may, perhaps, be regarded as little exceeding 4 millions.

**Tribes.**—The Afghan nation is composed of a great num-

## AFGHANISTAN.

bar of tribes, who claim a common origin, and assuredly differ intrinsically very much from all their neighbours. This origin is very obscure: a lately translated history derives them from *Sem*,<sup>1</sup> the king of Israel, whose progeny was carried away in the time of the captivity; but no proof of this is adduced, and Mr. Elphinstone classes this among other fabulous genealogies. The name *Afghan* is not known to the people, who call themselves *Peshawar*, in the plural *Peshawars*, from whence, by corruption, *Peshā* or *Pāshā*, the name they have obtained in India; and of their great antiquity there is no reasonable doubt. The tribes of Soor and Lodi, from both of which kings have sprung, are mentioned as owing their origin to the union of an Arab chief, Khaled ibn Abdoola, with the daughter of an Afghan chief, in A.D. 622; and Mahmood of Ghiznee, though sprung from another race, ruled over the Afghans in the ninth century. According to their own traditions, the whole of the tribes descended from the sons of one Kys or Kais Abdorreheed, who, whether a real or imaginary character, is the person to whom all their genealogies refer; but as it would be impossible to examine all these, the following classification must suffice to enumerate the principal tribes, with their *habitates*, as they at present exist:

### EASTERN DIVISION.—*Bardoozanets*.

**National Character.**—This aggregation of tribes, though exhibiting considerable diversity in customs, dress, and appearance, among themselves, form, taken together, a nation singularly homogeneous; yet Mr. Elphinstone remarks, that "amid the contrasts which are apparent in the government, manners, dress, and habits of the different tribes, I find it difficult to select those great features which all possess in common, and which give a marked national character to the whole of the Afghans." And this becomes the more perplexing, because even the virtues and attributes on which they most value themselves, and which separate them most from their neighbours, are apt to be misunderstood or overlooked by strangers. Thus an English stranger might regard their wild freedom as but a savage mixture of anarchy and arbitrary power. Alarmed at the absence of any organized government, or regular courts of justice, and witnessing the summary inflictions of retributive and customary law, he might fancy that violence and revenge entirely usurped the place of justice and equity; while the rude hospitality, the bold and simple manners, and martial and lofty spirit of the people, would scarcely in his mind compensate for their proneness to violence and rapine—to the deceit and fraud which are the vices necessarily engendered by the lawless freedom in which they exist.

The traveller from India, on the other hand, sickened

with the servile vices of its slient, timid, and indolent inhabitants, would probably be favourably impressed, not less with the bold and independent bearing of his new acquaintance, than with their sobriety, their superior energy, their strong and active forms, their fair complexions, and features marked and striking even to harshness; and he might view, in the stormy independence of their mode of life, a favourable contrast to the apathy of that which he had left. The result in both cases might be, that, mingled with many a vice and failing, he would find the germ of many a virtue and noble quality; and that however much he might lament their great failings, he would not be able to deny them a portion of his esteem.

One of the strongest characteristics of this people, according to all travellers, is their hospitality, which is founded on national feeling, and there are some usages connected with this principle which deserve mention. The first is that of *Namastees* (two Afghan words, signifying, "I have come in"), by which a person having a favour to entreat goes to the house of the individual on whom it depends, but refuses to sit on his carpet or partake of his food until the boon be granted; and this, if in the power of the party besought, custom makes it imperative on him to concede. A still stronger appeal is the second, being made by a woman, when she sends a person her veil, and implores assistance for herself or for her family.

All persons, even a man's bitterest enemy, is safe under the protection of his roof; but this protection extends not beyond the lands of the village, or at most of the tribe; and it is not uncommon for the stranger who has benefited by it, and experienced the kindest treatment, to be robbed and plundered when once beyond its influence. "There is no point in the Afghan character," remarks Mr. Elphinstone, "of which it is more difficult to get a clear idea, than the mixture of sympathy and indifference, of generosity and rapacity, which is observable in their conduct to strangers. So much more do they attend to granting favours than to respecting rights, that the same Afghan who would plunder a traveller of his cloak if he had one, would give him a cloak if he had none." In this, as well as in their regard for hospitality, their customs much resemble those of the Desert Arabs.

The pastoral tribes in the west are more addicted to robbery and theft than the agricultural ones; but, in general, a previous understanding with the chiefs, confirmed by the presence of a single man, ensures safety; and the Afghans, it is said, are less prone to add murder to plunder than most other rapacious tribes. They are reproached with ignorance, barbarism, and stupidity, by the Persians, but on no sufficient grounds. They are less polished, it is true, and have less of worldly knowledge than their reproachers; but are in general prudent, sensible, and observant, and are less indifferent to truth than most of their neighbours. Like most mountaineers, they are proud of their lineage, and will hardly acknowledge one who cannot prove six or seven descents. Like Highlanders too, they are highly national. Love of individual freedom, strong though it be, is exceeded by devotion to family and clan, and this seems by no means to prejudice their love of country at large; for the "*Misg du Pook tassak*," or honour of the Afghan name, which is one of the feelings warmest in their breasts, appears to be equalled by local attachments, so strong in all mountaineers. A native of the wild valley of Speiga, who for some offence had been forced to wander abroad, declared, on his return, that he had "seen all Persia, India, Georgia, Tartary, and Beloochistan, but in all my travels I have seen no such place as Speiga." "To sum up their character in a few words," says Mr. Elphinstone, "their vices are, revenge, envy, avarice, rapacity, and obstinacy; on the other hand, they are fond of liberty, faithful to their friends, kind to their dependants, hospitable, brave, hardy, frugal, laborious, and prudent; and they are less disposed than the nations in their neighbourhood to falsehood, intrigue, and deceit."

**Customs, Manners.**—The former of these heads comprehends the internal government of the tribes. This is patriarchal. Tribes are subdivided into branches, which are termed *coloon*, and each of these are commonwealths, which have their chief or *spoon-sherak* (literally white beard), or *mullik* (master), if small; or if large, a khan, who is always chosen from the oldest family, and is sometimes selected by the king, sometimes by the people. These carry on the internal government, in conjunction with certain assemblies of heads of divisions, which are called *Jeerna*, and which determine all matters of consequence. In civil actions the statutes of Mohammed are generally adhered to; but criminal justice is administered according to *Pookshawallas*, or Afghan usage, a system sufficiently rude, and founded on the law of retaliation. This, however, as tending to perpetuate feuds and quarrels, is modified by judicial *jeergas* composed of khans, elders, and modallahs, who inflict suitable penalties on offenders; and in fact this whole system is subject to various and considerable modifications.

<sup>1</sup> Baron says, the Afghans call themselves "Bin-Israel," or children of Israel; but consider the term of "Yahoodas" or Jew, to be one of reproach.

<sup>2</sup> The termination *tasak* corresponds exactly to the Scotch *Fish or Mac*, or the Arab *Ben*: thus *Emuss tasak* means "the son of Emuss;" *Khell* means *Chin*, or subdivision of a tribe.

<sup>3</sup> Both the *Subdoozies* and *Burkistanes*, the first the tribe of the kings the second that of their ministers and of *Peshabans*, are divisions of the *Peshabans*.

<sup>4</sup> A striking instance of this is given by Captain Burnes, who saw on a steep hill the mangled and hardly dead bodies of a woman, caught in an act of adultery by her husband, and of her paramour; both of whom had fallen victims to the severity, but here judiciously, of the injured party.—*Travels*, ii. p. 50.

## AFGHANISTAN.

A family forced or induced to quit its colons may be received into another; and once received, it is treated with peculiar attention, and placed in all respects on an equality with the original members of the community. Every colon, moreover, has many persons called *Hussangaks* (or companions), who are not Afghans, and who are regarded with consideration, but not permitted to share in the administration of affairs. Of such *hussangaks* and tribes the nation is composed; and when placed under one sovereign, has seldom yielded him a full or implicit obedience. Mr. Elphinstone has compared it to that yielded by Scotland of old to its kings, who ruled pretty absolutely over the principal towns and country in their vicinity, but whose authority diminished as it extended to the extremities of the kingdom; whose court nobles were inordinately proud, and whose more distant chiefs were nearly independent.

**Women, Marriage.**—Their customs with regard to their females are nearly those of most Mohammedan countries; those in towns are jealously secluded, those in the country have greater liberty. They purchase their wives, who therefore are regarded as property. The husband can divorce at pleasure; a man marries the widow of a deceased brother\*, and it is a mortal affront for any other man to take her without his consent; but she is not forced to marry at all. The age for marriage is twenty among men, sixteen for women. In towns, courtships resemble those in Persia, &c. In the country, matches are made more according to the liking of the parties. If a lover can cut off a lock of his mistress's hair, or snatch away her veil, and in doing so proclaim her his affianced wife, no other will approach her with these views, and he generally obtains the consent of her parents on payment of her price; if not, they elope; and this offence, which ranks not less gravely than a murder, is settled by intervention of parties. Among some tribes the bridegroom earns his wife by service, as Jacob did Rachel; some permit not the least familiarity before marriage, others an excessive and perilous degree of it. Polygamy is permitted, as in other Mohammedan countries, but less practised; the poor content themselves with one, those of middle rank with two wives, and perhaps as many concubines. The wives of the rich live in luxury and indolence; the poor not only employ themselves in household, but in field labour. In towns they go about, as in Persia, veiled from top to toe; in the country they only veil in the presence of strangers, and that more from decency than obligation. The Afghan women are said to be correct in conduct and deportment; but adultery or incontinence is punished with death to both parties upon the spot, by the injured relative. (See ante, p. 35, note.)

**Education** is conducted much as in the neighbouring countries. A village moolah, or schoolmaster, teaches the children of the poor to say their prayers and to read the Koran; the rich keep *talles*, or private tutors, in their houses; the village schoolmasters are paid in allotments of land and some small fees. Those intended for the learned professions go to towns, and live in colleges instituted for the purpose of instruction.

**Literature** is at a very low ebb. The Poohtoo language is an original stock, embracing a good deal of Persian, with some Zend and Sanscrit words: they use, in writing it, the Niskoo character of the Persian alphabet; but there are few or no works of much repute in the language.

**Religion.**—The Afghans are all Mohammedans of the Scone persuasion, and are superstitious enough, believing in alchemy, astrology, and magic; but are far from being intolerant to others. Hindoos remain unmolested, on paying a slight tax. Christians sustain neither persecution nor reproach; they are called people of the book, as deriving their tenets from a written source, which they themselves respect, instead of being pagans, as the Hindoos. Sheas are detested more than any sect: yet the country is full of Persian sheas, many of whom held important offices under the crown, and now do so under the several chiefs. Scoffism (or free-thinking), though denounced by the moolahs, is common, and gains ground among the higher orders. The priests and moolahs, like those of Persia, are avaricious, hypocritical, and bigoted, as well as arrogant and overbearing, and they exert a very absolute and dangerous power over the people. This is strengthened by the occasional exercise of good offices, and by the influence of some rare examples of wisdom and virtue, evinced in repressing bloodshed and violence. But the blind regard of the Afghans for these holy impostors is chiefly attributable to their ignorance and superstition, which lead them almost to adore all dervishes and other ascetics, and to visit their tombs as those of canonized saints.

**Personal Appearance, Amusements.**—The men of Afghanistan are for the most part robust, generally lean, though bony and muscular. They have elevated noses, high cheek

bones, and long faces; their hair is commonly black, sometimes brown, rarely red; they wear long thick beards, but shave the middle of the head: the western tribes are stouter than those to the east; the latter have darker complexions, and more strongly-marked features: their demeanour is frank and open, equally free from staidness and puerility: they are very social, delighting in dinner-parties, smoking after dinner, and sitting in a circle telling stories of kings, viziers, and genii, or singing songs, generally about love, to the sound of instruments like rude guitars, fiddles, and hautboys: they take much snuff, of a high-dried, fine-powdered sort, like the Scotch; they are fond of the chase, driving the game into some valley, and killing great quantities; also of coursing hares, foxes, and deer with greyhounds; and they ride down partridges in the open ground, driving them out till they can knock them down with sticks; they are also fond of horse-racing, and fighting cocks, quails, rams, dogs, and even camels. The western Afghans have a dance, called the *atum* or *ghoomboor*, in which ten or twenty people move in strange attitudes, shouting and clapping hands in a circle, round a single person, who plays on an instrument in the centre. The national costume appears to consist of a loose pair of trousers of dark cotton stuff; a large shirt, like a waggoner's frock, reaching a little below the knees; a low cap, the sides being of black silk or satin, and the top of some sort of brocade; half-boots, lacing up to the calf; and a cloak of soft gray felt, or of well-tanned sheepskin, with the wool inside. The women wear a shirt like that of the men, but much longer, and of finer materials, coloured or embroidered with silk; their trousers are tighter than those of the men; a small cap of bright-coloured silk, embroidered with gold thread, comes down to the forehead or the ears; and they throw over their head a large sheet of plain or printed cotton, with which they hide their face when a stranger approaches; they divide the hair on the brow, and plait it into two locks, which fasten behind; they wear round their head strings of Venetian sequins, and chains of gold or silver, which are hooked up, and end in two large balls hanging down on either side: ear-rings, finger-rings, and nose-pendants are worn. In towns the fashions more approach those of Persia, particularly to the westward.

**Of individual Tribes.**—What has been said applies to the nation in general; but almost every tribe has its peculiar characteristic, which can be but shortly touched upon. The Berdooranees, who occupy the north-eastern districts, are brave but quarrelsome, active, industrious; but selfish, bigoted, and remarkable for vice and debauchery. Their quarrelsome disposition is thought to have given origin to a sort of federative alliance, offensive and defensive, among tribes and subdivisions called *Goondess*, which were held more binding than ties of blood. From these *Goondess*, however, were excepted the *Buzsuffzees*, the most powerful and numerous, as well as most haughty, insolent, and turbulent tribe of the Berdooranees, who are said to number 700,000 souls. They now occupy Swait, Bunere, Punjcoora, &c., and are notorious for the anarchy which reigns among their colonies. Though an agricultural people, they do not themselves labour; this is left to their *fakirs*, a species of *villains* or servants, consisting of strangers or individuals of conquered tribes of other nations, reduced to serve these invaders, and protected by them for their services. Their masters, or *khawasss*, can beat or kill them at pleasure, but are bound by custom to protect them; and, provided they pay their customary tax and do their work, they may engage otherwise in trade as they please, and are commonly treated mildly.

The *Torkolanees*, who are brave, active, industrious, and cheerful, are all subject to one powerful chief, who exercises over them a very powerful authority.

The *Khyberes*, who possess the upper branches of the Rajgul or Spengur mountain, and derive their name from the formidable pass of Khyber, are the most rapacious and treacherous robbers of all Afghanistan: no previous agreement secures the traveller from their assaults; they watch the approach of the caravan, matchlock in hand, and choose their victims with certainty and security. They are a lean muscular race, capital marksmen, and carry swords and short spears in addition to their matchlock; they are altogether more uncouth than most of their countrymen.

The *Khastaks*, occupying the banks of the Indus, from the Caubul River to the Salt range, are a tall, well-favoured people, as remarkable for honesty and orderly conduct as is their country for dreary and rugged barrenness.

The tribes of *Dameas* are said to be more simple and honest, less bigoted and litigious, less vicious and debauched, than the northern tribes. They are a more bony and fiercer race than the Berdooranees, and universally wear long hair and beards. They owe the greater order which prevails in their colonies to an establishment of magistrates, founded some fifty or sixty years ago, which has been eminently efficient.

The *Gundappers* are a particularly thievish and quarrelsome race, in spite of a commercial town, which lends many

\* This looks like a relic of Jewish custom, and tends, *pro tanto*, to indicate the Semitic descent they claim.

## AFFGHANISTAN.

of them to make annual trading journeys to India and Khorasan.

The *Bashere* are a civilized tribe, much employed in merchandising. The *Sherazee* were shepherds till robbed of their pasture-lands by the *Cashere*, when they betook themselves to agriculture. These agricultural tribes shave all skins or villans, like the *Buzmashchees*.

Of the central division, the *Jajyes* and *Thorees*, hereditary enemies, live in the glens and valleys of the Bolyzmaun range. The country of the former is colder, wilder, and higher than that of the latter; the mountain-sides are covered with pine. The *Jajyes*, who dwell in a pleasant district westward of the rich plain of Buzano, are remarkable only for their disgusting vices.

The *Sherazees*, who inhabit the borders of the Tukhu-e-Solymaun, a wild, inaccessible country, are very poor and uncivilized, plunder every one, and are at war with all the world; yet they never break their word, and a single individual of their tribe suffices to secure the safety of a party; they are described as wild and savage in their appearance, as in their habits and modes of life. The *Zawzees*, neighbours of the last, resemble them closely, but are less inveterately predatory. The *Vizzees*, N.W. of the two last-mentioned tribes, live in little societies, among pine-covered mountains, and are equally uncivilized and addicted to plunder; yet the smallest escort ensures safety, and the chiefs, powerful khans, are, it is said, remarkable for their love of peace. The *Vizzees* are divided into a fixed and erratic population. The long valley of Zawru, which opens on the plain of Tuli and Chooteeslee, is inhabited by the white and black (*open and tor*) *Zerrees*, great carriers of merchandise between Upper Sind and Candahar.

The two most noble and important tribes, however, are the *Dorranees* and *Ghiljees*. Their territory consists chiefly of high black down, interspersed with hills, in some parts desert, in others sparsely cultivated; in all open, bare, and fit chiefly for pasture. They are, therefore, chiefly a pastoral people, with patriarchal habits, and live for the most part in tents of black wool. These (*kishdees*) are from 30 to 35 feet long, by 10 or 12 broad, and eight or nine high, supported by a row of three poles, and closed all round with a curtain. In winter they are lined with felt, and are warm and comfortable. The country of the *Dorranees* is 400 miles long, by 130 broad, extending from the Paropamoun mountains to the Khojeh Amran range. They were formerly called *Abdallees*, till the late Ahmed Shah, their chief and sovereign, changed the name, in consequence of the dream of a famous saint, he taking that of Shah Dooree Dooran. They may amount to 800,000 souls; the *Suddoozchees*, from whence sprung the king, is a subdivision of the *Popalzchees*. The king is their hereditary chief, and military commander of the whole: he claims a horseman's service for every plough of land; and the officers commanding them are the civil magistrates of their respective districts, besides being employed in offices of state at court, when there was a court. The internal government of the clans is better maintained than among other tribes, and the progress of improvement and civilization among the agricultural *Dorranees* has been correspondingly great. They are generally handsome, stout men, with good complexions and fine beards. They are brave and hospitable; and though not quite strangers to rapacity, still may be esteemed the worthiest of their race.

The *Ghiljees* occupy the upper valley of the Turnuk, and great part of the Canbul valley, to the Berdoorance country; a tract which contains some of the principal cities, with some fine districts of land, but the climate of which is cold. The *Ghiljees* were formerly the leading tribe of Afghanistan. It was a branch of them that conquered Persia and broke down the power of the Saffavian kings; and they are still a high-minded, brave, and numerous people.

The *Hakkees* and *Tekkees* are the noblest of their clans, having produced, the first, kings; and the second, their victors; and they are a hospitable and good people, ranking deservedly as the second of the Afghan tribes; they amount to about 100,000 families, and resemble much the *Dorranees* in appearance, customs, manners, and dress, though hating them, as their successful rivals, with an unquenchable hatred. They are perhaps the fairest and handsomest of all the Afghans.

There is yet another class, which, though not strictly Afghan, still, as amalgamated with that people, ought to be mentioned—the *Tajiks*.<sup>\*</sup> The word is used in opposition to that of *Therk*, the peaceable to the warlike; and it was applied to the subdued Persians by their Tartar masters. In Afghanistan they are supposed to be descendants of Arabs displaced by their conquerors, who now live scattered over the land which they might once have cultivated as their

## AFRICA.

own. As tenants or servants, they are mild, sober, peaceable, and industrious, and live on good terms with the Afghans, who, though they regard them as inferiors, do not treat them with contempt. They are most numerous in and around the great cities, and are all zealous sonnies. Mr. Elphinstone calculates the *Tajiks* as numbering 1,500,000 throughout the whole country.

**Government Chiefships.**—Afghanistan, it has been said, is now split into three principal chiefships. Dost Mohammed Khan, who resides at Canbul, rules the country from Bannisa and the Hazara mountains to and including Ghilzee on the south, and to Neemla in the Canbul valley on the east. When Captain Burnes was there in 1833–2, his revenues amounted to 18 lacs, or £180,000 a year, and he maintained 9000 Afghan horse, well appointed, with 3000 foot, and 14 guns, besides auxiliaries and village troops, that is, contingents; and both revenue and military forces have increased since then. This chief is very attentive to business, superintending personally the distribution of justice; he encourages trade; his own country is safe to the merchant; he is zealously orthodox, remarkably intelligent and inquisitive, and of excellent manners and address. He is even now but little past forty; so that, with his great natural abilities and excellent disposition, he may be the author of much good to his country. Unfortunately he is on bad terms with his brothers, particularly with those at Kandahar.

These are, Kohn Dil Khan, Ruhan Dil Khan, and Meer Dil Khan, who rule Kandahar together; the first, however, being regarded as chief. His territory is less defined and less valuable than that of Canbul, extending south towards Cutch-Gundava and the Sindian frontiers. His revenues in 1833 were about eight lacs of rupees, or about £80,000 a year; his military force 9000 horse and six pieces of artillery; but this, were his government popular, which it is not, he might greatly increase, as Kandahar is close to the *Dorranee* country. He has none of the abilities of his brother at Canbul, and his acts of oppression will prevent his power or influence from increasing it.

Kamran, son of the late Mahmood Shah, retains Herat, as we have said, and maintains the shadow of a court on the ancient Abdallee model. But it is rather in consequence of the claims set forward by Persia to this province, than his own intrinsic power, that he has been permitted to remain unmolested. The Afghans came forward, as is understood, to assist this last descendant of their kings in his late successful struggle with Persia, and Kamran took the field with a considerable force. He is said still to possess some of the crown jewels of Canbul, and he derives a considerable revenue from the transit of goods through the city. Commonly states the nominal amount of duty levied in the city at £31,429 sterling, but says that much more is really extorted; and that Kamran's annual revenues are £89,948 sterling. But he is a cruel, capricious, and rapacious tyrant, and not likely ever to consolidate any considerable share of power. (We are indebted for this valuable article to J. B. Fraser, Esq., the celebrated traveller.)

**AFIUM-KARA-HISSAR** (or *Black Castle of Opium*), a city of Asiatic Turkey, in Anatolia, cap. Sanjakk, 188 m. E. Smyrna, lat. 39° 45' N., long. 30° 55' E. It is situated on the declivity of a mountain range, and is defended by a citadel, built on a high and almost inaccessible rock. Pop. estimated by Kinner at 12,000 families, or from 50,000 to 60,000 individuals. It is pretty well built; but the streets are exceedingly narrow, and in many parts very steep. Some of them are washed by streams that descend from the adjacent mountains. It has numerous mosques, two Armenian chapels, six khans, and five public baths; an extensive manufactory of black felts, fire-arms, short sabres or *yatagams*, with stirrups, bridles, &c. But it is principally celebrated for the great quantity of opium grown in its vicinity; from which, indeed, it derives its modern name. It is said by D'Anville to be the *Spemee* of the Greeks and Romans; but the letter was situated a good deal farther W. According to the Turkish annals, it was founded by Aladdin, one of the Seljukian sultans. It was the patrimony of Othman, the founder of the Turkish empire, of which it has ever since formed a part. —(*Kinner's Journey*, p. 229; *Olivier*, vi., p. 400.)

**AFRAGOLA**, a town of Naples, prov. Terra di Lavoro, 5 m. N.N.E. Naples, in a plain. Pop. 3000. It has manufactures of straw hats; and a great annual fair, which commences on the second Sunday of May.

**AFRICA.** A vast peninsula, one of the great divisions of the globe, situated to the S. of Europe, and to the W. and S. W. of Asia. It is separated from the former by the Mediterranean Sea and the Strait of Gibraltar; the two continents approaching at the latter within about 10 m. of each other. It is separated from Asia by the Red Sea, at whose southern extremity, the strait of Bab-el-mandeb, the shores of the two continents are only 16 m. apart. But at the most northerly extremity of the Red Sea, Asia and Africa are united by the isthmus of Suez; the Mediterranean being there about 73 m. from the Red Sea.

\* In Persia, the inhabitants of great part of the northern provinces bordering on the Caspian Sea are *Tajiks* or *Afghans*. They are held to be the aboriginal people of the country, and speak a peculiar language, supposed a mixed dialect of the ancient Persians.

## AFRICA.

The most southerly point of Africa, Cape das Agulhas (Cape Needles), is in lat 34° 53' S.; and the most northerly, Cape Blanco, opposite Sicily, in lat. 37° 21' N. Cape Gardafui, the most easterly point, is in long. 51° 30' E., and lat. 11° 50' N.; and Cape Verde, the extreme western point, is in long. 17° 33' W., and 14° 43' N. lat. The distance between the most southerly and most northerly points is consequently about 5000 m., and between the extreme eastern and western points not much less. The area probably falls little short, if it do not exceed, 12,000,000 sq. m.

1. Africa is distinguished from the other continents by its coasts extending mostly in continuous, unbroken lines, having but few indentations of the sea, and no extensive peninsulas; so that it forms a more compact and undivided mass of land. The uniformity of its outline seems to be in accordance with the uniformity of its interior. The surface of the latter does not present that endless succession of changes which are met with in Europe and southern Asia, and which are found in both Americas, but on a greater scale and at greater distances. It resembles rather the northern parts of Asia, exhibiting elevated table-lands and low plains, both of immense extent and of remarkable uniformity. The whole of Africa south of the equator, and north of it up to 10° lat., seems to constitute an extensive table-land, fringed in most parts by a comparatively narrow stripe of low land along the sea. North of this table-land, between 10° and 30° N. lat., extends an immense low plain, the greater part of which is occupied by the Great Desert, or Desert of Sahara. A comparatively narrow tract of mountainous country, including Atlas and its dependencies, separates the desert from the Mediterranean. On the E. the desert does not reach the Red Sea; being separated from it by the mountains of Abyssinia and the rocky countries extending from them northward along the Red Sea to the shores of the Mediterranean.

1. *The elevated table-land* in South Africa is less known than any other portion of the continent, the nature of its surface rendering it extremely difficult to penetrate from the seacoast into the interior. We are only well acquainted with the southern extremity, which forms the Cape Colony. Here Africa presents to the Indian ocean a broad line of coast, running east and west nearly along the 34th parallel from 18° to 26° E. long., or from the Cape of Good Hope to Algoa Bay. Along this coast extends an undulating country, intersected with a few elevations deserving the name of hills. Its width varies between 10 and 50 miles. North of this the table-land rises in terraces. The first terrace, called the Long Kloof, is enclosed by the double ridge of the Zwart Berg, or Black mountains, of which the northern, or the Groot (Great) Zwart Berg, rises to about 4000 feet above the sea. North of this range is the second terrace, called the Great Karroo, which is about 100 miles across and 3000 feet elevated above the sea. It is bounded on the N. by the Nieuveveld Bergen, a chain of which some summits are considered to rise to 9000 or 10,000 feet. On its northern side the table-land seems to have attained its mean elevation, which probably is not less than from 4000 to 5000 feet.

At both the eastern and western extremities the two above-mentioned ranges run N. W. and N. E. parallel to the seashore, at a distance of from 30 to 900 miles; the intermediate space being likewise occupied by two or more terraces. The ranges along the W. shores do not extend farther than about 26° S. lat., where they terminate in isolated hills and with a high bank on the Gariep or Orange river. North of this river the coast, when seen from the sea, presents only high sand-hills without any traces of water, and is, consequently, entirely destitute of vegetation. It extends as far as Cape Negro (18° S. lat.). The interior east of the western ranges and of this coast is an elevated sandy desert, with few wells and little rain. Only that portion lying S. of Gariep river has been visited, the remainder, and by far the greater portion, is less known than the Sahara itself. This desert country, which presents a level without hills or mountains, extends over half the breadth of the continent as far as 24° E. long.

The eastern half of the table-land from the Cape Colony to 18° S. lat. offers a different aspect. A great number of mountain ridges, of moderate elevation, traverse it in different directions; and at the foot of these ridges the country is well watered and fertile; though here, too, extensive sterile tracts occur, but they are not continuous. We are, however, only acquainted with the southern part, up to 26° S. lat. Farther north, about 26°, a high mountain range is said to exist, called the Lupata mountains, but this is doubtful. The descent from the table-land to the Indian ocean is also formed by two or three terraces, the highest edge of it being about 90 or 100 miles distant from the shore. This edge, formed by a mountain ridge, prevents the rivers of the table-land from escaping to the Indian ocean; so that they either run westward, and fall partly into the Gariep river, or are partly lost in the sands of the desert.

North of the Zambese river (about 18° S. lat.), which appears to have the greatest part of its course on the table-land,

the interior of its eastern part is entirely unknown. A lake, called Moravi, is reported to extend over many degrees of lat., but its existence is doubtful. The eastern descent of the table-land resembles that farther south, being formed by terraces. This, however, extends only to the equator, or the mouth of the river Juba; for farther north, up to Cape Gardafui, the coast itself is formed by high rocks, rising to 400 feet and upward, and no mountain ranges are visible from the sea. A few rivers, apparently of considerable size, break through the rocks along the coast.

It would seem that on the western side of the continent, between 18° and 40° S. lat., there is a considerable depression in the table-land. This country, which is known under the name of Lower Guinea, has low shores, behind which at a considerable distance the surface seems to rise, but not to a great height. Then follows an uneven plain, watered in its lower parts by numerous rivers, among which the Zaire or Congo and the Cuanza are the largest; but towards the sources of these rivers the country is mountainous, and it is even reported that some of the mountains are always covered with snow. In the plain numerous lakes of considerable extent are met with.

North of the river Zaire, at about 4° S. lat., the country again rises at no great distance from the sea to a great height. This high ground is called Serra Compide. Its W. declivity extends N.W., by degrees approaching nearer the Atlantic, till it reaches the innermost corner of the Bay of Biafra, where it comes close down to the sea and forms for more than 30 miles the shore, rising, under the name of Cameroon mountains, to 13,000 feet above the water. These great mountain masses seem to form the W. extremity of an extensive range, which at about 5° of N. lat. seems to traverse the whole continent, and of whose central parts we get some information from the Arabian geographers, by whom it is called Djebel-Kumri, or the Moon mountains. This range, which seems to constitute the higher edge of the table-land to the north, appears to stretch eastward towards the Strait of Bab-el-mandeb, until it unites to the mountain system of the Abyssinian Alps. North of this range, as far as about 10° N. lat., a mountainous country extends between 10° and 25° E. long., which may be considered as the terraces by which the table-land descends gradually to the low plain, which extends farther north.

The extensive mountain region which has obtained among us the name of Kong may be considered as a continuation of the high table-land of southern Africa, being separated from its northern terraces only by the narrow valley of the Quorra, between 7° and 8° N. lat., and farther south from the Cameroon mountains by the extensive delta of that river. East of the meridian of Greenwich it approaches by degrees nearer the sea, while its northern edge draws off in a N.W. direction, until between 4° and 5° W. long. it approaches 15° N. lat., so that between 5° and 15° W. long. it extends over 10° of lat. It terminates rather abruptly near 15° W. long., but its rocky masses come down close to the shore between Cape Palmas and Cape Sierra Leone. This mountain region, in which a great number of fertile valleys and plains are embosomed, is of very moderate height in its eastern and more narrow portion, rising hardly to more than 3000 feet; but farther west it is higher, and between 5° and 8° W. long. it is reported to be crowned by several peaks which pass the snow line. But only a very small portion of it has been visited by Europeans. In its western districts are the sources of the Quorra.

2. *The Great Plain*, which, on the south, is bounded by the high table-land of southern Africa and the Kong mountains, and hence stretches northward to mount Atlas and the ridges depending on it, contains two different countries—a fertile and a sterile. The former called Soodan, and the latter Sahara.

Soodan, under which name the lower terraces of the table-land seem also to be comprised, extends from the E. descent of the Kong mountains to the banks of the Bah-el-Abiad (the W. branch of the Nile), occupying, inclusive of the lower terraces of the high table-land, the country lying between 5° and 15° N. lat. Its lower districts, which lie contiguous to the Sahara, are, according to a vague estimation, from 1000 to 1500 feet above the sea, but the terraces of the table-land rise to 3000 feet and upward. In many parts it is well watered by rivers, which descend from the table-land or originate in the low ridges by which the country is intersected; such districts are covered with immense forests, and are very fertile where cultivated. In other parts water is rather scarce, and some of them partake largely of the nature of the Sahara. Its climate is extremely hot; nevertheless it sometimes happens that during night the thermometer descends to the freezing point.

The Sahara, or sea of sand, covers perhaps nine-tenths of the whole plain. For on the west of the meridian of Greenwich, it extends from the foot of the Kong mountains (15° N. lat.) to that of mount Atlas (about 30°), occupying the whole width of the plain, which is here 1000 miles across

## AFRICA.

Further east, where it is bounded on the south by Soodan, it is somewhat less wide, which is produced by some mountain ranges connected with the Atlas, extending in an E.S.E. direction. But its breadth is nowhere less than 750 miles. It is divided into two parts by a tract of stony country, by which it is traversed from N. to S., between 19° and 15° E. long., and which in parts offers some cultivable land, while in others the stony surface is covered with sand. By following this stony tract Messrs. Denham and Clapperton, who set out from Tripoli, succeeded in reaching Soodan. That portion of the desert which extends between this tract and the Atlantic ocean is called *Sahel*, and is almost entirely covered with a fine sand, which being agitated by strong easterly winds, appears like the surface of the sea, and often rises in the air in the form of sand spouts. Low hills and wells occur in a few places; and water, in many parts, is only found at a depth of more than 100 feet. In that division of the desert which extends between the above-mentioned stony tract on the one side, and Egypt and Nubia on the other, the surface is covered rather with gravel than sand, and in many places with a hard clay: elevations, and even ridges of low hills are here much more frequent, and, consequently, also wells. All the western part of the Sahara would, owing to its burning heat and the want of water, be totally impassable, were it not that it is here and there interspersed with verdant well-watered spots or oases, which appear like islands of the blessed in the midst of desolation. The ancients compared them to the spots on a leopard's skin. (*Strabo*, p. 120.) These oases are mostly of very limited dimensions; but some of them, particularly those on the east side of the great desert, are very extensive: the country of Fezzan, for example, is in fact an oasis. They are usually surrounded by higher land, which serves to account for the springs, and consequently the verdure, for which they are so celebrated. But there seems to be much probability in the shrewd conjecture of Major Kennell, that the oases are indebted for no inconsiderable portion of their reputed beauty and delicious freshness to the striking contrast between them and the parched desert by which they are surrounded.—(*Geography of Herodotus*, 8vo ed., ii., p. 125.) Those only who have toiled for days amid a pathless burning sand, can form a proper idea of the delight experienced in falling in with one of

The infertile land,  
That verdant rise amid the Libyan wild.

In England or France they might be thought nothing of; but in the Sahara they seem more than a paradise. The famous temple of Jupiter Ammon was erected in the oasis of Siwah, in the N.E. angle of the great desert, in lat. 31° 12' N., long. 29° 19' E.

3. *The Abyssinian Mountains*, which are little known to us, except in their north-eastern and northern declivities, where they approach the strait or Bab-el-mandeb and the shores of the Red Sea, and terminate at about 12° N. lat., seem to constitute an extensive mountain system, whose centre is placed between 6° and 9° N. lat. in the countries called Nares and Efat. In this part it seems to approach the snow-line, but not to rise above it. It is less elevated at the source of the Bari-el-Azrek of Blue river, one of the upper branches of the Nile, where it rises, according to Bruce, at from 9000 to 10,000 feet above the sea. We do not know whether or in what manner the Abyssinian mountains are connected with the Gebel-el-Komri, or whether they are separated from the high table-land, or constitute its N.E. boundary, which seems to be the more probable hypothesis. The valleys of this mountain system are fertile and well peopled.

From the northern declivity of the Abyssinian mountains extends along the shores of the Red Sea as far as the isthmus of Suez, a rocky country, which, between 12° and 30° N. lat., occupies in width an extent of between 300 and 400 miles, but farther north by degrees grows narrower. Between 23° and 30° N. lat. it is only from 150 to 200 miles across. Near its western border it has a deep, but comparatively narrow depression, in which the river Nile flows N. from the Abyssinian mountains to the Mediterranean. This long valley is mostly very fertile. The small portion of the rocky country which lies to the west of the valley, and which forms the eastern boundary of the Sahara, does not rise to a great height, rarely to more than about 1000 feet above the valley. But the countries east of the valley of the Nile and between it and the Red Sea are more elevated. They form a table-land, mostly of an uneven surface, which however in many places exhibits extensive plains, while in others it rises into ranges of high hills. Many of the plains are covered with sand, and resemble the eastern portion of the Sahara; other districts afford pasture ground, but very few places are fit for agriculture and cultivated.

This rocky country terminates on the banks of the Nile in the parallel of Kahira (Cairo), from the neighbourhood of which its northern boundary runs off in an E.N.E. and W. N.W. direction. The former constitutes the isthmus of Suez, and reaches to the Mediterranean between the lakes

of Menzaleh and Ras Kezroon in Syria; farther east it joins the mountains of Arabia Petrea. This rocky country lies to the E. of the delta of the Nile. On the W. of the delta the rocks run from Kahira W.N.W. to the Arabs' Gulf, where they approach the Mediterranean near the Arabs' Tower (31° N. lat. and 29° 30' E. long.). From this line the rocky country extends westward with a width of about 70 miles at the outset, which, however, increases as it advances farther W., so as to occupy between 200 and 300 miles at 30° E. long., where it suddenly terminates. In the neighbourhood of the Egyptian delta, the rocks are hardly a hundred feet above the plain, but farther W. they rise into high hills and mountain ridges (Gerdobah mountains), and terminate with the high table-land of Barca, whose mean elevation above the sea is estimated to be about 1500 feet. Where the table-land of the Barca terminates with a rather abrupt descent (near 30°), a narrow strip of the Sahara comes up to the very shores of the Mediterranean, at the most southerly corner of the gulf of Sydra or Kibbir (the Great Syrtis), where it terminates on the beach with sand-hills. This strip of the Sahara separates the rocky region of the Nile from the mountain system of the Atlas.

4. *Mount Atlas and its dependencies*, by far the most celebrated of the African chains, occupy that portion of the continent most to the north and nearest to western Europe. It seems to begin on the E. near the eastern boundary of the country of Fezzan, whence two ridges of moderate elevation run W.N.W., and in the beginning are called Karamah. Farther E., however, they receive other names. The mountainous country, which traverses the N. of Fezzan and the S. of Tripoli, is nowhere probably more than 120 miles in width; but the ridges of low hills which issue from it advance to the very shores of the Mediterranean, between capes Mesurata and the gulf of Cabes (the Lesser Syrtis), so that the whole region may be from 180 to 200 miles across. At the gulf of Cabes, however, the region of mount Atlas enlarges considerably towards the N., and thence to its western extremity on the shores of the Atlantic ocean its mean breadth exceeds 350 miles. The highest ridge seems to traverse the region in an oblique line, beginning on the east opposite Sicily, at capes Bon and Blanco, and terminating on the shores of the Atlantic at capes Geer and Non. The mountains which occur in that line do not appear to rise above the line of congelation, or at least only in a few insulated points. The country which extends N. of it to the shores of the Mediterranean is mountainous, and contains a number of fertile longitudinal valleys. Farther W. (about 5° W. long.), however, where its northern slope is diverted W. to the Atlantic ocean, it extends in large plains, which follow each other in the form of terraces. The tracts of country which lie to the S. of the highest ground cannot be called mountainous, their surface being formed by wide, broad-backed ridges, of very moderate elevation, and by slight depressions between them in the form of shallow valleys. These latter tracts partake of the hot and dry character which distinguishes everywhere the African continent; while the district situated towards the Mediterranean and the Atlantic ocean resembles more the countries of southern Europe. (See *ATLAS*.)

5. *Climate*.—By far the greater part of Africa lies within the torrid zone, those countries only which are situated towards its southern and northern extremities being beyond the tropics, or within the temperate zones. Owing to the vast extent of its arid plains, and the general want, in so far as we are able to discover, of the tempering influence of extensive inland lakes or seas, the temperature of Africa is decidedly higher than that of any other of the great divisions of the globe. The parts without the tropics are destitute of that regular succession of four seasons which is considered as a characteristic feature of the temperate zone. Here, as between the tropics, the year is divided into the dry and rainy seasons; but with this difference, that between the tropics the rainy season sets in when the sun approaches the zenith, whereas it occurs in the countries beyond the tropics when the sun approaches the opposite tropic, and consequently, is at the greatest distance from their zenith. The rainless zone, or the space intervening between the countries which have the rainy season in summer and those which have it in winter, occupies in Africa a much wider extent of surface than in the other divisions of the globe. In the northern hemisphere, the tropical rains cease on the southern borders of the Sahara at about 16° N. lat., and the winter rains begin at its northern border about 26°; so that the rainless region here occupies twelve degrees of lat. In the stony country E. of the Sahara, the tropical rains cease between 18° and 19° N. lat., and the winter rains between 27° and 35°; here, therefore, the rainless season occupies nine degrees of lat. We are less acquainted with the climate of the countries lying contiguous to the southern tropic; but it is certain that on the western side of Africa, between 29° and 30° S. lat., a great sandy desert extends over the greatest portion of the table-land, in which there falls very little, if any, rain. The

## AFRICA.

eastern declivity of the table-land, which is exposed to the immediate influence of the north-east monsoon, has a regular succession of dry and rainy seasons.

The great extent of the rainless regions seems to be one of the principal causes of the high temperature of this continent. Nearly all the countries of Africa are hotter than those of Asia and America situated under the same parallels. The highest degree of heat is experienced in the Sahara and the countries bordering the great desert. It is, however, worthy of remark, that in Soodan, in about 10° N. lat., and at no great distance from the Sahara, the temperature sometimes descends at night to the freezing point.

6. *Rivers.*—Though Africa, being mostly situated between the tropics, has the full advantage of the abundant tropical rains, it is less favoured with running waters than the other divisions of the globe. This is partly ascribable to the great extent of the rainless regions, and partly to the elevation of the table-land occupying the southern half of the continent. The countries which are well watered are not numerous, and occupy but a small portion of the whole surface. Such are the northern declivity of mount Atlas, the countries embosomed within and lying contiguous to the Kong mountains, Soodan, the valleys of the Abyssinian mountains, the western coast between 40° and 18° S. lat., and the comparatively narrow strip of country lying along the east coast from the Cape of Good Hope to the equator; to which are to be added the deltas of the Nile and the Quorra.

The largest river is the Nile, which probably has a course of not less than 2500 m.; but as the source of its remotest branch, the Bahr-el-Abiad (the White river), is still unknown, its length cannot be determined with any degree of precision. It is equally impossible to determine the length of the Quorra or Joliba, the Niger of the ancients. For though its middle portion was ascertained by Mungo Park, and its lower by Clapperton and the Landers, its upper portion, which seems to traverse the high table-land enclosed by the Kong mountains, has not been visited. Its whole length does not probably exceed 3000 m. The course both of the Senegal and Gambia are known; the former running about 1000 and the latter 700 m. The rivers traversing the high table-land of southern Africa are only known at their mouths and a short distance inwards. These are the Congo or Zaïre, and the Coanza, which fall into the Atlantic Ocean; and the Zambesi, which falls into the channel of Mozambique. The river Gariep or Orange, which flows a short distance to the N. of the Cape Colony, is pretty well known in its whole course, and may run about 900 miles.

7. *Lakes.*—These are neither numerous, nor generally of great extent. In the older maps a large lake is laid down to the W.N.W. of Mozambique, called Moravi or Zambe; but its existence is problematical. The largest lake by far of which we have any certain account is that of Tchad, made known and partly explored by Messrs. Denham and Clapperton. It is situated almost in the centre of the continent, in Soodan, to the S. of the great desert, near the 15th degree of N. lat., and under the 15th degree of E. long. The lake Debo, or Dibble, in the same lat., and under the 5th degree of W. long., traversed by the Niger or Joliba, though considerable, is of very inferior dimensions. Some lakes are met with in the ranges of mount Atlas, especially towards the gulf of Cabes, among which, that of Lowdejah is the most extensive. The greater number of lakes seem to occur within the depression of the table-land of southern Africa, between 40° and 18° S. lat.; but our information on this as on most other points connected with the geography of Africa is in the last degree vague and unsatisfactory. The lake of Demben, in Abyssinia, traversed by the Bahr-el-Azrek, or Eastern Nile, is also of very considerable magnitude.

8. *Minerals.*—The mineral riches of Africa are very imperfectly known; but the probability seems to be that in this respect it is but little if at all inferior to any of the other great divisions of the globe. Gold dust, principally obtained from the sands in the upper parts of the rivers, forms a principal article of import from Africa; and iron, the most useful of all the metals, is known to be very generally diffused. Salt is wanting in Soodan and some other very extensive districts; but on the other hand it is found in immense quantities both to the S. and N. of this central district.

II. *Races of People.*—Although we are accustomed to consider the inhabitants of Africa as being generally of the negro race, the actual number of varieties of the human family occupying this portion of the globe is not only much greater than those found in Europe, but the differences in colour, form, and stature are much wider. There are about seven ascertainable varieties, which may be enumerated as follows, beginning with the southern extremity of the continent; viz., the Hottentot, Kaffer, Abyssinian, Egyptian, Numidian, Nubian, and Negro. We shall give a brief description of each race in this order. In the *Hottentot* the colour of the skin is a yellowish brown, and has been compared to that of a "faded leaf." The cheek bones are high, and much spread out in the lateral direction; and from these the face is sud-

denly contracted below to a very narrow and pointed chin. Nose remarkably flat and broad towards the end. Colour of the eyes a deep chestnut; they are long, narrow, and removed to a great distance from each other. The hair of the head is of a singular nature; it does not cover the whole scalp, but grows in small tufts at certain distances from each other. When kept short, it has the appearance and feel of a hard aloe-brush; with this difference, that it is curled, and twisted into small round lumps about the size of a mousefoot pen. When suffered to grow, it hangs on the neck in hard twisted tangles like fringe. There is little beard; and the hair on other parts of the body is either scanty or altogether wanting. The stature of the Hottentot is very short, about four feet six inches being considered about the middle size for the men, and four feet for the women, which is about fourteen inches short of the average stature of Europeans. Their form is slender, delicate, and not ill proportioned; but altogether they may be pronounced a very ugly race. The sex is distinguished from all others of the human race by a pendulous ragged elongation of the symphysis of from two to five inches long, and by a vast accumulation of fat over the *glutei* muscles, which invariably takes place after the first conception. Both these appearances are well ascertained to be natural, and in no way the result of art. The language of the Hottentots is as singular as their persons. Its pronunciation has been compared to the clucking of a turkey. There are numerous guttural sounds produced deep in the throat, and pronounced with a peculiar clack of the tongue, which is quickly struck against and withdrawn from the teeth or palate. The aspirated gutturals are combined with harsh consonants in a manner unpronounceable by Europeans, except those who have acquired the language in infancy. No portion of this race, unconnected with Europeans, has advanced beyond the rudest stage of the pastoral state of society. When discovered, they had domesticated the ox and the sheep, the flesh and milk of which afforded them food, and their skins, with those of wild animals, clothing; they knew nothing of tillage, had no fixed dwellings, and practised no mechanical art except that of fabricating the bow and arrow. The ancient country of the Hottentot variety may generally be described as that which now constitutes the British colony of the Cape of Good Hope.

The immediate neighbours of the Hottentots, and lying N. and N.E. of them, are the *Kaffers*—a very different race. The colour of the Kaffer is neither black, like that of the Negro, nor of the colour of a faded leaf, like that of the Hottentot, but of a deep brown. Hair short, curling, and woolly; but it is not of the wooliness of the Negro. Nose tolerably elevated; lips large and thick; but the lower maxillary bone does not project in the remarkable manner of the Negro, and, consequently, the facial angle is much greater. The body, instead of being, as in the Hottentot, diminutive and feeble, is muscular and athletic, and the stature is equal to that of the European race. The peculiarities of the female form in their southern neighbours have no existence among them, and the genius of their language is distinct and peculiar. In the useful arts they have made considerable progress. Besides domesticating the ox and sheep, they have also tamed the horse and goat; and their agriculture extends to the cultivation of barley and millet. It is a singular and distinctive trait that they practise universally the rite of circumcision. Of the origin of the practice they can give no account; and it has most probably been derived from intercourse, at some remote period, with some people by whom it was practised.

The *Abyssinian* race is entirely different from those previously mentioned. Their colour is nearly black; but the hair is long, and generally lank, like that of an Arab or Hindoo. Features regular, after the European model, and the nose often aquiline. The stature equals that of the European; and the whole person is generally well formed, and occasionally handsome. The nations comprehended under this race have made considerable progress in the useful arts. They have domesticated most of the useful animals, as the ox, sheep, horse, ass, and camel; and cultivate most of the common corns, as wheat, barley, and millet. They also work, with some skill, articles of iron, copper, and brass; and except the ancient Egyptians, and probably the Numidians, are the only native race of the entire continent who have invented an alphabet or possessed a literature.

The *Egyptian* race is represented by the *Copts* of Egypt. These have long hair, a yellowish dusky complexion, neither Grecian nor Arabian, a puffed visage, swollen eyes, flat noses, and thick lips; and, in short, according to Volney, much resemble mulattoes, or the mixed offspring of the European and Negro. It is almost unnecessary to add, that this was one of the earliest civilized races of mankind; and that at least thirty ages ago it had already tamed the useful animals, cultivated the most valuable plants, smelted the useful and precious metals, and erected architectural monuments which, for their durability, extent, and grandeur, still astonish the world. They were also among the first to invent hieroglyphics and alphabetic writing.

## AFRICA.

The next race to be named is the *Numidians*. The people, not yet mentioned, who inhabit the northern portion of Africa from about the 18° of N. latitude to the Mediterranean, and known by the various names of Moors, Berbers, Tuanghis, and Tibbians, are, in some cases with an admixture of Arab blood, probably the aboriginal inhabitants of the country before the settlement of the Phœnicians, Romans, Vandals, or Arabs; that is, they are the descendants of the Lybians, Numidians, Mauritanians, &c. With this race the hair is long and black; eyes dark; the colour of the skin a light brown, little deeper than that of the inhabitants of Spain; the features are European, but the nose generally not very prominent, and never aquiline, as is often the case with the Arabian. Although apparently superior at all times in civilization to any Negro nation, this race appears at no period to have made any remarkable progress in arts or arms, and scarcely any in letters; for it has been ascertained only of late years, rather as a matter of curiosity than anything else, that they once possessed the art of alphabetic writing. Their language, indeed, is but the jargon of a rude people, destitute of terms to express the most common distinct ideas, such as *shortness, roundness, sloth, death, &c.* Such ideas are either expressed by circumlocutions, or, in more difficult circumstances, recourse is had to the Arabic language. Their inferiority is indeed most decidedly implied by the facility with which they have given way before every successive race of conquerors, during a period of at least 3500 years.

The next race to be described may be called the *Nubian*; and, with the exception of the Abyssinians, will comprehend nearly all the people of Africa from about 30° of N. latitude to the southern confines of Egypt, and from the Red Sea and Indian ocean on the east to about the 25° of E. longitude westward. In this race will be included the people called Barabars or Nuba, the people of Sennar, the Sursull, the Saunkis, the Bishari, the Abbadahs, the Galis, and others. A long oval countenance; a carved nose, somewhat rounded towards the top; rather thick lips, but not protruding excessively, like those of the Negro; a retreating chin; scanty beard; lively dark eyes; strongly frizzled, but never woolly hair; a finely formed person of the middle size, with a bronze complexion—are the physical characteristics of this race. Some of the nations of this race have made considerable progress in the common arts of life, but they have no indigenous literature.

With the exceptions now mentioned, the rest of the African continent may be said to be peopled by the *Negro* race, which commences at the southern boundary of the great desert, and, embracing both the western and eastern coast, with the island of Madagascar, extends to about 30° of S. latitude.

The following are the leading characteristics of this well-known variety of our species: Skin and eyes black; hair black and woolly; skull compressed laterally, and elongated towards the front; forehead low, narrow, and slanting; cheek bones prominent; jaws narrow and projecting; upper front teeth oblique; chin receding; eyes prominent; nose broad, thick, flat, and confused with the extended jaw; lips, particularly the upper one, very thick; palms of the hand and soles of the feet flat; tibia and fibula convex; pelvis narrow; knees turned in, toes turned out. The stature and physical strength are equal to that of the European, while the latter exceeds that of any other race. Many of the Negro nations have made considerable progress in the necessary and useful arts; a progress which, it may be safely affirmed, greatly surpasses that made by any native nation of America. They cultivate many useful grains, roots, and fruits; have appropriated the services of the most useful of the domestic animals, such as the ox, horse, ass, camel, goat, sheep, and hog, all of which appear to be indigenous. It is singular, however, that no Negro nation, nor even any native African nation, has ever had the ingenuity to tame and train the elephant, a service to civilization which has been performed by almost every Asiatic nation to whose country this animal is indigenous, and which, there is abundant evidence to show, was done by the Carthaginians and Roman settlers in Africa.

It is a still more striking fact, that no Negro, and, indeed, no African nation, save the Egyptians, Abyssinians, and partially the Numidians, ever possessed a literature, or had ingenuity to invent any alphabet, however rude.

The general character thus sketched belongs, with more or less intensity, to the whole Negro race within the limits we have assigned to it; but it is not, at the same time, to be forgotten that there is much variety—a greater, perhaps, than exists among the European or any other family. We shall endeavour to describe a few of the most remarkable and best ascertained of these. The *Mandingoes* are a numerous people, occupying the mountainous country on the west side of the continent which lies towards the sources of the rivers Senegal and Gambia. They possess the true Negro features, but not in an exaggerated form. The colour is black, with a mixture of yellow; the person strong, symmetrical,

and above the middle stature. Of all the Negro races the Mandingoes have exhibited the greatest aptitude for improvement. They are industrious, enterprising, and, compared with their neighbours, of an open and generous character. They have adopted the Mohammedan religion, and with it the letters and literature of Arabia. The *Foulahs*, or *Fulles*, inhabit the same portion of Africa. The colour of the skin with this race is a sort of reddish black. Their countenances are regular, and their hair longer and not so woolly as that of the ordinary Negro. They are robust, courageous, industrious, and enterprising, and, like the Mandingoes, have adopted the literature and religion of Arabia. Altogether they make a considerable approach to the family which we have before described under the name of the *Nubians*. The *Swahils* are a stout robust Negro race, not exceeding five feet eight inches high. They are remarkable for their courage and hardihood, and have made considerable progress in the common arts of life, but have not adopted Mohammedanism or the Arabic letters. The *Jolofs* inhabit both the maritime and mountain country on the south banks of the Senegal, and are, in fact, the first Negro nation we encounter on the western side of the Continent after quitting the Berbers. Their complexion is a fine, transparent, deep black. With the exception of thick lips, and a nose much rounded at the end, their features make some approach to the European. The hair is crisp and woolly, the stature tall, and the figure good. To the south of the Gambia, and extending to Cape Palmas, we find the race called *Feloups*, of a deep black colour; with longish woolly hair; features so regular as to be thought to bear some resemblance to the Hindu; and of slight and short stature, but much agility. These are nearly in a savage state. To the south of the Feloups are the *Pepels*, a race of very ugly Negroes, of dull, gross, and ferocious aspect, with very flat noses, and of a dirty livid colour. These and some other races resembling them are followed in proceeding southward by the *Bullom*, &c., of a fine black colour, of good features, and well made, with persons above the mean stature. Proceeding southward, and more to the Gold coast and the country lying inland from it, we find the *Intor*, *Fantee*, and *Ashantee* nations, which appear to constitute another distinct variety of the Negro race. It is of the mean stature, and well proportioned. The face is of an oval form; the eyebrows lofty and thick; the lips fresh, red, and not hanging down as in the extreme forms of the Negro, and the nose not so flat. The hair is rather curled than woolly, and occasionally so long as to reach to the shoulders. Now and then are to be seen examples rather Asiatic than African. No nation of this variety has ever possessed the art of writing, either springing up among themselves or borrowed from strangers; and, although they have all made considerable progress in several of the common arts of life, they are in the habitual perpetration of cruel and ferocious rites, not to be paralleled by any other race of mankind. From the Bight of Biafra down to 30° S. latitude, where we encounter the *Kaffers*, there is comparatively little variation from our general description of the Negro family. In the interior of Africa, lying between the mountains of the Moon, which cross, or are supposed to cross, the entire continent in about 10° of N. latitude, and the great desert, we have, as far as our very imperfect information extends, little variety from the common type of the Negro. This is the country which the Arabs call *Soudan*; a word which means the country of "black men," and is exactly equivalent to the Persian word *Hindustan*. On the east coast of Africa, between the *Kaffer* and *Nubian* races, we have nothing but true Negroes. It is, however, to be observed of these, that although the woolly head, black skin, flat nose, thick lips, and projecting jaws are never absent, their excess which is found in general on the western coast does not exist. Under the same denomination, though shorter and feebler, is to be included the inhabitants of the great island of Madagascar, who, because their language contains probably about 100 or 150 words of Malayan, are absurdly supposed by some writers to be of the Malayan race, which they no more resemble than they do Europeans. The introduction of such terms has, in fact, been satisfactorily accounted for by the drifting of boats with crews of Malays from the shore of the island of Sumatra, two or three authentic examples of which have occurred within our own time. The fact of such occurrences having taken place is a sufficient answer to the apparent difficulty of open boats with their crews performing a voyage which cannot be less than 3600 nautical miles. The manner in which such events would take place is, we think, obvious enough. A trading or fishing boat with a few cocoa nuts, affording meat and drink to the crews, and known to be a constant sea-stock in such cases, driven from the coast of Sumatra in the height of the N.E. monsoon, would in due course be carried into the S.E. trade wind, and, going with a flowing sheet before the wind (the only course she could pursue), would be carried to the shore of Madagascar in a shorter time and with more safety than might at first be imagined.

## AFRICA.

Such is a brief and necessarily imperfect account of the races of men inhabiting Africa. The subject is, indeed, full of difficulty; not only from its extent, variety, and complexity, but also from the imperfect information, and, indeed, in most cases the entire ignorance, which exists regarding it. The number of different nations, and even of distinct languages, is proportional to the barbarism of the people; and there is no quarter of the globe, America excepted, in which the number of both is so great. In our inquiry we have been able to detect at least 200 languages, and, indeed, the empire of Bornou alone is said to contain no less than thirty.

*Amount of Population.*—There are no means whatever by which to form any estimate of the population of Africa. Hence the great discrepancy among the guesses that have been made of its amount. According to Balbi, it contains 60,000,000, whereas Malte-Brun gives it 70,000,000, and the Weimar Almanac 101,000,000.

III. *Animals of Africa.*—These, at its northern extremity, where it approaches Europe, and at its eastern, where it approaches, or, rather, joins Asia, are generally the same as those of these two portions of the globe; but throughout its greater part they are not only different from the European and African species, but equally also from the animals of the two portions of America, and from those of the Oceanic continent and islands. We shall confine our observations chiefly to those more immediately subservient to the uses of man.

Of 1270 known species of terrestrial *Mammalia* there have been discovered in Africa, although more imperfectly explored than any other portion of the globe, no fewer than 200, of which 943 are peculiar to this continent. Of the *Quadrumanæ*, comprehending apes, monkeys, and lemurs, there are fifty-five species, of which forty-eight are peculiar to it; not one of them being identical with the species found in Asia or America. The most remarkable of the whole tribe is the *Simia troglodytes* or chimpanzee, which, after a careful anatomical comparison with the *orang utan* of Borneo, is now considered to make, in physical formation, a nearer approach to man than the latter, while it is unquestionably more lively and intelligent. Of the *Cheiroptera* or bats there are thirty species in Africa, four of which only are common to it with Europe and Asia. The carnivorous animals of Africa are sixty-six in number, of which fourteen only are found in other parts of the world. The most remarkable of these is the lion, which is known historically to have once existed in the east of Europe and west of Asia. With the exception of an inferior variety found in some parts of northern Hindustan, this animal, so renowned in the fable, poetry, painting, and sculpture of almost every nation of the Old World, from China to Spain, is now confined to Africa (*Leontem arida* austris), which it ranges from its N. to its S. extremity. Panthers, leopards, and many small species of the feline race also exist; and the cat has been domesticated, though it be much more rarely found in this state than in Europe, Asia, or even America.

Of the Canine family, Africa contains the dog, wolf, fox, jackal, and hyena. The dog has not been found there in the wild state, but many varieties exist in a semi-domesticated condition, living in troops in the towns and villages, as it does in almost all the countries of Asia. The Africans have never, that we are aware of, used it for food or labour, or even for the chase. Jackals and foxes are numerous. Africa may be considered the peculiar country of the hyena; for, of four existing species, one only, belonging to Hindoostan, is found out of its limits. Of the *Viværa* or civets several species exist in Africa; among which is the true civet cat, domesticated by the natives to produce civet, and a species of the Mongoos, viz. the celebrated Ichneumon, or rat of Pharaoh. Of bears, which either still exist, or are known to have existed, in almost every country of Europe, Asia, and America, no example has yet been found in Africa.

The Marsupial order of animals, or that of which the females have a double womb, is wholly wanting in Africa, as it is in Europe and continental Asia. Of the Rodent *Mammalia* or gnawers, Africa yields many species of rats, squirrels, and four or five species of hares; while the rabbit is thought to have been originally brought to Europe through Spain from the African coast of the Mediterranean. The *Pachydermata*, or thick-skinned order, is very abundant; more so, indeed, than in any other part of the world. We find among these the horse, ass, zebra, dow, and quagga; the elephant, rhinoceros, hippopotamus, common hog, and lingallo or African boar. Although the horse cannot be asserted to be a native of Africa, not being found in the wild state, it has been domesticated there from the earliest ages of history. The Numidians had their cavalry when the Romans first became acquainted with them; and the horse does not appear to have been a stranger even to the ancient Egyptians; though among the mummies of quadrupeds found in the catacombs that of this animal does not appear. The most improved of the Negro tribes possess the horse,

and have often a numerous cavalry; but, like Asiatics generally, the Africans do not apply the horse to draught or burden, and confine its use to war or pleasure. When the Arabs conquered Egypt and northern Asia, they introduced their own breed, which, mixed in some degree with the native one, constitutes the barb and Egyptian horse—little inferior to the pure Arabian blood itself. The Dutch and English introduced into the colony, at the southern extremity of the Continent, their respective national breeds; and the soil and climate of Africa being found generally congenial to the constitution of the horse, it has thriven and multiplied there as everywhere else.

The ass is most probably not a native of Africa, or we should still, in a country so little occupied by man, find it in its wild state, as we do in so many countries of Asia. It has, however, been introduced into Egypt and Barbary—possibly by the Arabs—and thrives extremely well in both. The zebra, the dow, and the quagga, quadrupeds peculiar to Africa, and beautiful, at least as to colour, are found in troops all over its arid plains and deserts. But from a natural indolence or waywardness of temper, or from the unskillfulness of the African people—probably, indeed, from both causes—and the possession of the horse and ass, they have never been tamed and applied to economical uses.

Ruminating animals are not less abundant than the *Pachydermata*. Of the 157 species of those which are ascertained to exist, seventy-three are found in Africa; and, with the exception of ten, all of them are peculiar to it. The dromedary, or single-humped camel, is now abundant in all the dry parts of Africa, and is the principal beast of burthen. In the earliest portion of Scriptural history it is mentioned as being employed in carrying on the trade between Syria, Arabia, and Egypt, and therefore it is fairly concluded that it was well known to the ancient Egyptians. It is also found sculptured on some of the earliest Egyptian architectural monuments. Egypt, however, from position, physical character, and civilization, was always more an Asiatic than an African country; and from the fact of the camel's existing there, its general diffusion over the country cannot be inferred. It does not appear to have been known in the portion of Africa lying along the coast of the Mediterranean during its possession by the Romans; and it seems not improbable, therefore, as some have conjectured, that its general diffusion over the continent was the work of the Arabs, after their adoption of the Mohammedan religion in the 7th century. The *Giraffe*, known to the Romans, and used in their games, is exclusively an inhabitant of the dry parts of Africa. Notwithstanding its size, strength, and gentleness, it has never been applied, in its domesticated state, to any useful purpose of man; and from its eccentric and awkward form and movement, is probably unsuited for any.

Horned cattle, or oxen, of many varieties, are generally among all the more civilized tribes of Africa; and in Egypt the existence of the ox is coeval with the earliest records of the country. Mummies of this animal have been found in the catacombs, supposed to be not less than three thousand years old. Whether the original stock was imported or was indigenous, cannot be ascertained; but most probably the latter, for the common ox in the wild state is not known to exist in any part of this continent as it does in many parts of Asia and its islands, and as it is known once to have done in Europe. The buffalo (*Bos bubalus*) has been naturalized in Egypt since the middle ages, having been introduced from India through the conquests of the Arabs. One species of the ox family only is ascertained to be indigenous to Africa, and is peculiar to its southern extremity. This is the buffalo of the Cape, or *Bos Caffé*; an animal of great size and ferocity, which has never been tamed, and is probably unteachable.

Sheep and goats exist throughout all the drier parts of the continent; but neither are found in the wild state, and have probably been introduced. The prevalent variety of the first is that with the fat tail, of from 10 to 30 pounds weight, the same which is so general in Persia, Arabia, and Tartary; and which, though long looked upon as a rarity and a monstrosity, is probably as extensively diffused over the globe as the variety more familiar to us. The wool and flesh of the fat-tailed sheep are greatly inferior to those of our own breed; but the flesh of the lamb is thought to be superior. There are said to be but two species of deer—one of which is the common deer—existing in this continent, and these are confined to the countries bordering the Mediterranean. This is compensated by the existence of not less than sixty species of antelope, all peculiar to it; a number far exceeding that of the genus found in every other part of the world. Some of the species, as the gazelle, do not exceed a foot and a half high, and are remarkable for the beauty and gracefulness of their form. Others are equal in size to a large ass or zebra; as the gnu, which has the body, tail, and paces of a horse. The most numerous species is perhaps the springbok; which, in the wide

## AFRICA.

plains of southern Africa, is said to be found in herds of 10,000, or even 50,000. Not one of the whole family has ever been domesticated for the purposes of food or labour by the natives, as the rein and fallow deer have been in Europe.

The elephant is found in all the wooded and low parts of Africa, from the northern limits of the great desert to the southern cape; and generally in greater numbers than any where else in the world, if we except Ceylon and the countries lying between Hindostan and China. The African elephant differs, specifically, from the Asiatic. The crown of the tooth is marked by a keel instead of ribbon stripes; the hind foot has three toes instead of four; the forehead is convex instead of concave, and the ears are longer. In point of size, general form, sagacity, and docility, there is probably no great difference. No native African people, that we are aware of, ever tamed the elephant. When an African is told that this is done in the East, he is as incredulous as a European would be if an African told him that his countrymen tamed the hippopotamus, and used it as a beast of burden. The only hint we have seen that such a thing may have been given by Mr. Campbell, the African traveller, who informs us that he was told by a people of the interior whom he encountered, that another people more advanced in civilization than themselves, the Mahalasey, "wear clothes, ride on elephants, climb into their houses, and are gods." That the elephants used by the Carthaginians were of the African species there cannot, we think, be the least question. One of the conditions of the treaty forced upon them by the Romans after the battle of Zama implies this clearly enough. They were to surrender all the elephants which they had tamed, and to tame no more for the future.\* It is obvious enough that had the elephants been Asiatic, they would only have been brought to Africa when already tamed. The Carthaginians being of an Asiatic, not an African stock, form no exception to our previous remark. The Egyptians, the only people of Africa from whose ingenuity we might have looked for the domestication of the elephant, had none to tame; nor was their highly-cultivated country well suited for their use, if they had. As a contrast to the Africans, it may be observed, that there is no people of Asia whose country produces the elephant by whom it has not been domesticated and used as a beast of burden, from the Hindoos, the most civilized, to the Malays, the least so. The Africans consider the elephant only as a beast of chase, and hunt it for its ivory, its flesh, and its hide; and the herds are so numerous, and the population so scanty, that the supply, according to present circumstances, appears for all practical purposes inexhaustible.

The two-horned rhinoceros, of a different species from the two-horned rhinoceros of Sumatra, inhabits the same localities as the elephant, is hunted with the same avidity by the natives for its tough and thick hide and its horns. Traces for ox-harness, but above all shields, are made of the former, which are in repute throughout all eastern countries; and the latter are used for their supposed medicinal virtues, and are a regular object of traffic. It may be observed of this species of rhinoceros, as well as of the two which belong to India and its islands, that their docility and capacity for domestication are not inferior to those of the elephant itself. The slow and sluggish movements of this animal make it, notwithstanding these qualities and its great strength, an unsuitable beast of burden, especially in countries where the elephant, the ox, the buffalo, and the horse exist; and, consequently, it has never been applied to such a purpose.

The hippopotamus is exclusively a native of Africa, inhabiting the rivers and fresh-water lakes of the whole continent, from the southern confines of the Sahara nearly to the extreme cape. It was well known to the Greeks and Romans as an inhabitant of the Nile; from which, however, it has now disappeared everywhere below the third cataract. In the rivers and lakes of tropical Africa it still exists in undiminished numbers, being from its locality difficult to come at by the hunter.

The common hog, in the wild state, is said to be found at the two extremities of the continent, where it approaches Europe and Asia, viz., Barbary and Egypt; but there is no evidence of the existence, anywhere else in Africa, of this animal, which was at one time general throughout Europe, and is still general throughout Asia and its large islands. Its place seems to be taken by the lingillo, or masked boar. This animal, which has teeth of a formation and growth resembling those of the elephant, and a large pendulous pro-

nubance supported by a bony process on each cheek, giving it a hideous appearance, is not only found on the continent, but in Madagascar and the Canary Islands. It has never been domesticated, but the common hog has a limited extent.

The native Ornithology of Africa does not present the same number of subjects subservient to man as that of Asia, or even of America. The common fowl, geese, and duck are all of them probably strangers, and there is no doubt that this is the case with at least the first. They are bred by the native inhabitants, but only to a very limited extent. The only bird which Africa has contributed to the poultry of the Guinea hen; of this genus there are four or five species found abundantly on the western coast and its islands. This bird, as its Latin name, *Nympha*, implies, was known to the Romans, and bred by them. Most probably they received it domesticated from the Carthaginians. It is very remarkable that it is now wholly unknown to any African people in the domestic state, except as imported by European colonists—a singular proof of apathy and dulness in the whole race. This bird seems to supply, in Africa, the place of the common fowl of Europe, the peacocks and pheasants of Asia, and the turkeys and alouettes of America. The ostrich, which once extended to the nearest parts of Asia, is now confined to Africa; and the Arabs are said to have introduced the practice of breeding them in the domestic state, in order to obtain their feathers in greater perfection. Of our summer birds of passage many pass their winters in Africa; as the cuckoo and nightingale, some swallows, and the common quail and land-rail. The cheerful and active period of their lives, therefore, is passed among us, and the note of the cuckoo and song of the nightingale are wholly unknown to the people of Africa. The woods of tropical Africa abound with birds of the parrot family, from those which are no bigger than a lark, to some which are equal in size to a large falcon. As in South America, the Indian islands, and Australia, they are remarkable for the variety and brilliancy of their plumage, their dissonant and incessant notes, and their utter inability to man. Proportional to the number of graminivorous and frugivorous birds, and of wild mammals and reptiles, is that of eagles, hawks, vultures, and other birds of prey.

Among Reptiles are to be found a great variety of the lizard family, from the chameleon up to the crocodile; and of snakes (a few poisonous, but the greater number harmless), some species not exceeding a few inches long, up to the python, which measures thirty feet in length. All the species of this class differ from those of Asia and America, not to say of Europe, or the Indian islands, or Australia. Africa, of course, abounds in the insect tribe. Of these the bee alone is directly useful to man, but has never been domesticated by the Africans. Africa yields no useful insect, such as the kermes of Europe and Western Asia, the lac of Eastern Asia, or the cochineal of South America.

IV. *Plants of Africa.*—In reference to its Flora, Africa may be divided into three regions, the Atlantic, the Equinoctial, and the Austral; to which we may add the principal islands on its western and eastern side, viz., the Canaries and Madagascar, with the Mauritius and Bourbon. The plants of the Mediterranean coast differ little or nothing from those of the opposite shore of Andalusia. Wheat, barley, maize, rice, the grape, the fig, and olive, thrive here in perfection, as does the date. It is not until we reach as far as Egypt that the Flora assumes a character intermediate, as it were, between European and Tropical; and here, to the plants already enumerated, may be added the sugar-cane, cotton, indigo, and coffee. In Upper Egypt, Nubia, and Abyssinia, we have a somewhat peculiar vegetation; and here we find the *acacias*, which produce gum-arabic, and the *cassias*, which yield the medical senna. In Abyssinia first appears the Scitamineous family of plants, the same which in the East yields ginger, turmeric, and cardamoms. The coffee plant still grows wild in the same region, which is, indeed, supposed to be its native country.

In the Equinoctial part of Africa a totally new vegetation presents itself, entirely differing from that of Europe, and almost equally so from those of tropical Asia and America. One conspicuous forest-tree of great size, however, the *Bombax pentandrum*, is common to the three continents. Another forest-tree of vast magnitude, the Baobab, or *Adansonia*, is supposed to afford examples of the oldest living organized matter on our globe; some specimens, by counting the number of their concentric circles, being estimated at near 6000 years old. The African oak, or teak, which, however, is probably neither the one nor the other, though its botanical place has not been as yet ascertained, is an inhabitant of the same region. The bamboo, so common and so useful in Asia and America, is unknown to Africa. Whole plains in this quarter are occasionally overspread with the papyrus-plant, to the exclusion of every other. Peculiar palms of course abound; among which, however, the date

\* "Perhaps *Elephantus*, et *capivus* omnes rudiores Romanis, et *navis* *indorum*, *propter* *decem* *tribus* *fractum*, *deperditum*, *et* *habetum* *de* *indis*; *capivus* *deperditum* *aflic*."—(Livy, lib. xii., c. 37.) The elephants of Pyrrhus were, no doubt, Asiatic, and received through the Macedonian conquests. His invasion of Italy was but forty-seven years after the Indian invasion of Alexander; and therefore considering the long age of the elephant, the very individual animals in the army of Pyrrhus may have been the same which Alexander brought from the banks of the Indus.

## AFRICA.

is no longer found. The most useful of these is that which yields the oil of commerce, the *Elais Guineensis*. Whether from the barbarism of the natives or the uncongeniality of the soil and climate, corns are little grown, and their place is taken by hardy farinaceous roots, pulses, &c.; as the *Dioscoria* or yam, the *Arachis* or ground-nut, and the pigeon pea or *Cytisus cajan*. The fruits of tropical Africa, in comparison with those of Europe, Asia, the Asiatic islands, or America, are few in number and of indifferent quality. The most remarkable are the nitia or doona (*Parkia Africana*), a species of custard apple (*Annona Senegalensis*), the safu, the cream fruit, the negro peach (*Jacocarpus laurina*), the monkey apple, pigeon plums (*Chrysophalanus*), the Ramee apple (*Mammea Africana*), and the star apple (*Chrysophyllum*). The pine apple, a native of America, grows luxuriantly in the forests, as if it were indigenous.

As we approach the southern extremity of the continent, a new form of vegetation presents itself, different essentially from that of every other part of the world, but bearing the nearest analogy to that of Australia. Its character is suited to the arid nature of the soil and climate; and the prevailing genera are euphorbias, aloes, crassulæ, and heaths, of endless species, and often of great beauty; plants generally with fleshy leaves, and slender roots, which are nourished more by dew than by the moisture of the earth. The grasses are generally coarse, and forest trees are only found in the moister parts near the banks of rivers.

In the Canary Islands the species are for the most part European, but their growth and luxuriance is tropical. The great island of Madagascar has on its western side plants common to Africa, and on its eastern some that are common to the Indian Archipelago. But generally both here and in Bourbon and the Mauritius, the flora is peculiar and local.

From this brief sketch of the native flora of Africa, we shall be disposed to conclude, that although it may be equally varied, grand, and beautiful with those of Asia and America, it yields far fewer objects ministering directly to the uses of man. To Asia, or Egypt (a country African only by position), Africa probably owes the bananas, the orange, lime, and lemon, the tamarind, the cocoa-nut, cotton, and sugar-cane. It may even be conjectured that it owes to the same source, and perhaps through the Phœnician settlers, wheat, barley, the grape, fig, and pomegranate. To America it unquestionably owes maize, tobacco, manioc, and the pineapple.

If Africa be excelled by Europe, Asia, and America, in its turn it immeasurably exceeds Australia, which yields neither useful corn, root, nor fruit.

**V. Religion.**—Fétichism,\* in its most degrading and offensive form, is the religion of the greater number of the inhabitants of Africa, being professed by almost all the Negroes, and by nearly all the natives of Madagascar. They appear generally to admit a good and an evil principle, have their lucky and unlucky days; and their priests claim the power of preserving men and animals from the influence of evil spirits. Several of these nations have a national and supreme *fétiche*: the people called Ouidah or Widah, for instance, worship the serpent, an order of priests and priestesses being set apart to minister to this reptile. The Bissagos worship the cock; and the tribes on the Bight of Benia, who regard their own shadow as a *fétiche*, have a lizard for their principal divinity. Other tribes worship alligators, hyenas, leopards, &c.; and in some instances immolate to their human victims. The Agows, who reside near the sources of the Nile in Abyssinia, have, with less absurdity than most others, from time immemorial, offered sacrifices to the genius of that river. The narrative of the Moor Sydy Hamed represents the inhabitants of Wassabah and some tribes of Nubia, and in other countries in the region of the Nile and the interior of Africa, as worshippers of the moon; and those contiguous to the Capas Mesurado in Guinea, as worshippers of the sun. The Gallas hold as sacred certain trees and stones, the moon, and some of the stars. Sometimes the Negroes frame idols with a human countenance; and Capt. Tucker and Dr. Smith were surprised to see, on the banks of the Zara in the interior of Africa, idols with European features, and resembling the Egyptian, or rather the old Tuscan statues. The Betouanas have a kind of high-priest, who ranks as the most important personage after the king. At Dagoumba, in central Guinea, there is a famous oracle, the resort to which renders it the entrepôt of a flourishing commerce. According to M. Douville (who, though referred to by Balbi, is a very doubtful authority), the

Cawange, Moloupa, Macking, Moungouma, and other nations of southern Nigritia, like many tribes in the centre, unite to idolatrous superstitions the horrible practice of human sacrifices; and though of an hospitable disposition, are said to be cannibals. Such are the dreadful aberrations to which uneducated and uncivilized man is exposed.

Among these nations, human sacrifices, according to M. Douville, take place only on the accession of a sovereign or on the occurrence of some great epidemic. The victim is always selected out of the country, and, if possible, at a great distance from the place of sacrifice: it must be a young man or woman, and ignorant of the fate that awaits him or her till the moment of immolation. Should any one reveal the fearful secret, death is the inevitable penalty. During the interval between the selection and the sacrifice the victim is kept with the greatest care, and every possible means is adopted for the purpose of making him fat. On the arrival of the fatal moment, he is suddenly put to death in the midst of imposing solemnities, and in the presence of the king, grandees, and people assembled to witness the spectacle. His body is usually quartered, and immediately roasted, to be portioned out among the spectators according to their rank, and devoured on the spot. But enough of these horrid and envenomed crimes perpetrated in the sacred name of religion.

With the exception of Abyssinia and the colonies founded in modern times on some points of the African coast, where Christianity is professed, Mohammedanism prevails in all the countries of Africa not devoted to Fétichism and idolatry. It is very widely diffused, having extended itself over the whole of Barbary, Egypt, Nubia, &c., and being professed by a considerable number of the more advanced Negro nations. Its introduction has been, perhaps, the greatest boon ever conferred on Africa, and has tended materially to improve the habits and morals of the people. The Koran is the only recognized code in many countries; and, what is singular, the Arabic is everywhere throughout Africa, with the exception of Abyssinia, the language used by such of the natives as either read or write. It was introduced in the first age of the Hegira, and has participated but little in the improvements that have since been made upon it in Asia. Arabic has been for some centuries the language of the Copts or descendants of the ancient Egyptians.

The Christianity that prevails in Abyssinia is largely alloyed with debasing practices and observances; and the priests are as ignorant and worthless as can well be imagined. With the exception of the Cape Colony, the seats of Christianity in other parts of the continent are too trifling to deserve notice; but a considerable number of Christians of various denominations, and of Jews, are found in countries where Mohammedanism and Fétichism are prevalent.

**VI. Language.**—Balbi has given a classification of the people of Africa according to their languages. Perhaps it was impossible to have selected a worse standard. We know little, and sometimes literally nothing, of the people in some very extensive countries, and if it be possible we know still less of their languages. Our knowledge of the latter is indeed in most instances exceedingly imperfect; so that any classification of the people bottomed on it must necessarily be little else than a tissue of errors. The Arabic, as we have just seen, is the learned language of the entire continent. The Berber is the vernacular idiom of the Barbary states; the Sango is used in Guinea; and the Foul, the Kolo, &c., bear the names of the people by whom they are spoken. The Amboumba is the language of all the tribes between the Congo and the coast of Mozambique. As was to be expected from the low state of civilization of those by whom they are used, these languages are all miserably poor. The reader will find in the article Abyssinia some account of the languages of that singular portion of the African continent.

**VII. Government.**—Most forms of government may be found in Africa. Despotism, however, in its worst and most offensive shape, is by far the more prevalent. In some states there exists a sort of feudal aristocracy, and in others an aristocracy depending on the rude distinctions of superior strength and prowess in war, which participates to a greater or less extent in the rights of sovereignty, and in some they are occasionally shared by the people. Some large states consist of a kind of confederacy of petty chiefs, who, however, are very frequently at war with each other. In fact, with but few exceptions, slavery and anarchy reign triumphant throughout Africa. And it would be to no purpose, even if we were accurately informed as to the discrepancies in the forms of government established in different parts, to waste the reader's time by detailing in what respect one barbarous and generally fluctuating system of government differed from another.

**VIII. Industry in Africa** is at the lowest ebb. Except where they are associated with or have been instructed by

\* *Fétichism* is the worship of natural objects, whether animate or inanimate. The word is derived from the Portuguese *Fético*,—something enchanted, sacred, or divine; and comes most probably from the Latin *fatum*, *fatum*, *fari*.—Anything, however, vile or worthless, may be a *fétiche*, that pleases the fancy of a nation or an individual, and requires merely to be consecrated and set apart as a special object of adoration. When this is done it is regarded with every mark of the most profound veneration and respect—it is referred to on all occasions of difficulty, sworn by, &c.—See the *Treatise De Cultu de Divinis Feticis* (by the President Debonis), 1720, 1724, cap. 1, &c.

\* Those who wish for further details may consult Balbi, 2d ed., p. 245, &c.

## AFRICA.

Europeans or Arabs, the Africans have made little progress in the arts. All the more laborious occupations are devolved on females; and in some parts the wives of kings or petty princes are made to till the land for the support of their barbarous lords. Even the most necessary arts are in an extremely backward state. The ground, after being soaked with rain or covered with the mud brought down by the rivers during the inundation, is not ploughed, but merely scratched with a hoe. There are no doubt many exceptions to the extreme indolence, stupidity, and barbarism that seem to distinguish the bulk of the native races. The Mandingoes have made considerable advances in civilisation, and are advantageously distinguished among the people of the west coast; but the Ovas of Madagascar are said to be in this respect discriminated from the others, and to be not only the most industrious people of that great island, but of the whole African continent. Egypt and Barbary excepted. The Ashantees, too, seem to be in this as in some other respects superior to the bulk of the Negroes; and this, indeed, is one of the grounds on which they have been supposed to be not of Negro but of Abyssinian or Ethiopic origin.—(*Breitlich*.) It is farther true, as has been remarked by Baili, that the cotton and other manufactures of Egypt have recently attained to considerable importance. But their progress has been, as every one knows, forced and fictitious. In point of fact, too, they are carried on wholly under the superintendence of Europeans, and are no evidence whatever of the improvement of the Africans in manufacturing industry.

It is a curious fact, that the smelting and working of metals, which would seem to require a degree of intelligence or of traditional knowledge hardly consistent with their backward state in other respects, is pretty extensively carried on by several of the Negro tribes.—(*Baili*, p. 844.) Generally, however, the arts practised by the natives are of the most limited description, and are restricted to those necessary to supply the most indispensable wants. The tanning of leather, the weaving of cotton cloths, and the manufacture of mats are everywhere carried on; and in parts the articles produced are of a very good quality, and have much beauty. But the natives are for the most part ignorant of the use of the shuttle; and in weaving pass the threads of the web between those of the warp one after the other, by the unassisted agency of the hand; taking a month or two to despatch as much work as a European could effect by means of his loom in as many hours! In all their works, in fact, they display little contrivance or design, but generally only a sort of indolent, stupid routine.—(*Mod. Universal History*, xiv. p. 31.)

**IX. Commerce.**—It may appear a singular and not easily explained fact, that notwithstanding the low state of the arts in Africa, and the difficulties of the country, an extensive intercourse has been carried on, from the remotest antiquity, between very distant parts of that continent. This, no doubt, has been owing to the natural productions in greatest demand being confined to certain localities; and to the facilities afforded for traversing the vast deserts which intersect Africa by the aid of the numerous oases with which they are studded; and the employment of the camel, or *ship of the desert*. Salt and dates are the principal articles conveyed from northern to central Africa. The extensive region of Soudana, to the south of the great desert of the Sahara, is completely destitute of these valuable articles. Both of them, but especially salt, are, however, in great demand in it; the latter being, in many parts, so highly prized and so scarce as to be employed to form the functions of money. This necessary article is found in various places in the desert, while dates are found in the greatest abundance all along its north frontier, the country adjoining to it being called from this circumstance *Bliesdagerid*, or the *country of dates*. But, though destitute of these important products, central Africa has others; such as gold-dust, ivory, gums, palm-oil, feathers; and, above all, slaves, for which there has always been a ready market in Barbary and Egypt. In consequence of this natural adaptation of the products of one part of the continent to supply the wants of another, an intercourse has subsisted among them from the remotest antiquity. Even so early as the days of Herodotus, the merchandise engaged in the interior traffic had penetrated as far as the Niger, or one of the rivers flowing into lake Tchad; which the venerable father of history correctly describes as a considerable river beyond a sandy desert, which it required many days to cross, flowing eastward, and infested with crocodiles! (II. § 22.) Egypt and different towns in the N. or Barbary states have always been, and continue to be, the great seats of this trade. It is carried on at present as it was 3000 years ago, wholly by caravans. These consist of an indefinite number of camels, seldom less than 500, and often as many as from 1500 to 2000. They do not follow a direct course across the desert from their point of departure to where they are destined, but diverge to the oases, or verdant spots, where they procure water and refresh them-

selves. If they be disappointed in finding water at one of these resting-places, or be overtaken by a sand-storm, the consequences are often most disastrous. In 1804, a caravan proceeding from Timbuctoo to Tadmec, not having found water at a resting-place, the whole persons belonging to it, 3000 in number, with about 1800 camels, perished miserably!—(*Jackson's Morocco*, p. 329. See also the excellent chapter in *Hervey*, on the Land Commerce of the Carthaginians.)

Exclusive of this internal commerce, Africa has carried on a considerable commerce by sea, since the discovery of her W. coast by the Portuguese; but the probability seems to be that she has lost more than she has gained by this commerce. Slaves have been the staple article of export from the African coast; and in some years as many as 10,000 have been carried across the Atlantic. It has been said, and no doubt truly, that the opening of this new and vast outlet for slaves was advantageous to Africa, by lessening the odious practice of cannibalism, and preventing the immolation of the captives taken in war. But, admitting this, it seems notwithstanding abundantly certain that the slave-trade has been productive of a far greater amount of misery than it has supposed. Without stopping to inquire whether death might not be preferable to slavery, it has multiplied the latter in no ordinary degree. Formerly the peace of the country was comparatively little disturbed by war; but now a wholesale system of brigandage and robbery is organised in many extensive districts; the bulk of the people being huddled down like game by the petty princes, and by the Mohammedans, who affect to believe that they are entitled to capture and sell the "isolators," to serve as beasts of burden in another hemisphere. Hence it is that the suppression of occasional instances of cannibalism, and of the sacrifice of human victims, has been supplanted by a widely diffused system of rapine, productive of a total want of security, and subversive of every thing like good government and good order. Until this state of things be totally changed, it would be idle to expect that civilisation should make any progress in the countries where it exists. Its abolition is indispensable as a preliminary measure to give them even a chance of emerging from the barbarism in which they have been so long involved.

There seems to be a reasonable prospect that the meritorious efforts of Great Britain for the suppression of the slave-trade will, at no very distant period, be crowned with success, in so far as so many as the nations of Europe and America are concerned. But it is quite otherwise with the slave-trade carried on from the interior with the Barbary states, Egypt, and Arabia. There are no grounds for supposing that it will be speedily suppressed. Probably, indeed, it is destined for a while rather to increase. Luckily, however, it is much less extensive than that carried on from the W. coast, the entire export of slaves rarely amounting to so many as 10,000 in a single year, and it is not accompanied by so many disastrous results.

Exclusive of slaves, palm-oil, gold-dust, ivory, gums, teak, timber, wax, hides, feathers, &c., are the principal articles imported into W. Europe and America from Africa. The most exaggerated notions seem to have been always entertained of the value of the trade and of its capacity of extension. That it may be materially increased is, no doubt, true; but the fair presumption seems to be, that the wants of the native Africans, and their industry, are much too contracted to admit of their ever becoming extensive demanders of European produce.

Carthage, the first maritime power of antiquity, though situated in northern Africa, was a Phœnician colony, and her fleets were principally manned from her colonies in the Mediterranean. Since the fall of this powerful republic, no African people has had the smallest claim to be called maritime. The most advanced nations are at this moment, and have always been, nearly ignorant of the art of ship-building. It is to European engineers and carpenters that the Pacha of Egypt is indebted for his ships; and every one knows that this was formerly the case with the deys of Algiers, Tunis, &c. In some few places the natives fit out a sort of large cutters; not, however, for the purpose of trade or fishing, but to engage in piracy.

Besides salt, to which we have already alluded, gold-dust or *tibber* and cowries are the articles principally used as money in Africa. The latter, a species of small shell gathered on the shores of the Maldivé islands, are used in small payments throughout Hindostan; but in the interior of Africa their value is about ten times greater than in Bengal.

**X. The social condition of the people of Africa** is as depressed as their industry and their science. But what else could be looked for where Fétichism, idolatry, and the most revolting superstition are so very prevalent? Polygamy may be said to be diffused all over Africa; and though forbidden in Abyssinia, the marriage tie is there so slight as hardly to have any sensible influence; and morals are, in this respect, in a state of almost total dissolution. That cannibalism

## AFRICA.

formerly existed to a frightful extent in many parts of Africa, cannot be doubted; and though it has greatly declined, partly because of the introduction of Mohammedanism, and partly, and principally, perhaps, because of the ready and advantageous markets that have long been opened in the West Indies and America for the slaves or captives taken in war, there seems to be no doubt that it still exists among certain tribes. Among some considerable nations the exposure of children, and the slaughter of those that are deformed or maimed, is not tolerated merely, but enforced. In some parts human blood is reported to be mixed up with the lime or mortar used in the construction of temples. And it is said to be usual among the greater number of the nations on the coast of Guinea for rich individuals to immolate human victims once in their lives to the manes of their fathers!—(*Baldi, Abrege*, p. 249, 2d ed.) Atrocities like these are, however, principally confined to the least improved tribes of the Negro race. But, speaking generally, barbarism, cruelty, and the most degrading superstition are universally prevalent among by far the greater number of the nations of African origin.—(See art. AFRICA.)

As already stated, with the exception of Egypt and Abyssinia, all the science and literature to be found in Africa are of Arabic origin. The Arabs have schools established in Cairo, Merou, and Darfour, in the region of the Nile; in Morocco, Fez, Algiers, Tunis, &c., in Barbary; and there are schools among the Mandingoes, Foulahs, Jolofs, and other Mohammedan nations of central Nigritia or Soudan; these are placed under Mohammedan teachers, and assist in disseminating the rudiments of Arabic learning and science. The European colonies at the Cape, Algiers, and various other places along the coast, have been regarded as so many centres, whence the language and literature of Europe might be expected gradually to spread over the whole continent. But our anticipations in this respect are far from sanguine; and the presumption seems to be that if barbarism and ignorance are not to be immortal, they are, at all events, destined to a prolonged existence in Africa.

**XL Causes of the Inferiority of the Africans.**—The low state of the arts in Africa, and the barbarism that so generally prevails in it, have been variously accounted for; and, perhaps, we are yet without the means of coming to any satisfactory conclusion in regard to either matter. But it would seem that the first, or the low state of the arts, is mainly attributable to the climate, which supercedes the use of many articles indispensable in regions more to the north and south. Manufacturing industry is principally devoted, in European and Asiatic countries, to the production of articles of clothing; but where clothes are an incumbrance, and most of the people are satisfied if they have a piece of coarse common cotton stuff to wrap round their middle, it would be absurd and contradictory to expect that this great department of manufacturing industry, and its many dependant and subsidiary arts, should make any progress. The agriculture, too, of the greater part of Africa is exceedingly unfavourable to the development of a spirit of enterprise and invention. The seasons differ but little from each other; and in those tracts not condemned to perpetual sterility, that is, in the tracts watered by the periodical rains or by the overflowing of the rivers, the rudest husbandry is sufficient, the heat of the sun operating on the moisture of the soil being all but enough to produce the most luxuriant crops. The houses, too, in tropical climates may be constructed at comparatively little expense; and, except for the cooking of victuals, fires would be a nuisance. It is idle, therefore, to wonder at the backward state of industry in Africa. It would be as reasonable to expect to find a manufactory of freezing-machines at the North Cape, as to expect to find extensive cloth-factories in Nigritia. The industry of a country always bears some proportion to the wants and necessities of its inhabitants; and few, comparatively, of those things which employ a large part of the industry of Europeans being wanted in Africa, they are but little produced.

It is true, that besides the great articles now referred to, there are others, such as articles of show and ostentation, arms, &c., for which it might be supposed the taste in Africa would be as strong as in Europe. But these are costly articles; and, in point of fact, are never found generally diffused in any country not distinguished by its industry. Men are not instinctively laborious or enterprising. Industry is with them only a means to an end: a sacrifice they must pay to obtain supplies of the necessities and conveniences of human life. Wherever the sacrifice required to procure food, clothes, and other necessary accommodations is considerable, the population is generally indolent; and a taste for labour being widely diffused, those who are not obliged to apply themselves to the production of necessities, engage in the production of superfluities. But wherever the principal wants of man may be supplied with but little exertion, indolence becomes the distinguishing characteristic of the population; and instead of employing their spare

time in the production of articles of ostentation and luxury, they usually waste it in idleness and apathy.

In addition to the circumstances now mentioned explanatory of the low state of the arts in Africa, and the barbarism prevalent in it, the negroes and other African races have been supposed by some philosophers to be naturally inferior in point of intellect, and not to possess the same capacity for improvement as the Europeans, or people of the Caucasian variety. This supposition has, however, been vehemently denied; and it has been contended, over and over again, that the peculiar circumstances under which they have been placed sufficiently account for the condition of the Africans, for their want of literature and their low civilization. That great weight should be attached to the considerations now mentioned, is true; but still we do not think that they are sufficient wholly to account for the existing state of things. Egypt was, at a very remote period, the principal seat of science and of art; and various nations of Africa were in contact with, and had a pretty extensive intercourse with the Egyptians, and also with the Phœnicians, and afterward the Romans. But they seem to have profited little or nothing by this association. And while the people of Greece, Asia Minor, and Magna Græcia raised themselves in a comparatively brief period to the highest pitch of civilization and refinement, the nations of Africa continue, without a solitary exception, down even to the present day, immersed in the grossest barbarism. Surely, however, during the space of 3000 or 4000 years, opportunities must have been afforded to some of them to make some advances. But if so, no one has had sagacity to profit by them. Africa, in fact, does not seem to have produced a single great man. She has had no Hercules, no Minos, no Thebes, no Confucius, no Manco Capac. Among all the varieties of superstition that exist in it, we look in vain for hero-worship—for the divine honours paid in rude but improving nations in other parts of the world, by the public gratitude, to departed heroes, legislators, and authors of important discoveries in the arts.

With the exception of that of the ancient Egyptians and Ethiopians, whose descent is involved in the greatest uncertainty, almost all the civilization that exists in Africa seems to be of foreign origin. The introduction of Mohammedanism, though in a debased form, has, as previously stated, gone far to banish cannibalism from many countries; and some of them have also adopted the letters and literature of Arabia. But the progress they have hitherto made is not such as to lead to any very sanguine anticipations as to their future advancement; and it would not, indeed, be very philosophical to suppose that those who have been wholly unable to produce anything original should attain to much eminence in the practice of foreign arts and sciences.

It is unnecessary to enter into any examination of the vexata quæstio whether the varieties of the human race in Africa originally sprung from different sources, or whether they all belong to the same stock, but changed to the state in which we find them by the influence of circumstances in the lapse of ages. Whatever conclusion may be come to on this point cannot in anywise affect the question as to the comparative intelligence of the African people. The same circumstances that are supposed by those who contend for the original identity of the races to have so greatly affected their appearance and physical capacities, could hardly fail to have an equally powerful influence over their mental faculties. This in fact is substantially admitted by Dr. Pritchard, who has ably contended for their common origin, and the equality of their intellect with that of the other races. "The tribes," says he, "in whose prevalent conformation the negro type is discernible in an exaggerated degree, are uniformly in the lowest stage of human society; they are either ferocious savages, or stupid, sensual, and indolent. Such are the Papæ, Bulloms, and other rude hordes on the coast of western Guinea, and many tribes near the slave coast, and in the Bight of Benin; countries where the slave trade has been carried on to the greatest extent, and has exercised its usually baneful influence. On the other hand, wherever we hear of a Negro state, the inhabitants of which have attained any considerable degree of improvement in their social condition, we constantly find that their physical characters deviate considerably from the strongly-marked or exaggerated type of the Negro. The Ashantee, the Sulema, the Dahomans, are exemplifications of this remark. The Negroes of Guber and Hausa, where a considerable degree of civilisation has long existed, are, perhaps, the finest race of genuine Negroes in the whole continent, unless the Jolofs are to be excepted. The Jolofs have been a comparatively civilized people from the era of their first discovery by the Portuguese."—(*Researches into the History of Man*, ii., p. 338, 3d ed.)

Here we have it distinctly laid down that the existence of the distinguishing features of the Negro race, in a strongly-marked degree, is uniformly associated with the lowest

## AFRICA.

state of barbarism; and that as they recede from this strongly-marked type, we find a greater degree of civilization and improvement. The inevitable conclusion is, that every variety of the Negro type, which comprises the inhabitants of almost all central Africa, is indicative of mental inferiority; and that ferocity and stupidity are the characteristics of those tribes in which the peculiar Negro features are found most developed. We believe that this is a perfectly correct statement; and we do not know that anything that can be said could show more conclusively the radical inferiority of the great bulk of the African people.

But we do not form our opinion as to their inferiority on their configuration and appearance, but on the fact, that while numberless European and Asiatic nations have attained to a high state of civilization, they continue, with few exceptions, in nearly primeval barbarism. It is in vain to pretend that this is the result of the unfavourable circumstances under which they have been placed. An intelligent, enterprising people contend against unfavourable circumstances, and make them become favourable. But the Africans, with the questionable exception of the ancient inhabitants of the valley of the Nile, have never discovered any considerable degree of enterprise or invention, or any wish to distinguish themselves either in arts or arms. From the remotest antiquity down to the present day they have been hewers of wood and drawers of water for others, and have made little or no progress; and the only legitimate inference from this lengthened induction seems to be, that they are incapable of making it; that civilization will not spring up spontaneously among them; and that if ever it grow up, it must be introduced from abroad, and fostered and matured under foreign auspices.

**XIII. Divisions.**—Africa has been variously divided, according as one standard or another has been adopted. Owing to the barbarism of the people, our ignorance of the different states into which the continent is divided, and the revolutions to which they are perpetually subject, any distribution of the country founded on its political divisions would be almost impossible; and, however accurate at the time, would speedily become quite obsolete. A better method would be to distribute it according to the races of people by which it is principally occupied; but as these are in parts very much blended, and it is sometimes no easy matter to say which predominates, it seems, on the whole, the better way to distribute it according to the great natural features of the country. On this principle, Africa may be distributed as follows, beginning with the North:

1. *The Barbary States*, including the whole country N. of the desert of Sahara, and W. of the 25th degree of E. long.
2. *Sahara*, or the Great Desert.
3. *The Region of the Nile*, including Egypt, Nubia, Abyssinia, Sennar, Kordofan, and all the country drained by its affluents.
4. *Nigritia*, which may be subdivided as follows, viz.:
  - a. *Soudan*, or N. Nigritia, being the country to the S. of the Sahara and N. of the Kong mountains, watered by the Senegal, Gambia, Niger, and the rivers flowing into the great lake of Tchad.
  - b. *Central Nigritia*, being the region between the Kong mountains and the N. shore of the gulf of Guinea to the Right of Biafra.
  - c. *Southern Nigritia*, including the countries from the Right of Biafra along the coast to cape Negro, and inwards to the sources of the rivers flowing through it to the coast.
5. *Southern Africa*, or the region S. of cape Negro on the W., and of the Zambesi river on the E.
6. *Eastern Africa*, or the region N. of Zambesi river, round by the sea coast to the confines of Abyssinia and the Gebel-el-Komri, or Mountains of the Moon.
7. *The islands of Africa*, including the Madeira, Canary, and Cape de Verde islands on the W. coast, with those of St. Helena, Ascension, &c.; and on the E. coast the great island of Madagascar, the Isles of France and Mauritius, Socotra, &c.

**XIII. Progress of Discovery.**—Africa, among the quarters of the globe, has always been the chief object of curiosity and discovery. Her Mediterranean coast, indeed, was well known to the ancients, and included in their circle of civilized states. But her eastern and western limits, stretching on an indefinite extent southward, long baffled the attempts to reach their termination and that of the Continent; while immense deserts barred the access into the interior. A peculiar difficulty was also found in tracing the source, and sometimes the termination, of the mighty rivers by which its inland regions are watered.

Tyre, the earliest seat of a flourishing commerce, might be expected to seek a route to the distant parts of Africa. In the curious account given by Ezekiel, Tarshish is mentioned as both the most remote and most important place with which she trafficked. The learned, however, have

been much divided respecting its site; but the Tarshish to which the Tyrians sailed down the Mediterranean, whence they imported iron, silver, lead, and tin, the products of Spain and Britain, was most probably either Carthage, or the S. part of Spain. Carthage made violent efforts to prevent other commercial powers from penetrating beyond Sicily, thus seeking to monopolize the exclusive trade of the remoter countries, of whose products her merchants would, of course, keep an assortment.

Mention, however, is made of another route to Tarshish, by the Red Sea, which has singularly perplexed geographers. It was opened by Solomon, during the most prosperous period of the kingdom of Judaea, and aided by an alliance with Hiram, king of Tyre. To reconcile these two voyages, M. Gosselin supposes the term to mean "the ocean," as distinguished from inland seas or gulfs: so that one voyage was to the Atlantic, the other to the Indian ocean. But all the modes in which Tarshish is mentioned—the fare of a vessel thither, its merchants, its kings—seem inconsistent with so very vague a sense; nor does there appear any room to think the Jews ever viewed the Mediterranean as an inclosed sea. We are disposed, therefore, to prefer the suggestion of Mr. Murray, in the *Encyclopedia of Geography*, that the Tyrians gave the name of Tarshish to the whole continent, of which it formed for them the most important part. Tarshish, in this larger sense, becomes nearly synonymous with Africa; the one voyage was along its northern, the other along its eastern coast.

Ophir is another country much celebrated in the Jewish scriptures, particularly for its gold. Many learned men have sought it in India, though gold was not then an article of export from that country, but the contrary; and no one staple of Indian trade is mentioned as brought from Ophir. Indeed its position seems clearly fixed, when we find the Red Sea voyage to Tarshish described elsewhere as one to Ophir. The latter, then, was on the eastern coast of Africa, where gold is nowhere found north of the Zambesi. Here, accordingly, we find Sofala, long the chief emporium of that river; and it may be observed that Ophir is called in the Septuagint Scopheira, while the modern Arab term is indifferently Zofar or Zofot.

This intercourse did not survive Solomon, whose successors, weakened by the division of the kingdoms, were unable to maintain it.

Our next information is derived from Herodotus, who, during his residence in Egypt, made very careful inquiries of the priests and learned men. He gives a very curious report of no less an exploit than the entire circumnavigation of Africa. Necho, one of the greatest Egyptian princes, engaged for this purpose Phœnician mariners, who descended the Red Sea, and having reached the ocean, landed, sowed a crop, reaped it, and renewed their voyage. Thus they proceeded for two years, and in the third entered the Pillars of Hercules. They remarked that, in rounding Africa, they had the sun on the right, that is, on the south, which must have been correct. This brief relation has given rise to a mass of controversy, greater, perhaps, than the slight narrative can well support. The curious reader may consult Rennell in favour, Gosselin against it.\* On the whole, we are disposed to conclude in favour of its authenticity. The time is adequate; and, as Rennell observes, the flat-bottomed vessels of the ancients, keeping always close to the shore, might avoid dangers that arrested larger ships in the open sea. That the event should be afterward forgotten or discredited, would be only a common occurrence in those early periods, when knowledge was very little diffused.

Herodotus has given a detailed account of the wild and wandering tribes behind the Atlas ridge, extending to and somewhat beyond Fezzan. He adds an interesting narrative of an expedition to explore the interior, undertaken by some youths from the country of the Nasamones lying inland from Cyrene. They passed, first, a verdant and cultivated territory; then a wild region filled with wild beasts; next entered into an arid, dreary desert. Here, while plucking some wild fruits, a party of black men surprised and carried them along vast marshes and lakes to a city situated on a river flowing eastward. These last features, after they were within the desert, could not be found short of central Africa; but it is doubtful whether they refer to Timbuctoo and the Niger, as supposed by Rennell and Heeren, or to the lake Tchad, and the Yeou or river of Bornou.

Another singular circumstance mentioned by Herodotus relates to a traffic for gold carried on by the Carthaginians with a people beyond the straits, and managed in a peculiar manner, without the parties seeing each other. There is no gold in Africa north of the Senegal or Niger; but whether the Carthaginians penetrated thither, or the gold was brought by natives across the desert, there seem no means of certainly determining.

\* Herodotus, iv. 42. Gosselin, *Géographie des Anciens*, t. 1, 192-218.  
Rennell, *Geog. Herodotus*, s. 24, 65. Herodotus, lib. ii., 32.

## AFRICA

The records of Carthage, which would have thrown so much light on ancient commerce and geographical knowledge, have unfortunately perished. There remains only one valuable document, the narrative of a voyage by a commander named Hanno, sent to found colonies on the western coast, and to push discovery as far as possible. He is said to have carried with him sixty vessels, and no less than 30,000 men, women, and children. After passing the straits, he founded successively four colonies in convenient situations, then sailing three days along a desert coast, came to Oerne, a small island in a bay. In its vicinity he visited a lake through which flowed a large river; and another stream full of crocodiles and hippopotami. Then, returning to Oerne, he sailed twelve days along the coast of the Ethiopiæ, a timid race, who fled at the approach of strangers. His party then reached and sailed for several days along a coast, where they observed many striking objects. In one place the earth was so hot that it could not be trodden; torrents of flame were seen to roll along it and rush into the sea. During the day there appeared only a vast forest; but in the night, the air was filled with the sound of musical instruments and of human voices. Landing on an island, they found a singular race of beings, in human shape, but with rough skins, leaping from rock to rock with preternatural agility. Towards the close of their voyage, there appeared a very lofty mountain, seeming to reach the skies, called the Chariot of the Gods.

This voyage has been the subject of elaborate dissertation by learned men, who have differed very widely as to its extent. Bosgawinville carries it to Cape Three Points on the Gold coast, Rennell to Sierra Leone; while Gosselin restricts it to the river Nun in Morocco. The first space exceeds 3000 miles; the latter falls short of 700. The difficulties are very great; not a single name coincides; the descriptive features are too slight to fix any one spot with precision. The period, estimated only at thirty-eight days, seems scarcely adequate to so long a voyage of discovery along an unknown coast. Yet the aspect of man and nature; the Ethiopians or black races; the garilla, evidently large apes, whose form resembled the human; the great rivers, full of crocodiles and hippopotami; the conflagration, apparently occasioned by the still prevalent custom of burning the grass at a certain season;—all these strikingly suggest, and gaily in the night—almost irresistibly suggest, tropical Africa. Gosselin indeed maintains that the coast of Morocco, in its then comparatively rude state, would much more than now resemble the Negro countries; but this seems scarcely to account for all the above particulars.\*

The Persians, who entertained an almost superstitious dread of the sea, were little likely to extend maritime knowledge. Yet Xerxes showed some interest in the subject. Having condemned to death Sataspes, a Persian nobleman, he was persuaded to commute the sentence to that of circumnavigating Africa. Sataspes passed the straits, but soon terrified by the stormy ocean and rocky shores, he returned, and declared to his sovereign that the vessel had stopped of itself, and could not be got forward. The monarch indignantly rejected this apology, and ordered the original sentence to be executed.<sup>1</sup> The attempt was not renewed; and under this empire, the knowledge of Africa seems to have on the whole retrograded. When Alexander sent an expedition down the Persian gulf to seek its way into the Red Sea, it returned without success; whence the inference was made that no communication existed.

Under the Ptolemies, though they were an enterprising dynasty, and a learned school of geography was then formed, little progress was made. The prevailing hypothesis of an uninhabited torrid zone at once indicated the limited amount of knowledge, and tended to perpetuate it. The map of Eratosthenes makes Africa an irregular trapezium, of which the N. and S. sides were nearly parallel, and the whole terminated N. of the equator. The coasts beyond the Straits of Gibraltar and cape Gardafui, being observed on both sides to converge, were supposed to continue in that direction and meet. A navigator named Eudoxus, partly aided by Ptolemy Evergetes and by the merchants of Cadiz, made several spirited attempts to perform this voyage, of which he did not suspect the extent; but he returned always without success.

The Romans did not much advance the knowledge of interior Africa. Mela, without any additional information, adopts the system of Eratosthenes, with some fanciful additions. Pliny, however, had access to all the information collected by the Roman chiefs and commanders. Scipio had sent Polybius, to explore the western coast, which was surveyed by that officer for about 800 miles, consequently not beyond the limits of Morocco. Suetonius Paulinus had

penetrated into the regions of Asia, describing its lofty and rugged steeps richly clothed with forests. Under Vespasian, Cornelius Balbus made an expedition into the desert, receiving the submission of Cydamus (Gadames), and Gerama (Germa), but we can scarcely identify Boin with Bornou.<sup>4</sup>

Alexandria meantime, under the impulse given by the luxurious consumption of Rome, acquired a great extension of commerce. She opened a regular communication with India, and also to a considerable extent along the eastern coast of Africa. Both are described in an important commercial work written in the first century, called the *Periplus of the Erythræan Sea*. The African coast terminates at Rhapta, a promontory and flourishing port, the position of which, however, from the usual sources of changed names and vague descriptions, is open to controversy. Vincent fixes it at Quiloa, while Gosselin makes it Magadore, not quite a third part of the distance from the ascertained point of cape Arromata (Gardafui). But the former has one conspicuous feature; five successive large estuaries, which Gosselin owns himself unable to find within its limits, but which actually occur a little north of Quiloa, in the mouths of the great river Quillimanchi. There seems little room to hesitate, therefore, in fixing Rhapta at Quiloa. The gold of the Zambesi had not reached this port, the exports from which consisted only of ivory, tortoise-shell, and slaves.

About a century after Ptolemy published his geographical work, the most complete of any in ancient times. On the eastern coast he adds to that described in the Periplus an additional range, stretching south-east from Rhapta to another promontory and port called Prassum; considerably south-east from which lay a large island, Menuthius, evidently Madagascar. According to Gomela, Prassus is Brava, while Vincent makes it Moambique; but the southeasterly direction of the coast seems to limit it to cape Delgado. This too would harmonize with Ptolemy's singular theory of a great austral continent extending from Prassus to the coast of the Sine (China), thus making the Indian ocean an immense inland sea.

In regard to the W. boundary, Ptolomy's ideas seem by no means very precise. His graduation shows an extent of coast which would reach far into tropical Africa; yet the Canaries are placed opposite to his most southern limit, which would thus seem to have scarcely reached beyond Morocco. Gosselin accuses him of having employed the materials afforded by three different voyages along the same line of coast, supposing them to apply to separate and more distant parts, thereby troubling the extent; but he must have been in error in this, as the eminent geographer an error so flagrant.

On the side of central Africa, Ptolemy delineates a very extensive region, reaching far south, which he names Interior Libya. It contains two spacious lakes, the Libyan and the Nigritian, receiving the great rivers Nile and Niger, derived from chains of lofty mountains. A number of cities are inserted which cannot be recognised by modern names. But the remarkable circumstance is, that these objects appear contiguous to, and even connected with others, that undoubtedly belong to northern Africa. Hence Gould and another writers conclude that his interior Libya was not central Africa, but merely the region along the northern borders of the desert. We must observe, however, that the former, as described as a region of mountain, river, and lake, all of a great scale, bears very little resemblance to the desert border of northern Africa. Our impression is that Ptolemy, receiving his intelligence from caravans coming E. from Bornu to the Nile, not from those crossing the great desert, was ignorant of the extent of the latter, and consequently, of the interval separating northern from central Africa; and that he hence supposed and delineated the two as almost in contact. Yet this geographer had received intelligence of two marches, one by Julius Maternus from Cyrene, the other by Septimius Flaccus from Garama, who during periods respectively of three and four months, had penetrated into the country of the Ethiopians. Ptolemy scarcely gives credit to reports of such an extent; but he lays down Agyalimba (perhaps Agadiz), into which they penetrated, as the most southerly known region. As it contains neither rivers nor lakes, it cannot be central Africa; but if, in the manner above supposed, he was ignorant how far south that region lay, the length of the marches would necessarily oblige him to extract Agyalimba beyond it.

In the seventh century a grand revolution changed the face of the world. The followers of Mohammed, inspired by fanatical zeal, issued forth from Arabia, and not only shook the Roman empire, but spread their conquests and settlements over countries never visited by the Roman arms.

## AFRICA.

To Africa particularly they gave an entirely new face. Along its Mediterranean coast, they established several flourishing and civilized kingdoms. Their wandering habits, and the use of the camel, an animal expressly formed for sandy deserts, enabled them to overcome obstacles that baffled the Romans. The Sahara, across which no regular route appears to have been known to the ancients, was penetrated by them in different directions. Their dispersion was aided by the great schism between the dynasties of the Abbasides and Omniades. The vanquished party, in large bodies, crossed the desert, and formed settlements, where, under the title of Fellates or Foulahs, they still exist as a race entirely distinct from the Negroes. Their possessions extended along a great river called by them the Nile of the Negroes, which, however, was not, as long supposed, our Niger, but a tributary flowing into it from the east, termed by Clapperton the Quarrans or Zimbe. Ghana, the modern Kano, was then the chief seat both of empire and commerce. The sovereign displayed a pomp unrivalled in Africa, having his throne adorned with a mass of pure gold, indicating the commerce by which the city was enriched. This gold was found in a country to the south, called Wangara, intersected by numerous branches of the Nile, and where the metal was extracted from alluvial earth. There is evidently some confusion here, as gold, in alluvial deposits, is only found in countries far to the west: the error probably arising from the channel by which it was brought. Farther east, on the Nile of the Negroes, Edrial represents Berbera and Tirka, which seem to have been recognised by Clapperton in Berabese and Grikwa, still considerable towns. Farther in that direction, Kuku, a great and flourishing kingdom, is evidently Bornu, the capital of which still bears that name; while Kungah, twenty days to the south, and distinguished by its arts and industry, appears pretty clearly to be the Loggum of Denham. Returning to Ghana, and proceeding down the river, we are conducted to Touru, an inferior, yet large and powerful kingdom. It appears evidently to be Socotran, which, in a document quoted by Clapperton, is even called Takur. Sals, two days' journey lower, cannot now be identified. Farther west, the knowledge of the Arabians became most imperfect. They considered the ocean as only 500 miles beyond Touru, when it is nearly 2000. They notice in that direction the island of Uhl, at the mouth of the great river, whence all the countries on its banks were supplied with salt. This was pretty evidently suggested by Walat, the great mart for the salt of the northern desert; and its being reached across the great lake Dillie might attach to it the idea of an island.\*

About four centuries after Edrial, central Africa was visited and described by Leo, a Moslem Spaniard, who was even surnamed Africanus.† A great change had now taken place, Timbuctoo having risen to be the most powerful city, the chief seat of commerce and splendour, the mart for gold. The neighbouring states, including even Ghana, called now Kano, had become its tributaries. This writer mentions Berbera under that name, and adds for the first time other states that still subsist—Camina, Guber, Zepzog, and Zanfara. Eyro, under the name of Gago, is justly described as a large and fine kingdom, 400 miles north-east of Timbuctoo. In a western direction, Ghinos or Gheneos, distinguished for its great commerce, is the Jenné of Park. Thus all this part of the continent had assumed nearly the shape which it has ever since retained.

Soon after began that grand career of maritime enterprise, which terminated in the circumnavigation of the African continent and the discovery of a passage to India. It was carried on entirely by the Portuguese, and proceeded by gradual steps, from the rounding of Cape Bojador in 1483 by Giliazee, to the memorable passage of the Cape of Good Hope, in 1497, by Vasco de Gama. During this long period, at every successive point, vigorous efforts were made to penetrate into the interior. These were inspired, not only by the report of gold mines and other objects of commerce, but still more by the hope of reaching the court of a mysterious personage named Prestor John. This name appears to have originated in reports brought by Rubruque and other early travellers of a ruling Nestorian bishop in central Africa. When, however, notices arrived of a Christian prince in Abyssinia, the name Prestor John settled down upon him; and, ignorant of the breadth of the Continent, they supposed that, at no very great distance from the western coast, his dominions might be found. The commanders were therefore instructed on every new discovery to make their first inquiry concerning Prestor John; and though total ignorance was everywhere professed, they persevered, and really appear to have sent embassies even to Timbuctoo. Di Barros has given a pretty correct account of the position of

that city, and of Gonnai (Jonné), its rival. The English and French found a considerable Portuguese population on the Senegal and Gambia, and many words of that language current among the people of Bambock. Yet nothing was done to correct the Arabian idea of the Niger rolling westward into the ocean; and the Senegal was, therefore, considered as forming its lower course, though Di Barros expresses wonder that after passing through so many regions, it should not have rolled a greater body of waters.

The Portuguese formed leading settlements at Elmina on the Gold coast, and at the mouth of the river Formosa, which has now proved to be that of the Niger. They learned that the rulers here, on their accession, were accustomed to send ambassadors about 250 leagues into the interior to the court of a prince named Agané, from whom, as from a superior lord, certain symbols were received, which formed the prince's investiture. This potentate, during the interview, was screened from view by a silk curtain, and only at the close his foot was put forth, to which they did homage.‡ Major Rennell, with seeming reason, presumes this to be the king of Ghana; and in the maps of the sixteenth and seventeenth centuries there appears a very large lake named Guardia, which, from the site and a rude resemblance of name, we suspect to be the Tshad; but D'Alvill, finding no authority in its support, expunged it. The Portuguese also formed considerable settlements on the coast of Congo, which to a certain extent they still retain; and their missionaries penetrated to some distance inland. After passing the cape, and on the way to India, they sailed along nearly the whole of the eastern coast as far as Melinda and Mombasa. The king of Portugal had previously sent out two envoys, Govilliam and De Payva, to reach India by way of the Red Sea. Their notices and observations, coupled with those of the circumnavigators, first conveyed to Europe a full view of the outline and circuit of this vast continent.

Govilliam, in returning, settled in Abyssinia, and transmitted such accounts as induced his sovereign to send thither a succession of missionaries, through whom copious accounts were received of that remarkable country, scarcely as all known to the ancients. They did not, however, carry discovery far into the interior of the continent; and indeed such ignorance prevailed on the subject, that in the maps of the seventeenth century Abyssinia and Congo are brought nearly into contact, while the Nile rises almost in the vicinity of the cape of Good Hope.

In Europe meantime a growing interest was excited respecting the course of the Niger, the country of gold, and the trade of Timbuctoo. It was heightened by the conquest of that city by the emperor of Morocco in the end of the sixteenth century.† In 1618, an English company was formed for the purpose of penetrating thither, by ascending the Gambia, supposed one of the mouths of the Niger. They sent out Captain Thompson, who, leaving his vessel at Kassar, went in a boat to Tenda, which no European had yet reached; but he was killed in a contest with the natives, another body of whom, instigated by the Portuguese, attacked and massacred most of the men in the vessel. Another crew, sent to reinforce him, fell almost all victims to the climate. In 1630, Captain Richard Jobson came out with a larger armament, and, undismayed by these evil tidings, made his way considerably higher than his predecessors. He even supposed, on erroneous information, that he was near Timbuctoo, and returned with the intention of actively resuming his researches, but was prevented by a quarrel with the merchants, who lost courage, and dropped the undertaking.‡

A century elapsed without further effort, till the Duke of Chandos, director of the African Company, entertained the idea of enlarging its scanty profits by opening a communication with the country of gold. He sent out, in 1723, Captain Bartholomew Sibbs, who, having procured canoes, pushed vigorously up the river. On passing the falls of Barraconda, however, the stream became in many places so extremely shallow, that even his little boats could scarcely be dragged upward. He was finally obliged to stop nearly at the point which Jobson had already reached. His information led him to conclude that "the original or head of the river Niger is nothing near so far in the country as by the geographers has been represented." The Gambia, at a little distance upward, was described as dwindling into a mere rivulet. It had no communication with the Senegal, or with any lake. He nowhere heard the Niger named, and had great doubts if such a river existed. Moore, a zealous agent of the company, strenuously repelled this conclusion, and endeavoured to overwhelm him by quoting Pliny, Ptolemy, Leo, and other high authorities; but Sibbs, though unable to meet him on this ground, continued not the less steadily to affirm what he had seen with his own eyes.§ In fact, notwith-

## AFRICA.

standing one or two other attempts, the English made no further discoveries in this quarter, nor obtained any intelligence of the real Niger.

The French meantime were making greater exertions on the Senegal, which they early chose as their place of settlement. About 1630, a commercial intercourse had been opened by some merchants of Rouen and Dieppe, without any settlement, the crews merely erecting temporary huts during their stay.\* They were obliged, however, in 1664, to give way to the great West India Company, whose privilege included also western Africa. In nine years, however, it fell; and on its ruins was erected a second, succeeded by a third, fourth, and fifth, which last was merged in the Mississippi scheme. These, like similar mercantile associations, were all disastrous; but each had its interval of activity, during which a good deal was done to extend discovery and trade. The chief efforts were made by the Sieur Brue, appointed governor in 1697. From Port St. Louis, where a settlement was now formed, he immediately sailed up the river, with a view to adjust some differences with the Siratik or king of the Foulahs, and open a trade with its upper regions. He succeeded in his negotiations, and had hoped to reach Gallam, but was obliged to stop at Goree, where he erected a fort. In 1698 he reached Gallam, and arrived at the rock of Felu, which stops the navigation for large barks. At Dramanet he fired on a position for a fort, which was soon after erected under the name of St. Joseph, and became the centre of French interior trade. Through the exertions of one Compagnon, he acquired a full account of Bambouk, and its gold mines, the most productive in Africa. He laid before the company a plan for conquering the country, which he undertook to effect with 1900 men, but could neither obtain the requisite authority nor means. He made diligent inquiries respecting the regions beyond, and obtained pretty distinct accounts of Bambarra, the lake Maberia (Dibbie), and Timbuctoo. Respecting the Niger, two opposite statements were made. According to one, it flowed westward, and divided into the three branches of the Gambia, the Faleme, and the Senegal; while others asserted its course to be eastward. The former continued to be the popular belief; but D'Anville, who bestowed much attention on the subject, and had access to the best documents, became convinced that there was a great river quite distinct from the Senegal, which flowed eastward, and was the one that passed by Timbuctoo. Upon this principle he formed his map of Africa, a wonderful effort of sagacity and ability, and which, in fact, is still tolerably correct as to a great part of that continent.† By restricting Abyssinia and Congo to their true limits, and obliterating imaginary features, this great geographer first exhibited that vast interior blank which so strongly excited the curiosity and enterprise of Europe.

The spirit of African discovery slumbered in Britain till 1788, when it burst forth with an ardour which led to the most splendid results. In that year was formed the African Association, composed of a number of distinguished individuals, among whom Sir Joseph Banks and Mr. Beaufort took the lead. Leyard was sent to penetrate by way of Egypt, and Lucas by that of Tripoli. The former, who, with an iron frame, had travelled great part of the world on foot, excited great expectations; but unhappily a fever carried him off before leaving Cairo. Mr. Lucas, long vice-consul at Morocco, had the advantage of understanding perfectly the African languages. He found no difficulty in obtaining the concurrence of the Pacha of Tripoli; and had set out for Fezzan, but was arrested by an insurrection among the Arab tribes. Valuable information, however, was obtained from several intelligent natives, confirmed by the testimony of Ben Ali, a merchant, who happened to be in London, and had travelled far into the interior. From these sources pretty copious accounts were received respecting the great countries of Bornou and Camina, the latter of which had become the chief among the states of Houssa. The informants described also a great caravan route across the continent, from Tripoli to Asiente or Ashantee, behind the Gold coast. In this course it crossed the great central river, described, however, as flowing to the westward. It was, in fact, the Arabian Nile of the Negroes, the Quarrum of Clapperton, which in that direction proceeded to the main river, of which it is only a tributary. Rennell, having these materials put into his hands, and not being aware of any central river but one, reversed the direction given by D'Anville to the Niger, making it flow westward to the ocean by the channel of the Senegal. At the same time Bornou, understood to be described as bordering on Nubia, was carried far to the north and east of its real position, and the bordering countries displaced in consequence; so that this map, though ably drawn up,

formed decidedly a retrograde step in African geography.\*

The Association now turned their attention to W. Africa, and engaged Major Houghton, for some time consul at Morocco, to proceed from the Gambia. He went on foot, imprudently loaded with a quantity of valuable articles. He passed unmolested through Medina and Bamboek; but on reaching the territory of the Moors, he was abducted by that people into the desert, where he was either killed or abandoned to perish.†

On receiving this intelligence, the Association lost no time in seeking a substitute, and were fortunate enough to engage Mr. Mungo Park. That gentleman, in December, 1795, set out from the Gambia, and passed through Medina, Bondou, Gellam, Kasson, and Kasarta. Having suffered on the way severe spoliation, he was seized and detained long in captivity by the Moors of Ludamar. He contrived to escape, and, though in extreme distress, made his way through the kingdom of Bambarra to Segou, its capital. This formed a crisis in African geography, for he there saw "the long-sought majestic Niger, glittering in the morning sun, as broad as the Thames at Westminster, and flowing slowly to the eastward." The extent of the city, its crowded population, and the numerous canoes on the river, presented altogether a scene little expected in the heart of Africa. Mr. Park penetrated down the Niger as far as Silla, but his destitute condition, and the formidable accounts of the bigotry prevailing at Jenné and Timbuctoo, deterred him from proceeding farther.

This traveller's arrival in England in December, 1797, with accounts of such important discoveries, raised higher than ever the enthusiasm for African discovery. He retired into private life; but the Association obtained the services of Hornemann, a German, who possessed many requisites of a traveller. He went by way of Egypt to Fezzan, thence into central Africa, and appears to have penetrated by way of Cashna to Nyffe on the Niger, where he fell a victim to the climate. The same fate befel Mr. Nicholls, who attempted to reach the Niger by way of the gulf of Benue. Some years before, Mr. Browne, an enterprising individual, by his own resources had penetrated by way of Egypt into the interior country of Darfour, about midway between Abyssinia and Bornou. He obtained there some important detailed notices respecting the neighbouring nations, and the origin of the White river, or main branch of the Nile, said to rise in the mountainous territory of Donga.

Meantime Park's mind was intensely bent on Africa; and through his acquaintance with Mr. Maxwell, who had commanded a vessel employed in the Zaire or Congo, he became persuaded that that river was the termination of the Niger. Being invited by government to lead an expedition on a large scale, he readily accepted it, and his arrangements were adjusted with a view to his hypothesis. On the 4th of May, 1805, he departed from the Gambia, with a well-appointed party of upwards of forty; but the harassing attacks of the natives, with the pestilential influence of the rainy season, reduced them to seven before they reached the Niger. He proceeded downward, however, and at Samanding obtained materials for constructing a schooner forty feet long, which he named the *Joliba*; and on the 17th November, 1805, set sail to explore the mysteries of interior Africa. It appears that he passed Timbuctoo, and made his way down the river to Boussa, where the king of Yendi, indignant at having received no presents, pursued with a large body of men, and attacked him in a narrow and rocky channel. Park and his companions, unable to resist, threw themselves into the water, attempting to reach the shore, but were drowned. His papers are reported to be still in the king's possession, having never been recovered.

A German named Roentgen attempted to penetrate by way of Morocco, and set out in 1800 from Mogadore; but he appears to have been murdered by his guides. Some intelligence was gleaned from Adams and Eiley, two Americans, who were successively shipwrecked on the coast of Sahara; but much uncertainty attaches to their statements. In 1800, the Association engaged the services of the celebrated Burkhardt, who undertook to accompany the interior caravan from Cairo. While preparing himself for the expedition, he made excursions through Nubia, and also through Syria and Arabia, his observations on which have been published, and are extremely valuable. In 1817, however, when about to set out on his main destination, he fell a victim to dysentery.

The public mind continued to be intently fixed on African discovery; partly from a wish to learn the real state of countries so difficult to explore and so different from those of the temperate zone, and partly, and perhaps principally, from absurdly exaggerated ideas as to the value of the commerce that might be carried on with the natives. At length government, on the suggestion of Sir John Barrow,

## AFRICA.

determined to make a more extensive effort than ever. Following up the hypothesis of the identity of the Niger and Congo, two expeditions were prepared; one to ascend the latter river, another to descend the former. Captain Tuckey, who commanded the first, sailed from England in February, 1816, and arrived in June at the mouth of the Congo. The party proceeded for some time with great spirit; but being obliged by the catarrhs to leave their boats, and proceed on foot through a rugged country affording little shelter, they became exposed to the baneful influence of the climate. Severe sickness soon assailing the whole party, obliged them to stop short, and ultimately proved fatal to all the officers, including the commander. The other expedition, destined to go down the Niger, was commanded by Major Poddie, who endeavoured to reach the interior through the country of the Foulahs. Having died before the march began, he was succeeded by Captain Campbell, who reached the Foulah frontier; but the sovereign, jealous of their designs, detained them under various pretexts, till exhausted supplies and general sickness obliged them to return. Immediately after Captain Campbell died, and his fate was shared by Lieutenant Skoko, just as he had planned a new expedition. Captain Gray of the Royal African Corps penetrated by another route Gailam, but could not obtain permission to proceed through Bambarra.

All this series of disaster did not shake the perseverance of the British government. A new opening was afforded through the Facha of Tripoli, who, inspired with a desire of improvement new in this quarter of the world, cultivated European connexion, and, through the judicious conduct of consul Warrington, was rendered friendly to Britain. Holding Fezzan tributary, and having a commanding influence over the central states, he could secure the safe passage of a traveller through a great part of Africa. Under his auspices, in 1819, Mr. Ritchie and Lieutenant Lyon reached Fezzan; but through the climate, and the treacherous ill treatment of the sultan, they incurred such severe illnesses as proved fatal to the former, and obliged the latter to return.

This failure did not prevent the speedy formation of another expedition, for which a more fortunate destiny was reserved. Its chiefs, Major Denham, Lieutenant Clapperton, and Dr. Oudney, arrived at Tripoli in November, 1821. Next spring they proceeded to Fezzan; but through the neglect of the sultan were unable to procure camels, which obliged Denham to return to Tripoli. Here he received assurances of protection from Boo Khaloon, a great Arab slave-merchant, who was setting out for the very countries which he sought to explore. Under his guidance, the party, in the end of 1822, began their route through the great desert, passing between the territories of the two remarkable native tribes, the Tuareks and the Tibboos. They then travelled for a fortnight amid hills of moving sand, without the slightest vestige of life or vegetation. Soon after they entered Kanem, the northern provinces of Bornou. At Lari they came in view of lake Tchad, the great interior sea of Africa, 900 miles long, receiving two great rivers, and containing numerous islands. In proceeding along its eastern shore they visited most parts of Bornou and its chief cities of Kouka (Kuku of Edrie), New Biele, and Angorou. This kingdom, once the most powerful in central Africa, had about thirty years before been conquered and dreadfully ravaged by the Fellatas from Houssa; but a private individual, by valour and ability, had reasserted its independence and driven out the enemy. That person, under the title of Sheik, exercised all the real power, while he suffered the legitimate king to reign in empty pomp. Major Denham also visited the smaller kingdom of Mandara, bounded by an almost interminable range of mountains filled with savage tribes, who are hunted down for slaves. In Logrun, situated along the great river Shary, which falls into the Tchad, he found a people more ingenious and industrious than those of Bornou.

Meantime Clapperton and Oudney were making an expedition through Houssa, the most interesting region of central Africa. It was found inhabited by the Fellatas, a people having nothing of the Negro features, but apparently descended from the great body of Moslem Arabs, who had migrated many centuries ago. They were quite superior to the Bornouese both in aspect and character, cultivating the land with greater skill and diligence, and manufacturing very fine cottons. The sway of Ghana, and even of Camina, had been transferred to Sackatoo (Tocrur), the sultan of which, about the beginning of the present century, overran all Houssa, and for some time occupied Bornou. Ghana, however, under the name of Kano, was found great in its decay, and still the chief seat of commerce. The transactions were extensive and well arranged; but slaves were the staple commodity. Sackatoo was found considerably larger than Kano, and the traveller was hospitably received by sultan Bello. The river Quarrema was observed traversing this country, and flowing westward into the Niger, which,

at the nearest point to Sackatoo, had a southward course; but accounts varied, whether continuing in that direction it reached the sea, or making a great circuit emptied itself into the lake Tchad. The traveller, having in vain solicited the means of proceeding to the river and the coast, returned to Bornou by a new route, which enabled him to see Cassina, a capital now greatly decayed. Dr. Oudney died early on this journey.

The British government determined to follow up these extensive and important discoveries. Clapperton was employed to land on the coast of Guinea, thence to penetrate to Sackatoo, and on his way explore the termination of the Niger. Instead of attempting to ascend the river of Benin, he was advised to proceed by land from Badagry; but from imprudent exposure to the climate two companions died, and he became sickly. He soon, however, reached the Yarriba, or Kingdom of Ewe, which he found populous and flourishing; and the natives, not imbued with Mohammedan bigotry, courteously received him. In traversing it he crossed the chain of the Kong mountains, peopled to the summit. Leaving Yarriba, and passing through the large cities of Klama and Wawa, he reached Boussa on the Niger, where he received a confirmation of Park's death, and even an invitation from the king of Youri, who promised to give him that traveller's books and papers; but this visit was delayed till he should return from Sackatoo. On his way thither he passed through Nyffe, a highly improved territory, though dreadfully laid waste by the Fellatas; and through Zegze, also very populous and well cultivated. At Sackatoo, or Soccatoo, an expedition against the rebel territory of Goobar enabled him to procure farther information. The sultan, however, prepossessed with groundless jealousies, treated him with a harshness, which, with previous sickness, brought this spirited traveller to a premature grave. His servant, Lander, after doing the last duties, conceived the plan of himself exploring the termination of the Niger, but was forcibly prevented.

The information attained on this journey afforded the strongest reason to suppose that the Niger terminated in the sea. Lander on his return submitted to government a plan for proceeding to Boussa, and thence navigating the stream downwards. Government agreed to furnish the means, though promising only a very slender reward. In March, 1830, accompanied by his brother, he arrived at Badagry, and proceeded by nearly the former route to Boussa. Thence he visited Youri, which proved a very rich and populous country; but the king treated him ill, and he had no success as to Park's books and papers. On the island of Pataah, below Boussa, he procured, with great difficulty, two canoes, afterwards exchanged for one of larger size, and thus began the navigation down the Niger. He soon found it expand into a most magnificent river, about three miles broad, and bordered by noble forests. The large island of Zagohi presented an active scene of industry and navigation, and by a large force of armed canoes maintained its independence of the neighbouring states. On the adjoining shore appeared a very large town, named Rabba. Further down, Egga, another great port on the river, terminated the comparatively civilized territory of Nyffe; below which were only detached states of a very turbulent and lawless character, among which serious dangers were encountered. The next striking object was the influx from the westward of the great river Tahadda, three or four miles broad, and with a current so strong that they soon gave up the attempt to ascend it. They learned, however, that three days' journey up was Fundah, of whose importance they had often heard. It became more and more evident that their voyage was to terminate in the sea, and that the numerous river branches which opened into the gulf of Benin are the delta of the Niger. Near the large town of Kirro, they passed the one which runs towards Benin. Here the natives were almost entirely clothed in the manufactures of Europe, and had fleets of large canoes adorned with European articles. The travellers, however, were made prisoners, and carried down to Eboe, the great mart for slaves and palm oil, with which trade the natives, who are rude and dissolute, do not hesitate to combine piracy. With great difficulty, and the promise of a high ransom, they succeeded in getting arrangements made for conveying them to the sea. They reached it by the channel called by the Portuguese Nun, by the English Brass River; not the largest of the estuaries, but that which comes in the most direct line from the main trunk. Thus, by very humble agency, was solved that grand problem in African geography, in the search after which so many abstruse efforts had been made.

This important discovery, opening a water communication into the very centre of the continent, made a strong impression on the mercantile world. Mr. McGregor Laird, and some other gentlemen of Liverpool, entered into an association for forming a settlement and opening a trade on the Upper Niger. Two steamers, the Quorra and Aburrah, were fitted out; while the Columbine, a larger sailing ves-

so, was laden with goods. They arrived in the mouth of the Nun in October, 1832, but suffered severely from sickness amid the swamps of the delta; and though before the end of the year they reached a healthier station, the survivors did not regain their health. In the course of the next two years, Mr. Laird ascended the Tahadda, and reached Fumeh, nine miles inland, which he found a large city, with nearly 40,000 inhabitants, situated in a very extensive and beautiful plain. Its commerce, however, had been much injured by war, and by the tyranny of its ruler, from whose power Mr. Laird had some difficulty in escaping. Mr. Oldfield in the Alburkah sailed about 100 miles up this river, but neither found its banks so fruitful nor the commerce so active as on the Niger. He also visited Rabba, which proved equally extensive with Fumeh. The streets were crowded and dirty, but the markets spacious and well arranged. The state of the vessel frustrated the attempt to ascend to Boosma. Lander had unfortunately died of wounds received in a contest with the natives. The expedition was unfortunate in a commercial view, the only valuable article being ivory, in too small quantity to pay the expense of the voyage. As the natives, however, are active and eager for gain, Mr. Laird conceives that this and other articles could be supplied to almost any extent, if a steady demand were once understood to exist for them.

From the southern extremity of Africa, interesting discoveries have also been made. It was not till 1650 that the Dutch formed a colony at the Cape of Good Hope, which quickly became flourishing. Beyond the Karroo desert they settled rich grazing farms, at the foot of the high interior ranges of the Nieuweveld and Sneeuwgebirge, compelling the natives to labour as slaves. Towards the end of the eighteenth century, Sparrman and Vaillant brought interesting accounts of the scenery of this tract, and its natural productions, both animal and vegetable. The settlement having been captured by Britain, Mr. Barrow, as secretary to Lord Macartney, made, in 1797, an excursion into the interior, and gave striking pictures of the pastoral life of the Caffres, and of the miserable aspect and condition of the Boesmans or mountain Hottentots. In 1801 Messrs. Trutter and Somerville passed the Sneeuwgebirge, discovered the large stream of the Orange river, with the pastoral tribe of the Koranas, and finally arrived at Lattakoo, capital of the Boesmanas, a more industrious and improved people than any yet known in southern Africa. On receiving this intelligence, Lord Caledon sent Dr. Cowan and Mr. Donovan, with a party of twenty, to attempt to penetrate as far as Mozambique; but after proceeding considerably beyond Lattakoo, they were surprised and killed by a party of natives.

The Rev. Mr. Campbell, in his zealous pursuit of missionary objects, considerably extended our knowledge of this part of Africa. Beyond Lattakoo, he passed through a succession of towns always rising in importance. Kurrechane, the last, was estimated to contain 16,000 inhabitants, who, besides agriculture, showed considerable skill in adorning their habitations, tanning skins, and smelting iron and copper. Dr. Lichtenstein and Mr. Burchell made important observations on the Boesman people; but neither penetrated so far as Mr. Campbell. In 1833, while Mr. Thompson was at Lattakoo, these districts were invaded by a numerous and formidable Caffre people, from the vicinity of Cape Natal. These, it was discovered, had been driven from their country by a still more powerful tribe, the Zoolas, whose chief, Chaka, could muster 100,000 fighting men. Yet there was found to be in that quarter a large extent of fertile territory, to which a number of Dutch farmers were induced to emigrate; but having been involved in hostilities with this savage tribe, they have of late suffered dreadfully, and many of them have perished.

During the years 1833 to 1836, Captain Owen was employed by government in making a very careful survey both of the eastern and western coasts. He obtained much information respecting the former, which had hitherto been very imperfectly known. In 1837, Sir James Alexander, under the auspices of the Geographical Society, performed an expedition to the northwest from the Cape, into the country of the Damara, where he penetrated farther than any former traveller.

After all that has recently been done to explore Africa, there still remain very important points involved in obscurity. The most important relates to the courses of the Tahadda and the Shary, flowing respectively into the Niger and lake Tchad. It is a favourite hypothesis with some, that both are one stream, pursuing an unbroken course from the lake to the river; but the fact observed by Denham, that the Shary flowed into the Tchad, renders this physically impossible. It has been recently conjectured that the Yeou may be identical with the Tahadda, and thus unite the two great receptacles; but the travellers, who crossed that river and went a great way along its banks, could not well be mistaken in their belief of its flowing into the Tchad. It seems more probable that these two great rivers

have their sources in the mighty chain to the south of Mandara; that their sources, and perhaps some of their branches, may be at no great distance from each other.

Another object should be to connect lake Tchad and the surrounding countries with Nubie and Abyssinia, exploring on the way the source and early course of the Behr-el-Abiad, or principal branch of the Nile. This wide interval has as yet been only broken by Brown's journey into Darfour, and some notices procured by him respecting the adjacent countries. An expedition, we understand, is at present projected from Egypt to the head of the Nile.

There remains still farther to the southward a great mass of unknown territory, between the Portuguese settlements on the eastern and western coasts. The people in these have formed a few stations on the Zambeze, with a view to the traffic in gold and slaves; and they have others on the eastern coast, whence merchants, with similar objects, penetrate to some distance in the interior. Still the great body of the country remains unexplored. The intimations received represent it as occupied by numerous tribes, who have made some progress in culture and the arts. To explore it with any degree of completeness, two expeditions would be necessary; one from the Cape northward as far as Bornou and Houssa; the other across the continent, between Congo and Mozambique. Both, however, would be accompanied with considerable difficulty and danger; and though they could hardly fail to add to our knowledge of the physical structure of the country, we incline to think that they would be of little or no importance in other respects.

**AFRICA, or MAHADIAH**, a sea-port town of Barbary, E. coast reg. Tunis, 110 m. S.S.E. Tunis, lat. 35° 38' N., long. 11° 16' E. It may contain about 3000 inhab., and is at present a wretched place, surrounded with broken down walls, and without shops or bazars. Formerly, however, it was a sea-port and fortress of very considerable importance. In 1550 it was besieged by a powerful armament, under the orders of the viceroy of Sicily and of Doria the famous admiral of Charles V., who took it after an obstinate and desperate resistance. But being found to be untenable it was subsequently abandoned. (*Temple's Algiers*, 4c., l. p. 137.)

**AFRIQUE (ST.)**, a town of France, dep. Aveyron, cap. arrond., on the Sorgue, lat. 43° 37' N., long. 1° 47' 15" E. Pop. 4757. It is situated in a fine valley. Streets broad, but houses mostly old and ill built. It has tribunals of original jurisdiction and commerce, a communal college, and an agricultural society; with manufactures of coarse cloth, coverlets, cotton yarn and hosiery, tanneries, &c.; and a very considerable trade in wool, cheese, &c. It was formerly fortified.

**AGABLY**, a town of the desert of Sahara, cap. of an oasis, on the caravan road from Tripoli to Timbuctoo, lat. 27° 44' N. long. 4° 25' E.

**AGADIR, or SANTA CRUZ**, a sea-port town of Morocco, on the Atlantic ocean, and the most S. in the empire, lat. 30° 38' 35" N., long. 9° 35' 56" W. It is built on the declivity of a hill on the shore of a gulf or large bay of the same name, well defended from the winds, and affording good anchorage for shipping. Agadir belonged at one time to the Portuguese, by whom it was surrounded by walls. It was taken from them by the Moors in 1536, when its fortifications were farther strengthened. It was for a considerable period the centre of an extensive commerce; but having rebelled against the government in 1773, the principal part of its population was transferred to Mogadore; and it had so much declined that it is said by Mr. Jackson, in 1809, not to have had more than 300 inhabitants. The vast sandy deserts of N. Africa commence immediately to the S. of Agadir; and hence its bay is aptly termed by the Arabs *Bah-Soudan*, that is, *Gulf of the Blacks*.—(*Jackson's Morocco*, p. 115; *Ritter's Glogr.* Trad. Franc., iii. p. 161.)

**AGDE (an Agatha)**, a town of France, dep. Hérault, on the river of that name, near where it is traversed by the canal of Languedoc, about 3 m. above where the former falls into the gulf of Lyons, and about the same distance from where the latter is united with the lake Thau, lat. 43° 18' 40" N., long. 3° 38' 10" E. Pop. 7965. Ships of 300 tons burden come up to the town by the river, near the mouth of which is fort Briscoon. It has a considerable coasting and some foreign trade, with ship-building, manufactures of verdigrise and soap, and distilleries. Being entirely built of black basaltic lava, and surrounded by a wall and towers of the same material, it has a grim appearance, and is called by the country people the *Ville Noire*. It made a part of *Gallia Narbonensis*, and was in 506 the seat of a council summoned by Alaric.—(*Hugo, France Pittoresque, dep. Hérault*.)

**AGEN (an. Agriana)**, a town of France, cap. dep. Lot-et-Garonne, on the right bank of the Garonne, nearly half way between Bordeaux and Thoulose, lat. 44° 12' 22" N., long. 0° 38' 38" E. Pop. 19,551. It is ill built; streets nar-

## AGGERHUUS.

town, crowded, and dirty. The hotel of the prefect is worth notice, and there is a fine bridge over the Garonne of eleven arches; it is the seat of a *seur regale* for the depts. Lot-et-Garonne, Lot, and Gers, has a college and several literary institutions, a public library with above 12,000 vols., and a theatre. Its situation, though rather unhealthy, makes it the entrepôt of the commerce between Bordeaux and Toulouse. There is here a sail-cloth manufactory, which recently employed above 600 work-people, and produced annually 150,000 metres of canvases for the navy; there are also manufactures of serges, printed cloths, cottons, branders' ware, pottery, soap, spirits, &c. Environs beautiful; the *promenade du Grevisier* is one of the finest in France. Agen is very ancient, and under the Roman emperors was a *provincia* town.—(*Hugo, France Pittoresque, dep. Lot-et-Garonne; Briand, de Versé Dictionnaire de la France, &c.*)

AGGERHUUS, a bishopric of Norway, and one of the most important divisions of that kingdom, which see.

AGGERSOR, a small Danish island in the Great Belt, near the E. coast of the island of Zealand, lat. 55° 15' N., long. 11° 15' E.

AGHRIM, or AUGHRIM, an inconsiderable town or village of Ireland, co. Galway, 89 m. W. Dublin. One of the greatest battles ever fought in Ireland took place in the vicinity of Aghrim in 1801, when the troops of William III. commanded by Ghinkel, afterwards Earl of Athlone, gained a complete and decisive victory over those of James II., commanded by St. Ruth, who fell early in the action.

AGINCOURT, or AZINCOURT, a village of France, dep. Pas de Calais, 13 m. N.W. St. Pol; famous in history for the great victory gained near it in 1415 by the English monarch, Henry V., over a vastly superior French force.

AGLIE, or AGLIA, a town of the Sardinian states, Piedmont, 10 m. S.W. Ivrea. Pop. 3940. It has a collegiate church, and a magnificent palace with a considerable library.

AGNEE (ST.), one of the Scilly Islands (which see), being the 8th S. of the group. It contains about 300 acres, and had in 1831 a pop. of 393. It is celebrated for its light-house with a revolving light, in lat. 49° 53' 37" N., long. 6° 19' 52" W. The lantern is elevated 126 feet above high-water mark.

AGNONE, a town of the Neapolitan dominions, prov. Salerno, 18 m. N.N.E. Ischia, in an elevated healthy situation. Pop. 7600. It has an immense number of churches, a hospital, and five *monts-de-piété*, which make loans of seed-corn to the peasants. It is the seat of the principal copper manufactures in the kingdom. Some writers have affirmed that it occupies the site of the ancient *Aquilonia* of the Samnites.

AGOA DE FAO, a sea-port town of St. Michael, one of the Azores, 13 m. E. Ponta del Gada. Pop. 3000.

AGON, a small sea-port town of France, dep. La Manche, 7 m. W. Coutances. Pop. 1462.

AGOSTA, or AUGUSTA, a maritime town of Sicily, cap. cant. prov. Syracuse, on its E. coast, 12 m. N. Syracuse, lat. 37° 15' 35" N., long. 15° 14' E. Pop. 8667. It stands on a peninsula, and was built in the 13th century by the emperor Frederick, who peopled it from Centurians, which was razed for sedition. It was nearly destroyed by the earthquake of 1863, when numbers of people were crushed to death under the ruins of their houses, and a sulphurous vapour finding its way to the principal powder magazine, it blew up with a tremendous explosion. Streets regular and parallel, with some tolerable municipal edifices and magazines for articles of commerce; but the houses are low and mean, and the inhabitants have an air of dejection and poverty. Their whole existence depends on the export of salt, and a little oil, honey, and wine. It is strongly fortified both on the land and sea sides. The harbour, though rather difficult of entrance, is deep, spacious, and secure: but in E. and S. gales there is often a heavy swell. The holding ground is excellent.—(*Smith's Sicily, p. 139; and App., p. 14.*)

AGOWS, a people of Abyssinia, inhabiting the territory to the E. of the sources of the Bahr-el-Azek, or Abyssinian Nile. This district is uncommonly fertile, particularly in cattle and honey, with which it almost exclusively supplies Gondar. The country is also very populous; and though of limited extent, can bring a considerable force into the field. There is another tribe of the same people, called Tcheret Agowa, inhabiting a district along the N. bank of the Taccaze.

AGRA, one of the *sabhs*, great divisions, or provinces into which Hindostan, or India N. of the Nerbuddah river, was divided by the emperor Achar. It lies chiefly between 25° and 26° N., and may be computed to contain about 45,000 sq. m., and from 6 to 7 millions of inhabitants. These *sabhs* or provinces of the Moghul empire were in fact equal in extent and population to kingdoms. The province of Agra lies in the alluvial plain of the Jumna and Ganges, with an elevation but a few hundred feet above the level of

## AGRA.

the sea; and the finest portion of it, well known under the name of the Doab, or country of the "two rivers," lies between these streams. By far the greater portion of its surface is a dead flat. Although watered by three great navigable rivers, the Chambel, Jumna, and Ganges, the country is characterised in general for its drought, the greater part of its irrigation being effected by means of deep wells. It may also be described as eminently deficient of timber. From March to June the climate is dry, and extremely sultry; from June to October, sultry and rainy; and from November to February inclusive, serene, dry, and cold, the thermometer almost every morning falling below the freezing point. With the exception of a few woody portions of the province lying towards its W. extremity, and here only during the seasons of the periodical rains, the climate is healthy. No metallic mines exist in the province; and its only valuable minerals are the red sandstone, of which nearly all the monuments of the cities of Delhi and Agra are constructed; and a species of tuffaceous limestone, called *langer* in the language of the country, and which is the only source from which lime is obtained for economical purposes. There are commonly two harvests; the greater crops being reaped before the setting in of the rains in May and June, and the lesser in December and January. The principal corn crops are those of wheat and barley. Rice is not known, and oats hardly so, and rice is not cultivated for want of a sufficiency of water. Of the smaller kinds of corn, those chiefly cultivated are two species of millet, viz., *Holcus Sorghum*, called in the language of the country *Jeswar*; and *Holcus spicatus*, called *Bajra*. These two constitute the chief bread-corn of the labouring people, who seldom taste wheat. Great quantities of pulses are raised as a winter crop for the food of man and cattle, the most common of which is the *Cicer arvensis*, called grain by Europeans. Mustard seed is raised for oil, and the sugar cane is cultivated for the manufacture of sugar. Cotton is cultivated to a very considerable extent, and indigo is produced more extensively in this province than in any other part of upper India. It was, indeed, from hence that the drug, in the earlier periods of European commerce, was procured for the trade of Europe. The great mass of the inhabitants are Hindoos; among whom the two first classes in rank, the Braminical and Military, are more frequent than to the eastward, or to the south. To the W. of the Jumna, chiefly, are found two nations or tribes well known in the history of upper India, the Jauts and the Meematties, both distinguished by their warlike and predatory habits. It is remarkable of a country so long subject to Mohammedan rule, and the immediate seat of power, that the proportion of the Mohammedans found in this, as indeed in the neighbouring provinces, is smaller than in the more remote one of Bengal. The inhabitants, of whatever denomination, are of more robust frames and a far bolder spirit than those of the last-named country. The language of the people throughout is the Hindi or Hindustani. The basis of this language is the Hindoo dialect, which was spoken in the kingdom of Kanooj, which is within the limits of this province, on the first Mohammedan invasions. The Persian, the most cultivated tongue, spoken by the conquerors, has been superadded to this local tongue, in the same way as Norman French has been added to the Anglo-Saxon; so that, in short, the history of the formation of the Hindi is exactly a parallel case to that of English. Another Indian dialect, now nearly extinct, was the ancient language of the country near the town of Agra.

AGRA, the name of a *sillah*, or district, constituting a judicial and fiscal division of the last-named province, lying on both banks of the Jumna. Its computed area is 4500 Eng. sq. m.; and if it be equally populous with the neighbouring province of Delhi, of the population of which some estimate has been made, and it is probably somewhat more so, it contains 273 inhabitants to the square mile, or near one million of absolute population. In 1813, ten years after this district came into British possession, it was estimated to contain 2,456,914 bighas of land, each equal to near one third of an English acre, of which there were under actual culture 1,222,667; fit for culture 330,807; and waste or uncultivable 902,740. Half the area of the whole district, therefore, was under actual tillage. The land-tax as assessed to the land under culture was at the rate of two rupees and two *anas* a bigha, or near 13s. an acre; a very high or rather oppressive land tax, for a poor country just recovering from long disorder and anarchy.

AGRA, a city of Hindostan, cap. of the above province and district, on the S.W. bank of the Jumna, which, during the season of the floods, is here about half a mile broad, and at no season fordable, in lat. 27° 11' N., long. 77° 53' E. It is distant from Calcutta 950 m., Madras 1190, and Bombay 850. Agra, like other considerable towns of India, is built of bricks, the houses having terraced roofs; the streets being extremely narrow, and never paved or flagged. Much of it is at present in a state of ruin. No census of its population,

## AGRA.

that we are aware of, has been taken; but, judging by the amount of the town duties, which have been about 60,000 rupees a year, or £8000, it would appear to be about equally populous with Dacca, Bareilly, and Mirzapore, and may contain about 65,000 inhabitants. It is very conveniently situated for the commerce of W. India and E. Persia, and is the mart of a very considerable inland and frontier trade. The trading communication is carried on by boats on the Jumna and Chumbul; and by horses, camels, bullocks, and bullock carts by land. The goods comprising the imports consist of shawls, horses, camels, rock-salt, and the dry and fresh fruits and drugs of Persia; cotton wool and coarse cotton fabrics from the S., with European commodities by the Jumna and Ganges. The chief exports consist of raw silks, indigo, and coarse sugar. In 1832, the custom duties levied on these, commonly at the rate of from 7½ to 10 per cent. on the value, were, for the exports 352,980 rupees; and for the imports 1,100,495 rupees. In 1815 the amount of the joint export and import duties was 1,032,157 rupees; so that in fourteen years' time the increase was 34 per cent. Agra, in remote times, appears to have been a fortified town of some consequence; but it was not until the year 1504 that it was made the seat of Mohammedan empire. This was effected by the Afghan emperor Shihzadur Lodhi. About half a century later, the place was greatly embellished by Akbar, by far the most illustrious of all the Indian emperors. It continued to be the seat of government during his reign and that of his son; and Delhi was not restored as the metropolis until the reign of his grandson, Shah Jehan, in the year 1647. When Akbar fixed the seat of his government at Agra, he changed its name to Acharabad, which continues to be its Mohammedan designation. It contains many fine monuments, all of Mohammedan origin. The fortress is of great extent, the double rampart and bastions being built entirely of hewn red sandstone, and at least 60 feet above the level of the Jumna, on the bank of which it stands. The most remarkable structure, however, is the Taj Mahal, literally the "Crown of Empires." This stands about 3 m. below the fortress, and on the bank of the river. It is a mausoleum, built by the emperor Shah Jehan in honour of his empress, the Begum Narr Mahal; a building of white marble raised on a terrace, and in the ordinary form of a Mohammedan mosque with minarets. The mosaic ornaments of the interior, including even the marble pavement, are extensive, rich, and elaborate, the flowers and arabesques being composed of no less than twelve different stones, such as agates, jaspers, lapis lazuli, and various coloured marbles, and the numerous quotations from the Koran being in black marble. A garden with fountains and highly ornamented gateways surrounds the mausoleum; and the *total ensemble* is supposed, whether for extent, symmetry, material, or execution, to surpass anything in the world of the same description. 'This is the uniform opinion even of those who have seen the masterpieces of Italian art. "It is possible," says the celebrated and accurate Bernier, "I may have imbued an Indian taste; but I decidedly think that this monument deserves much more to be numbered among the wonders of the world than the pyramids of Egypt—those unshaped masses, which, when I had seen them twice, yielded me no satisfaction, and which are nothing on the outside but heaps of large stones piled in form of steps, one upon another; while within there is very little that is creditable either to human skill or to human invention." The architect was a Mohammedan native of Bahar, and the whole building is said to have cost £750,000. It is kept in excellent repair by the British government, which assigns a handsome annual revenue for this object. The tomb of the emperor Akbar at Secundra, 6 m. from Agra, would be considered a splendid building in any place that had not the Taj Mahal to boast of. It was constructed by his son the emperor Jehangire. A marble palace of Shah Jehan exists within the fortress; and the neighbourhood of the town, for miles, contains the ruins of palaces and tombs of costly materials and workmanship. Agra, with the district to which it belongs, was conquered by the chief Madhjee Sindiah in 1784, and formed a portion of the jagheer assigned by this prince for the maintenance of the army, organized on the European system, and offered by Europeans, by means of which he maintained his supremacy in upper Hindostan. In the course of the military operations which deprived the Maharrats, in 1803, of nearly the whole of their possessions in Hindostan, Agra was besieged by Lord Lake, and surrendered after a practical breach had been effected in one of the bastions. Since that time it has continued in our occupation, and constitutes our only depot or military magazine on the N.W. frontier. The fortress has always a considerable garrison, and about 2 m. beyond its walls is a cantonment where a much larger military force is stationed. Agra was the birthplace of Abul Fazel, the famous prime minister of the emperor Akbar.

AGRA, the name of a new government in British India, founded under the charter act of 1833. The unwieldy size

## AHMEDNUGGER.

of the Bengal presidency, which is far greater in extent, and contains more than double the population of both the presidencies of Madras and Bombay, along with the additional duties assigned by the act in question to the governor-general of India, suggested the convenience of erecting a new presidency, and the historical reputation of Agra suggested the name. The new presidency was to have had a governor and council, but all the civil and military establishments were to have been borrowed from Bengal. The inconvenience of this arrangement in this respect soon became obvious in practice, and, accordingly, an act of parliament was obtained doing away with the new presidency, and substituting for it a lieutenant-governor, named by and subject to the governor of Bengal. By this change the essential administration rests with the latter authority, but local details are conducted by the lieutenant-governor. The authority of this officer extends over all the territories N. and W. of Allahabad inclusive, conquered or obtained by cession since 1801. The names of the districts subject to the lieutenant of Agra are as follows: Allahabad, Ferozepore, Bundelcund North, Bundelcund South, Benares, Ghazepore, Gurruckpore, Jaunpore, Amdighur, Mirzapore, Agra, Allyghur, Furruckabad, Bareilly, Shahjehanpore, Baharumpore, Meerut, Cawnpore, Etawah, Moradabad, and Bolundshuhur. These are computed to contain 65,510 sq. m. The authority of the lieutenant-governor, however, also extends to other districts possessing a less regular form of civil government, as the hill districts ceded by the Nepalese, which are computed to contain 18,000 sq. m. The population of all the territories now enumerated has been reckoned at 30,000,000. It has farther, however, jurisdiction over the districts ceded by the Maharrats on the Nerbudda in 1817, estimated to contain 29,500 sq. m.; and by the rajah of Berar in 1836, calculated at no less than 55,500 sq. m. No estimate of the population of these two last territories has been made, but they are known to be very thinly inhabited. The political correspondence with the chiefs on the W., N., and S. frontiers of his jurisdiction is also under control of the lieutenant-governor of Agra.

Authorities for these four articles, viz. Agra province, Agra district, Agra city, and Agra government: *Hamilton's Description of Hindostan*; *Hamilton's East India Gazetteer*; *Bernier*; *Return of the Population of British India made in 1831 to the House of Commons*; *Briggs's Persia*; *Trevelyan's Report on the Indian Customs of Bengal*.

AGRAM, or ZAGRAE, a fortified city of the Austrian empire, cap. Croatia, and the residence of the governor-general, on a hill on the banks of the Sava, lat. 45° 49' 2" N., long. 15° 4' E. Pop. 17,000. Agram is the seat of a bishopric and of a tribunal of appeal for Croatia, the Banat, and Slavonia. It has a superior academy, a gymnasium, a Franciscan convent, and a considerable commerce, particularly in the tobacco and corn of Hungary.

AGREDA, a walled town of Spain, prov. Seville, at the foot of mount Cayo, celebrated by Martial. Pop. 3300. It is ill built, has six churches and four convents, with tanneries and potteries.

AGREVE (St.), a town of France, dep. Ardèche, cap. cant. Pop. 2500.

AGUAS CALIENTES, a town of Mexico, prov. Guadalupe, 100 m. N.E. Guadalupe, lat. 29° N., long. 101° 45' W. It is situated in a fertile district, has a fine climate, and is one of the handsomest of the Mexican towns. Being intersected by several great roads, it has an active and considerable commerce. It is celebrated for its great cloth manufactory, which employed, in 1825, 330 hands (Ward), and the hot springs in its vicinity, whence it derives its name. Its pop. may probably amount to 18,000 or 20,000.

AGUILAR DE LA FRONTERA, a town of Spain, prov. Cordova, 93 m. S.E. Cordova.

AGUILAR DEL CAMPO, a town of Spain, prov. Palencia, on the Pisuerga, 40 m. N.W. Burgos. Pop. 1600.

AHANTA, a territory on the Gold Coast of Africa, between the rivers Ancobia and Suberlin.

AHMEDABAD, a town of Hindostan, presid. Bombay, prov. Gujrat, cap. district of same name, on the navigable river the Sabarmaty, lat. 29° 58' N., long. 79° 37' E. Pop. 100,000? About the middle of the 15th century it was a flourishing city, celebrated for the magnificence of its mosques, palaces, and streets; but it has since fallen greatly to decay. It is surrounded by a high wall flanked with towers; and is a great resort of itinerant players and poets. It suffered severely from the plague in 1819, and from an earthquake in 1819. The district of which Ahmedabad is the cap. produces a land revenue of about £190,000 a year.

AHMEDPORE, a town of Hindostan, prov. Orissa, 11 m. S. Juggernaut.

AHMEDNUGGER, a city and fortress of India, presid. Bombay, prov. Arrunghabad, cap. district of same name, on the river Seena, 70 m. N.W. Poona. lat. 19° 5' N., long. 74° 55' E. The town, founded in 1493, is enclosed by a stone wall, and has a handsome market-place and some

pretty good streets. At present it is the head station of a civil establishment, and has about 30,000 inhab., exclusive of the garrison. The fortress, a little way from the town, is oval-shaped, and about 1 m. in circ.: it is built entirely of stone, and is surrounded by a broad and deep ditch. It surrendered to general Wellesley (now duke of Wellington) in 1803.

The district or collectorate of which Ahmoonggur is the cap., contains an area of 9910 sq. m., with a pop. of about 60,000. The land revenue amounted in 1827-8 to £181,584, the average rate of assessment being 14 rup. per begah. The total revenue for the same year was £203,400.—(*Parl. Papers on Indian Affairs*; *Revenue Appendix*, p. 680.)

AHMOOD, a town of Gujarat, 30 m. N. by W. Broach, lat. 23° 5' N., long. 73° 6' E.

AHREBERG, a town and castle of Bavaria, circ. Regat, 10 m. S. Augsburg. Pop. 3300.

AHRWEILER, a town of the Franconian prov. lower Rhine, cap. arc., on the Ahr, 23 m. W.N.W. Coblenz. Pop. 2100.

AHUN, a very ancient town of France, dep. Creuse, cap. cant., 10 m. S.E. Guéret, on a mountain at the foot of which flows the Creuse. Pop. 2183.

AHWAZ, or AHWUZ, a town of Persia, prov. Kuzistan, on the Karoon, 46 m. S. Shuster. In former times this was a large and flourishing city, cap. prov. of same name, and the winter residence of the Persian kings. It is now a wretched place, with 600 or 700 inhabitants. Some ruins of the old city are still to be seen. Of these the most worthy of attention are the remains of a bridge over the river, and of a royal palace. The portion of the wall of the latter now standing is built of large blocks of hewn stone, and is about 200 feet in length, and 14 or 15 feet high. A little below Ahwaz, at the deserted village of Shibia, are the remains of a remarkable mound or dam made across the river to procure water for the irrigation of the surrounding country.—(*Kennedy's Pers. Exp.*, p. 69.)

ALAE, or AJASSO, a ruined sea-port of Asiatic Turkey, on the N. shore of the gulf of Iskenderoon.

ALCHACH, or AICHA, a town of Bavaria, circ. Upper Danube, on the Paar, 12 m. E.N.E. Augsburg. Pop. 1600. It is surrounded by walls and ditches.

AID, L., Lawrence co., O. It has three schools, 78 scholars. Pop. 608.

ANGLE, a town of Switzerland, cant. Vaud, cap. district same name, on the torrent Grande-Eau, near the Rhone. Pop. 1750.

ANNE (L'), a town of France, dep. Orne, cap. cant., on the Rille, 16 m. N.N.E. Mortagne. Pop. 5454. Though old and surrounded by the remains of old walls, it is well built, neat, and clean, and is distinguished by its industry. The needles and pins manufactured here are celebrated all over France, and it has also fabrics of iron and cotton wire, wire gams, nails, &c. It has withstood several sieges.

ANGHAN (St.), a town of France, dep. Loire et Cher, cap. cant., 24 m. S. Blois. Pop. 2536. There is in the vicinity the only quarry of gun-flints in France. The quantity annually manufactured is estimated at from 35,000,000 to 40,000,000. Those for the use of the army are kept in dépôt in the castle of Ambais.

ANGRE FENILLE, a village of France, dep. Charente inférieure, cap. cant., 12 m. N.N.E. Rochefort. Pop. 1700.

ANGUE PERSE, a town of France, dep. Puy de Dome, cap. cant., 11 m. N.N.E. Riom. Pop. 3115. Near it is the Chateau de Roche, the birthplace of the chancellor de l'Hôpital.

ANGUES MORTES, a town of France, dep. Gard, cap. cant., 30 m. S.W. Nîmes, lat. 43° 33' 35" N., long. 40° 11' 25" E. Pop. 3240. Though now about 4 m. inland, Angues Mortes was formerly a sea-port, and was, in fact, the place where St. Louis embarked on his two expeditions to Africa. At present it is connected with the sea by a canal, which is prolonged to Beaucaire on the one hand, while it is united on the other with that of Languedoc. It is fortified, and, from its position, is an important post for the defence of the coast. Owing to the retrogression of the sea, the town is surrounded by marshes (whence its name *Angus Mortue*), and is very unhealthy. The salt lake of Peccalis, in the neighbourhood, is celebrated as well for the quality as for the quantity of the salt obtained from it.—(*Hugo*, art. "Gard.")

ANGUILLE (L'), a celebrated mountain in France, dep. Isère, 4 m. N.W. Corps, height 2000 mètres (6565 feet). Its upper part has the appearance of a truncated cone, and its upper part is of a cubical form. It was long supposed to be inaccessible, and was hence called *Mont Inaccessus*; but in 1693 an officer of Charles VIII. reached its summit.

ANGUILLO, a town of France, dep. Lot et Garonne, at the confluence of the Lot and the Garonne. 17 m. N.W. Agen. Pop. 2019. It was unsuccessfully besieged by John duke of Normandy in 1245; when, it has been said, but incorrectly, that swans were first made use of,

ANGURANDE, a town of France, dep. Indre, cap. cant., 12 m. S.W. Châtre. Pop. 1945. It is the centre of an extensive cattle trade; and has, or had, an octagonal monument, believed to be very ancient, but of which the object is unknown.

AILAH, or ELANA, a decayed town of Arabia, on the gulf of Akabah; which see.

AILSA, an insulated rock in the Frith of Clyde, 10 m. W. Girvan. Its base is elliptical, and it rises abruptly from the sea to the height of 1008 feet. It consists of columnar trap. The N.W. side is almost perpendicular, being formed of successive tiers of immense columns. It is frequented by innumerable flocks of sea fowl, and is a very striking object from every part of the Ayrshire coast. It gives the title of marquis to the noble family of Kennedy.

AIN, a frontier department in the E. of France, having the Rhone, which separates it from Savoy on the E. and S., the Saône on the W., and the depts. of Saône et Loire, Jura, and part of Switzerland, on the N. and N.W. Area 502,674 hectares. Pop. 346,188. Exclusive of the Rhone and Saône, by which it is partly bounded, it is divided by the Ain, whence it derives its name, into two nearly equal parts; that to the E. being rugged, mountainous, and principally adapted to pasturage; whereas that to the W., though in parts marshy, is generally level and fit for cultivation. There are in the S.W. portion of this dep. a great number of lakes or ponds, some of which are subjected to a very peculiar species of rotation. It is usual to drain and cultivate them for a season; and when the crop has been gathered, they are again filled with water, and with different sorts of fish, according to the nature of the pond; and, after being occupied in this way for two years, or thereby, are again dried and subjected to the plough. The extent of the ponds so employed is estimated at nearly 16,000 hectares. This is found to be a very profitable species of cultivation; though, from the humidity it occasions, it is said to render the climate unhealthy. Oxen, of which large numbers are bred, are generally used in tillage. Produce of corn crops sufficient for the consumption. Vintage considerable, three fifths of the produce exported. Woods very extensive, amounting to about 120,000 hectares. Near Belley are produced the best lithographic stones in France. Manufactures inconsiderable. Great numbers of the inhabitants emigrate annually after harvest to seek for employment in the contiguous departments. Ain returns five members to the Ch. of Deputies, and has 1305 electors. Public revenue of the dep. in 1831, 6,258,042 fr. Chief towns Bourg, Nantua, Trevoux, Belley, and Gex. But the most celebrated place in the dep. is Ferney, long the residence of Voltaire.—(*Hugo*, *France Pittoresque*, dep. Ain; *French Official Tables*.)

AIN-TAB, a large town in the N. of Syria, on the S. slopes of the Taurus, lat. 36° 58' N., long. 37° 13' 15" E., 70 m. Aleppo, and 30 m. W. Bir, on the Euphrates. Pop. has been estimated at 20,000, which, if the town be two thirds the size of Aleppo, as stated by Maudrell (*Journals*, 310), can scarcely be considered as exaggerated. The inhabitants consist of nearly equal numbers of Armenian and Greek Christians, Kurds, and Mohammedans, among whom a spirit of toleration and unity prevails unparalleled in most other Eastern societies. They use the Turkish language. Houses well built, of a fine stone resembling porphyry, flat-roofed, and generally of only one story. There are few mosques, and several large and well-supplied bazars. In the centre of the town is a castle on a mound, resembling, in every respect, that of Aleppo, but much smaller. Water abundant, many of the streets having streams flowing through them. On the S. is a large burial-ground, which, at a short distance, resembles an important suburb, and is perhaps not much inferior in extent to the town itself. Manufactures of goat-skin leather, cotton and woollen cloths, are carried on to some extent; and there is some trade in raw and tanned hides, cloth, honey, and tobacco.

Ain-Tab may be regarded as the capital of a limited, but very fine country, consisting of small hills and valleys among the roots of the Taurus. The towns and villages in this little district are very numerous, the most important being Adja, Silam, and Klea. At Adja, 6 or 7 m. distant, is the source of the Koek (the river of Aleppo); and within 10 yards of this stream there runs another, the Sejour, the banks of which are thickly set with trees and villages. The Sejour has a good bridge over it, about 2½ m. from Ain-Tab. The air is good and the soil fertile; but cultivation is not much followed, the majority of the rural population being shepherds. Principal agricultural products corn and tobacco. Bees are very plentiful.

Ain-Tab was taken and plundered by Timur Bee in 1400; but its favourable site, and the tolerant spirit of its inhabitants have kept the district remarkably free from the usual Eastern calamities. The Turkish pashas, notorious as they are for exaction and oppression, respect the homes and rights of these hardy mountaineers. They have, indeed, been

## AIR.

taught this forbearance by some severe lessons, having experienced, in every attempt at tyranny and extortion, a firm and successful resistance. The last of these attempts was made in 1780, when the Turkish forces were completely defeated; since which the men of Ain-Tab and its vicinity have been suffered to enjoy the produce of their fields, flocks, and bees in undisturbed tranquillity. According to Maundrell, Ain-Tab is identical with the *Antiochia ad Taurum* of the ancients; but this is doubtful. (*Maundrell's Journey*, p. 209; *Folney*, ii. 137; *Brown's Travels*, 210.)

AIR, t., Bedford co., Pa. It contains one store, one woolen factory, two flouring-mills, two grist-mills, three saw-mills. Pop. 1453.

AIRDRIE, a bor. and m. town of Scotland, co. Lanark, pa. New Monkland, on a rising ground between two little rivulets, 12 m. E. Glasgow. Pop. 13,416. It consists principally of two parallel streets joined by cross streets, the houses of the labouring population being well built and comfortable. In the early part of last century Airdrie contained only one solitary house. It owes its rapid rise to the coal and iron mines in its immediate vicinity, and to its contiguity to the Monkland canal, to which it is united by railways. The Calder iron works in the neighbourhood employ a number of hands; and within the town there are two iron foundries, at which machinery is made, with distilleries, breweries, malt barns, &c. But the weaving of cotton goods on account of the Glasgow manufacturers has hitherto been the principal source of employment; though this will probably soon cease to be the case, a large cotton factory having recently been erected. It was constituted a royal borough in 1833. The Reform Act united Airdrie with Hamilton, Lanark, Falkirk, and Linlithgow in the return of a member to the H. of C. £10 houses in 1831, 130; par. constituency, 1841-37, 850. (*Boundary Report*, p. 121, &c.)

AIRE, a river of England, important from its navigation and the numerous canals with which it is connected. It rises in Yorkshire, in the central mountain ridge, a little to the E. of Settle. It pursues a S.E. course, till, passing Leeds, it is joined by the Calder at Castleford; its course is thence E., with a good many windings, till it falls into the Ouse, a little above Goole. From Leeds to Ferrybridge the Aire flows through one of the richest plains in the kingdom.

AIRX (an. *Vicus Julii*), a decayed city of France, dep. Landes, cap. cant., on the Adour, 80 m. S.E. Bordeaux. Pop. 4028. This is a very ancient city, and has been since the 5th century the seat of a bishopric. The Goths became possessed of it in the 6th century, and it was for some time the residence of Alaric II. It suffered much in the wars with the English, and still more in the religious contests of the 16th century. The fortifications by which it was once surrounded have now wholly disappeared. It is pretty well built, has a cathedral, a college, and a secondary ecclesiastical seminary. A bridge has been recently built over the Adour. (*Hugo*, art. "Landes.")

AIRX, a fortified town of France, dep. Pas de Calais, cap. cant., at the confluence of the Lys and Laquette. Pop. 5610. It is pretty well built; has several public fountains; with manufactures of linen, hats, soap, Dutch tiles, Geneva, &c. In a military point of view, it is of considerable importance for the defence of the country between the Lys and the Aa.

AIRVAULT, a town of France, dep. Deux Seines, cap. cant., on the Thoné, 15 m. N.N.E. Parisien. Pop. 1923. It is well built, and has the remains of an old castle and monastery, destroyed in the 16th century.

AISCHUM, county, Mich. Situated in the N.W. part of the state, and contains 576 sq. m. It is unorganized.

AISNE, a dep. in the north of France, between 49° 50' and 50° 4' N. lat., and 2° 56' and 4° 12' E. long.; the principal town, Laon, in its centre, being 75 m. N.E. Paris. Area 792,530 hectares. Pop. 527,093. It is traversed by the Aisne, whence its name, the Oise, Marne, and by several canals. Surface generally flat or undulating, but in parts hilly; soil fertile. The cultivated land amounts to about 500,000 hectares, about 100,000 being occupied with woods, and 42,000 with meadows. Agriculture good; and after providing for the inhabitants there is a large export of corn, as well as of sheep, oxen, horses, and pigs. It also produces flax and hemp, hops, rape, beet-root, potatoes, &c. In the southern part wine is made; but the ordinary drink of the inhabitants is wine and beer. This dep. is celebrated for its manufactures, at the head of which must be placed the cottons, laces, lawns, shawls, table-linen, &c. of St. Quentin; the mirrors of St. Gobain; and the bottles, of which Polambury furnishes about 3,000,000 a year, for the wines of Champagne. It has also cast iron and iron plate foundries, brick and tile works, manufactures of chemical products and of beet-root sugar, meadow fields, &c. It is divided into seven electoral arrond., returns seven m. to the Ch. of Deputies; and had, in 1836, 3160 electors. Public revenue, in 1831, 18,722,067 f. Chief towns, Laon, St. Quentin, Soissons, Chateau-Thierry, Vervins, &c. (*Hugo*, *France Pittoresque*, art. "Aisne;" *French Official Tables*, &c.)

## AIX-LA-CHAPELLE.

AIX, an ancient city of France, dep. Bouches du Rhone, cap. arrond. and cant., formerly cap. Provence, in a plain at the foot of some hills, 16 m. N. Marseilles, lat. 43° 34' 28" N., long. 5° 28' 47" E. Pop. 18,940. It was founded by Caius Sertius Calvinus, a Roman general, 130 years B.C., and received the name of *Aquis Sextie*, from its famous hot springs. It is a well-built handsome town. Streets generally well paved, wide, and clean. It has a beautiful public promenade, and some good squares ornamented with fountains. A side of one of the squares is formed by what is called the *Palais*, an old building containing some spacious halls, formerly occupied by the parliament of Provence and other public bodies. It has also a town-hall, containing a valuable collection of antiquities, a magnificent cathedral, a museum of pictures, a theatre, and other public buildings. Previously to the Revolution, Aix was the seat of a university; and at present it has a royal academy equivalent to a university, with faculties of theology and law, and a valuable library containing above 90,000 vols. It is also the seat of a *cour royale* for the dep. of the Bouches du Rhone, Basses Alpes, and Var, and of an archbishopric; and has several learned societies. Aix has manufactures of silk, wool, and cotton, and its industry and commerce have materially increased within the present century. Inhabitants said to be decidedly aristocratical, while those of Marseilles incline strongly to democracy. The mineral springs, from which the town took its ancient name, were accidentally discovered in 1704, and were identified by the medals, inscriptions, and other Roman monuments then dug up. The establishment of the baths belongs to the hospital. Tournefort, celebrated as a botanist, and one of the best of the travellers that have visited the Levant, was a native of Aix; as were Vanloo and Adanson. (*Hugo*, art. "Bouches du Rhone.")

Aix, an ancient town of the Sardinian States, Savoy, 8 m. N. Chamberry. Pop. 2300. It is celebrated for its hot baths, which were in vogue among the Romans, and are still extensively resorted to. The king of Sardinia has constructed a large and convenient building for the accommodation of visitors.

AIX D'ANGILLOU (LES), a town of France, dep. Cher, cap. cant., 12 m. N.E. Bourges. Pop. 1414.

AIXE, a town of France, dep. Haute Vienne, cap. cant., 6 m. S.W. Limoges. Pop. 2645. It has some remains of Roman antiquities.

AIX-EN-OTHE, a town of France, dep. Aube, cap. cant., 18 m. W.S.W. Troyes. Pop. 1707. It has a cotton factory.

AIX-LA-CHAPELLE (the *Aachen* of the Germans, and the *Aquisgrana* of the Italians), an old and well-built city of the Prussian states, prov. Lower Rhine, near the confines of the Netherlands, lat. 50° 47' N., long. 6° 15' E. It was formerly a free imperial city, and is now the cap. of a reg. of the same name. It is divided into the inner and outer town, and contained, in 1835, 38,383 inhab. It is the seat of a bishop, of a court of appeal, a tribunal of commerce, and has an exchange, a gymnasium or college, a school of arts, a picture gallery, and a public library with above 10,000 volumes. Manufactures considerable, and recently increased. The most important are those of broad-cloth and cotton; and next to them the famous needle-works, which employ and support large numbers of individuals; watch-making, jewelry, &c. are extensively carried on; and there are also print-works and tan-works. Exclusive of the cathedral, there are eight Catholic churches, a Protestant church, and a synagogue. It had at one time twenty-one monasteries and convents, but most of them have been suppressed. Among the public buildings, the most remarkable are the town-house, enriched with portraits of the different ministers present at the negotiation of the treaty of 1748; the cathedral, founded by Charlemagne; the theatre, the fountains in the principal market-place, &c. Handsome private houses are to be met with in every street. Aix-la-Chapelle was the favourite residence of Charlemagne, and for some time the capital of his empire; hence it was long customary to hold the coronation of the emperors of Germany in this town; and till 1794, when they were carried to Vienna, the regalia used on the occasion were to be seen in the convent chapel. Strangers are still shown a sabre of Charlemagne, a copy of the gospel written in gold characters, and an immense number of relics.

Aix-la-Chapelle is celebrated for its hot baths, which issue from six different springs. The most celebrated is that called the *Source de l'Empereur*. The water is strongly impregnated with sulphur, and has a temperature of 143° Fah. The baths are generally opened, with much ceremony, on the 1st of May. Two celebrated treaties of peace have been concluded in this city; the first in 1666, between France and Spain; and the second in 1748, between the different powers engaged in the wars of the Austrian succession. Here also a congress was held in 1818.

The *Salle des Rois*, one of the most splendid gambling-houses on the Continent, is thus noticed in Mr. Murray's *Handbook*: "The lower story is occupied by print and

## AIACIO.

inside shops, by a restaurant, and a reading room, where the principal European newspapers are to be found. In the ground suit of apartments, balls are given once or twice during the season; but they are principally devoted to gambling. Games of hazard, rouge et noir, &c. are carried on in them, almost without interruption, not only by night but by day, beginning at 10 or 11 in the morning. The tables are open to all comers, except inhabitants of the town and officers of the Prussian army, who are expressly forbidden by a police order to play at the table. Before 10 P.M. the lowest stake allowed is a kron-thaler; after 10, half a kron-thaler is the lowest sum. Public gaming is not tolerated anywhere else in the Prussian dominions. The tables are let out to a company, who are compelled to apply a large portion of the gains to the improvement of the town and the walks in the neighbourhood.

AIACIO, a sea-port town of the island of Corsica, of which it is the cap., on its W. coast, and on the N. side of a gulf to which it gives name, lat.  $41^{\circ} 59' 11''$  N., long.  $8^{\circ} 44' 4''$  E., Pop. 9003. It has a citadel, built in 1554; is the seat of a bishopric; has a royal court and other judicial establishments, a college, a model school, a public library, a good theatre, and a fine promenade along the bay. The latter is spacious and commodious, but exposed to the W. gales. Streets straight and broad, and houses good; but it labours under a deficiency of good water. It has a considerable trade, exporting wine, oil, and coral. Ajaccio will be memorable in all time to come, from its having been the birthplace of by far the most extraordinary, and, perhaps, also the greatest, man of modern times. Napoleon Bonaparte was born here on the 5th of August, 1769. He was descended of a respectable family long settled in the island. — (*Encyc. art. "Corse."*)

AJMERE, a town of Hindostan, cap. district belonging to the British, in Rajpootana, 285 m. S.W. Delhi, lat.  $26^{\circ} 31' 1''$  N., long.  $74^{\circ} 35' 5''$  E. It is a well-built moderate-sized town, on the slope of a high hill, at the summit of which is a fortress, formerly deemed impregnable, and which, with a little improvement from European skill, might easily be made a second Gibraltar. Ajmere is a holy city, having the good fortune to possess the tomb of a saint, whose miracles are renowned all over India. The emperor Akbar made a pilgrimage on foot to the shrine of the saint; and it continues to be resorted to by devotees from all parts of India. It is not uncommon, in Malwa, for pilgrims who have been at Ajmere to set up a brick or a stone, taken from the sanctuary, near their dwelling, and to become saints themselves, and have pilgrimages made to them! A strong detachment of troops is usually stationed at Ajmere, and the neighbouring town of Nasarabad.

At a short distance W. from Ajmere is the celebrated Hindu temple of Poochhur, on the banks of a sacred pool nearly a mile in circuit. It is annually visited in October by crowds of pilgrims from all parts of India. — (*Heber, II., p. 440-441.*)

AKABAH (GULF AND CASTLE OF). The gulf of Akabah is a deep narrow inlet, uniting with the N.E. extremity of the Red Sea. It extends in a N.N.E. direction from  $26^{\circ}$  to  $26^{\circ} 32' 1''$  N. lat., a distance of above 100 Eng. m.; being, where broadest, 16 or 17 m. across. It communicates with the Red Sea by channels on each side the side of Tiran at its S. extremity. This gulf, the *Sinus Eilatensis* of antiquity, so called from the port of Eilana or Eilat, forms the E. boundary of the peninsula occupied by Mount Sinai. It has the appearance of a narrow deep ravine, the cliffs rising in some places 2000 feet perpendicularly from the sea; and has been very little frequented in modern times. Being exposed to sudden and heavy squalls, and encumbered in parts with coral reefs, its navigation is not a little dangerous.

The castle of Akabah, from which the gulf takes its modern name, is not a place of any strength. It is situated about 130 yards from the beach, on the E. side of the gulf, and about 24 m. from its extremity, in lat.  $26^{\circ} 30' 31''$  N., long.  $35^{\circ} 7' 3''$  E. It has a supply of good water, and there are several Arab huts within its walls. The garrison consists of about 30 Egyptian soldiers, kept to guard the corn deposited in it for the supply of the caravans, in their journey from Cairo to Mecca.

Akabah has been supposed to occupy the site of Eilat or Elath, from which an extensive intercourse was carried on in the earliest ages with Rhinocorura, now El Arish, on the Mediterranean, only 116 m. distant. There are, however, no ruins of any kind at Akabah, and no port. It would, therefore, seem more probable that the situation of Elath is identical with that of Jezirat Faroun, on the W. side of the gulf, and about 6 m. from its extremity. There are there very extensive ruins, and a natural harbour. Dr. Shaw supposes, apparently with much probability, that Meenap-el-Dahie, i. e., the *Golden Port*, on the W. coast of the gulf, and nearly opposite to mount Sinai, occupies the site of Ezion-geber, whence the ships of Solomon sailed to fetch gold from Ophir. It is said by Lieutenant Wellsted to be the only "well-sheltered" harbour in the gulf. — (*See Shaw's*

## AKRON.

*Travels in Barbary, &c., 2nd ed., p. 282; Laborde's Arabes Petres, Eng. trans., p. 94; Wellsted's Travels in Arabia, II., passim.*

AKERMANN (an. Tyrrus), a town of Russia in Europe, in Bessarabia, on the W. side of the estuary or *Husen* of the Danester, near its junction with the Black Sea, lat.  $46^{\circ} 19' 15''$  N., long.  $30^{\circ} 34' 4''$  E. The statements as to its pop., even in works whose authors may be supposed to have had access to the best sources of information, differ extremely. Probably, however, it may be estimated, suburbs included, at nearly 12,000. The citadel, surrounded by a deep ditch, was constructed by the Genoese during the time that they were masters of the Black sea. The Danester being rapid and not well suited for internal navigation, the commerce of the town is not very considerable. The exports consist principally of salt, the produce of the salt lakes in its vicinity, which, in 1833, yielded 1,326,000 poods of salt to government, and 2,227,045 poods to individuals. Their produce, however, is said sometimes to amount to 7,000,000 poods. The salt is sold by government at 65 copecks per pood. The basin of the Danester having only from 5 to 7 feet water, the larger class of vessels anchor outside the bay, in the Black sea, about 16 m. from town.

Akermen is distinguished in recent diplomatic history by the treaty concluded here in 1826 between Russia and the Ottoman Porte, by which Wallachia, Moldavia, and Servia were emancipated from all but a nominal dependence on the latter. — (*Schmitzer la Russie, &c., p. 741; Hagmeister on the Commerce of the Black Sea, p. 81, 131, &c.*)

AKHISAR (an. Thyatira), a city of Turkey in Asia, Anatolia, the seat of one of the Apocalyptic churches, 58 m. N.E. Smyrna. It stands on an eminence elevated but little above the surrounding marshy and alluvial plain. Messrs. Smith and Dwight, the American missionaries, state that, having suffered severely from fire a few years ago, it is now mostly of wood; that its aspect is poor and mean, with but few remains of ancient grandeur; and that the pop. is not supposed to exceed 1000 families (5000 individuals), of whom 1500 may be Greeks. — (*Missionary Researches in Armenia, p. 5, &c.*) Mr. Elliott's account is not so unfavourable. He states that, being situated on the direct road between Constantinople and Smyrna, it wears an appearance of comfort superior to that of Anatolian towns in general; that the bazars are large and amply supplied; the khans handsome, clean, and well ordered; and that it contains 1740 houses, of which 400 belong to Greeks, and 48 to Armenians. If we suppose each house to lodge, at an average, 6 individuals, the town would, according to Mr. Elliott, have a population of about 10,400! — (*Elliott's Travels, II., p. 111.*) Perhaps the truth may lie midway between these conflicting statements. There is in the town a Greek school, attended by 150 children of both sexes.

AKHLAT, a town of Turkey in Asia, in Koordistan, on the N.W. shore of lake Van, at the foot of the Selbandagh. It is very ancient, and was formerly a place of considerable importance; but it is now greatly decayed, not having more than 1000 houses, or perhaps 6000 inhab. Its territory is filled with gardens and vineyards. — (*See Es-saïr's Persian Empire, p. 328, where it is noticed under the name Arghish; and the Dict. Geographique.*)

AKHTYRKA, a town of Russia in Europe, govern. of Kharhof, 60 m. N.W. Kharhof. Pop. 12,000. It has a pretty considerable commerce; and among its churches is one that attracts a good many pilgrims to visit a miraculous image of the virgin. — (*Schmitzer la Russie, &c., p. 477.*)

AKISKA, or AKHALZIKH, a city of Asiatic Russia, prov. Georgia, formerly the cap. of a Turkish pachalik, on an affluent of, and at a short distance from, the Kur, 115 m. W. Tiflis, lat.  $31^{\circ} 45' 1''$  N., long.  $43^{\circ} 1' 1''$  E. Pop. has been estimated at above 20,000, but at present it does not probably reach half that amount. It is an open town; but is defended by a strong castle situated on a rock. It is remarkable for its fine mosque of Sultan Ahmed, built in imitation of St. Sophia, and for the college and library attached thereto. The latter was reckoned one of the most curious in the E.; but the Russians have removed about 200 of the rarest and most valuable works to Petersburg. Akiska is also the seat of a Greek archbishopric, and has about 60 Jewish families and a synagogue. Its environs are productive of silk, honey, and wax; and it has some manufactures. It was formerly a principal seat of the slave trade. The slaves sold in its markets were brought from Georgia, Mingrelia, Imeritia, &c.; and being conveyed to the nearest ports on the Black sea, were shipped for Constantinople and Alexandria. This commerce is now entirely suppressed. Many of the Turkish inhabitants have left the town since its occupation by the Russians. — (*Baldi Abrede, 3d ed., p. 209; Missionary Researches in Armenia, p. 100.*)

AKRON, p. v., Portage L., cap. of Summit co., O. Situated on the Ohio canal at the junction of the Pennsylvania and Ohio canal 26 m. S. Cleveland. At this place the Ohio canal suddenly rises, by a succession of locks, to the Portage

## AKSERAI.

**AKSERAI.** A great water power is concentrated here, by means of the Little Cuyahoga river, and the waste water of the canal, which, by a great descent, is used several times over; and the water power will be increased by bringing the water of the Great Cuyahoga river in a canal discharging itself by a high fall into Cuyahoga river. This place is finely situated for trade and manufactures, and contains a court-house, jail, three churches, one Methodist, one Presbyterian, and one Universalist, thirty-four stores, four furnaces, four fulling-mills, three woollen-factories, three scouring-mills, one grist-mill, two distilleries, one powder-mill, one oil-mill, one machine-shop, two printing-offices, three weekly newspapers, one academy, 9 students, six schools, 360 scholars. Pop. 1665. Portage L., exclusive of Akron v., has 718.

**AKSERAI**, a town of Turkey in Asia, in Caramania, cap. smajack of the same name, on the S.W. arm of the Kizil Ernak, 90 m. N.E. Koneh (aa. *Icentum*). Pop. uncertain. It has a castle, and its territory is productive of corn and fruits.

**AC-SHEHR** (the *White City*), a city of Asiatic Turkey, Caramania, cap. smajack of the same name, 55 m. E.S.E. Afium Karahissar, lat. 39° 13' N., long. 31° 30' E. It is situated near the S. extremity of a considerable lake, at the foot of a mountain chain, in a rich and well-watered country. Its position is said to be identical with that of the ancient *Thymbrissa*, visited by the younger Cyrus; and, according to D'Anville, it was denominated *Antiochia ad Pisidiam*, from its being on the confines of Pisidia, of which prov. it afterwards became the capital. It is mentioned in Turkish annals as the place where Bajazet was confined by Timur, and where he expired. It is supposed by Mr. Kinnear to have about 1500 houses, with many fine gardens in the vicinity. Its principal ornament is a handsome mosque and college, dedicated to the memory of Bajazet. The streets are cleaned by means of streams from the neighbouring mountains that run through them.—(*Kinnear's Journey through Asia Minor*, &c., p. 236; *Oliver*, vi., p. 306.)

**AKYAB**, a mart, town of India beyond the Ganges, cap. prov. Aracan, and of a dist. of same name, on the E. side of the island of Akyab, lat. 30° 8' N., long. 93° 54' E. It is built of wood; has broad streets, and markets for grain, and European and Indian goods. Its harbour, though inferior to that of Kyauk Phyoe, is safe; and it is, in most other respects, superior to the last-mentioned town as a place of trade. The vicinity is level, fertile, free from jungle, and traversed by several roads. It is the residence of a British commissioner, and is garrisoned by two companies of Sepoys.—(*Pemberton on the E. Frontier of India*, p. 87; *Journal Geog. Society*, i., p. 175.)

**ALA**, a small town of the Tyrol, on the Adige, 7½ m. S. Roveredo. Pop. 2400. It has a gymnasium, and a Capuchin convent.

**ALABAMA**, one of the Southern United States, is bounded N. by Tennessee; E. by Georgia; S. by Florida and the gulf of Mexico; and W. by Mississippi. It is between 30° 10' and 35° N. lat. and 83° and 89° 30' W. long.; and between 80° and 110° 30' W. long. from W. It contains 46,000 sq. m., or 92,160,000 acres. In 1800, the population was only 3000; in 1810, 10,000; in 1820, 137,901; in 1830, 308,997; in 1840, 520,758, of whom 253,533 were slaves. Free white males, 176,692; do. females, 158,493; free coloured males, 1030; do. females, 1009. Employed in Agriculture, 177,439; in commerce, 2919; in manufactures and trade, 7195; navigating the ocean, 356; do. canals, rivers, &c., 753; learned professions, 1514. It contained, in 1840, forty-nine counties, which, with their population, were as follow:

| Northern District. |         |            |         |
|--------------------|---------|------------|---------|
| Counties.          | Total   | Counties.  | Total   |

## ALABAMA RIVER.

The capital is Tuscaloosa, situated on Black Warrior river. Mobile is the most populous and commercial place in the state. The other principal towns are Huntsville, Florence, Wetumpka, Montgomery, Cahawba, and St. Stephen's.

Near the gulf of Mexico, the country is low and level, with many swamps and savannas; the soil is sandy, and the prevailing timber is pine. The central part is an elevated table land, with a deep, rich, and productive soil, and a mild and healthy climate. Toward the N., the country becomes hilly and mountainous, beyond which is the valley of Tennessee river, on which, in some parts, the bottom land is low, and, near the Muscle Shoals, unhealthy.

Cotton is the chief production of the state, of which there were produced, in 1840, 117,128,822 pounds. Of wheat, 828,058 bushels; of Indian corn, 30,947,004; of oats, 1,406,263; of potatoes, 1,708,356; of tobacco, 272,203 pounds; of rice, 140,018. The exports, in 1840, amounted to \$12,854,804; and the imports to \$574,651. There were 152 stores engaged in foreign trade, with a capital of \$2,355,013, and 890 retail stores, with a capital of \$5,642,885. Domestic or family manufactures amounted to \$1,458,119; and the total capital employed in manufactures was \$4,130,064.

Mobile is the principal river, and is formed by the junction of the Alabama and Tombigbee rivers, and enters Mobile bay by two mouths. The Alabama is navigable for vessels requiring 6 feet of water, 60 m. above its junction, and has 4 or 5 feet of water 150 m. to the mouth of the Cahawba; and to the junction of Coosa and Tallapoosa, of which it is formed, it has, in its shallowest places, 3 feet of water. The Tombigbee, the other constituent of Mobile river, is navigable for schooners 130 m., to St. Stephen's; and for steamboats to Columbus, Mississippi. Black Warrior, a large branch of it, is navigable by steamboats to Tuscaloosa. The Chattahoochee, for a considerable distance, separates this state from Georgia on the E. The Tennessee curves southwardly from the N.E. to the N.W. corner of the state, and is navigable for steamboats to Florence, at the foot of the Muscle Shoals. Mobile bay sets up 30 m. from the gulf of Mexico, with an average breadth of 13 m. The principal literary institution is the university of Alabama, at Tuscaloosa, which has been simply endowed by the state, and is flourishing. La Grange college was founded in 1830 by the Methodists; and there is a Roman Catholic college near Mobile. The chief religious denominations are Methodists, Baptists, Episcopalians, and Roman Catholics.

There are two banks in this state, with an aggregate capital of \$3,922,000, besides a state bank with four branches, the capital of which in state bonds amounts to \$1,225,431. The state debt amounts to \$10,859,553.

This state has not neglected works of internal improvement. *Muscle Shoals canal* is designed to overcome an obstruction in Tennessee river, and extends from Florence 35½ m., and cost \$571,535; and when completed to Brown's ferry, at the head of the shoals, is estimated to cost \$1,361,057. *Huntsville canal* extends 18 m., from Triana on Tennessee river to Huntsville. *Montgomery and West Point rail-road* extends 87 m., from Montgomery to West Point, at the head of the rapids on Chattahoochee river, 30 m. above Columbus. *The Tusculum, Cortland, and Decatur rail-road* extends from Decatur, 44 m., to Tusculum. The Selma and Tennessee rail-road extends from Selma on Alabama river, 170 m., to Gunter's landing, on Tennessee river. *The Wetumpka rail-road* extends from Wetumpka, at the head of steamboat navigation on Alabama river, 55 m., to Fort Williams, at the head of the great falls on Coosa river, and is designed to unite with the Selma and Tennessee rail-road. *Cahawba and Marion rail-road* connects the two places, 35 m. distant.

The executive power is vested in a governor, elected biennially by the people. The legislative power consists in a senate and house of representatives; the former contains 30 and the latter 100 members. The legislature meets annually at Tuscaloosa, on the first Monday of November. The secretary of state is elected for two years, and the comptroller and treasurer annually, by the joint ballot of both houses of the legislature. The right of suffrage is possessed by every white male citizen of twenty-one years of age, who has resided within the state one year immediately preceding an election, and the last three months within the county, city, or town in which he offers his vote.

This state was originally included in the territorial limits of Georgia, except the part which belonged to Florida. In 1809, Georgia ceded all her territory W. of Chattahoochee river to the Mississippi river, to the United States, and in 1817 it was constituted the Mississippi territory, and Alabama continued a part of this territory until it was admitted to the Union and became an independent state in 1820.

**ALABAMA**, p. L. Genesee co., N.Y., 263 m. W. by N. Albany, 388 W. Pop. 1738.

**ALABAMA RIVER**, Ala., United States, gives name to the state in which it runs, and is formed by the junction of the Coosa and Tallapoosa rivers, both of which rise in

## ALABASTER.

Georgia. They are rapid streams and not navigable for any considerable distance above their junction. The Alabama pursues a very winding course in a W. and S.W.W. direction to the S.W. part of the state, where it unites with Tombigbee river to form Mobile bay, 40 m. above Mobile bay. See the article ALABAMA.

**ALABASTER, or ELEUTHERA**, one of the Bahamas or Lucayo islands, which see.

**ALACHUA** county, Flor., is situated on the W. side of the peninsula, bounded S.W. by the gulf of Mexico, and contains 9500 sq. m. It contains much good land, and its extensive prairies feed large herds of cattle. Sawannee river bounds it on the W. Watered by Wakulla and Whithacoochee rivers. The surface is level towards the coast, in other parts rolling. It had, in 1840, 5685 neat cattle and 9441 swine, and produced \$7,345 bushels of Indian corn and 2000 pounds of sugar. Pop. whites 1719, slaves 329, free-colored 1; total, 2048.

**ALAIS** (an. *Alais*), a town of France, dep. Gard, cap. of the Gardon. It lies at the foot of Cevennes, 95 m. N.W. Nîmes, lat. 45° 7' 39" N., long. 3° 4' 38" E. Pop. 11,740. It is ancient, and pretty well built. During the religious wars of France the inhabitants were distinguished by their attachment to the Protestant party, and to Louis XIV. constructed a fort in the town. It has a communal college, a tribunal of primary jurisdiction, a theatre, a public library, a communal Protestant church, &c. It has, also, manufactures of shawls, silk stockings, and gloves; with a glass-work, potteries, copper-works, &c. Besides its own produce, it has a considerable trade in the raw and dressed silk, oil, linen, &c. of the surrounding country. There are mines of iron and coal in the vicinity. —(Hugot, art. "Gard;" *Dict. Géographique*.)

**ALAND ISLANDS** (or. *Åland*), a group of islands at the entrance of the gulf of Bothnia, between 59° 30' and 60° 30' N. lat., and 19° 10' and 21° 7' E. long., consisting of more than 60 inhabited and upwards of 300 uninhabited islets and rocks (*Skärer*), occupying an area of about 470 sq. m., and divided into three oblong clusters by the straits of Belot and Lapped. The Baltic heads, belong to the S.; on the W. the straits of Alandsk separation them from Sweden, in which being about 94 m.; and on the E. the straits of Wättersk, which are scarcely two m. broad where they are narrowest, and about 14 where they are broader; intermediate between them and the Finland straits. Pop. 14,000, of Swedish extraction. Most of the islands stand at a considerable elevation above the level of the sea, and are intersected by chains of granite rocks, which occasionally rise into peaks, and are full of hollows. There are no rivers, but many small lakes. The surface is either a thin layer of clay or rich mould, slate-stone, or sand. The climate, though keen, and at times severe, is more temperate than that of Finland. There are extensive forests, chiefly of birches and pines; the pasture grounds are very poor, excepting some parts of the coast; and the Swedish land, on which rye and barley are mostly grown, produces a subsistence for cabbage consumption, the best yielding seven-fold. Hops, cabbage, parsnips, carrots, and other roots, potatoes, and a little flax, are likewise raised. Hens form an article of export. The hatched cattle, of which there are upwards of 15,000, are small in size, and few of the cows have horns; the latter furnish the "Aland cheeses," which are much sought after, and made principally in the island of Fagö. Of sheep there are above 15,000, the wool of which is converted into coarse stuff and mill-cloth; horses and goats are also bred in considerable numbers. The fisheries are productive, particularly of (*strömming*) herrings and seals, of the first of which 6000 tons and upwards are salted. Waterfowl abound. The exports consist of salt meat, butter, cheeses, hides and skins, dried and salted fish, wood for fuel, &c.; and the imports of salt, colonial produce, iron ware, woollen, cotton, and other manufactures, &c. The Alanders are excellent seamen, and navigate small vessels of their own that trade with the adjacent parts; they are Swedes in their language, manners, and usages. There are a number of good harbours, many of which have been fortified by the Russians, who keep up a disproportionately large military force in the islands, as well as a numerous militia, called the "Skarpskott." The islands contain 8 parishes and as many churches, and 7 churches or chapels of ease. Åland, the largest island, is nearly circular, being about 17 m. in length and 16 in breadth; it contains above 9000 inhabitants, and has an excellent harbour at Västana, on the W. side. It is divided by a narrow strait from Ekero, the westernmost island, which has a telegraph. On the E. coast of Åland is the old castle of Castelsholm, now in ruins. Kamlinge has a pop. of 3000. These islands were wrested by Russia from Sweden in 1809; and give the former a position from which they may easily make a descent on the Swedish coast.

**ALA-SHEHR**. (The exalted city, an. *Philadelphía*.) A city of Turkey in Asia, prov. Nakhia, famous as the seat of one of the Apocalyptic churches. It is situated 68 m. E.

## ALAYA.

Smyrna, near the Cyprian, partly in the plain, and partly on one of the roots of Tmolus, which, separated by a valley from the posterior range, and rising to a very considerable elevation, is the site of the Acropolis. The old wall of the town, formed of small stones, held together by a strong cement, and strengthened with towers, is broken down in many places, and the Acropolis is also in ruins. The modern houses are mean and irregular, and the streets narrow and filthy. The ruins of the church of St. John are of great antiquity, and ancient relics meet the eye at every step. Here, a broken Ionic column forms the angle of a house, and an architrave its step; three fragments of a rich cornice are built into a wall; a modern minaret is supported by the truncated shafts of antique columns; and sacred architecture is desecrated by conversion into common water-troughs; fountains in the dirtiest streets, and the very pavement on which one treads, bear witness to the antiquity; and in a neglected spot, near the S. wall of the city, amid dirt and rubbish, we remarked two venerable marble pillars lying unheeded on the ground." —(Elliot.) According to Mr. Elliot, Ala-Shehr contains nearly 2000 Turkish and 500 Greek houses; so that, supposing this statement to be correct, the pop. may be estimated at from 15,000 to 18,000.

It is the seat of a Greek archbishop, and divine service is regularly performed in five Christian churches. The Greeks, at present, as is in the time of Chandler, are exceedingly ignorant; and though few of them know any language except their own, the Liturgy is always read in the language of their forefathers. The country round is very fruitful—the wheat is said to be excellent in dyeing, and being sown on one of the most frequented roads to Smyrna, it is much resorted to by caravans, and has a good deal of trade. It is held in sacred, even by the Turks, that they occasionally convey their dead thither for interment from Constantinople; and apply to it the epithet of *Ala*, or the exalted.

Philadelphía derived its name from Attalus Philadelphus, husband of Eumeneus, by whom it was founded in the second century B.C. Strabo says that it suffered much from repeated shocks of earthquakes; and it was one of the fourteen cities which were partially or wholly destroyed by a subterranean convulsion in the reign of Tiberius. Anciently, indeed, it was matter of surprise, that it was not abandoned; but it continues to be a considerable place; and the church of Philadelphía is still erect, "a column in a scene of ruin." It was the last city of Asia Minor that submitted to the Turks. "At a distance from the sea, forgotten by the emperors, encompassed on all sides by the Turks, her valiant citizens defended their religion and freedom above four centuries; and at length (in 1390), capitulated to the proud sultan of the Ottomans (Bajazet)." —(Chandler's *Asia Minor*, the ed., p. 298; *Elliot's Travels*, ii. p. 85; *Gibbes*, cap. 64.)

**ALASSIO, or AERACI**, a sea-port town of the Sardinian States, prov. Alghero, cap. district, 5 m. S.W. Alghero. Pop. nearly 5000 industrious, active, and daring seamen. There is good anchorage opposite to the town, which consists of a long, narrow street. Fine coral is fished on the coast. A good harbour for the largest class of vessels might be found between cape Mele and the island of Gallura; but this has always been discouraged by the Genoese, the former masters of this part of Italy. —(Rampoldi *Corografia dell' Italia*, art. "Alasio.")

**ALTAMAHNA, or ALTAMAHNA**, a river of Georgia, formed by the junction of the Ocmulgee and the Ocmee rivers. It runs S.E., and falls into the Atlantic between Sapelo and St. Simons's islands, 60 m. S.W. Savannah. It is navigable on the Ocmee branch for vessels of 30 tons and for steam-boats 300 m., to Milledgeville. The bar at its mouth has 14 feet of water at low tide. The whole length to its source is about 500 m.

**ALATRI**, a city of Italy, Papal States, prov. Campagna, dioc. Frosinone, 8 m. N.E. Frosinone, lat. 41° 44' N., long. 12° 19' 15" E. Pop. circa 8000. It is the seat of a bishopric, has a cathedral, a collegiate church, and some convents. Antiquities are frequently dug up in the environs, which abound in olives and vines.

**ALATYR**, a town of Russia in Europe, gov. Simbirsk, at the confluence of the Alatyry with the Volga, 90 m. N.N.W. Simbirsk. Pop. 3000. It is built of wood, has tanneries, a glass-work, and a considerable trade in corn.

**ALAYA** (an. *Corecastrum*), a sea-port town of Turkey in Asia, Anatolia, cap. anjack of the same name, on the E. side of a lofty promontory, lat. 36° 31' 51" N., long. 36° 9' 34" E. Pop. 1500 or 2000. The promontory on which this town is built bears a striking resemblance to that of Gibraltar. It is joined to the continent on the N. by a low sandy isthmus, from which it rises abruptly, and its W. and E. sides consist of perpendicular cliffs 500 or 600 feet high. The E. side, on which the town is built, is also so steep that the houses seem to stand on the top of each other. "In short, it forms a natural fortress that might be rendered im-

## ALBA.

peagable; and the numerous walls and towers prove how anxiously its former possessors laboured to make it so." At present it is of trifling importance. Streets and houses miserable; mosques few and mean. When visited by Captain Beaufort it had no signs of commerce. The bay is open to southerly winds, and the anchorage indifferent.

Coraceum shut its gates against Antiochus when all the other towns of Cilicia had submitted; and at a subsequent period it was the place selected by the pirates at which to make a last stand in their struggle with Pompey.—(*Beaufort's Karamania*, p. 173, &c.)

ALBA, a town of the Sardinian States, in Piedmont, cap. prov. same name, on the Tanaro, 38 m. S.S.E. Turin. Pop. 7000. It has a tribunal of original jurisdiction, a cathedral, three parish churches, a college, and a considerable trade in cattle.

ALBACETTE, a town of Spain, prov. Murcia, 9 m. N.W. Chinchella, agreeably situated in a vast and fruitful plain. Pop. of town and suburbs 11,508. It has manufactures of coarse cloth and soap. Great quantities of wine and saffron are collected in its vicinity; and a great cattle market is annually held in September.

ALBAN (ST.), a town of France, dep. Lozère, 28 m. N.N.W. Mende. Pop. 2493.

ALBANIA, a large prov. of European Turkey, bounded N. by Dalmatia and Servia, E. by Macedonia and Thessaly, S. by Livadia, and W. by the Adriatic, along with that part of the Mediterranean called the Ionian sea. It thus comprehends, in its widest acceptation, the ancient Illyria and Epirus, and is at present included in the Turkish government of Romania.

ALBANO (TOWN, LAKE, AND MOUNTAIN OF), in the Papal dominions, in the Campagna di Roma. The town is situated in the line of the Appian Way, on a hill, near the S.W. side of the lake, about 14 m. S.S.E. Rome. Pop. 4300. This town is not built, as some have supposed, on the site of *Alba Longa*, which stood on the other side of the lake, but on the ruins of Pompey's villa. Its situation, at a moderate elevation above the level of the plain, fine salubrious air, shady walks, and magnificent views of the "eternal city," the Campagna, and the sea, make it a favourite retreat of the more opulent Roman citizens, particularly during spring and autumn. It is the seat of an archbishop; is well built; has a cathedral and some convents, with many fine palaces, among which may be specified those of the Corsini and Barberini families. At a little distance, on the margin of the lake, is Castel Gandolfo, the summer residence of the pope. The adjacent country is almost wholly appropriated to the culture of the vine; and the wine which it yields still maintains its ancient reputation.

The lake of Albano, a little to the N.E. of the town, is surrounded on all sides by very high banks, except towards the N., where they are a little lower. It has the form of an irregular ellipse, and there would appear to be little doubt that it occupies the crater of an extinct volcano. The distance round the crater, or summit of the basin of the lake, is estimated at about 8 m., and that round the water's edge about 4 m. It is in parts very deep; a variety of fish are found in it, among which are eels of an immense size and highly esteemed.

But the subterranean conduit or tunnel, called by the Italians an *emissaria*, for conveying away its surplus water, is the feature most worthy the attention of the intelligent traveller who visits this lake. This tunnel, intended to prevent the waters of the lake from injuring the surrounding country by overflowing its banks, and to keep them always at their present level, was completed at an early period of the Roman history (about 400 years B.C.), and bears unequivocal proofs of the sagacity and perseverance of those by whom it was executed. It is cut right through the mountain, and mostly through solid rock, a distance of considerably more than a mile, being generally about 3 feet 10 inches wide, and from 64 to 7 feet in height; at its entry from the lake, and its issue in the plain, it is solidly built round with large stones, arched at the top, and is in perfect preservation.\* This great work is said to have been completed in about a year; but it has been objected to this, that as only three or at most four men could have wrought together, and those at the outer end of the tunnel only, the other end being under water, it must have taken many years for its completion. But Piranesi has shown that after tracing the line of the tunnel above ground, shafts had been sunk, by which workmen might have been let down in various places, and the work completed within the stated time.†

\* For an account of the circumstances which are said to have occasioned the undertaking of this work, see *Leobus*, lib. vi., c. 15, 16, and *Cic. de Divinatione*, lib. ii., c. 44. No doubt, however, it was made, as Cicero has observed, "ad utilitatem ædificandi subterranei non ad arcum urbemque retinendam." (*De Divinatione*, lib. ii., c. 21.)

† M. Simoni has repeated this objection (*Tour in Italy and Sicily*, p. 916), apparently unconscious of what Piranesi had stated in his *Descrizione e Disegno dell' Emisario del Lago Albano*.

## ALBANY.

The Alton mount (*Mons Almus*), now *Monte Ceval*, lies a little to the E. of the lake. It is about 2600 feet in height; and the view from its summit, extending over Lethum and a great extent of country, is one of the noblest that can be imagined. It was crowned by a temple in honour of Jupiter Latiavis, where sacrifices were annually offered up by deputies from the various Latin states, with the Romans at their head, to their common father and protector. Here, also, the Roman generals, refused the honour of the great triumph in the city, performed the lesser triumph, or ovation, and sacrificed to Jupiter Latiavis. Some fragments of this famous temple existed in 1730; but they have since disappeared. (Besides the authorities referred to, see the excellent work of Lamidon on the *Antiquities of Rome*, p. 433-445.)

ALBAN'S (ST.), an ancient borough of England, co. Hertford, occupying the summit and sides of a low hill, on a feeder of the Colne, 30 m. N.N.W. London. It had in 1841 a population of 17,061, inhabiting 3346 houses. It has long had the privilege of returning two members to the House of Commons; the right of voting having been vested in the freemen, whether resident or not, and in the cot and lot householders. It is very ancient, and is either on or very near the site of the ancient Roman *Verulamium*. The abbey church is the most imposing object in the place, and is celebrated alike for its antiquity and great magnitude. It lately underwent a thorough repair. In the church of St. Michael is the tomb of the famous Lord Bacon, with a fine marble monument to his memory. There is a free grammar school, with several charitable institutions. The town is not thriving. Straw plait is the principal manufacture; and there are, besides, a cotton-mill and a silk-mill, but neither on a large scale. There is a market each Saturday. No. of £10 houses in pari. borough 507; constituency in 1837, 606.—(*Boundary Report*, &c.)

ALBAN'S HEAD (ST.), a cape of England, on the English channel, co. Dorset, lat. 50° 38' 10" N., long. 2° 6' 15" W.

ALBANY, county, N. Y. Situated in the E. part of the state, and contains 515 sq. m. Bounded E. by Hudson river. The surface is uneven in some parts, in others level; soil on the river fertile; in the interior sandy and unproductive. Drained by small tributaries of Hudson r. The Erie and Champlain canal form a junction on the N.E. border of the county. There were, in 1840, 25,784 neat cattle, 57,478 sheep, and 49,468 swine; and it produced 31,068 bushels of wheat, 145,941 of rye, 197,163 of Indian corn, 155,008 of barley, 103,583 of buckwheat, 653,794 of oats, and 540,393 of potatoes. There were forty-seven commission houses engaged in foreign trade, 1106 retail stores, eleven fulling-mills, eight woolen factories, two cotton-factories, with 5160 spindles, twenty-five tanneries, eight breweries, four potteries, six flouring-mills, twenty-two grist-mills, eighty-four saw-mills, one paper-mill, eleven printing-offices, three daily, five weekly, and two semi-weekly newspapers, five academies, 460 students, 119 schools, 9319 scholars. Pop. 68,363. Capital, Albany.

ALBANY, city, N. Y., the capital of the state, and of Albany co., is situated on the W. side of Hudson river, 145 m. N. New-York, by the course of the r., in 42° 29' 3" N. lat., and 73° 39' W. lon., and 3° 15' E. lon. from W. 164 W. by N. Boston, 320 S. Montreal, 370 W. Pop. in 1830, 12,630; 1836, 24,538; 1840, 33,731. Employed in agriculture, 144; in manufactures and trades, 1631; navigating the ocean, 8; do. rivers and canals, 106; in the learned professions, 337. On the margin of the river is a flat alluvial tract, from 15 to 100 yards wide, back of which the ground rises abruptly, and in the course of one mile attains to the height of 230 feet, beyond which it is level. Originally the city was not very regularly laid out, and some of the streets are narrow; but those more recently laid out are spacious and regular. State street, the principal early street, is from 150 to 170 feet wide, and has a steep ascent, at the head of which is the capital, a fine stone edifice, 115 feet long and 90 wide, with richly-furnished apartments for the accommodation of the state legislature, and cost \$190,000. In front of it is a handsome square, surrounded by an iron railing, and ornamented with walks, trees, and shrubbery. On the N. of this, and separated from it by a street, is another corresponding square, the whole constituting a fine public ground, on the E. side of which is the city Hall, a splendid marble edifice with a gilded dome; and on the same side of the same square is the state Hall for the public offices, a corresponding marble building. The Albany Academy, of free stone, is a fine edifice, situated on the N. square. The other public buildings are a Medical College, a Female Academy, the Exchange, a large building of granite, at the foot of State street, and thirty churches, four Presbyterian, one Associate Reformed, three Dutch Reformed, three Episcopal, four Methodist, one coloured Methodist, two Baptist, one coloured Baptist, two Lutheran, one Friends', one Independent Mission church, one Bethel, one Universalist, two Roman Catholic, and two

## ALBANY.

**Jewish synagogues.** The old state Hall, on the south side of State-street, is fitted up for the reception of the geological cabinet, collected in the geological survey of the state. The Albany Academy has able instructors, 400 students, and a liberal course of study. The Albany Female Academy has from 300 to 350 pupils, and has a high reputation. The Young Men's Association has a room in the Exchange building, 1500 members, a library of 3000 vols., a reading-room; and sustains through the winter season an able course of scientific lectures. The Albany Orphan Asylum supports 80 or 90 female children. The St. Joseph's Roman Catholic Asylum sustains 40 females, under the charge of the Sisters of Charity. The Poor-house, in the S.W. part of the city, has commodious buildings, and 150 acres of land, cultivated by its inmates. There are in the city 100 streets and alleys, eleven public squares, three markets, ten public school buildings, with dwellings for the teachers, and a state arsenal. There are eight banks, with an aggregate capital of \$3,751,000, and four insurance companies, with a total capital of \$700,000. There were, in 1840, forty-seven commission-houses engaged in foreign trade, 770 retail stores of different kinds, the whole employing a capital of \$1,635,000. The manufacturers are numerous and various, employing a total capital of \$1,735,500. Two ferries cross the Hudson r. at this place. Twenty steam-boats and fifty-one tow-boats ply between this city and New-York, and the intermediate places on the river. An ordinary passage of a line boat occupies about ten hours. A large number of sloops are also owned here, which ply on the river. By the Erie canal and a continuous line of rail-roads, Albany is connected with Buffalo, and shares extensively in the trade of the Far West. By the Champlain canal it receives the trade of the N. Rail-roads also extend to Saratoga, and another great line of rail-roads extends on the E. to Boston. A spacious basin,  $\frac{1}{4}$  m. long, is constructed on the margin of the river for the reception of canal-boats, and the protection of sloops against the descending ice in the spring. Albany was founded by the Dutch in 1614, and by them called Fort Orange, which was properly the name of the fort. It was chartered as a city in 1698.

ALBANY, P. L. Oxford co., Me., 68 m. W. Augusta, 507 W. It has one store, one grist-mill, three saw-mills, seven schools, 573 scholars. Pop. 1671.

ALBANY, L. Bradford co., N. H., 8 m. N. by E. Concord. Watered by Swift river. Chartered in 1760. It has five schools, 153 scholars. Pop. 408.

ALBANY, P. L. Orleans co., Vt., 39 m. N. Montpelier, 535 W. Watered by Black river. It has one store, one grist-mill, three saw-mills, ten schools, 535 scholars. Pop. 590.

ALBANY, L. Bradford co., Pa. Drained by Towanda creek. Pop. 503.

ALBANY, L. Berks co., Pa. It contains two churches, one Presbyterian and one Lutheran, six grist-mills, six saw-mills, and one oil-mill. Pop. 1057.

ALBANY, P. V. capital of Clinton co., Ky., 136 m. S. by W. Frankfort, 690 W.

ALBANY, P. V. Whitesides co., Ill., 177 m. N. by W. Springfield, 573 W. Situated on the E. side of Mississippi river.

ALBANY, P. V. Baker co., Ga., 198 m. S.E.W. Milledgeville, 785 W. Situated on the W. side of Flint river.

**ALBANY, a district of S. Africa,** belonging to Great Britain, at the E. extremity of the Cape colony. It has on the E. the Great Fish river, on the W. the Bushmans river, on the N. an imaginary line drawn from the junction of the Great and Little Fish rivers to the Konag, and on the S. the ocean. Its area has been variously estimated, but may probably amount to about 2000 sq. m. or 1,280,000 acres. Its aspect is highly pleasing, being diversified with hills and dale, its verdant pastures and smooth grassy knolls contrasting agreeably with the dark wooded forest, which clothe the broken ground near the river courses. Soil very various. The stiff clayey lands would be the most productive, were they sufficiently watered; but this is precarious, and the rivers are said not to be suitable for irrigation, light friable soils are preferred. Climate temperate, malarious, and suitable for European constitutions. Lions, wolves, and leopards, are occasionally met with, but are every day becoming rarer. Elephants are now seldom seen within the limits of the district. Horses, cattle, sheep, goats, hogs, &c., thrive remarkably well, and their produce forms the great dependence of the colonists. The country is traversed by numerous streams, of which the Great Fish river is by far the most important. Previously to 1820, there were not more than 1600 Europeans in the district; but government having given encouragement to emigration to this quarter, 3739 emigrants landed in 1820 at Algoa bay, whence the greater number proceeded to this district. For the first four or five years, the colonists suffered severely from a failure of the wheat crops; but their progress from 1825 down to 1835 was comparatively rapid, and presented a picture of prosperity and advancement not often to be met with in the early

## ALBONA.

annals, even of the most successful colonies. At the last-mentioned epoch, however, this career was suddenly arrested by an irruption of the Kaffers, who destroyed a great quantity of valuable property, and killed several of the colonists. This invasion having been repelled, and peace having been again restored with the Kaffers, a lieutenant-governor was appointed to the E. province, and the district is fast recovering from the losses it had sustained. In 1837, it had a population of 11,732, of which 11,500 were whites. During the same year, the births were 700, and the deaths only 150. The value of the produce exported in 1836 was £47,307; the principal articles being—hides, £15,476; wool, £7353; skins, chiefly goat, £5749; tallow, £2437; ivory, £23546; with horses, beef and pork, butter, &c. The colonists had, in 1834, 38,945 head of cattle, 104,000 sheep, and 9735 horses. Graham's Town, the cap. of the E. prov., and the residence of the lieutenant-governor, is situated almost in the centre of this district. It contained, in 1834, 519 houses, and 1800 inhabitants, exclusive of the military. A town, called port Francis, has been founded at the mouth of the Kowie river; but as the access to it is obstructed by a dangerous bar, it is doubtful whether it will ever become of any importance. The entire shipping trade of the district is at present carried from Port Elizabeth on Algoa Bay. (See *Cape Annals* for 1834 and 1836; *Port. Paps.*, Beemom, 1837, &c.)

**ALBARRAZIN,** a fortified town of Spain, prov. Arragon, on the Guadalquivir, with a cathedral, in a bleak and barren district. Pop. 2337.

**ALBEMARLE,** Sound, N.C., on the E. coast of the state, and is 60 miles long from E. to W., and from 4 to 15 miles wide. It receives the waters of Roanoke and Chowan rivers. It communicates with the ocean E. by several inlets, and with Pamlico sound on the S. It communicates with Chesapeake bay by a canal through the Diamond swamp.

**ALBEMARLE county, Va.,** situated in the central part of the state, and contains 709 sq. m. Drained by Bevarina river and its branches. It contained, in 1840, 14,819 free cattle, 30,519 sheep, 34,608 swine, and produced 336,936 bushels of wheat, 117,260 of rye, 711,518 Indian corn, and 2,499,526 pounds of tobacco. It had secretly four stores, one cotton factory with 1500 spindles, thirteen tan-works, four distilleries, fifteen flouring-mills, fifty-one grist-mills, forty-six saw-mills, two printing-offices and two weekly newspapers, one college, 247 students, eighteen academies, 400 students, twenty-one schools, 326 scholars. Pop. whites, 10,513, slaves, 13,809; free coloured, 603; total, 23,924. Capital, Charlottesville.

**ALBENGA** (an *Albium Inguensum*), an ancient seaport town of the Sardinian States, cap. prov. same name, 44 m. S.W. Genoa, on the Costa. Pop. 4000. It is the seat of a bishopric, and has several remains of antiquity. The situation is unhealthy; but the surrounding country is productive of oil and hemp. This is the birthplace of Proculus, a competitor with Pompey for the throne of the Caesars.

**ALBENQUE,** a town of France, dep. du Lot, cap. cant., 10 m. S.E.E. Cahors. Pop. 1984.

**ALBERT,** a town of France, dep. Somme, cap. cant., on the Miraumont, 15 miles E.N.E. Amiens. Pop. 2542. It has a cotton-mill, with print-works, bleach-works, paper-mills, &c. In its vicinity is a cave or quarry, where there are a variety of petrifications.

**ALBINO,** a town of Venetian Lombardy, prov. Bergamo, on the Serio, 7 m. N.E. Bergamo. Pop. 3200. It is very well built, the castle and gardens of Count Spini being particularly worthy of notice. There are silk flatures, with a manufactory of agricultural implements, and machinery for polishing whetstones, renowned all over Europe.

**ALBIO** (NEW), a large tract of the N.W. coast of America. This designation was given by Sir Francis Drake to California and part of the adjoining coast; but recent geographers, and, among others, Humboldt, limit the denomination of New Albion to that part of the coast which extends from the 43d to the 48th deg. N. Lat. It was carefully explored by Vancouver in 1792.

**ALBION, P. L.** Kenosha co., Mo., 96 m. N.E. Augusta, 621 W. It contains four stores, one grist-mill, four saw-mills, and 693 scholars in school. Pop. 1694.

**ALBION, P. V.** capital of Orleans co., N. Y., 950 m. W. by N. Albany, 392 W. It has a court-house, jail, county clerk's office, two banks, three churches, one Presbyterian, one Baptist, and one Methodist, an academy, a female seminary, eighteen stores, seven warehouses, one flouring-mill, and about 1400 inhabitants.

**ALBION,** a town of W.V.N.W. Albany. Watered by Salmon river, and has three stores, one grist-mill, eighteen saw-mills, sixteen schools, 581 scholars. Pop. 1503.

**ALBION, L.** Calhoun co., Mich. Watered by Kalamazoo river, and contains four stores, two flouring-mills, two grist-mills, four saw-mills, eight schools, 901 scholars. Pop. 932.

**ALBONA,** a small town of Itria, 25 m. E. Rovigno, whose vicinage is celebrated for its olives and vines.

## ALBUFIERA.

**ALBUFIERA**, a sea-port town, of Portugal, S. coast Algarve, 36 m. E. Lagos, lat.  $37^{\circ} 7' 30''$  N., lon.  $7^{\circ} 19' 15''$  W. Pop. 3000. Large vessels may anchor in the port, which is defended by a citadel and batteries. The inhabitants mostly subsist by fishing.

**ALBUHERRA**, a town of Spain, Estremadura, 14 m. S.E.E. Badajoz, on the river and near the mountain of the same name. Here, on the 16th May, 1811, a sanguinary conflict took place between the allied British, Spanish, and Portuguese troops under Marshal Beresford, and a French force under Marshal Soult. Each army lost about 7000 men in killed and wounded. On the allied side the chief brunt of the action fell on the British, who suffered severely. In the end Soult, who commenced the attack, was compelled to retreat.

**ALBUQUERQUE**, a town of Spain, with an old castle, prov. Estremadura, on the frontier of Portugal, 28 m. N.N.W. Badajoz. Pop. 5580. It has cloth and cotton manufactures.

**ALBURG**, p. t. and port of entry, Grand Isle co., Vt., 83 m. N.W. Montpelier, 357 W. It is a point of land projecting S. into lake Champlain, and is level, low, and fertile. It contains four stores, one grist-mill, one saw-mill. Pop. 1344. It contains a mineral spring of some celebrity.

**ALBY** (*Albige*), a city of France, cap. dep. Tarn, on the Tarn, which is crossed by an old-fashioned bridge, lat.  $43^{\circ} 55' 46''$  N., lon.  $9^{\circ} 8' 23''$  E. Pop. 6267. It is situated on a hill, and has few public buildings worth notice, except the cathedral, begun in 1377, and finished in 1480. It is ill-built; the houses being gloomy, and the streets narrow, crooked, and dirty; but the shady promenade of *la Lice*, on the side next the country, is universally admired. It has a public library, a museum, and barracks, with various manufactures of coarse cloth, macking, table linen, handkerchiefs, cottons, hats, paper, a foundry for balls, &c. The preparation of wood has been long carried on in the vicinity. Alby has suffered much at different periods for its attachment to Protestantism.

**ALCALA DE GIEVERT**, an ill-built town of Spain, prov. Valencia. Pop. 3600.

**ALCALA DE HENARES** (*Complutum*), a city of Spain, prov. Madrid, on the right bank of the river of the same name, 17 m. E.N.E. Madrid. Pop. 5800. Though much decayed from what it was in the 16th century, this is said by Mr. Townsend (l. p. 245), to be one of the handsomest, best built towns of Spain. It is surrounded by walls flanked with square towers, has a fine Gothic cathedral, a magnificent palace of the archbishop of Toledo, with numerous churches and convents. It is the seat of a university founded in 1510 by the illustrious statesman Cardinal Ximenes, which, next to Salamanca, is the most celebrated seminary in Spain: it had, in 1831, seventeen colleges and thirty-one professors. The cardinal also bequeathed his library to the university, and founded in it a printing-press, which produced, at his expense, in 1519-17, the famous Polyglott Bible, denominated the *Biblia Complutensis*; as imperishable and noble monument of his piety, learning, and liberality. The remains of the cardinal were interred in the college church. But it is the chief glory of Alcala de Henares to have given birth, in 1547, to Cervantes, the inimitable author of Don Quixote: it is also, the birthplace of the poet Figueroa, of Soles, the historian of Mexico, &c.

**ALCALA DE LOS GAZULES**, a town of Spain, prov. Cadiz, in a hilly and bleak district, totally unfit for tillage, but well adapted for rearing sheep, which, accordingly, constitutes the chief employment of the people: it is at a very short distance from the river Barbata, which flows into the sea 35 m. S.E. Cadiz. Close to the town are the remains of an old Roman castle. Dist. 36 m. E. Cadiz, and 43 m. S. Seville. Pop. of town and sub. 17,918.

**ALCALA LA REAL**, a town of Spain, prov. Jaen, on the Guadacota, at an elevation of more than 3700 feet above the level of the sea, 30 m. W.S.W. Jaen. Pop. 4574. It had, and perhaps still has, a rich abbey, with various churches, convents, and an hospital. On the 28th January, 1810, the French defeated the Spaniards in the vicinity of this town.

**ALCAMO**, a town of Sicily, in the Val di Mazzara, on the great road from Palermo to Trapani, 24 m. W.S.W. Palermo. Pop. said by Swinburne to be 8500; perhaps it may now be estimated at 10,000, the pop. of the district being, in 1831, 15,589. Streets straight, but ill paved and dirty. It is situated on high ground, in a fine, open, cultivated country, and is well sheltered by large woods of olive trees. Within the district of Alcamo, and at so great distance from the town, finely situated on an eminence, are the magnificent ruins of an ancient Doric temple—all that now remains of the once powerful Segesta! It is a parallelogram, 163 by 66 feet, and has 36 columns, which, when examined by Swinburne, were all, with one exception, perfectly entire. (For an account of the ruins, see Swinburne's *Two Sicilies*, 2, p. 238, 4to ed.)

## ALCIRA.

**ALCANTARATE**, a town of Spain, prov. Jaen, in a rugged, mountainous country, at a short distance from the river Guadajoz, lat.  $37^{\circ} 45'$  N., long.  $4^{\circ} 15'$  W. The Roman inscriptions seen here show its antiquity. Pop. 8800.

**ALCANIZ** (*Arab. for treasury*), a town of Spain, prov. of Teruel, Aragon, on the r. bank of the Guadalupe on a hill side, above which is a castle, built by James I. of Aragon, 62 m. S.E. Saragossa. Pop. 3834. A handsome collegiate church, with a noble portico, is the chief building. It is encircled by walls; and is connected by a canal, constructed by the Moors, with the Ebro. There are in the vicinity rich mines of alum, and thriving plantations of mulberry and other trees; there is also in its vicinity a pond which produces remarkably large fine eels.

**ALCANTARA** (from the Arabic *al-antar-at-al-saif*, the bridge of the sword), a fortified town of Spain, prov. Estremadura, lat.  $39^{\circ} 41' 30''$  N., long.  $6^{\circ} 43'$  W., and the cap. of a dist. having the same name. Pop. 3332. It stands on a steep hill, close to the E. bank of the Tago (running here N.W.), was called by the Romans, its founders, *Norte-Caesares*, and they, in the reign of Trajan, erected the famous bridge, whence its present name is derived. It was of granite, the length 577 ft., breadth 23 ft., span of the two centre arches 110 ft., thickness of piers 38 ft., height above river-level 175 ft.; in the middle of the bridge was a triumphal arch, 46 ft. high, with a Roman inscription. (*Laborda's Voyages Pittoresques*, where see views and sections of the bridge. Ponz, viii., 63.) This fine relic of antiquity was unfortunately destroyed, together with some adjoining buildings, by the British troops, June 10, 1808, owing to a mistake of military orders. (*Napier*, vol. ii., 316.) The river was once navigable up to this town, and before the separation of Portugal, in 1580, a large trade in fruit was carried on with Lisbon (*Mifano*); but it now serves only to turn a few mills, and to supply the people with dace, barbel, eels, and other fish, which greatly abound (*Ponz*). It is joined a little below Alcantara by the Alagon, Jardin, and Salor. At the expulsion of the Moors in 1313, which was aided by the knights of San Julian del Pereyro, the defence of the town was entrusted to them, and they thenceforward assumed the title of knights of Alcantara. The order is now a dignity of some value, and the monarch has been the grand-master since 1495. The knights, in 1506, built a handsome convent and church, which still exist. A cloth manufacture once existed here, but it has perished. Brick-making and tanning are all the signs now to be seen of industry.

**ALCANTARA**, a sea-port town of Brazil, prov. Maranhão, on a hill, 15 m. N.W. San Louis de Maranhão. The surrounding territory is productive of excellent cotton and rice; and the salt lakes, a little to the N. of the town, might yield the largest supplies if they were properly managed. Its port admits only small vessels.

**ALCANTARILLA**, a dist. and town of Spain, prov. Murcia, lat.  $37^{\circ} 36'$  N., long.  $1^{\circ} 13'$  W., 4 m. from the l. bank of the Segura. Dist. 5 m. S.W. Murcia, and 30 S.W. Alicante. Pop. 4037.

**ALCAREZ**, a town of Spain, prov. La Mancha, on the Guadarama, 45 m. W.S.W. Maanazares. Pop. 3900. It has a citadel, manufactures of cloth, mines of calamine and copper, and an aqueduct.

**ALCAZAR DE SAL**, a town of Portugal, prov. Estremadura, on the r. bank of the Sado, 29 m. S.E. Setubal. It is delightfully sit. in the midst of an extensive and fertile plain, and is chiefly distinguished for its salt-works and sedge-mat factories.

**ALCAZAR DE SAN JUAN**, a town of Spain, prov. La Mancha, lat.  $39^{\circ} 25'$  N., long.  $3^{\circ} 15'$  W., and the cap. of a dist. so called, which contains sixteen towns and villages. The dist. (besides its pasture, corn, oil, and fruits, which are abundant) produces salt-petre, and other minerals, supporting above 300 workmen and their families. The town contains twelve soap-factories, and had formerly forty. Dist. 45 m. N.E. Ciudad Real, 35 m. S.E. Toledo. Pop. of dist. 7000.

**ALCESTER**, a pa. and m. town of England, co. Warwick, 103 m. N.W. Lond., 16 m. W.S.W. Warwick. Pop. 2405. The town, situated at the confluence of the Aine and Arrow, has a handsome Gothic church, a free school, a good corn market, and carries on a pretty large needle manufacture.

**ALCIRA**, a town of Spain, prov. Valencia, on an island of the Xucar, 25 m. S.S.W. Valencia, and so low that the river, by rising 12 ft. above its usual height, inundates the town, lat.  $39^{\circ} 0'$  N., long.  $0^{\circ} 25'$  W. Pop. 8415. It is fortified and flanked with towers; has several churches, convents, and hospitals, with two fine bridges over the Xucar. This is a very ancient town, having been successively occupied by the Carthaginians, Romans, and Moors. The inhabitants are thrifty and intelligent farmers, superior to most in Spain, and in the immediate neighbourhood of the town they raise excellent pimientos and tomatoes. In addition to the rice and other produce of the district. About 2 m.

## ALCKMAER.

It is some Timestone hills, among which is a "Waldschu" cave (*Cueva de las Maravillas*), visited as a natural curiosity. (*Beules*.)

### ALCKMAER. See ALCKMAER.

**ALCOBAZA**, a town of Portugal, prov. Estremadura, lat. 39° 35' N., long. 9° W., 15 m. S.S.W. Leiria, and within 5 m. of the sea, at the confluence of two small rivers. Pop., according to Missao, 1716. It contains a very handsome and extensive Cistercian monastery, founded by Alfonso I., possessing a good library, with valuable MSS., and a collection of pictures, among which are portraits of all the Portuguese kings, from Alfonso I. to Donna Maria I. The cotton manufacture is carried on here to some extent; the Marquis de Pombal set 250 looms at work in the monastery; but the late disturbed state of the country has very much impaired the industrial resources of this place.

**ALCOLEA DEL REY**, a town of Spain, prov. Seville, 35 m. N.E. of that city, near the r. bank of the Guadalquivir, in the midst of a fine and productive plain. Pop. 3008. When the Guadalquivir was more navigable than at present, this town appears to have been of some importance; the completion of the projected canal will perhaps restore it to its former prosperity.

**ALCORA**, a town of Spain, prov. Valencia, 48 m. N.Valencia, in a country watered by the Mijares. Pop. 6060. Its agricultural and industrial products are not important.

**ALCOVER**, a town of Spain, prov. Catalonia, on the banks of the small river Angura. In the time of Alfonso VIII., it was a place of some importance; but the oppressions of the French, at different times, have driven away the principal landholders, and the people seem now to be in a very wretched condition. 13 m. N.N.W. Tarragona. Pop. 3300. Contrib. to rev. 30,000 reals v.

**ALCOY**, a town of Spain, Valencia, at the source of the Alcoy, 24 m. N. Alicante. Pop. of town and district 14,600. Besides churches and convents, it has a college, a considerable manufactory of fine cloth, soap works, and paper works; the contiguous territory is very fertile.

**ALCUDIA**, a town belonging to Spain, near the N. extremity of the Isle of Majorca, on a small peninsula between the bays of Pollensa and Alcudia, lat. 39° 50' N., long. 3° 8' E. Pop. 1018. Two stagnant pools, or Albuferas, lie between it and the bay; and the exhalations from them greatly injure the health of the inhabitants, a sickly and miserable race. The pools might be drained, and the soil rendered useful, if the natives were possessed of any enterprise or energy. Coral-fishing employs some forty vessels in the bay. At about 3 m. S.E. is a stalactitic cave, visited and well described by Antillon. (*Geog.*, p. 76.)

**ALCUDIA DE CARLET**, a town of Spain, prov. Valencia, in a plain about 8 m. from the Xucar, whose water supplies its rice grounds with nourishment. It is on the royal road of Madrid, about 18 m. S. Valencia. Pop. 3000.

**ALDBOROUGH**, a borough of England, W.I. co. York, wapentake Claro, 185 m. N.N.W. Lond., 18 m. W.N.W. York. Pop., in 1831, 680. Its former importance was wholly derived from its having enjoyed, since the era of Philip and Mary, the privilege of returning two members to the H. of C. It was disfranchised by the Reform Act.

**ALDBOROUGH**, or **ALDEBURGH**, a sea-port town of England, co. Suffolk, hund. Plumegate, 85 m. N.E. Lond. Pop. of bor. and pa. 1341. It returned 2 m. to the H. of C. from the 15th Elis. down to the passing of the Reform Act, when it was disfranchised. It has suffered much from encroachments of the sea.

**ALDEA DEL REY**, a town of Spain, prov. La Mancha (Ciudad Real), on the l. bank of the Jabalon, an affluent of the Guadiana, 17 m. S. Ciudad Real. Pop. 2900. The climate is very unhealthy, owing to inundations of the river, which a very slight industry might obviate. Here is a palace of the knights commanders of Calatrava.

**ALDEA GALEGA**, a town of Portugal, prov. Estremadura, metuary of the Tagus, on the E. side of the bay of Montijo, well known as a ferry station between Lisbon and the great road to Badajoz and Madrid. Pop. 3430.

**ALDEN**, p. l., Erie co., N.Y., 23 m. E. Buffalo, 270 W. Albany, 350 W. It contains one Presbyterian church, one cane, one woollen factory, three grist-mills, ten saw-mills, fourteen schools, 667 scholars. Pop. 1984.

**ALDERNEY**, an island belonging to Great Britain, in the English channel, 55 m. S. from the Isle of Portland, and 18 m. W. Capes la Hague in Normandy. The channel between Alderney, and the latter, called the Race of Alderney, is dangerous in stormy weather from the strength and rapidity of the tides. This island is about 34 m. in length by 4 m. in breadth, and had in 1821 a pop. of 1045. It is a dependency of Guernsey, and is principally celebrated for a small breed of cows, which afford excellent milk and butter. It has no good harbour.

**ALDSTONE MOOR**, a par. and m. town of England, co. Cumberland, Lenth ward, on the borders of Northumberland. The town stands on a hill washed by the Tyne.

## ALEPPO.

The parish contains 28,000 acres. Pop. 6938. It is chiefly celebrated for its lead mines, formerly the property of the earls of Derwentwater, and now of Greenwich Hospital. Their present (1826) annual produce is estimated at from 3800 to 4000 tons of pure metal.

**ALEDO**, a town of Spain, in the prov. of Murcia, sit. on a mountain side, 6 m. from the l. bank of the Sangonera, a branch of the Segura, and about 25 m. W.S.W. Murcia. Pop. 9330.

**ALENCÓN**, a town of France, cap. dep. Orne, in an extensive plain of the same name, on the Sarthe, near the western boundary of the dep., 66 m. S.S.E. Caen, lat. 49° 25' 45" N., long. 0° 5' 25" E. Pop. 12,877. The town is agreeably situated and well built; streets generally broad and well paved; the walls by which it was formerly surrounded have nearly disappeared, and it has several considerable suburbs. Among the public buildings may be specified the cathedral church, the town-house embodying two well-preserved towers, the only remains of the ancient castle of the dukes of Alençon, the courts of justice, the com-market, &c. It has a communal college, several hospitals, a public library, and an observatory. Its manufactory of the lace, known by the name of *Point d'Alençon*, established by Colbert, still preserves its ancient celebrity, and it has in addition manufactures of muslin, of coarse and fine linen, buckram, serge, stockings, straw hats, &c., with tanneries. There are freestone quarries in the neighbourhood; and at Hartz, a little to the W. of the town, are found the stones, called Alençon diamonds, which when cleaned and polished are said to be little inferior, in respect of lustre, to the genuine gem. Several fairs are held in the town, which is the seat of a considerable commerce. During the religious wars, Alençon, which was generally attached to the Protestant party, suffered severely.—(*Eugs.* art. *Orne*; *Dictionnaire Géographique*, &c.)

**ALENQUIR**, a town of Portugal, prov. Estremadura, 95 m. N.N.E. Lisbon. Pop. 3000. It is one of the principal points for the defence of Lisbon.

**ALENTEJO**, a prov. of Portugal, which see.

**ALEPPO**, a city in the N. of Syria, called by the natives, Haleb-ou-Shabha (an. *Chalphen* and *Berres*), lat. 36° 11' 25" N., long. 37° 10' 15" E.; 76 m. E.S.E. Iskenderoon, and 156 m. N.N.E. Damascus. Its present pop. is probably under 70,000; though from the middle of the 17th to the beginning of the present century it was variously estimated at from 300,000 to 250,000. According to Russel, it had in 1794, 235,000 inhab. of whom, 20,000 were Christians, and 3000 Jews, the rest being Mohammedans; but, according to Volney, the pop. in 1788 did not exceed 100,000, which we incline to think is the more probable statement. Aleppo occupies an elevation in the middle of an open plain; and is surrounded by walls 30 ft. high and 30 broad; supposed, from the massive style of its architecture, to be Sarcenic. The city, within the walls, is about 34 m. in circ. but including its suburbs, it occupies a circuit of more than double that extent. Houses of freestone: they are said to be elegant and durable, and those belonging to the better classes exhibit an elaborate degree of ornament in their lofty ceilings, decorated with arabesques; and their large windows of painted glass. Roofs flat, as in most Eastern towns; during the summer months, the inhabitants pass their nights upon them, unprotected by tents or awnings of any kind. These flat roofs form also a continuous terrace, upon which it is easy, by climbing over the low partition walls, to pass from one end of the town to another. Streets broad, well paved, and clean, remarkable qualities in the East: the latter may, perhaps, be owing, in part, to the drainage, occasioned by the slight elevation of the town and neighbourhood above the surrounding plain. The seraglio, or palace of the Pacha, which used to be admired for its magnificence, was destroyed in 1819-20 during the siege of the town by Khourchid Ahmed Pacha. Mosques numerous, but nearly all have been injured, and many of them are in ruins, from the effects of the earthquakes which have so often shaken this part of Syria: the Djamed, Zacharie, and El-Halawa, are, however, fine remnants of the ancient Roman style; they were originally Christian edifices, the latter built, it is said, by the Empress Helena. There are ten or twelve Christian churches, three Christian convents, and several wakfs, the conventual establishments of the Mohammedans. An ancient aqueduct conveys a plentiful supply of good water from two springs. This work is an object of much care; and it is singular, that being certainly constructed before the time of Constantine, it should have remained uninjured amid the frequent convulsions to which the town has been subject. In the centre of the city\* is a castle, partly in ruins, built upon an artificial mount, of considerable height,

\* This is Volney's statement. Robinson describes the castle as situated at the N.E. corner; the apparent discrepancy probably arises from the one including, and the other excluding the suburbs. The N.E. corner of the walled town would be nearly the centre of the whole mass of buildings.

## ALEPPO.

and 1/2 m. in circumference; this is surrounded by a broad and deep, but dry ditch, crossed by a bridge of seven arches. From this spot is commanded a very extensive view, bounded N. by the snowy tops of the Taurus, W. by the elevated rocky bed of the Asany; while to the S. and E. the eye reaches over the desert, as far as the Euphrates. Here are several large khans, principally occupied by Frank and other foreign merchants. These are handsome and convenient buildings, containing counting-houses and store-rooms ranged round an interior court, in which are stands for loading and unloading the beasts of burden, and a fountain to supply them with water. At present, however, Aleppo can be regarded as little more than the shadow of its former self: slight earthquakes are frequent in its neighbourhood, but in 1833 a tremendous shock overturned most of the public buildings, and reduced the greater part of the city to a heap of ruins. This calamity has occasioned the erection of a new suburb, materially altering the appearance, and injuring the beauty of the town. The houses in this suburb, intended at first for the temporary shelter of the population that had escaped from the town, were hastily constructed of wood, lath, and plaster; but from want, either of funds to repair their more substantial dwellings, or of energy to set about the work, or probably from a fear of returning into the city, these hastily constructed edifices have become permanent residences, while many, perhaps the greater number, of the large and convenient stone buildings in the city are either in ruins or tenanted.

Although upon the borders of the desert, Aleppo is advantageously and agreeably situated. A small stream, called the Koelik (an. *Khalas*), waters the W. side of the town. This brook, which is about the size of the New River, and nearly dry, swells, in the rainy season to a formidable and rapid current; it rises at the foot of mount Taurus, about 70 m. N., and after a course of 50 or 60 m. loses itself in a large morass full of wild boars and pelicans. The upper course of the Koelik lies between naked rocks; but near Aleppo, and S. of that town, it flows through an extremely fertile valley, in a high state of cultivation. This river, and the aqueduct before mentioned, furnish an abundant and unfailing supply of water; and besides the public fountains and baths, every private individual, who chooses to be at the expense of pipes, may have his house served with water in the European fashion.

The far-famed gardens of Aleppo are situated to the S.E. of the city, upon the banks of a small rivulet, one of the very few affluent of the Koelik. They are rather orchards than gardens, consisting of fruit trees, with vegetables growing between them, but scarcely any flowers. They are pleasant spots, from the luxuriance of their productions, and the nightingales that resort to their shades; but very little taste is exhibited in their arrangements. W. of the town the banks of the river are covered with vines, olives, and fig-trees, and towards the E. are some plantations of pistachio trees, which, though still extensive, are only the remains of much more majestic groves, for which this country was formerly famous.

The air of Aleppo is dry and piercing, but accounted salubrious both to natives and strangers; the former, however, are subject to a peculiar disease, said to attack them once, at least, in their lives, the *kebel-se-sine*; "ulcer," or "ring-worm of Aleppo." It is, at first, an inflammation of the skin, subsequently becomes an ulcer, continues for a year, and generally leaves a scar for life. It usually fixes in the face, and an Aleppine is known all over the East by the mark left by this disorder, the cause of which is unknown, but suspected to be owing to some quality of the water.

Aleppo appears to have risen to importance on the destruction of Palmyra. Like the latter, it was a convenient emporium for the trade between Europe and the East, so long as it was carried on over land. The productions of Persia and India came to it in caravans from Bagdad and Bussora to be shipped at Iskenderon and Latakia for the different ports of Europe. Aleppo communicated also with Arabia and Egypt, by way of Damascus; with Asia Minor, by Taurus; and with Armenia, by Diarbekir. It rose to great wealth and consequence under the Greek sovereigns of Syria, and into still greater under the early Roman emperors. In 636, A.D. it resisted the arms of the Arabs for several months; but being finally taken, it became of as much importance under the Saracens, as it had before been under the Romans or Greeks. In the 10th century, it was reunited to the empire of Constantinople, by the arms of Zimiscos; but it soon after fell into the hands of the Seljukian Turks, under whose sway it remained during the time of the crusades. It suffered considerably during the irruptions of the Mongols, in the 13th century, and again, by the wars of Tamerlane, or Timur Bee, in the 15th. Selim I. annexed it in 1516, to the Turkish empire, of which it constituted a part till 1839, when it opened its gates to Ibrahim Pacha without a summons. Its political revolutions, with the exception of its two captures by the Tartars, affected its pros-

## ALEUTAN.

perity only temporarily and in a slight degree; but the discovery of a passage to India by the Cape of Good Hope struck a deadly blow at its greatness. Since that event it has continued to decline, and the earthquake of 1833, together with the wars which have distracted Syria, by causing extensive emigrations, have reduced it to comparative insignificance. Its capabilities are however very great, and under judicious treatment it is more than probable it would speedily regain a considerable share of its former prosperity. It is the most convenient centre for the trade between Persia and the interior of Arabia, on the one hand, and Asia Minor and Armenia on the other; it is beyond all comparison the cleanest and most agreeable town in Syria; and still, even amidst its ruins, better built than almost any other between the Black sea and the Euphrates; its inhabitants, a great proportion of whom are sherrifs (descendants of the Prophet), are the mildest and most tolerant among the professors of Mohammedanism. These circumstances have made it the resort of strangers, and they are not likely, in peaceable times, to have less influence in future.

Aleppo formerly possessed several manufactures, and before the earthquake it was said to contain 12,000 artisans, chiefly weavers of gold and silver lace, silk and cotton goods, shawls, &c. These works are now languishing, but they still exist, and, with the pistachio nuts, form the chief part of its remaining trade. Its imports are goats' hair, from Asia Minor; gall nuts, from Kurdistan; and Indian goods, such as shawls and muslins. From Europe, it receives cotton stuffs, cloth, sugar, dye-stuffs, &c.; W. I. coffee, though a prohibited article, is also introduced, and is cheaper than that from Mecca.

About 50 miles N.W. of Aleppo, is the convent (in ruins) of St. Simon Stylites, where some fragments of the pillar on which that famous ascetic passed so many years are still exhibited. The ruins of the convent attest its former magnificence, and a great number of deserted villages, in this direction, evince the former population of the neighbourhood.—*Olivier, Voy. dans l'Em. Oth.* iv, 169-206; *Russell, Nat. Hist. of Alep.* 77 & passim. *Vesely, ii.* 194-199; *Robinson, ii.* 250-266; *Brown, 364-368.*

ALESSEINA, a town of Russia in Europe, gov. Toula, cap. district, on the Oka, 34 m. N.W. Toula. Pop. 2300. It has several breweries; and manufactures hats, soap, &c.

ALESSANDRIA, or ALEXANDRIA, an important town and fortress of the Sardinian states, prov. of the same name, in a marshy country on the Tanaro, near where it is joined by the Bormida, 47 m. E.S.E. Turin, lat. 44° 53' N., long. 6° 36' E. Pop. 36,000. It has a very strong citadel, and was surrounded by Napoleon with extensive fortifications, which have been demolished since his downfall. It is well built; has a cathedral, numerous churches, palaces, and hospitals; a handsome town-house, with a gymnasium, theatre, public library, and large barracks. It has manufactures of silk, cloth, and linen, and some trade. The letter is promoted by its two fairs, held the one at the end of April, and the other on the 1st of October; they are both well attended, not only by Italians, but also by French and Swiss. Alessandria was founded in the 12th century, and has frequently been taken and retaken. It has always been reckoned one of the bulwarks of Italy on the side of France. The village and battle-field of Marengo lie a little to the E. of the town.

ALEUTAN, or ALEUTIAN ISLANDS, a chain of islands in the N. Pacific ocean, stretching from the peninsula of Kamtschatka, in Asia, to Cape Alaska, in N. America, comprised in the Russian government of Irkutsk. They are very numerous, occupying a circular arc, extending from 165° to 180° E. long, whose chord is in 53° N. lat., and above 600 m. in length. Apparently, this insular chain consists of the summits of a range of submarine mountains. In 1793, a volcanic island rose from the sea, in the middle of the line, which, in 1807, was found to be enlarged to about 30 m. in circuit, and lava was then flowing down its sides. There are always among them several volcanoes in activity, and some, known to have emitted flames, are now quiescent. Earthquakes are common, and sometimes as violent as to throw down the huts of the inhabitants. Behring's Island, Attoo, and Onnashka, are the largest, the first being 164 m. in length, but many are only inconsiderable rocks. They are intersected by channels, various alike in width, and in the safety of navigation. All exhibit a barren aspect; high and conical mountains, covered with snow during a great portion of the year, being the most prominent features. Vegetation scanty; there are no trees nor any plants surpassing the dimensions of low shrubs and bushes. But abundance of fine grass is produced in the more sheltered valleys, and different roots, either indigenous or introduced recently. The seas abound in fish, and the fished tribes are numerous. The hunting the sea otter, whose skin affords a fur of the finest quality, was, formerly, carried on to a great extent; they were wont to be caught in thousands; but their indiscriminate destruction has greatly

## ALEXANDER.

reduced the number of those now taken. The seal is particularly valuable, affording the inhabitants a constant supply both of food and clothing; the thin membrane of the outside is also converted into a substitute for glass. Foxes are the principal quadrupeds. The natives are of middle size, of a dark brown complexion, resembling an intermediate race between the Mongol Tartars and N. Americans. Their features, which are strongly marked, have an agreeable and benevolent expression. Hair strong and wiry; beard scanty; eyes black. They are not deficient in capacity, and the different works of both sexes testify their ingenuity. They are indolent, peaceable, and extremely hospitable; but stubborn and revengeful. Tattooing, which was common among the females, is on the decline, but they practice a hideous mode of disfiguring themselves, by cutting an aperture in the under lip, to which various trinkets are suspended. These deformations, however, are less common than when the islands were discovered; the more youthful females having learned that they are no recommendations in the eyes of their Russian visitors. A man takes as many wives as he can maintain; they are obtained by purchase, and may be returned to their relations; or the same woman may have two husbands at once; and it is not uncommon for men to exchange their wives with each other. Their subsistence is principally obtained by fishing and hunting. Their dwellings are spacious excavations in the earth, roofed over with turf, as many as 50 or even 150 individuals sometimes residing in the different divisions. Only a few of the islands are inhabited; but in former times the population is said to have been more considerable. Its decrease is ascribed to the exactions of the Russian American Company, who have factories in the islands. Its present amount has been variously estimated, at from a few hundreds to 6000. The islands were partially discovered by Behring, in 1741.

ALEXANDER, p. t. Washington co., Mo., 25 m. N. by W. Machias, 308 E.N.E. Augusta, 768 W. It has six schools, 237 scholars. Pop. 513.

ALEXANDER, co., Ill. Situated in the S. part of the state, and contains 375 sq. m. It is between the Ohio and Mississippi rivers, extending S. to their junction. A part of it is liable to be overflowed. It had in 1840, 2938 neat cattle and 10,338 swine. There were produced 3477 bushels of wheat, 84,090 of Indian corn. It had thirty-four stores, ten grist-mills, nine saw-mills, eight schools, 190 scholars. Pop. 3313. Capital, Unity.

ALEXANDER, p. t. Genesee co., N. Y. 8 m. S.W. Batavia, 398 W. by N. Albany, 369 W. It has four stores, one woolen factory, four fulling-mills, two grist-mills, four saw-mills, one academy, 380 students, fourteen schools, 516 scholars. Pop. 29,423.

ALEXANDER, p. t. Athens co., O., 78 m. S.E. Columbus, 345 W. It is one of two townships granted to the Ohio university, located at Athens. It has five stores, three grist-mills, twelve saw-mills, five schools, 130 scholars. Pop. 1451.

ALEXANDER, t. Benton co., Mo. Pop. 1015.

ALEXANDRETTA. See ISKENDERHOON.

ALEXANDRIA (Arab. *Iskenderiyah*), a celebrated city and sea-port of Egypt, so called from Alexander the Great, by whom it was either founded, or raised from obscurity, 233 years B.C.; about 14 m. W.S.W. of the Canopic, or most W. mouth of the Nile, on the ridge of land between the sea and the bed of the old lake Mareotis, lat. 31° 13' 35" N., long. 29° 53' 33" E. Its situation was admirably chosen, and does honour to the discernment of its illustrious founder. Previously to the discovery of the route to India by the Cape of Good Hope, Egypt was the principal centre of the commerce between the E. and W. worlds; and it so happens that Alexandria is the only port on its N. coast that has deep water, and is accessible at all seasons. It has not, it is true, any natural communication with the Nile, but this defect was obviated in antiquity by cutting a canal from the city to the river. After Alexandria came into the possession of the Saracens, this canal was allowed to fall into disrepair; and it was not to be supposed that any attempt would be made to reopen it, while Egypt continued subject to the Turks and Mamelukes. But Mohammed Ali, the present ruler of Egypt, being anxious to acquire a navy, and to revive the commerce of the country, early perceived the importance of Alexandria, both as a station for his fleet, and a centre of commerce. In furtherance of his views he has greatly improved, beautified, and strengthened the city, and has restored the ancient communication with the Nile by means of the Mahmoodieh canal from Alexandria to Foush, a distance of 48 m., opened in 1819. It is to be regretted that its construction is in several respects defective; but it is, notwithstanding, of great advantage. Alexandria is built partly on a peninsula, consisting of the island of Pharos, so famous in antiquity for the lighthouse or pharos, whence it has derived its name, and partly on the isthmus by which that island is now connected with the mainland. The prin-

## ALEXANDRIA.

cipal public buildings, as the palace of the Pacha, the hospital, the Arsenal, &c., are on the peninsula, and the town principally on the isthmus. The ancient city was situated on the mainland opposite the modern town; and the vast extent of its ruins would sufficiently evince, were there no other evidences, its wealth and greatness.

Alexandria has two ports. That on the W. side of the city, called the old port, the *Esneetee* of the ancients, is the largest and by far the best. The entrance to it is narrow and rather difficult; but when in, ships may anchor off the town in from 22 to 40 feet water, and there is good anchorage in deep water all along the shore. The new harbour, or that on the E. side of the town, is very inferior, being comparatively limited, having a fodi and rocky bottom, and being exposed to the N. winds.

The change in the appearance of Alexandria during the last dozen years has been quite extraordinary—"J'allais," says Marshal Marmont, "visiter l'arsenal et l'escadre. J'étais extrêmement impatient de voir cette création étonnante, et, pour ainsi dire, incompréhensible. En 1803, il n'existait sur la presqu'île d'Alexandrie qu'une plage aride et déserte. Je la trouvai, en 1834, couverte par un arsenal complet, bâti sur la plus grande échelle; par des cales de vaisseaux, de ateliers de tous les genres, des magasins pour tous les approvisionnements, une corderie de mille quarante pieds de longueur (dimension égale à celle de la corderie de Toulon). J'y trouvai rassemblés des ouvriers nombreux, habiles dans tous les métiers qui se rattachent au service de la marine, et qui tous étaient Égyptiens; tout cela organisé, en mouvement, en plein service. Et de cet arsenal, dont les fondations datent de six ans, il est sorti dix vaisseaux de ligne de cent canons, dont sept étaient armés, avaient déjà navigué, et trois étaient sur le chantier, prêts à être lancés à l'eau. Je ne parle pas des frégates de divers rangs, des corvettes et des bricks, qui portent la flotte à plus de trente bâtiments armés. Ces prodigieux résultats ont été obtenus avec cette promptitude si grande, dans un pays où il n'y a ni bois, ni fer, ni cuivre, ni ouvriers, ni matériaux, ni officiers de marine; aucun des éléments, enfin, qui peuvent servir à la création d'une escadre. Je ne crois pas que l'histoire du monde entière, ait jamais présenté dans aucun temps rien de pareil."

A dry dock is at present (1837) in course of being constructed. Naval and military hospitals have been established, the former under the direction of an English, the latter of a French doctor. A quarantine board exists under the direction of the consular body, to which the Pacha has confided this branch of service, and connected with which, a large and commodious lazaretto has lately been erected outside the walls. Vessels arriving from any of the infected ports of the Levant, are subjected to quarantine, the same as in Europe; there is also a school for the marine, and a board composed of the admirals and higher officers of the fleet, for examining into the merits of candidates, maintaining the discipline and regulating every matter connected with that branch of service. The French system has been adopted in every department of the service, and to the French the Pacha is chiefly indebted for the advances he has made.

On the peninsula has been erected the *Schura*, or range of warehouses for the reception of the surplus produce of Egypt, and thither it all comes, with the exception of that exported from Suez and Cosseir, for the maintenance of the army and fleet in the Red Sea. According to the Pacha's monopolizing system, the whole produce of the country comes into his hands, at prices fixed by himself, without the option of resorting to other markets being allowed to the grower. And not only does this apply to the produce of Egypt, but to that of the adjacent countries, wherever the Pacha's influence extends, embracing the coffee of Mocha, the gums and drugs of Arabia, the tobacco of Syria, elephant's teeth, and feathers from the interior, &c., all of which are purchased for him in the first instance, the prohibition of trading in them applying to every one, and carrying with it the risk of confiscation, if contravened; the whole of this produce, native as well as exotic, being collected in Alexandria, is sold by public auction, in the same way exactly as auctions are conducted in Europe, the upset price being fixed according to the latest report of the markets, the merchant having the privilege of examining the article in the *Schura* before the sale, and being required to pay in cash the price at which it is knocked down to him within a limited number of days, when delivery takes place. The principal articles thus disposed of, are cotton, which is by far the largest, rice, opium, indigo, gums, coffee, senna, hemp, linseed, and the *comestibilia* of the country, wheat, barley, beans, lentils, &c., of which however there has lately been very little sold, there being barely enough produced for the home consumption. Ten years ago, a million of quarters of corn were generally exported, but now everything yields to cotton, which is found more profitable to the revenue. The cotton, gums, coffee, indigo, linseed, and some other articles

## ALEXANDRIA.

of less importance, go to the markets of Trieste, Leghorn, Marseilles, and Liverpool; the rice and opium to Smyrna, the Greek isles, and Constantinople. England sends in return, iron, lead, coal, ordnance, cables, anchors, machinery, and some manufactured goods, though not much. France, Switzerland, Italy, and Germany return wines, spirits, oils, manufactures of silk and cotton, articles of dress of every description, furniture, hardware, trinkets, and other things, suited not only to the consumption of Egypt, but of Abyssinia and the countries in the interior. Austria sends timber and other articles. From Turkey and the isles are received silks, tobacco, oils, and some wood and fruits. There is also a little commerce with Malta and the Barbary states, in grain chiefly.

According to official statements furnished by the French consul, the value of the imports into Alexandria, in 1837, amounted to 71,817,000 fr. (£2,873,000), and that of the exports to 55,687,000 fr. (£2,937,000). The imports were derived from, and the exports shipped for, the undermentioned countries, as follows:

| Imports.          |            | Exports. |            |
|-------------------|------------|----------|------------|
|                   | Fr.        |          | Fr.        |
| England and Malta | 15,124,000 | France   | 5,494,000  |
| Austria           | 18,250,000 | Belgium  | 14,532,000 |
| Belgium           | 385,000    | Spain    | 11,440,000 |
| France            | 10,702,000 | Greece   | 234,000    |
| Greece            | 1,859,000  | Sardinia | 111,000    |
| Sardinia          | 145,000    | Sweden   | 25,000     |
| Sweden            | 117,000    | Holland  | 3,130,000  |
| Tuscany           | 10,807,000 | Turkey   | 15,100,000 |
| Turkey            | 15,861,000 | Barbary  | 1,514,000  |
| Barbary           | 4,534,000  | Syria    | 6,858,000  |
| Syria             | 5,756,000  |          |            |
| Total             | 71,817,000 | Total    | 55,687,000 |

The description of articles imported and exported, and the value of each, were as follow:

| Imports.                             |            | Exports.             |            |
|--------------------------------------|------------|----------------------|------------|
|                                      | Fr.        |                      | Fr.        |
| Wool of all kinds                    | 529,000    | Coffee               | 1,280,000  |
| Timber for building & fuel           | 2,943,000  | Corn                 | 1,085,000  |
| Woolen caps                          | 1,810,000  | Cotton               | 24,358,000 |
| Cochineal                            | 421,000    | Dates                | 1,250,000  |
| Copper and copper wire               | 1,544,000  | Tortoise shell       | 185,000    |
| Coin                                 | 795,000    | Income               | 1,015,000  |
| Clutch                               | 8,623,000  | Gum                  | 3,112,000  |
| Drugs                                | 1,485,000  | Henna                | 655,000    |
| The plates and iron wire             | 2,822,000  | Indigo               | 1,591,000  |
| Fresh and dry fruit                  | 1,165,000  | Dried fruit          | 300,000    |
| Oil                                  | 1,119,000  | Mother of pearl      | 250,000    |
| Paper                                | 1,106,000  | Mats                 | 562,000    |
| Jewellery, haberdashery, and cutlery | 2,688,000  | Opium                | 880,000    |
| Sugar                                | 585,000    | Skins                | 874,000    |
| Cotton stuffs                        | 16,923,000 | Orich feathers       | 854,000    |
| Woolen do.                           | 1,980,000  | Rice                 | 7,749,000  |
| Silk do.                             | 2,823,000  | Senna and other med. |            |
| Glass                                | 668,000    | cines                | 1,754,800  |
| Wines and liquors                    | 712,000    | Soda                 | 1,296,000  |
| Different articles                   | 20,887,000 | Iran cloth           | 1,641,000  |
|                                      |            | Different articles   | 10,386,000 |
| Total                                | 71,817,000 | Total                | 55,687,000 |

The effect of the present monopoly system of the Pacha has been to drive out of the field large classes of traders, who before his time were rich, and had considerable influence; such as the coffee and tobacco merchants, to whom Napoleon, in his wants, never applied in vain; and to reduce all the native merchants and retailers to comparative beggary, as well as the Fellahs or peasants, whose condition is now little better than that of serfs, without interest in the produce of their labour. If his successor persevere in the same system, the country must ultimately be ruined, and that at no very distant period. A few Frank merchants (by which name the Europeans generally are designated), have alone thriven and arrived at wealth under the present system, not in the ordinary course of commerce, but by enjoying the confidence of the Pacha, acting as commission agents for him, negotiating his finance transactions, and by fortunate speculations in cotton, that is, by having taken cotton in payment of their advances, which they afterwards sold at a profit.

There is no doubt that the population has trebled or quadrupled since the opening of the Mahmoodieh canal, and is still on the increase. It may amount, in all, to from 20,000 to 40,000. A good deal of this increase has taken place at the expense of Rosetta, which has latterly very much declined. The population is of a mixed character, consisting, besides the native Turks and Arabs of Armenians, Greeks, Smyrniotes, Syrians, Moghrebins, or men from the Barbary states, Maltese, Jews, and Europeans of almost every nation, in such numbers, that it may be questioned, whether the strangers, in a communion, would not be more than a match for the natives. The English have ten commercial houses, independently of those engaged in other pursuits, yet

they are outnumbered about the waterfront in numbers, the French, Italians, and Greeks, being the most numerous. Amateur French and Italian theatres exist, the performances in which rival those of the Académie Royale and San Carlos; balls and dances are given in the most approved style of fashion; a commercial journal has been established in the Italian language, which, however, does not treat of politics; French *modistes*, tradesmen in all departments, and shops displaying every article of furniture, and of male and female attire, from the Parisian bonnet of the latest fashion to the very humblest article of dress, all conspire, in conjunction with the style of the buildings, and pretty equal balance of hat and turban, to take away from this place the appearance of an Oriental city; and it is only after leaving it, and pursuing his way to Cairo, that the stranger truly feels that he is in the East. Here also exist Catholic and Greek convents, where divine service is performed on Sundays and holidays to the people of those persuasions: the Armenians, Syrian Christians, and Jews, have also places of worship, Protestants alone being without a temple. There is little intercourse between the natives and Franks, except in the way of business. They occupy distinct quarters of the city, the former secluding their families, and maintaining all the reserve of Oriental life, the stents, pipe, and coffee filling up three fourths of their time; the latter adhering to the customs of their own country, in dress, furniture, the use of carriages and horses, and, indeed, in all things but the stents, the pipe, and insinuating themselves during the heat of the day, wherein they imitate the Orientals. Latterly also, after the example of some of the higher Turks, several of the richer Frank merchants have obtained grants of land from the Pacha, on the banks of the canal, and built houses and made gardens, which serve to beautify and give interest to the neighbourhood: but the great architect in this way is Ibrahim Pacha, the son of Mohammed Ali, whose garden is destined to become very shortly the chief attraction of the place.

The Turkish quarter of the city consists of a number of narrow, irregular, tortuous, filthy, and ill-built streets and bazars, with hardly any good houses but those of the Pacha's officers, and without a single public building, mosque, or other object worthy the least attention, the bazars being mean, and but very indifferently provided. The Frank quarter, on the other hand, presents several streets of well-built substantial houses, with good shops; in particular the square, which is the residence of the consuls and principal merchants, called the Piazza Grande, that may well bear comparison, for the size and style of its buildings, with some of the best streets of Paris or London. Ibrahim Pacha is the owner of the greater part of these houses, which he built on speculation, and for which he draws rents, varying from £300 to £340 per annum. The whole town is built of stone and brick, dug up from the foundations of the ancient city.

During part of the year Alexandria is supplied with water from the canal; and during the other portion, from the cisterns of the ancient city (the only portion of its public works that has been spared) which, at the period of the inundation, when the canal is full, are thence filled, and to which recourse is only had when the water of the canal, by being stagnant, becomes unfit for use. As the inundation advances, the old stagnant water is run off into the sea, and the canal, being filled brim full with fresh, is shut up at both ends, and so remains till the following year, serving in the mean time for navigation, for the use of man and beast, and for the irrigation of those small portions of land on its banks, that have been reclaimed from the desert, and brought into cultivation. The climate of Alexandria is considered very salubrious, the heats of summer, which rarely exceed 85° Fahr., being tempered by the Etesian, or N.W. winds, which prevail for nine months of the year. In winter, a good deal of rain falls, which, however, is confined to the coast, and is probably the cause, coupled with the wretched habitations and misery of the poorer classes, why the plague so often makes its appearance here. Were the labouring classes better clad, housed, and fed, there is little doubt that this scourge would soon be no longer heard of.

The municipal government of the city is entrusted to the governor, Moharrem Bey, son-in-law of the Pacha, who has under him a commandant de place, and an officer, called the Beshaga or chief police magistrate, whose duty it is to see that order and quiet be maintained. The city is besides divided into quarters, over each of which a sheikh presides, who is responsible to the governor for the peace of his district: and moreover, each trade and profession has its sheikh, whose duty it is to collect the taxes, and to see to the good behaviour of the members. Guard-houses are also distributed all over the city, and the military are instructed to take all riotous and disorderly parties into custody, the officer of the guard, if the offender be a native, having authority to inflict summary punishment by the bastinado; but if a Frank, he must send him to his own consul, to be pun-

## ALEXANDRIA.

lived according to the laws of his own country. This system works so well, that a more orderly place, or one free from riot or crime, is rarely to be seen: indeed, when crime is committed, it is usually by Frank upon Frank; and then, from defects in the consular system, it almost always escapes detection. Besides the Pasha's or police court, there is the Meh-kemah or Kadi's court, where all civil questions between natives are determined; and a commercial court, with Frank judges, but presided over by a Turk, for deciding questions between the Franks and natives, where the latter are defendants: the Franks themselves, besides exemption from all taxes and burdens of every sort, being amenable only when defendants to their own consular courts, and to the laws of their respective countries. These immunities have been secured to the Franks by convention with the Porte, and are rigidly insisted upon here as well as in every other part of the Turkish empire. The garrison usually consists of about 3000 men, besides the topazes or gunners, who man the forts.

There can be no doubt that Alexandria will profit much by the recent establishment of a steam communication with India, by way of Egypt, as well as by the lines of steamers now connecting it with Marseilles, Trieste, and the whole of the Levant. It is true that a considerable change must take place in the commercial system of the Pacha, before these advantages can have their proper effect; but, independently of this, it is quite clear that, in the novel circumstances under which the world is now placed, Egypt, and consequently Alexandria, must, from its position, become every day more and more important.

*Sketch of History, &c.*—The Ptolemies, to whom Egypt fell on the demise of Alexander the Great, made Alexandria the metropolis of their empire; and it became under their liberal and enlightened government one of the greatest and most flourishing cities of antiquity. When it was annexed by Augustus to the empire of Rome, it is said to have occupied a circumference of 15 miles, and to have had 300,000 free inhabitants, besides slaves, who were probably quite as numerous. It was regularly and magnificently built; and was traversed by two great streets, each more than 100 feet across, and the larger extending more than 4 m. from E. to W. Under the Ptolemies and the Romans, Alexandria was the entrepôt of the principal trade of antiquity, being the market where the silks, spices, ivory, slaves, and other products of India, Arabia, and Ethiopia, and the corn of Egypt, were exchanged for the gold, silver, and other products of the W. world. The inhabitants were distinguished by their industry: either sex and every age were engaged in laborious occupations, and even the lame and the blind had employments suited to their condition. Among the principal manufactures were those of glass, linen, and papyrus, the paper of antiquity. Under the Roman emperors, Egypt became a principal granary for the supply of Italy; and its possession was reckoned of the utmost importance, and watched over with peculiar care. Various privileges and immunities were conferred upon Alexandria; many of her inhabitants were admitted to the rights of Roman citizens, and her wealth and prosperity continued undiminished.

But Alexandria was still more distinguished by her eminence in literature and philosophy than by her commerce and riches. The foundation of her pre-eminence in this respect was laid by the Ptolemies, who founded the museum and library (*delegantem regum curaque egregium opus*, Livy); that afterwards became so famous, at the same time that they gave the most munificent encouragement to literature and learned men. This patronage being continued by the emperors, Alexandria was, for several centuries, a distinguished seat of science, literature, and philosophy. Generally, however, her literati were more distinguished for learning and research than for original genius. She produced a host of grammarians and critics; and the names of Euclid, Apollonius of Perga, Ptolemy, Eratosthenes, Nicomachus, Hierophilus, Zopyrus, &c., are but a few of those most distinguished in the schools of geometry, astronomy, geography, and medicine, that flourished in Alexandria. But her philosophy was the most striking feature of Alexandria, in a literary point of view. The influx of doctrines from the E. and W. schools produced a singular conflict of systems, which ended in an attempt of the philosophers Ammonius, Plotinus, and Porphyry, to establish an eclectic or universal system, by selecting and blending doctrines taken from the principal existing systems, particularly from those of Pythagoras and Plato. Christianity was not exempted from the influence of this spirit; and on its introduction, it was strangely alloyed with Platonism; and principles for expounding of its doctrines were laid down that would now be with difficulty admitted.

The schools of geometry, astronomy, physic, and other branches of science, maintained their reputation till A.D. 640, when, after a siege of fourteen months, Alexandria was taken by Amrou, general of the caliph Omar. The conquerors were astonished by the greatness of the prize; and

Amrou, in designating the caliph with its capture, said, "We have taken the great city of the West. It is impossible for me to enumerate the variety of its riches and beauty; and I shall content myself with observing, that it contains 4000 palaces, 4000 baths, 400 theatres or places of amusement, 12,000 shops for the sale of provision food, and 40,000 tributary Jews. The town has been subdued by force of arms, without treaty or capitulation."

It was on this occasion that the famous library is said to have been destroyed, conformably to the fanatical decision of the caliph, that "if the writings of the Greeks agreed with the book of God, they were useless, and need not be preserved; if they disagreed, they were pernicious, and ought to be destroyed." This barbarous judgment being carried into effect, the books and manuscripts were distributed among the 4000 baths belonging to the city; and so prodigious was their number, that six months are said to have been required for their consumption! Such is the tale that has so often excited the indignation and regret of scholars and the admirers of ancient genius. But Gibbon has shown that it has no good foundation: it rests on the solitary statement of Abulpharagius, who wrote six centuries after the event, and is not noticed by those more ancient annalists, who have particularly described the siege and capture of the city. It is, besides, repugnant to the character of the caliph and his general, and to the policy of the Mohammedans. Even if it did occur, the loss has been much exaggerated. Great part of the library of the Ptolemies was accidentally consumed by the fire which took place during the attack on the city by Omar; and either the whole, or the principal part of the library subsequently collected was destroyed A.D. 390, when the temple of Serapis, the most magnificent structure of the city, was demolished by the enthusiastic zeal of the Christians.

It would be useless to pursue further the history of Alexandria. It continued progressively to decline till, in 1497, its ruin was consummated by the discovery of the passage to India by the Cape of Good Hope. But there can be no doubt, as previously stated, that it is destined to recover some portion of its ancient importance. It will necessarily become the centre of the communications now carried on by steam between Europe and India; and will, most probably, again become a considerable emporium.

The clusters which, as already seen, are still in pretty good preservation, are the principal monuments of the ancient city that have outlived the injuries of time, and the ravages of barbarians. The catacombs are also comparatively entire. The magnificent column, improperly called Pompey's Pillar, seems to have been erected in the reign of Diocletian: its shaft consists of a single block of granite, 68 feet in height. Two obelisks, vulgarly called Cleopatra's needles, of which only one is erect, are said to have formed the entrance to the palace of the Caesars. (For further particulars, see *Dict. Geographique*, art. "Alexandria;" *Voyage de M. de Mariotti Marmont*, tom. II., passim; *Master over l'Ecole d'Alexandria*, passim; *Gibbon*, chap. 10, 36, and 51; and private information from residents in Egypt.)

ALEXANDRIA, p. t., Grafton co., N. H., 34 m. N. W. Concord, 515 W. It has two stores, one woollen factory, one grist-mill, five saw-mills, fourteen schools, 204 scholars. Pop. 1364.

ALEXANDRIA, p. t., Jefferson co., N. Y., 36 m. N. Watertown, 195 N. W. Albany, 447 W. A part of the Thousand Islands in St. Lawrence river belong to it. It has six stores, one grist-mill, seven saw-mills, six schools, 135 scholars. Pop. 3475.

ALEXANDRIA, p. v., Porter t., Huntington co., Pa., 98 m. W. Harrisburg, 157 W. Situated on the Frankstown branch of Juniata river. It contains two churches, seven stores, two tanneries, one brewery, one grist-mill, and about seventy dwellings, chiefly of brick. Incorporated in 1837. Pop. 574.

ALEXANDRIA, t., Hunterdon co., N. J., 19 m. N. E. Flemington. It has ten stores, one fulling-mill, five distilleries, six flouring-mills, four grist-mills, ten saw-mills, three oil-mills, nine schools, 490 scholars. Pop. 2490.

ALEXANDRIA, city and capital of Alexandria co., Dist. of Columbia, 43 m. S. S. W. Baltimore, 115 N. Richmond, 7 W.; 33° 48' N. lat. 77° 4' W. lon. and 60° 3' W. lon. from W. Pop. 1890, 8218; 1830, 5963; 1840, 8439. It is pleasantly situated on the W. side of Potomac river, from which the ground rises gradually to a considerable elevation, and the river here has a depth sufficient to admit vessels of the largest class to its wharves. It is regularly laid out, with streets crossing each other at right angles, and contains a court-house, two banks, with a capital of \$1,000,000, a fire insurance company, a marine insurance company, and ten churches, two Presbyterian, two Episcopal, two Methodist, one Baptist, one Friends', one coloured Methodist, and one Roman Catholic. The tonnage of the port in 1840 was 14,470. Its exports consist chiefly of wheat and flour, Indian corn and tobacco. It has eight academies, 294 scholars.

## ALEXANDROVSK.

area. The Chesapeake and Ohio canal terminates at this place.

ALEXANDRIA, county, Wis. of Col., comprises that part of the District of Columbia W. of the Potomac river, was ceded by Va. to the United States, and contains 26 sq. m. The laws of Va. are in force, unless superseded by the special enactments of the general government. It had, in 1840, 969 neat cattle, 262 sheep, 1190 swine, and produced 4334 bushels of wheat, 18,000 of Indian corn, 3768 of rye, and had 156 stores, five tanneries, one grist-mill, one pottery, one rope-walk, and one daily newspaper. Pop. whites, 6731; slaves, 1374; free coloured, 1892; total, 9097.

ALEXANDRIA, p. v., De Kalb co., Tenn., 50 m. E. Nashville, 640 W. It has one Campbellite and one Methodist church, two stores, and about 250 inhabitants.

ALEXANDRIA, p. v., capital of Rapids par., La., 201 m. N.W. New-Orleans, 1210 W. Situated on Red river below the rapids, and contains a court-house, jail, and a printing-office. It is built on a single street, along the river.

ALEXANDROVSK, a town of Russia in Europe, gov. Ekaterinoslav, cap. district on the Dnieper at the bottom of the cataracts, 140 m. N.E. Cherson. Pop. 3400. It is fortified, and displays considerable activity, from its being the place where merchandise conveyed from Ekaterinoslav by wagon, to avoid the cataracts in the river, is again shipped.

ALFARO, a town of Spain, prov. Boria, on the banks of the Alhama, close to its junction with the Ebro, 13 m. W. by N. Tudela. There is a military road between this place and Logroño. Pop. 6450.

ALFELD, a town of Hanover, prov. Hildesheim, at the conflux of the Leine and Werra. Pop. 3300. It has a normal school and three hospitals.

ALFORD, p. t., Berkshire co., Mass., 145 m. W. Boston, 261 W. Watered by Green river and its branches, which flow into Housatonic river. It contains one store, one fulling-mill, one grist-mill, two saw-mills, four schools, 144 scholars. Pop. 481.

ALFRED, p. t., York co., is one of the shire towns of the county, and has seven stores, three grist-mills, three saw-mills, two tanneries, one academy, 35 students, ten schools, 307 scholars. Pop. 1408.

ALFRED, p. t., Allegany co., N. Y., 19 m. S.E. Angelica, 949 W.S.W. Albany, 321 W. It has four stores, one fulling-mill, one grist-mill, three saw-mills. Pop. 1630.

ALFRETON, a par. and m. town of England, co. Derby, hund. Scarsdale, 16 m. N.N.E. Derby. Pop. 5691. The inhabitants of the town are principally employed in the manufacture of stockings and earthenware, and in the adjoining collieries.

ALGANSI, L., Branch co., Mich. It has one saw-mill, three schools, 45 scholars. Pop. 494.

ALGARINEJO, a town of Spain, prov. Granada, close to the frontiers of Cordoba, near the right bank of the Genil, in a country where abundant and fertilizing streams fall into that river. Pasturage and tillage form the chief business of the population. Pop. 3678.

ALGARROBO, a town of Spain, p. Granada, 2 m. from the Med. sea, in the midst of a country particularly rich in lemons, oranges, figs, and other fruits belonging to the south of Spain, 16½ m. E. Malaya, and 36 m. S.S.W. Granada. Pop. 3590.

ALGARV, the most S. prov. of Portugal, which see.

ALGECIRAS, the *Carteia* of Roman Geography, a town of Spain, prov. Cadix, on the W. side of the bay of Gibraltar, opposite to the celebrated rock and peninsula of that name, from which it is distant about 7 m. by water, and 17 m. by land. Lat. 29° 8' N., lon. 6° 31' 7" W. Pop. 4500. It has a good harbour, and some trade in the export of coal. It was built by the Moors, and taken from them after a two years' siege, in 1344.

ALGHERI, or ALGHERO, a town and seaport of the island of Sardinia on its W. coast, 15 m. S.S.W. Sassari, lat. 40° 23' 30" N., lon. 8° 16' 45" E. Pop. 6700. It is built on a low rocky point, jutting out from a sandy beach, in the shape of a parallelogram with stout walls flanked by bastions and towers; the walls are in good repair; but being commanded by two heights, it could not oppose any vigorous attack from the land side. To the S.W. of the town there is tolerable summer anchorage in from 10 to 15 fathoms, good holding ground. Though narrow, the streets are clean and well-paved. It is the seat of a bishopric, has a cathedral, and twelve churches and convents, with public schools which carry their scholars through a course of philosophy, and a surgical institution. It has a small theatre. The town was long occupied by the Spaniards, and their language and manners still prevail. The country round is well cultivated, producing wine, butter, cheese, &c. In addition to these the exports consist of wool, skins, tobacco, rugs, anchovies, coral, and bones. (Smith's *Sardinia*, p. 260.)

ALGIERS, now frequently called ALGERIA, a country of N. Africa, and, till recently, the most powerful of the Barbary states, comprising the *Musidic* Proper of the ancients,

## ALGIERS.

or the *Nemidic* of the *Maaspi* and the *Nemidic* *Maaspi*, afterward called *Mauritania Caesariensis*, with some portion of the region S. of the greater Atlas anciently inhabited by the Getales and Garamantes. The N. parts have been, since 1830, in possession of the French; but for more than three centuries previously they formed a subordinate part of the Turkish empire, and were, during that period, the seat of an extensive system of piracy and Christian slavery.

*Situation, Extent, Boundaries.*—Algiers lies between 10° 48' W., and 9° 16' E. lon.; its greatest N. lat. 37° 5'. It is bounded N. by the Mediterranean W. by Fez (Morocco), and E. by Tunis; its S. boundary is doubtful, but it extends beyond the greater Atlas range to the confines of the desert of Sahara: it is above 500 m. in length; its breadth, which is greater in the E. than in the W., varies from about 40 to about 300 m. The pop. has been variously estimated at from 1,700,000 to 2,300,000, and may probably amount to about 2,000,000. It need to be divided into four provinces: 1. Algiers (*Al Jazir*), including the capital, and a small surrounding territory; 2. Titteri, to the S. of Algiers; 3. Oran, or Tlemcen, to the W.; and 4. Constantine, to the E. of that city. But these provinces are generally understood to include only the *Tell*, or land N. of the greater Atlas, excluding the territories of Zaab or Wad-rang, S. of that range; for though the villagers in the latter either paid the taxes imposed by the Turks, or gave other tokens of submission to them, the greater portion of the population was independent. (Sass, p. 3, 4to ed.)

*Mountains.*—Algiers is mostly mountainous: the little Atlas, which runs along the coast parallel to the greater Atlas, varies from 3000 to 4000 feet in height; its loftiest point is S. of Chialfa; opposite to cape Matifou its elevation is little more than 3000 feet. The abrupt mountains of Titteri, belonging to the greater Atlas, reach in some points to an elevation of 9000 feet, and send off three principal ridges; N.W. towards cape Iry; N. towards Algiers; and N.E. towards Bugia. Many of these mountains are remarkable; as Wannashrees (*Zalacus*), prov. Oran, very lofty, and Jurjura, S.E. of Algiers, both capped with snow during winter; the Titteri Doah, or rock of Titteri, is also a remarkable ridge of rugged precipices. The Jibbel Aurem (*M. Audus* of Ptolemy), S. part prov. Constantine, is not, as the name would imply, a single mountain, but an extensive tract, 150 m. in circuit, of mountainous or, rather, hilly ground. It is interspersed with several fine valleys; and both its lower and upper parts are extremely fertile, it being, in fact, the garden of the prov. (Sass, p. 30, 35, 53.)

*Plains.*—The principal is that of Metidjah, immediately S. of Algiers, 50 m. by 20; fertile, well-watered, and covered with an abundant vegetation, but in parts marshy and unhealthy. In the W. prov. are several plains, especially that through which the Shellif runs; and another S.W. of Oran, sandy and saltish, dry in summer, but inundated in winter. In the S. prov. are the rich plains of Hamza, watered by the Nasava. Many luxuriant plains are found in the E. prov., as those of Sateef, Malanah, and that skirting most part of the E. coast, which is, however, in many parts marshy. (Sass, p. 24, 37, 44, 47, 50, 53.)

*The Rivers* are separated by the greater Atlas range into those which run N. and S. Of the former, or those which discharge themselves into the Mediterranean, the principal is the Shellif (an *Cataleph*), which rises S. of the Wannashree M., and after a tortuous course of 200 m., during which it passes through the Titteri Gawie or lake, falls into the sea under cape Jibbel Iddis. In the rainy season it overflows its banks, and interrupts the communication between Algiers and Oran. The Wad-el-Keber (an *Aspsaga*), which falls into the sea N. of Constantine, is 62 E. long, is the second in magnitude; the others are the Seifou, river of Bone, the Roberac, Yenn, Zowah, Wad-ry Zaine, &c. The large rivers, the Adjed and Abiad, run S.E., and empty themselves into the *Me'rig*; and several rivers of inferior dimensions empty themselves into the *Skett*. These are two very extensive salt marshes; the former on the S. the latter on the N. side of the greater Atlas; they consist partly of a light oozy soil, as dangerous as quicksands to travellers. The lakes are those of Titteri; two near Oran, which dry in summer, and from which salt is collected; some salt marshes near cape Matifou, and others along the coast from Bone to the borders of Tunis. (Sass, p. 19; Sass, p. 53.)

*Climate.*—Of the *Tell*, i. e., between lat. 34° and 37°, is generally wholesome and temperate. Shaw states that for twelve years during his experience, it only froze twice at Algiers; yet the heat was never oppressive, unless during S. winds. The mean temperature of the year at Algiers is 70° F., in July and August about 80° F.; but ranging occasionally during the prevalence of the khamasin, simoon, or hot wind from the Sahara, as high as 110°, or even more. Luckily, however, the latter seldom or never continues for more than five or six days at a time, and rarely occurs except in August or September. In winter the temperature is

## ALGIERS.

usually from 35° to 65° F. The heat is mitigated by the N. winds, which with the E. prevail during summer. About the equinoxes violent S.W. winds occur; N.W. winds are common from November to April, at which time storms and showers of rain are most frequent; but in summer these winds bring dry weather; the E. and S. winds are also dry, and quite unlike what they are on the opposite European coasts. The barometer varies only from 29 and 1-10th to 30 and 4-10ths in. There are about fifty wet days during the year, chiefly in March, along the coast and on the lesser Atlas. The quantity of rain varies greatly in different years; but, at Algiers, it may average from 37 to 38 inches; little falls during summer. Dew is abundant, and the air on the coast is damp. At the end of December the trees lose their leaves; but by the middle of February vegetation is again in full activity, and the fruit is ripe in May.—(Sass, p. 133-136; *Revet*, l. p. 140-149; *D'Avezac*, art. "Algier.") The atmosphere is very clear, and the country healthy, excepting in the marshy districts.

**Geology and Minerals.**—The primary rocks consist in part of granite, but chiefly of gneiss and micaceous schist. Traverdine is found on the coast; near Oran a grayish quartz, but no volcanic rocks; in the interior a lime formation often alternates with a schistous mass. The secondary deposits consist in many places of a lias formation and calcareous strata, containing a few organic and no vegetable remains. At Oran the lias contains bivalves, but no univalve shells. The tertiary deposits are mostly calcareous, in the Mirdjah of a yellowish gray colour; sometimes a blue clay, enclosing a laminary gypsum and a little iron, in other parts sandy and much impregnated with salt. All the chain of Atlas has a tertiary clay deposit. The W. province appears to be the richest in minerals. Salt is extremely abundant in springs and beds, on both the E. and W. frontiers; near Constantine, the Titteri Dosh mountains, the Meligeg and Shott marshes, &c. The salt-pits near Arzew occupy a space of 6 m. circ., forming marshes in winter, which dry in summer, when large quantities of salt are collected. Nitre, though not found pure, is very plentiful in the W. province, Gerulia, &c. Iron is most abundant. Copper is found in various places; and there are some very rich lead mines, the ore of those of the Wannashrees being said to yield eighty per cent. of pure metal. There are also fullers' earth, potters' clay, talc, pyrites, &c. Diamonds (verifying what was reckoned the apocryphal statement of Pliny, *Hist. Nat.* lib. 37, § 4) have been found in the sands of the Wadi-Kamamel that runs by Constantine, mixed with small quantities of gold-dust, silver, tin, and antimony. Saline hot and cold springs are exceedingly abundant, more so, in fact, than those of fresh water. The latter, however, are by no means rare, and may everywhere be found by digging through a crust of flaky, soft stone, lying at different depths, but near Algiers and Bona immediately below the surface of the ground.—(*D'Avezac*, art. "Algier.")

**Vegetation** in the N. parts of Algiers is nearly the same as in the S. parts of Spain, Provence, Italy, and the rest of the Mediterranean shores. The mountains of the little Atlas are covered with thick forests, in which are found five different varieties of oak, the Aleppo pine, the wild olive, the shumac-tree (*Rhus cotinus*), with arbutus, cypress, myrtles, &c. S. of the greater Atlas are found the date-bearing palm, and other trees belonging to a warmer climate.

**Animals.**—Lions of great size and strength, panthers, hyenas, and leopards inhabit the mountainous recesses of the great Atlas, but are never seen near Algiers: wild boars, wolves, and jackals are more common, and there are a few bears. Wild cats, monkeys, porcupines, and hedge-hogs are more or less abundant; as well as antelopes and other species of deer, hares, gennets, jerboas, rats, mice, &c. Ostriches are found in the desert on the confines of Morocco; there are also vultures and other large birds of prey; bitterns, curlews, lapwings, plovers, pigeons, and snipes; with great plenty of game and small birds. Some serpents of the Coluber race are met with; and lizards, chameleons, and other amphisba. Tunny and other sea fish abound on the coasts; barbel, perch, eels, &c., are found in the fresh waters, and even in the warm saline streams; conger at the mouths of the rivers; and lobsters and many other crustacea along the shores. Among the insect tribe are scorpions, tarantulas, &c. Locusts seldom commit the same devastations here as in Egypt and Syria. Coral, which is very abundant on the coasts, forms an important article of produce and industry: it is of a larger sort, but less vivid in its colour, than that of Sicily.—(*Revet*, vol. i. p. 218; *Sass*, p. 138; *Campbell*, *Letters from the South*.)

**People.**—There are nine distinct races of inhabitants, viz.: 1st, the Berbers or Kabyles, who, however, call themselves *Mazab* (noble) or *Mazag* (free); they constitute about half the entire population, and are the lineal descendants of the aboriginal inhabitants of the country. They are principally found in the mountain districts; and their lands are

occasionally well cultivated and irrigated. 2d, *Bisharis* or *Mozabs*, supposed to be the descendants of the Getulæ, living principally S. of the great Atlas, and comparatively industrious. 3d, Moors; a mixed race, descended from the Mauritians, Berbers, Carthaginians, Romans, Vandals, and Arabs; they constitute the bulk of the population of the towns and villages. 4th, Arabs, consisting of three tribes: the first, supposed to have descended from the ancient Amalekites, is nearly extinct; the second consists of cultivators of the soil, and is fixed to certain spots; the third, or wandering Arabs, are principally herdsmen and shepherds dwelling in tents. 5th, Negroes, called *Jyds* (slaves) or *Soudas* (black); originally brought thither from the interior, and sold as slaves. 6th, Jews, who form a third part of the inhabitants of Algiers, and a fourth part of those of Oran. 7th, Turks, now very few, nor ever very numerous, although long the dominant race: they were a heterogeneous body, composed of genuine Turks, Greeks, Circassians, Albanians, Corsicans, Maltese, and renegades of all nations; mounted, and forming a militia similar to the Mamelukes. On the conquest of Algiers, in 1830, by the French, the Turks, being permitted to withdraw, evacuated the country to the amount of about 50,000. 8th, Koloulis, or descendants of Turks by Moorish mothers; their name literally signifying "sons of soldiers." Although possessed of influence, they did not formerly enjoy the same rights and consideration as their fathers. 9th, Europeans, who may, of course, be subdivided into various nations, but are mostly French. Among the Kabyles of the Aures is a tribe distinguished by a fair complexion, blue eyes, and light hair, believed to be descendants of the Vandals. Traces of the Huns, Suevi, and other Gothic nations have been also found. (For further information respecting the different native races, see *ARABIA, BARBARY, MOROCCO*, &c.)

**Scenery.**—Proceeding from W. to E., a rich champagne country stretches for some distance inland S. of Arzew, bounded towards the sea by steep rocks and precipices; many fertile plains are irrigated by the Sigg river (or *Sikk*, a drain or trench), its waters being diverted by numerous canals for that purpose. Behind Mascragan, and near the Shellish, as far as the sea, is a tract girded with orchards, gardens, and country houses. The country round Shershell is of the most exuberant fertility, possessing large tracts of arable land, and the mountains covered to their summits with plantations of fruit trees, and affording delightful and extensive prospects. The inland parts of the W. province present alternately fertile valleys and high ranges of rocky mountains. "If we conceive," says Shaw, "a number of hills, usually of the perpendicular height of 400, 500, or 600 yards, with an easy ascent, and several groves of fruit and forest trees rising up in a succession of ranges one behind another, and if to this prospect we here and there add a rocky precipice of a superior eminence and difficult access, and place upon the side or summit of it a mud-walled *Dashke-rah*, or village of the Kabyles—we shall then have a just idea of the Atlas bounding the Tell." The verge of the Sahara beyond this presents nothing but scattered villages, and plantations of dates. The plain of Medjidja, adjoining the capital, contains many farms and country houses, producing in perfection, flax, henna, roots, pot-herbs, rice, fruit, and corn of all kinds; it is adorned besides with multitudes of oleanders, geraniums, passion-flowers, and other luxuriant shrubs. The S. province has the same general character as that of Oran. The Titteri Dosh, 50 m. S. of Medeah, is a towering range of bleak precipices. The Jurjura, S.E. of Algiers, is a similar tract. The sea coast of the E. province as far as the river Zhoore is mountainous, and called by the Arabs *El-Adwah* (the lofty); thence to the Seibous it is hilly; and from the latter to the border mostly level, and sometimes covered with forests. Some distance to the S. are the *M. Thames* of Ptolemy. The Seibous in some parts wanders through beautiful valleys, clothed with olive trees, lentisks, and a fine turf. The country about the source of the Zenati is broken and irregular, and appears to be volcanic; that to the N. and N.W. of Constantine, from which that city is chiefly supplied, is watered by the Ruseil, which is "bordered by a few villas and numerous gardens, rich in every variety of vegetable and fruit trees, with extensive groves of pomegranate, olive, fig, orange, and citron," and bounded by bold ranges of hills; its fruit is esteemed over the whole province. In the road from Algiers to Constantine, between the plains of Hamza and Majanah, a deep narrow pass, called *Bekes* (the Gates), which a few years might defend against an army, leads through a mountain ridge; and a little farther E. the road is carried by a dangerous track over the crest of a high mountain. S. of Seicef are many rich plains. The territory round Tifech is the most fruitful in Numidia, and the W. province the finest of the regency. The villages of Zaab are collections of dirty hovels, surrounded by date plantations; Wad-ree, a similar country, has twenty-five villages. To the W. extends the vast region of Blaid-el-Jerride, "a dry country," abound-

## ALGERIE.

ing in dates. (*Shaw*, p. 14-68; *Sir G. Temple*, *Excursions in the Geograph. Journal*, 1838, part ii.)

**Antiquities.**—Most of the cities and towns bear names little altered from those given them by the Romans. Many ruins remain; those of Tipasa (Tifennet), 12 m. E. of Sher-shell, stretch for two miles along the coast; on the brink of the Shellik, in about the same lat., there are several classical remains, Corinthian capitals, &c., probably the ruins of the Colonia Augusta of Pliny. About 14 m. E. of Algiers are the ruins of Ruscacrum. At Mellana, N. of the Shellik, a stone, inserted in a modern wall, bears an inscription, whence it has been inferred that this was the place where Pompey's grandson and great grandson were buried. (*See Martial, Epig.*, lib. v., Ep. 75.) Near Bona are the ruins of *Hippe Regius*, and many towns can boast of ancient relics in tolerable preservation. The province of Constantine, especially, abounds with them, and with Roman roads; and even the remote district of Wad-reag has numerous remains of Roman masonry. Near the capital is a collection of un-hewn stones, somewhat similar to those of Stonehenge, which the French call *Druidic*, but others believe to be Phœnician. There are few Christian remains, their buildings having been destroyed by the zeal of the Saracens. (*Shaw*, p. 91-67; *Sir G. Temple*, *Excursions*.)

**Agriculture.**—Much of the land is uncultivated and waste; but the fertility for which it was so famous in antiquity—

Non quicquid Libyæ trit,  
Fœvora arva moribus—

still continues unimpaired; and requires merely the substitution of regular government for lawless violence, and of industrious colonists for roving hardmen, to render it once more the granary of Europe. The land in many parts, owing to the quantity of salt with which it is impregnated, is so rich as to require no manure but burned weeds. But in a dry climate like this everything depends on the command of water; and the necessity under which the native inhabitants were placed of providing this indispensable element for their lands, had so far counterbalanced their indolence and want of science as to make them pretty expert in the art of irrigation. The French were not, at first, sufficiently alive to the vital importance of this; and some of the Arab works for irrigating were in consequence neglected, to the great injury of the province. The land is usually ploughed and sown in October or (if with barley) November: by the aid of April rains a good crop is thought secure, and the harvest takes place in the end of May or the beginning of June, yielding at an average eight or twelve for one. The species of corn mostly grown are the *Triticum durum* (hard wheat) and *Hordeum vulgare* (common barley). Maize is not much cultivated except in the W. province; white millet for fattening cattle is planted there; rice chiefly in the prov. of Oran. Oats not being grown, horses are fed wholly upon barley and straw. The plough used round Algiers is the same as that of Spain and Provence, but in general is not shod with iron. It is drawn by cows and asses, very rarely by horses; yet with such imperfect ploughing the crops are generally excellent. When reaped, the grain is trodden out by cattle or horses; and, after being cleaned by throwing it up against the wind, is deposited in subterraneous caves or magazines. The pulse crops are beans, lentils, kidney-beans, pease, and garbanos (cicer pea); turnips, carrots, cabbages, &c., are good and plentiful. Endive, cress, spinach, and artichokes are in season from October to June; after which come calabashes, mallows, tomatoes, and water-melons. Potatoes are frequently grown, but do not arrive at a large size, and are of inferior quality. The date is the principal fruit, and is by far the most valuable product of the country S. of the greater Atlas. It is propagated chiefly by young shoots, and yields fruit in its sixth or seventh year; it attains maturity at about its thirtieth year, and is in full vigour for sixty or seventy more, after which it gradually declines, till it becomes extinct when about 300 years old! (*Shaw*, p. 142.) Truly, therefore, might Pallasius say, *Oci placet curas agere saculorum de palmis cogitasse consensu*. (*Oct.* 12.) During its maturity it yields annually from fifteen to twenty-two clusters of dates, each weighing from fifteen to twenty pounds. The date-palm (*poiv*), when it dies, is always succeeded by others from shoots or kernels; whence may probably have originated the fable or allegory of the bird Phoenix. The lotus or *acacia* bears a berry sold all over the S. district. Most of the fruit trees common to Europe are found in Algiers; but the fruits are inferior, excepting nectarines, peaches, and pomegranates; there are no hazel-nuts, filberts, strawberries, gooseberries, or currants. The vine is cultivated with much advantage; the grapes ripen by the end of July, and are eaten both fresh and dry by the natives, who seldom make wine; though this, no doubt, will be attempted, and most likely with success, by the French. Oil of a very inferior quality, and always acrid, is obtained from the olive. Melons and Indian figs are largely grown, and form a considerable part of the

food of the Arabs. In some grounds near Algiers the sugarcane is cultivated. Cotton and indigo have been tried, but the climate suits them well; coffee has also been tried, but is not supposed to succeed.

Cattle constitute the principal wealth of the natives. Sheep are of two kinds: one small, with a thick large tail; the other of a much larger size, chiefly found in the country of the Melano-Gotulins. Sheep of the fine Tunisian breed are not met with. Goats pretty abundant; pigs few, round-bodied, short-legged, and generally black. Cattle usually black; their milk is inferior to that of European cattle; that of sheep and goats is mostly used in the making of cheese, butter, &c. The Arabs seldom diminish their flocks by killing them for food, but live on their milk, wool, &c.; no animals are castrated. The common beasts of burden are camels, dromedaries, asses, and mules. Dr. Shaw speaks of a singular cross breed between an ass and a cow, called *kusrah*, having a sleeker skin than its sire, no horns, but the dam's head and tail; but *Roset* says that he had not been able to find any trace of any such animal. Horses are not of the pure Arab breed, nor altogether well shaped, being lanky and round-shouldered; head small, and not ill formed; ears erect; and they are hardy, fleet, spirited, and docile: those of Oran are accounted the best. They are used only for riding, and, like the camels, are reared and live in the tents with their owners. (*Shaw*, p. 9-65, 160-170; *Roset*, p. 204-201; *Campbell's Letters from S.*)

**Trades and Manufactures.**—Almost all the trades of Europe are followed in the towns; but conducted in a very inferior manner, as well because of the indolence as of the ignorance of the natives. The Jews are the most industrious, and monopolize the greater part of the external trade, with the higher branches of art, being the chief jewellers, watch-makers, tailors, &c. The Arabs are merchants, tanners, and carpenters; the Negroes masons, bricklayers, and other artificers; the Kabyles extract iron, lead, and copper from their mountains, and manufacture gunpowder, said to be superior to that made at Algiers. The chief manufactures are coarse linen, woollen, and silk stuffs, the first two forming the greater part of the dress of the population, leather saddles, bridles, carriages, fire-arms, steel, and other metal articles, pottery, gunpowder, but very inferior to that of Europe. Women only are employed in the linen and coarse woollen manufactures, as well as in the slavish occupation of grinding corn. European goods are much in request, and are bartered in the S. for gold dust, ostrich feathers, &c.

**Trade.**—Previously to the occupation of Algiers by the French, the established rates of duty were 5 and 10 per cent. on imported articles, according to the stipulations in the treaties with the countries of which they were the produce. But these general rules were entirely disregarded in practice; and, in point of fact, little or no trade could be carried on, except by those who obtained licenses to that effect from government, which were either sold to the highest bidder, or to those who had most interest with the divan.

Such is the inexhaustible fertility of the soil that, notwithstanding the low state of agriculture, corn and animal products have always formed a principal part of the exports; and Marseilles and other towns in the S. of France, with Genoa, &c. in Italy, used to derive a considerable part of their supplies of corn and butcher's meat from Algiers. Exclusive of these, the principal articles of export were coral, hides, wool, wax, oil, leather, gums, ostrich feathers, dates, kermes, &c. But since the occupation of Algiers by the French, the exportation of corn has in the mean time almost entirely ceased; and besides the supplies obtained in the country, large quantities have been imported for the use of the French troops.

The other principal articles of importation are cotton, woollen, silk, and linen stuffs, but particularly the first; wines and spirits; sugar and coffee; arms, hardware and cutlery, &c. Subjoined is an account of the value of the imports and exports since 1831:

| Years. | Imports.   | Exports.   |
|--------|------------|------------|
|        | <i>Fr.</i> | <i>Fr.</i> |
| 1831   | 4,504,000  | 1,678,800  |
| 1832   | 4,954,820  | 384,000    |
| 1833   | 7,569,150  | 1,028,410  |
| 1834   | 8,580,220  | 2,378,000  |
| 1835   | 16,778,737 | 2,507,400  |
| 1836   | 22,402,708 | 3,438,722  |
| 1837   | 26,052,240 | 2,948,601  |

It is supposed that of the imports, in 1837, about one third part were on account of the army. No duties are charged on French commodities, nor on foreign commodities required for the subsistence of the inhabitants, or to be used in agriculture or building. On other articles the duties vary from a fifth to a fourth part of those in the French tariff: articles prohibited in France are charged with an *ad valorem* duty of 15 per cent. A tonnage duty of 3 fr. is charged on foreign ships.

The increase of shipping has been quite equal to the in-

## ALGIERS.

course of trade; and the proportion of both in the hands of the French is rapidly increasing. A regular intercourse is kept up by means of steam-packets between Marseilles and Algiers.

The barbarisms by which this fine country has been so long laid waste, while they neglected all the old Roman roads, constructed none themselves; so that the communication between different parts was very difficult, and produce could only be conveyed on the backs of mules and camels. The French have already directed their attention to the repair of the old and the opening of new roads; measures indispensable alike for their own security and the development of the resources of the country. (*Tableau de la Situation*, &c., p. 269-267.)

The weights, measures, and money in use are,

**Weights.**—The *Ounces* (4 grammes); *Roll a thary* = 16 *onques*; *Cantier* = 160 *rolls*.

**Measures of Capacity.**—*Litres*.—*Etich* (10-48 litres) = about 17 pints. *Bois* (48 litres) = 21 5/8 pints. *Of length*: *Barra* (Turk) (840 millimetres) = 2 2/3 feet Eng.; *Barra* (Italy) (850 millimetres) = 1.754 feet Eng.

**Money is as follows: *Gold*, *Soups* = fr. 61-64. *Silver*, *Mosannah* = 7-10ths of fr.; *Real* *Boudjex* = 34 mosannah. *Copper*, *Durham* *Sugar* 100ths of a sou.**

French money is now, however, in frequent use, and Spanish dollars worth about fr. 64.

**Revenues.**—It is impossible precisely to ascertain the amount of revenue at the disposal of the *dey* of Algiers previously to the French conquest; but it would seem, according to the best attainable information, that it may be fairly estimated at about 3,000,000 fr., or £150,000, including therein 550,000 fr., or £25,000 of tribute paid by Naples, Portugal, &c. for exemption from piracy; but it is probable that the taxes paid by the people amounted to at least three or four times as much. The taxes were of various kinds: the principal was the *tike* (*achir*) of all crops; and there were also poll taxes on the Jews, with taxes on professions, trades, &c.; and the government derived a considerable sum from the monopoly of wool, leather, salt, and wax. These taxes have been partly retained by the French; but the more oppressive, with the monopoly, have been abolished. A considerable revenue has been latterly derived from the sale of the public lands and other property belonging to the state, which are beginning to be extensively purchased and occupied by Europeans.

The revenues, which in 1838 amounted to only 1,400,416 fr., had increased in 1857 to 3,020,775 fr. But notwithstanding this increase, the occupation and defence of the Algerine territory entail on France a heavy annual expenditure; and confessed, for a while, considerable doubts as to the policy of her continuing to hold the country. (*Tableaux*, &c., p. 353, &c.)

The tribute of the Arabs was better collected by the Turks than might have been expected; but it was other wise with the Kabyles. No sooner had the latter got intimation of the approach of Turkish troops to enforce payment than they hastily decamped, carrying with them their cattle and families to fastnesses in the mountains; so that the tribute was seldom paid, unless the *dey's* troops succeeded in capturing some stragglers from the main body, or some stray cattle, which were usually ransomed.

The *Coral Fishery* is prosecuted from the middle of April till the end of July. Ten years being generally allowed for the growth of the coral, different spots are annually chosen for the fishery. Foreigners are allowed to fish on paying a rent to government. In 1838 there were 245 boats engaged in the fishery, principally at Bona, the revenue accruing on which to the French was 242,222 fr. (£10,894). The value of the coral exported in 1857 was 1,352,513 fr. (*Tableaux*, &c., p. 237, 238.)

The Government is at present administered by the commander-in-chief of the French forces in Algiers, who is governor-general, and responsible to the French cabinet; there is besides a civil intendant. Previously to 1830 the government was vested in a *dey*, or *pacha*, being the officer at the head of the Turkish soldiery in the regency. This officer, who exercised absolute power, was appointed for life, but was rarely permitted to die in office. He was chosen out of, or rather rose from, the army; and in the words of Dr. Shaw, "any bold and aspiring soldier, though taken yesterday from the plough, might be considered as heir apparent to the throne; and with this fact other advantage, that he lay under no necessity to wear all sickness or old age had removed the present ruler: it was enough if he could protect himself with the same armour which he had the hardihood to assume in the breast of his predecessor." (*Shaw*, p. 243.) They notified his accession by an embassy to the grand sultan, by whom it was uniformly confirmed. But he did this merely as an act of deference to the sultan as the chief of Islamism, and not as acknowledging him as his real suzerain. The *dey* received no orders from the Porte, but acted in all respects as an independent prince. He presided in the *divan*, *darwanah*, or council of state, consisting of sixty old

officers and other high functionaries, and which nominally formed the government; but though formally convened every Saturday, this body did little but agree to the measures previously decided upon by the *dey* and his favourites. Their ordinances began with "We, superior and inferior members of the mighty and invincible militia of Algiers, and of the whole regency, have hereby resolved," &c. Each of the three provinces, exclusive of Algiers, into which the regency was divided, was governed by a *beg*, nominated by the *dey*, and responsible to him.

Except in the towns, where they were absolute masters, and in their immediate vicinity, the Turks had but very limited authority over the rural population. The Arabs and Kabyles effected an almost entire independence, obeying only their sheikhs, and frequently committing hostilities on each other. The state of things has hitherto been but little changed under the French; and it is easy to see that the growth of a regular and efficient system of government can only be gradual, and must principally depend on the spread of agriculture, or on the more extensive occupation of the country by a settled population.

**Military and Naval Force.**—Under the Turks the *dey* maintained about 10,000 regular infantry and 6000 cavalry; but in case of need he could bring into the field a considerable body of irregular troops, bound to serve, like the European troops of the middle ages, for a certain number of days at their own cost. The cavalry was recruited chiefly among the Arabs and Berbers. The naval force, so long an object of terror to the Christian powers, was never very formidable. In 1816, when it was nearly annihilated by Lord Exmouth, it consisted of 4 frigates of from 40 to 50 guns, 1 of 36 guns, 4 corvettes, 13 brigs and golettes, and 20 gun-boats. In 1824 their remains had again begun to infest the seas; and in 1830, on the capture of Algiers, the French found a large frigate in dock, and two others in the port, 2 corvettes, 8 or 10 brigs, several *zabicks*, and 35 gun-boats. (*Revue*, iii., p. 269-268.) The French troops in Algiers in 1857 amounted to 35,474, exclusive of nearly 6000 native troops. This, however, was a much larger force than had been embodied in any previous year; though, considering the extent of the country and the predatory warlike habits of the natives, it does not appear likely that it can be advantageously reduced.

Justice has been continued by the French, except in political cases, much on the same footing as under the Turkish dominion; being administered by the rabbins among the Jews, and by *cadis* and other officers, according to the Mussulman law, among the Turks, Moors, Arabs, &c. In Algiers, questions among Europeans are decided by a civil court, and a correctional and criminal court. The civil court finally decides upon all cases in which the sum in dispute is under 12,000 fr.; when the sum exceeds this limit, an appeal may be made to the royal court of Aix in France. At Oran and Bona there are French judges, who decide cases under appeal to the courts of Algiers. In their procedure no departure from the French code is permitted.

**Religion.**—That of the French, and consequently now of the state, is Roman Catholic; but the great bulk of the people profess Mohammedanism. The Negroes, however, are mostly addicted to *Rutism*; and the creed of the Berbers is scarcely known, as they suffer no strangers to witness their rites: they pay great reverence to their marabouts or *marabouts*, persons who practise a rigid and austere life, and who sometimes affect to perform miracles. They regard them as inspired, and honour their tombs. This custom has crept in among the Jews, who venerate the sepulchres of their rabbins, and convert them into synagogues. Since the French occupation, a good many mosques have been converted into Christian churches.

**Morals** are at an extremely low ebb; the inhabitants, particularly the Moors, being in general grossly sensual, debauched and corrupt. Public women are numerous, and syphilis diseases common, and endemic. Drunkenness is not very frequent among the natives, but the French have lost 3000 men annually from excess.

**Public Instruction.**—The Moors and other inhabitants of the towns can, for the most part, read the Koran and write, which, however, comprises the whole of their instruction: few understand arithmetic, or go beyond the first two rules; and this limited instruction, it will be observed, is enjoyed by the male sex only, women being brought up in the most complete state of ignorance. The Moors often transact business by placing their fingers on different parts of each other's hands, without speaking; each finger and joint denoting a different number. Few books except the Koran, and some encomiastic commentaries upon it, are ever seen or sought after. The education of children in the Koran goes on for three or four years, when their tuition ceases. The French have established schools of mutual instruction in all the principal towns, which are chiefly superintended by Jews, and tolerably well attended. In 1857, there were 1508 pupils at the French schools in Algiers, Oran, Bona, &c.; out

## ALGIERS.

of these no fewer than 865 were Europeans, who were mostly instructed in Arabic. The native schools in Algiers were attended by 665 pupils, of whom more than a half were Moors, and the rest Jews. Hitherto very little progress seems to have been made in diffusing a knowledge of French among the Arabic population.—(*Traité de la Situation*, &c., p. 354.)

*Arts and Sciences.*—The Arabs of Algiers, though descended from the people who gave algebra to Europe, and preserved medicine during the dark ages, have no notion either of arithmetic, or of the correct measurement of time or distance. Their medicine, too, is in the rudest state, and few diseases occur that do not, under their treatment, become either chronic or mortal. Their remedies consist chiefly of superstitious practices, as pilgrimages, &c.; or inert decoctions, as that of mallows. They are accustomed, in cases of rheumatism and pleurisy, to puncture with a red-hot iron; to dress wounds with hot butter, and sometimes with pepper, salt, and brandy; and on the field of battle to thrust wool into them. When amputation is resorted to, it is performed by the stroke of an angham, and followed by the application of hot pitch. Hence, notwithstanding their aversion to change, we need not wonder that latterly the French army surgeons have been in great request by the natives. Hospitals have been established in the principal towns, and vaccination has been introduced.—(*Shaw*, p. 198-199; *Compell*, Let. 20.)

*Buildings, Furniture, &c.*—The Berbers or Kabyles live in cabins (*grubies*) made of the branches of trees plastered with mud and straw, with a low door and narrow glazed holes serving for windows; these huts are collected together in small groups or *dahirs*. The Moors, Jews, Negroes, and most others, except the Arabs, live in houses built on a uniform model, which, from the earliest times, has not varied. An open court-yard forms the centre, around which are various apartments, opening upon galleries supported by light pillars: the roofs are flat, surrounded by a battlement breast-high, and built with a composition of sand, wood-sawes, and lime, mixed with oil and water, called *terrazo*; whence our word. The rooms are floored and ceilings are made of this composition. Water-courses are composed of tow and lime only, mixed with oil; this mixture, as well as the former, soon acquiring the hardness and imperviousness of stone. In most habitations there is in each apartment a raised platform for sleeping on, the bed being composed of junk, matting, sheep-skins, or more costly material, according to circumstances. The other furniture consists, among the nomadic tribes, of two large stones for grinding corn, wrought by women; a few articles of pottery and bronze, and a rude frame for weaving. The better classes have cushions and carpets to their rooms, the lower part of their walls being adorned with coloured hangings, and the upper part painted and decorated with fret-work. The tents of the Arabs (the *magalla* of the ancients) are sometimes called *khyamas*, from the shelter they afford; and sometimes *bet-el-shaar*, or houses of hair, from the webs of goat's hair of which they are made. They are constructed at this moment precisely in the way described by Livy (lib. xli., § 31), Ballist (*Bell. Jug.*, § 21), Virgil, &c. They are of an oblong shape, not unlike the bottom of a ship turned upwards, and are easily set up and taken down.—(*Shaw*, p. 206-223.)

*Dress, Food, &c.*—The dress of the Berbers is very rude and coarse; that of the other classes varies greatly; but it is common with both sexes to wear abroad a *kaf*, or toga, and a *bermou*, which covers the head and shoulders: the shoes of the women are very much concealed. Vegetables form the chief diet of all classes, not a fourth part of the animal food being consumed by them that is consumed by an equal population in Europe. Bread, couscouson (a kind of Irish stew), legumes, potatoes, tomatoes, and other vegetables, dressed with spices, oil, butter, or aromatic herbs; Indian figs, raisins, melons, and other fruits; with water, asherbet, and coffee—form the main articles of consumption. (See ARABIA and BARBARY.)

*Amusements.*—Drinking coffee and smoking tobacco constitute never-failing amusements. Almost all the male inhabitants of the towns have a pipe attached to the button of their vest; and the more indolent and opulent will sit for days in cafes, unmindful of their families, smoking incessantly, or playing at chess. In the country, fowling, hawking, and hunting the wild boar and lion are actively pursued. Theatres are now opened in the principal towns.

*The Language* is mostly Arabic, but mixed with Moorish and Phœnician words. The Kabyles have a peculiar language, so very poor that it is without conjunctions or abstract terms, and is indebted to the Arabic for these, and for all terms of religion, science, &c. In conversing with Europeans, a *lingua franca* is made use of; a mixture of Spanish, Italian, French, Portuguese, &c. (See BARBARY.)

*History.*—This country formed part of the Roman empire; but during the reign of Valentinian III., Count Bon-

face the governor of Africa, having revolted, called in the Vandals to his assistance. The latter having taken possession of the country, held it till they were expelled by Belisarius, A.D. 534, who restored Africa to the E. empire. It was overrun and conquered by the Saracens in the 7th century; and was soon after divided into as many kingdoms as there are now provinces. Ferdinand of Spain having driven the Saracens from Europe, followed them into Africa, and in 1504 and 1506 took possession of Oran, Bugia, Algiers, and other places. The natives, wishing to throw off the Spanish yoke, had recourse to the famous corsairs, the brothers Arondj and Khayr-ed-Dyn, better known by the names of Barbarossa I. and II., who had distinguished themselves by the boldness and success of their enterprises against the Christians. The brothers speedily succeeded in expelling the Spaniards from all their possessions in Africa, with the exception of Oran, which they held to the end of the 18th century. Algiers became the centre of the new power founded by the Barbarossas; the survivor of whom obtained, in 1530, from Sultan Selim, the title of Dey, and a re-enforcement of 9000 troops. Since then it has been governed nearly in the manner described above; and has, with few interruptions, carried on almost incessant hostilities against the powers of Christendom, capturing their ships and reducing their subjects to slavery. Attempts have been made at different periods to abate this nuisance. In 1541, the emperor Charles V., who had successfully achieved a similar enterprise at Tunis, arrived with a powerful fleet and army in the vicinity of Algiers; but the fleet having been immediately overtaken and nearly destroyed by a dreadful storm, the troops, without provisions or shelter, underwent the greatest privations; and the emperor was compelled forthwith to re-embark such of them as had escaped the fury of the elements and the sword of the Turks. (*Robertson's Charles V.*, cap. 6.) This great disaster seems for a lengthened period to have discouraged all attempts at capturing Algiers. France, however, as well as England and other powers, repeatedly chastised the insolence of its banditti by bombarding the town; but in general the European powers preferred negotiating treaties with the dey, and purchasing an exemption from the attacks of the Algerine cruisers, to making any vigorous and well-combined effort for their effectual suppression. In 1815, the Americans captured an Algerine frigate; and the dey consented to renounce all tribute from them, and to pay them 60,000 dollars as an indemnification for their losses. But the most effectual chastisement they ever received was inflicted so late as 1816, by the British under Lord Exmouth; when Algiers was bombarded, the fleet in the harbour destroyed, and the dey compelled to conclude a treaty, by which he set the Christian slaves at liberty, and engaged to cease in future reducing Christian captives to that ignominious condition. But it is exceedingly doubtful whether these stipulations would have been better observed than others of the same kind previously entered into by his predecessors.

The last of the Algerine deys got entangled in altercations with the French government. Provoked by the discussions that had taken place, and the claims that had been put forward, he had the temerity to strike the French consul on the latter paying him a visit of ceremony. Redress was, of course, demanded for this gross insult; but instead of complying with any such demand, the dey took and demolished the French post at La Calle. This was equivalent to a declaration of war; and France determined on being avenged. In this view, she fitted out a powerful armament, including a land force of nearly 38,000 men, with a formidable train of artillery, under the command of General Bourmont. The armament arrived on the Algerine coast on the 13th of June, 1830; and having effected a disembarkation on the following day, Algiers capitulated, after a feeble resistance, on the 5th of July. The dey was allowed to retire unmolested to Italy, and his troops to wherever they chose.

The French found in the treasury of the dey gold and silver, coined and uncoined, of the value of 47,539,011 fr., exclusive of stores of various kinds valued at 7,089,936 fr.

The towns of Oran and Bona soon after submitted, and the bey of Titteri was also reduced to obedience. But the bey of Oran, or Tlemcen, carried on for a lengthened period a series of contests and negotiations with the French, which were terminated in 1837 by the treaty of Tafna; by which he agreed to abandon the maritime parts of the province, and to recognize the supremacy of the French in Africa. The bey of Constantine was less easily dealt with. Trusting to the strength of his principal city, its distance from Bona, the nearest port, and the badness of the roads, he braved the hostility of the French. In November, 1836, a force of 8000 men, under Marshal Clausel, advanced against Constantine. But the expedition, having been too long delayed, encountered the greatest difficulties on its march, from the severity of the weather, and the impracticable nature of the country; so that when it arrived before Constantine, it was unable to undertake the siege of the place.

## ALGIERS.

and with difficulty effected a retreat. To wipe off this disgrace, a powerful army left Bona in the following autumn at the attack of Constantine, before which it arrived on the 6th of October. The Arabs made a vigorous resistance; but breaches having been effected in the walls, the city was carried by storm on the 13th. The French commander-in-chief, General Damremont, was killed during the siege.

The occupation of Algiers by the French has excited some jealousy in this country, but without any reason. Such a conquest must undoubtedly weaken, instead of increasing, the power of France. But though in this respect it were otherwise, the benefits which it cannot fail in the end to confer on humanity are so great and obvious as to outweigh all other considerations. The French, ignorant of some of the peculiarities of Mohammedan law, and especially of the practice of bequeathing property in trust for individuals to the church, appear to have committed some injustice. But abuses of this sort will speedily disappear; and it is impossible to overrate the advantages that must result from the introduction of European laws, arts, and sciences into this part of Africa. Its wealth, population, and influence in antiquity show what it may become. But it was idle to expect that it should ever make any improvement so long as it was dominated over by a brutal soldiery, or till it was placed under an enlightened government capable of enforcing order, and of making its regulations and itself be respected. It were, in fact, much to be wished that all N. Africa were taken possession of and occupied by European powers. It would be impossible for them to extend their empire in this quarter without putting down intolerance, barbarism, and ignorance, and establishing in their stead liberality, civilization, and science. (The best authorities in relation to Algiers are the excellent work published by the minister of war, in Paris, entitled, *Tableau de la Situation des Etablissements Français dans l'Algérie*, Paris, 1838; and Dr. Shaw's learned and invaluable Travels.)

**ALGIERS** (Al Jazair, or the Islands), a maritime city of N. Africa, cap. of the above country, now in possession of the French, on the Mediterranean coast, on the W. side of a bay about 11 m. in width and 6 deep, in lat.  $36^{\circ} 48' 30''$  N., long.  $3^{\circ} 1' 30''$  E. It is built amphitheatrically, on the face of a pretty steep hill, having for its highest point the *Kasba* or citadel, 700 feet above the level of the sea. It is nearly two m. in circ., being surrounded by thick and high walls, flanked with towers and bastions. The fortifications towards the sea are comparatively strong, but those on the land side are incapable of any very vigorous defence, and are, in fact, commanded by the adjoining heights. Algiers had, previously to the French invasion, 5 gates, 2 on the sea, and 3 on the land side; about 160 streets, 5 squares, 9 palaces, 4 large and 30 small mosques (some of which are now converted into Christian churches), 9 large and 12 small synagogues, many buildings for the military, and about 10,000 private houses. The pop. was formerly estimated at from 110,000 to 180,000; but there can no longer be any doubt that the lowest of these numbers was very far beyond the mark. It appears from a census taken on the 15th of February, 1838, that the pop. amounted at that epoch to 25,992 individuals, exclusive of about 3000 Kabyles and others not classified. It is true that a considerable emigration of Turks and others took place after the occupation of the city by the French; but estimating the number of emigrants at 10,000, which is probably beyond the truth, still the population would not exceed 40,000. Of the classified population in 1838, about 7,500 were Christians, 6000 Jews, and 12,300 Mohammedans. The city has a very imposing appearance from the sea, looking like a succession of terraces, the houses, which are all whitened, giving it a brilliant aspect; but, on entering, the illusion vanishes: the streets are filthy, dark, crooked, and so narrow that, until lately, the widest was but 12 feet across. The French have, however, taken down many buildings to enlarge the streets, among others the principal mosque, in the view of making the *Place du Gouvernement*, in the centre of the city, a large and handsome square in the European style. The houses have flat roofs, that command a fine view of the sea; they vary from two to three stories in height, and have a quadrangle in their centre, into which the windows uniformly open. The streets have, in consequence, a gloomy appearance; and they are further darkened by the successive stories of the houses projecting over each other, and by their being frequently propped up by timbers across from one to another. The "islands" whence Algiers derives its name, are two rocky ledges opposite its N.E. quarter, which have been united, strongly fortified, and connected with the main land by a mole; another mole, stretching S.W. from these islands, and furnished with two tiers of cannon, incloses the harbour, which is rather small, and incapable of accommodating any vessel larger than a middle-sized frigate. A light-house is erected on one of the islands at the junction of the two moles. The *Kasba* or citadel is surrounded by strong walls, and its fortifications have been repaired and

## ALICATA.

strengthened by the French. It is, in fact, a little town in itself. It was here that the French found the treasure belonging to the dey referred to in the previous article. The mosques are octagon buildings, with a dome and minarets, often elegant, and adorned with marble colonnades. There are numerous public and private fountains, and baths of all kinds; for though formerly destitute of water, Algiers is now well supplied with that important element, which is brought to the town by aqueducts constructed in the last century, and which, previously to the French occupation, were kept in repair by funds set apart for that purpose. Many shops have been opened by Europeans; they consist of recesses in the sides of the houses, about 7 feet by 4; but business is mostly transacted in the bazars, which, with the barbers' shops and cafés, are the chief places of resort for the natives. Algiers is now the residence of the governor-general of the French possessions in Africa, and of the principal government functionaries and courts of justice. It was created the seat of a bishopric in 1638; it is strongly garrisoned, and has a regular intercourse by steam-packets with Marseilles. The manufactures are chiefly those of silk stuffs, girdles, purses, cloaks, jewelry, woollen cloths, *kaiks*, *bermouss*, sandals, harness, carpets, junk, bronze utensils, &c. The markets are well provided with meat, vegetables, and fruit; provisions generally cheap, excepting bread, which is dear: there were no ovens, and only hand-mills for grinding corn, before the occupation by the French. European manners, habits, and dresses are common; as many hats are seen as turbans; cigars replace pipes, shops and bars; grand hotels, cafés, billiard-tables, eating-houses, *cabarets littéraires* have been set up, and a circus, *commodore*, and opera established. The streets have all received French names. In 1837 there were at Algiers 293 fine days, 63 on which it rained, and 60 during which the sky was covered with clouds. There arrived at Algiers in 1837, 995 vessels of the burden of 74,769 tons. Of these 90 vessels, tonnage 6363, were from England; and 25 vessels, tonnage 4561, from British possessions in the Mediterranean. The environs of Algiers are very beautiful, and for some miles round interspersed with great numbers of elegant villas. There are two small suburbs, those of Bab-el-Oued and Bab-e-Zoun; the former to the N., the latter to the S. of the city. About a mile S. of the *Kasba* is the *Sultes Kalesse*, or fort of the emperor, an irregular polygon without fosse or countescarp, about  $\frac{1}{2}$  mile in circ. It stands on the spot where Charles V. encamped, A.D. 1541, and completely commands the town; but is itself commanded by mount Bonjerah. The ancient city of Numontum, the capital of Juba, was situated not far from Algiers, to the W. of Torretta Cica; some ruins of this city still exist. Algiers was founded A.D. 935. For some notice of its history, see the previous article. (See *Tableau de la Situation, &c.*; *Revue*, iii., p. 14-88; *Shaw's Travels*, p. 33-35.)

**ALGOA BAY.** See PORT ELIZABETH.

**ALHAMBRA.** See GRANADA.

**ALHANDRA**, a town of Portugal, prov. Estremadura, on the Tagus, 18 m. N.N.E. Lisbon. Pop. 1000.

**ALICANT** (an. *Lacantum*), a sea-port town of Spain in Valencia, cap. prov. same name, on the Mediterranean, lat.  $39^{\circ} 30' 41''$  N., long.  $0^{\circ} 30'$  W. Pop. about 14,000, having declined from 21,500 in 1810. It is situated between mountains at the bottom of a spacious bay, having cape la Hereta at its N.E. extremity, and Isla Plana on the S. Large vessels anchor from  $\frac{1}{2}$  to 1 m. from shore, and small craft lie alongside the pier, which, though incomplete, is about 390 yards in length. Alicante is defended by a castle on a rock about 400 feet high. Streets narrow and crooked; but when visited by Mr. Townsend they were well paved and clean. None of its churches, convents, or other public buildings deserve notice. It has a school of navigation, and has, or at all events had, an institution for providing for orphans, deserted children, and the sons of soldiers. We are not aware whether the "House of Mercy," founded in 1768, and intended to assist in the suppression of mendicancy, still exists. (Townsend, iii., p. 184.) The trade of Alicante, though still considerable, has fallen much off, partly in consequence of the emancipation of America, but more through the influence of oppressive duties and the disturbed state of the country. Its exports consist principally of wine, almonds (10,000 cwt.), barilla (50,000 to 90,000 cwt.), olives and olive oil, brandy, figs, salt, esparto-rush, wool, silk, linen, &c. The imports consist principally of linens, salted-fish, corn, cotton and cotton stuffs, colonial produce, timber, &c. (Besides Townsend, see *Argle's Spain*, ii., 304; *Communications from British Consul*, &c.)

**ALICATA**, or **LICATA**, a sea-port town on the S. coast of Sicily, Val di Giarretti, at the mouth of the Salso, lat.  $37^{\circ} 4' 25''$  N., long.  $13^{\circ} 53' 40''$  E. Pop. 13,465. It is built partly on the beach and partly on the slope of some hills. Its walls have gone to decay, and neither of its two castles is of any considerable strength. It is a poor-looking place, but exports considerable quantities of corn, with sulphur and soda,

## ALICUDI.

planchis trees, almonds, macaroni, &c. The port is shallow, so that large vessels must load in the ciling or road, about a mile S.W. of the town, where they are exposed to the southerly winds. (*Switzerland's Two Shells*, l. p. 297, 4th ed.; *Smith's Sicily*, p. 198.)

ALICUDI, the most W. of the Lipari Islands, 56 m. E.N.E. Palermo. Pop. 200. It is about 6 m. in circ., rises abruptly from the sea, with irregular ravines and precipitous hills. It is cultivated, wherever there is any soil, with singular and laborious industry, and produces most excellent wheat, basil, flax, capers, &c. The people are said to be exceedingly healthy; it has only two unsafe landing-places, and is rarely visited by strangers. (*Smith's Sicily*, p. 277.)

ALIGHUR, a strong fort of Hindostan, in the district of the same name, between the Ganges and the Jumna, 62 m. N. Agra, lat. 27° 56' N., long. 77° 58' E. It was taken by storm in 603; and was soon after made the headquarters of a civil establishment for the collection of the revenue, and the administration of justice. The N. portion of the district of Alighur is a desolate tract, overgrown with low jungle; but the S. portion is fertile and highly cultivated. The natives, though warlike, are superior to the Bengalees, and other tribes near to the River.

ALKMAAR, a town of N. Holland, cap. around, and one on the great ship canal from Amsterdam to the Helder, 30 m. N.N.W. of the former, lat. 52° 28' N., long. 4° 44' 30" E. Pop. 5580. It is strongly fortified and well built; there are many fine canals, shaded with trees, and the whole town has a strikingly clean and comfortable appearance. The *Hôtel de Ville* and the arsenal are the only public buildings that deserve notice. It is the seat of a court of primary jurisdiction, and has a college, physical society, theatre, concert hall, &c. Vast quantities of excellent butter and cheese are produced in the surrounding meadows. Exclusive of butter, about 40,000 tons of cheese are said to be annually disposed of in its markets. It also manufactures canvas, and has a considerable trade in cattle, corn, tulips, &c. Its commerce has been materially facilitated by the construction of the great canal. Without the town is a fine promenade, similar to those at the Hague and at Haarlem. In 1573, Alkmaar was invested by the Spaniards; but, having been repulsed with great loss in an attempt to take the town by storm, they abandoned the siege. In 1709, the Anglo-Russian army, under the Duke of York, advanced from the Helder as far as Alkmaar. (*Dict. Geographique; Murray's Hand-book*, &c.)

ALLAHABAD, an extensive and populous province or soubah of Hindostan proper, between the 94th and 96th deg. N. lat., and 79th and 83d E. long. It is bounded on the N. by Oude and Agra, S. by Gaudwana, E. by Bahar and Gaudwana, and W. by Malwah and Agra. It is about 970 m. in length by about 190 in breadth.

It is divided into the following zillahs or districts, viz.: 1. Allahabad; 2. Benares; 3. Mirzapoor; 4. Jaunpore; 5. The Rewah territory; 6. Bundelcund; 7. Cawnpore; 8. Manipore territory. It is watered by the Ganges, Jumna, and other great rivers. Adjacent to the former, the country is flat and very productive, but in the S.W., in the Bundelcund district, it forms an elevated table-land, diversified with high hills containing the celebrated diamond mines of Poonah. The flat country is extremely sultry, and subject to the hot winds, from which the more elevated region is exempted. In the hilly country, where the rivers are less numerous than in the plains, the periodical rains and low-water are chiefly relied on for agricultural purposes. On the whole, however, Allahabad is one of the richest provinces of Hindostan. The principal articles of export are sugar, cotton, indigo, cotton cloths, opium, salt-petre, diamonds, &c.; and, in addition, it produces all kinds of grain and a vast variety of fruits.

The chief towns are Allahabad, Benares, Callinger, Chatterpore, Chunar, Ghazypore, Jaunpore, and Mirzapore. The whole of this extensive province is now subject to the British government; the Benares district having been ceded in 1775; Allahabad and the adjacent territory in 1801; and the districts of Bundelcund in 1803. Seven eighths of the inhabitants are supposed to be Hindoos, the remainder Mohammedans.

ALLAHABAD, an ancient city of Hindostan, cap. of the above prov. and dist., near the confluence of the Ganges and Jumna, being, by the course of the river, 690 m. from the sea, but the distance in a direct line from Calcutta is only 476 m.; from Benares, 75 m., and from Agra, 360 m.; lat. 26° 27' N., long. 81° 30' E. At a short distance from the city, at the junction of the rivers, is situated the fortress, founded by the emperor Akbar, in 1583; but much improved since it came into the possession of the British. It is lofty and extensive, completely commanding the navigation of both rivers. On the sea side it is defended by the old walls; but on the land side it is regularly and strongly fortified. It could not be taken by a European army, except by a regular siege; and to a native army it would be all but

## ALLEGAN.

impenetrable; and hence it has been selected as the great military depot of the upper province.

Being situated at the point of union of two great navigable rivers, Allahabad would seem to be in one of the finest positions in India for being the seat of an extensive commerce. And if we suppose, with D'Anville and Dr. Robertson, that it occupies the site of the ancient Palibothra, it certainly ranked among the first commercial cities of antiquity. But in modern times it does not appear to have ever attained to the magnitude or importance that might have been anticipated. Formerly, however, it was both more populous and flourishing than at present. A considerable cotton manufacture is said to have been driven from the town by the exertions of the native officers of the Oude government. According to Hamilton, the pop. amounted, in 1803, to about 28,000, exclusive of the military; and there is no room for thinking that it has been materially increased in the interval. The houses are of mud, raised on the foundations of more substantial brick edifices that have fallen into decay. Heber says, it has a desolate, ruinous appearance, and that it has obtained among the natives the name of *Paherbabad* (beggar abode!). It is the permanent station of a high court of justice—*Sudder Moftess*, commission—and has a school formed, in 1835, for the education of the natives. Allahabad has been in possession of the British since 1765.

Besides the Ganges and Jumna, the Hindoos believe that another river, the *Sorawati*, joins the other two from below ground. In consequence of this extraordinary junction, Allahabad is reckoned peculiarly holy, and is annually visited by many thousands of pilgrims, who come from all parts of Hindostan to bathe and purify themselves in the sacred stream: in some years their numbers have amounted to nearly 280,000, each of them paying a small tax to government: "When," says Mr. Hamilton, "a pilgrim arrives, he sits down on the bank of the river, and has his head and body shaved, so that each hair may fall into the water, the sacred writings promising him one million of years' residence in heaven for every hair so deposited. After shaving, he bathes; and the same day, or the next, performs the obsequies of his deceased ancestors. The tax accruing to government for permission to bathe is three rupees each person; but a much greater expense is incurred in charity and gifts to the Brahmens, who are seen sitting by the river-side. Many persons renounce life at this holy confluence, by going in a boat, after performance of certain solemnities, to the exact spot where the three rivers unite, where the devotee plunges into the stream, with three pots of water tied to his body. Occasionally, also, some lose their lives by the eagerness of these devotees to rush in and bathe at the most sanctified spot, at a precise period of the moon, when the immersion possesses the highest efficacy. The Bengalees usually perform the pilgrimages of Gaya, Benares, and Allahabad in one journey, and thereby acquire great merit in the estimation of their countrymen." (*Hamilton's Gazetteer*, Heber, i. p. 441-445.)

ALLAHABAD (DISTRICT OF), consists of the territory immediately adjacent to the city of Allahabad. In 1815, it contained 1,665,106 begahs of cultivated land, assessed at 2,378,394 a year of *jumma*, or land revenue. At the same time it contained 355,018 begahs of land, fit for cultivation, and 1,108,777 waste. It is watered by the great rivers Ganges and Jumna, and, when well cultivated, is remarkably fertile. Wheat is the principal crop; but the culture of cotton and indigo has greatly increased—and that of opium has also been introduced. A considerable quantity of cotton cloths and chintzes were formerly produced; but this branch of industry is now nearly annihilated in consequence of the native manufactures being undermined by the British. This district suffered considerably from the *jumma*, or land revenue, having been fixed at too high a rate when the perpetual assessment was introduced. It has been the theatre of a considerable number of gang robberies, but these have been either wholly suppressed, or greatly diminished in consequence of the introduction of a more efficient police. (*Parl. Papers*, No. 733, II., Sess. 1832, p. 69, &c.; *Hamilton's Gazetteer*.)

ALLAN (BRIDGE OF), a neat village of Scotland, on the Allan, 3 m. N.W. Stirling. It is a good deal resorted to in summer by visitors, on account of a mineral spring in the vicinity.

ALLAUCH, a town of France, dep. *Beuches du Rhone*, 5 m. E.N.E. Marseilles. Pop. 3568. It is built on the declivity of a hill, and is very ancient.

ALLEGAN, co. Mich. Situated in the W. part of the state, and contains 940 sq. m. Bounded W. by Lake Michigan. Watered by Kalamazoo, Black, and Rabbit rivers.

\* Major Russell denies this, and contends that Palua occupies the site of Palibothra. (*Memoria of a Map of Hindostan*, 3d ed., p. 48.) But the reasoning of Dr. Robertson, founded on the statements of Strabo and Arrian, seem to prove conclusively the identity of Palibothra and Allahabad. (*Discoveries in Ancient India*, note 111.)

† A length of 1000 in size, but is generally about one third of an inch.

## ALLEGHANY RIVER.

On the river the soil is a fertile alluvion, on the lake shore it is sandy, and in other parts a mixture of clay and sand. In 1840 there were 1811 neat cattle, and 8260 swine; and there were produced 13,816 bushels of wheat, 14,725 of Indian corn, and 118,945 pounds of sugar. It contained one furnace, two flouring-mills, one grist-mill, fifteen saw-mills, one academy, 15 students, twelve schools, 305 scholars. Pop. 1733. Cap. Allega.

ALLEGAN, p. l., capital of Allegan co., Mich. 161 W. by N. Detroit, 636 W. Situated on both sides of Kalamazoo r., over which are here two bridges. It is at the head of navigation on the river, which has here a fall of eight feet, furnishing a valuable water power. The ground on which it stands is elevated thirty feet above the river, and the soil is dry and sandy. It exports three or four million feet of lumber annually, and has one furnace, one flouring-mill, four saw-mills, one academy, 15 students, three schools, 61 scholars. Pop. 634.

ALLEGHANY RIVER, rises in M'Kean and Potter counties, Pa., and, after the union of its head branches, passes N.W. into the state of N.Y., and thence, by a considerable bend, it returns again into Pa., and proceeds in a S.W. course until it unites with the Monongahela river at Pittsburgh, to form the Ohio river. Its length is about 375 m., and it is 400 yards wide at its mouth. It is navigable for keel boats of ten tons to Olean, N.Y., 800 m. above Pittsburgh. Nearly 20,000,000 feet of plank descend this river annually. The *Genesee Valley* canal, when completed, connects the Erie canal at Rochester with this river at Olean.

ALLEGHANY, or APPALACHIAN MOUNTAINS, extend from the Catskill mountains in N.Y., in a S.W. direction, to Ga. and Ala. where they sink to elevated hills, though some choose to extend them much farther to the N.E., reaching to the White mountains in N.H., and even further. But N.E. of the Catskill, the range is not continuous and well defined. They consist of a number of ridges, denominated the Blue ridge, North mountain, Jackson's mountain, Laurel mountain, Cumberland mountain, &c., the whole from 80 to 900 m. in breadth, and from 50 to 130 m. from the ocean, and nearly parallel to it. They have a mean elevation of about 2500 feet above the level of the sea, though in Yancey co., N.C., are some peaks over 6000 feet high, which are a little higher than the highest peaks of the White mountains, N.H., and constitute the highest land in the U. States E. of the Rocky mountains. This great chain divides the waters which flow into the Atlantic from those which flow into the Mississippi. These ridges are generally wooded to the top, and between them are extensive and fertile valleys. Their steepest side is towards the E., where granite gneiss and other primitive rocks prevail. On the W. they descend by a more gradual slope towards the Mississippi. The anthracite coal, so extensively found, is on the E. side of these mountains, while among them, and W. of them, bituminous coal prevails. A spur of these mountains called the Highlands, crosses Hudson river, and the tide flows through them with deep navigable water, which is the only instance on the Continent, excepting the St. Lawrence, where the tide passes through a primitive mountain.

ALLEGHANY, co., N.Y. Situated in the S., towards the W. part of the state, and contains 1185 sq. m. Watered by Genesee river and its branches. The surface is an elevated table-land, and much of the soil is very fertile. The Genesee valley canal passes through it, and will connect the Erie canal at Rochester with the Alleghany river at Olean, furnishing a navigable communication with the Ohio at Pittsburgh. In 1840, it contained 45,864 neat cattle, and 199,655 sheep, and produced 238,471 bushels of wheat, 63,137 of Indian corn, and 583,945 of potatoes. It had thirteen stores, twenty-four fulling-mills, four woolen factories, thirty-one tanneries, two distilleries, three flouring-mills, thirty-six grist-mills, 264 saw-mills, six furnaces, three printing-offices, and two weekly newspapers, one academy, 47 students, 215 schools, 9157 scholars. Pop. 40,973. Cap. Allega.

ALLEGHANY, co., Pa. Situated in the W. part of the state, and contains 575 sq. m. The Alleghany and Monongahela rivers unite in this county to form Ohio river, which runs 14 m. in the county. The surface is hilly; soil fertile. It had, in 1840, 21,512 neat cattle, 54,450 sheep, and 24,635 swine; and produced 461,167 bushels of wheat and 299,797 of Indian corn. It had thirty-nine commercial and commission houses in foreign trade, 351 stores, five woolen factories, five cotton factories, with 17,370 spindles, fourteen distilleries, six breweries, seventeen glass-houses, thirty-seven flouring-mills, fifty-two grist-mills, eighty-one saw-mills, twenty-eight tanneries, eighteen printing-offices, four daily and eleven weekly newspapers, and ten periodicals, two colleges, 81 students, twenty-one academies, 1189 students, 908 schools, 10,981 scholars. Pop. 61,835. Cap. Pittsburg.

ALLEGHANY, co., Md. Situated in the W. part of the state, and contains 600 sq. m. The surface is broken and rough, the main branch of the Alleghany mountains passing through it. The N. branch of Potomac river bounds it on

## ALLEN.

the S.E. Drained by Youghiogheey river. Along these rivers the Chesapeake and Ohio canal is to pass. The Great National road, extending in the western states, commences at Cumberland, in this county. It contained, in 1840, 10,031 neat cattle, 12,763 sheep, and 11,490 swine; and produced 86,646 bushels of wheat and 191,747 of Indian corn, and had sixty-three stores, two woolen factories, eight tanneries, eight distilleries, eleven flouring-mills, eighteen grist-mills, forty-four saw-mills, one furnace, two printing-offices, three weekly newspapers, one academy, 65 students, twenty-nine schools, 988 scholars. Pop.: whites 14,063, slaves 815, free coloured 215; total, 15,093. Cap. Cumberland.

ALLEGHANY, co., Va. Situated in the central part of the state, and contains 531 sq. m. Drained by branches of James river. The surface is uneven; some of the soil is fertile, particularly on the streams, while in other parts it is barren. A stream, issuing from a spring, has a fall of 169 feet, and proceeds, by a succession of cataracts, to Jackson's river. There were, in 1840, 2636 neat cattle, 3647 sheep, and 4578 swine; and there were produced 25,440 bushels of wheat, 70,238 of Indian corn, and 62,506 pounds of tobacco. It had five stores, five distilleries, four flouring-mills, twenty grist-mills, twenty-one saw-mills, one furnace, five schools, 88 scholars. Pop.: whites 3143, slaves 347, free coloured 69; total, 3749.

ALLEGHANY, t., Armstrong co., Pa. It has five stores, three grist-mills, three saw-mills, and some salt-works. Pop. 1838.

ALLEGHANY, t., Huntingdon co., Pa. It has six stores, two woolen factories, one furnace, two tanneries, three grist-mills, twenty saw-mills. Pop. 9233.

ALLEGHANY, t., Venango co., Pa. It has three stores, two tanneries, one pottery, three grist-mills, one saw-mill, four schools, 108 scholars. Pop. 804.

ALLEGHANY, t., Somerset co., Pa. It has one store, three grist-mills, eight saw-mills. Pop. 633.

ALLEGHANY, t., Potter co., Pa. Pop. 236.

ALLEGHANY, t., Westmoreland co., Pa. It has five stores, six flouring-mills, five saw-mills, eleven schools, 343 scholars. Pop. 2641.

ALLEGHANY, t., Cambria co., Pa. It has three stores, two grist-mills, eight saw-mills, seven schools, 256 scholars. Pop. 1217, including Loretto v.

ALLEGHANY city, Ross t., Alleghany co., Pa. Situated on a point of land formed by the Ohio and Alleghany rivers, opposite to Pittsburgh, with which it is connected by a covered bridge 1193 feet long, resting on five piers of hewn stone, which cost \$26,949. Incorporated in 1898; and contains fifty-eight stores, nine lumber-yards, three cotton factories, with 14,370 spindles, two tanneries, one brewery, and one rope-walk. Pop. 10,069. See PITTSBURG.

ALLEN, co., O. Situated in the N.W. part of the state, and contains 564 sq. m. Watered by Anglin's river. The soil is fertile. It contained, in 1840, 9068 neat cattle, 3728 sheep, 18,893 swine. There were produced 60,321 bushels of wheat, 168,545 of Indian corn, 106,744 pounds of sugar. It had nineteen stores, four tanneries, two distilleries, seven grist-mills, six saw-mills, nineteen schools, 418 scholars. Pop. 3079. Cap. Lima.

ALLEN, co., Ia. Situated in the N.E. part of the state, and contains 680 sq. m. Watered by St. Joseph and St. Mary's rivers, which unite at first Wayne to form Maumee river. The Wabash and Erie canal passes through the co. It had, in 1840, 2634 neat cattle, and 8594 swine. There were produced 34,819 bushels of wheat, 84,375 of Indian corn, and 94,865 pounds of sugar. It had forty-one stores, three flouring-mills, two grist-mills, fourteen saw-mills, one printing-office, issuing a weekly newspaper, thirty-two schools, 980 scholars. Pop. 5942.

ALLEN, co., Ky. Situated in the S. part of the state, and contains 400 sq. m. Watered by Big Barren river and its branches. It had, in 1840, 8051 neat cattle, 11,419 sheep, and 23,165 swine. There were produced 47,157 bushels of wheat, 312,065 of Indian corn, 508,870 pounds of tobacco, 17,860 of cotton, 33,113 of sugar. It had eleven stores, forty-nine distilleries, six flouring-mills, three grist-mills, nine saw-mills, five schools, 104 scholars. Pop.: whites 6375, slaves 925, free coloured 19; total, 7399.

ALLEN, p. t., Cumberland co., Pa., 18 m. W.S.W. Harrisburg, 108 W. It has six stores and two fulling mills. Pop. 3235.

ALLEN, t., Northampton co., Pa. It has two Lutheran churches, eleven stores, six flouring-mills, four grist-mills, two saw-mills, two tanneries, three distilleries, one academy, 59 students, seven schools, 975 scholars. Pop. 2547.

ALLEN, t., Hillsdale co., Mich. It has three schools, 98 scholars. Pop. 466.

ALLEN, t., Darke co., O. Pop. 194.

ALLEN, t., Union co., O. Pop. 713.

ALLEN, t., Noble co., Ia. It has one school, 18 scholars. Pop. 179.

ALLEN (See ov), the name usually given to the extensive tracts of moor situated in Kidder, and King's and

## ALLENDORF.

Queen's counties, and the adjoining counties of Ireland. These do not, however, form, as is commonly supposed, one great morass, but a number of contiguous morasses separated by ridges of dry ground. Though flat, the bog has a mean elevation of about 250 feet above the level of the sea, and gives birth to some of the principal Irish rivers, as the Barrow, flowing S., and the Boyne, E.

ALLEN (LOUGH), a lake, co. Leitrim, Ireland, about 10 m. in length, and from 4 to 5 in width. This lake is generally supposed to be the source of the Shannon, and it has perhaps the best title to that distinction. It is elevated 144 feet above the level of high water-mark at Limerick; and the Shannon has been rendered navigable as far as the lough.

ALLENDORF, a town of Hesse Cassel, on the Werra, 23 m. E.S.E. Cassel. Pop. 3500. There is in the vicinity a considerable salt-works.

ALLENSTEIN, a town in East Prussia, cap. circ., on the Alle, 37 m. S.S.W. Hellaug. Pop. 3000. It has a gymnasium, and fabrics of cloth and earthenware.

ALLENSTOWN, p. t., Merrimack co. N. H., 10 m. S.E. Concord, 420 W. It has four schools, 106 scholars. Pop. 445.

ALLENSTOWN, p. v., Wilcox co., Ala., 111 m. S. Tuscaloosa, 903 W.

ALLENSTOWN, p. v., Upper Freehold t., Monmouth co., N. J., 13 m. E. by N. Trenton, 178 W. It contains one Presbyterian and one Methodist church, one grist-mill, two saw-mills, one cotton factory, and about eighty dwellings, some of them of brick.

ALLENSTOWN, p. t., capital of Lehigh co., Pa., 87 m. E.N.E. Harrisburg, 180 W. It is regularly laid out with streets crossing each other at right angles, with a square in the centre, and contains a court-house, jail, county offices, a bank, four churches, one Presbyterian, one Episcopal, one Lutheran, and one German Reformed, fifteen stores, two tanneries, four printing-offices, four weekly newspapers, one academy, 30 students, seven schools, 435 scholars, 300 dwellings, and 3493 inhabitants.

ALLESTAR, a town in the peninsula of Malacca, which contained, in 1823, 9000 houses.

ALLEYARD, a town of France, dep. Isère, cap. cant., 21 m. N.E. Grenoble. Pop. 2509. There are valuable iron and copper mines in its vicinity, and foundries where iron of an excellent description is prepared for conversion into steel, and also for being cast into cannon. In the neighbourhood are the ruins of the castle of Bayard, the birthplace of the famous knight of that name—the *chevalier sans peur et sans reproche*.

ALLIER, a dep. almost in the centre of France, so called from the river Allier, one of the principal affluents of the Loire, which traverses it from S. to N. between 45° 58' and 46° 47' N. lat., and 2° 16' and 3° 57' E. long. Area, 723,981 hect., whereof about 468,000 are cultivated land, 70,000 meadows, 18,000 vineyards, 64,000 woods, 28,700 heaths, moors, &c. Pop. 309,370. Exclusive of the Allier, it is bounded E. by the Loire, and is traversed by the Cher, and other lesser rivers, &c. The ponds and smaller lakes are so numerous, that they are said to have an injurious influence over the climate. Surface undulating, and in parts hilly; soil generally fertile, producing a surplus of corn and wine for exportation, with great numbers of cattle, sheep, and excellent horses. A good deal of the timber in the forests is oak, suitable for ship-building. Agriculture in this, as in many other departments of France, is in a very backward state. The peasantry are small proprietors, and wedded to the practices of their forefathers. *En vain leur indigence ou de nouveaux procédés agricoles, ils cultivent comme faisaient leurs pères. Une aveugle routine sert de bornes à leur étroite intelligence.* There are valuable mines of coal, iron, and antimony; and quarries of marble and granite. Among the manufacturing establishments may be mentioned the glass-works of Sourignac and Commeny, which employ about 800 work-people; the iron-works of Tronçais, which employ above 500 ditto, and furnish annually above 800,000 kilograms of iron; and there are also manufactures of cutlery, earthenware, cloth, and paper, with spinning-mills, and numerous breweries, rope-walks, &c. It is divided into four electoral arrond.; returns four m. to the ch. of deputies; and had, in 1838, 1617 electors. Public revenue, in 1831, 6,444,045 fr. Chief towns, Moulins, Montluçon, Gannat, La Palisse, &c. (*Hugo, France Pittoresque, ch. Allier; French Official Tables.*)

ALLISON, L., Clinton co., Pa. It has six stores, one tannery, one brewery, two printing-offices, two weekly newspapers, one school, 70 scholars. Pop. 643.

ALLOA, a sea-port and m. town of Scotland, co. Clackmannan, on the Forth, at the point where it ceases to be a river, and becomes a firth, 25 m. W.N.W. Edinburgh. Pop. of town, 4417; of parish and town, 6377. It is irregularly built, but has recently been much improved. A church, opened in 1819, has a spire 200 feet in height. The harbour

## ALMEIDA.

is excellent; vessels of large burden lying close to the quay; there is also a dry dock and two yards for ship-building. The trade of the town is considerable, and it has nearly 8000 tons of shipping. There are very extensive collieries, distilleries, and iron-works in the neighbourhood, the produce of which is principally shipped here: and in the town and its vicinity are extensive breweries, which produce ale rivaling that of Edinburgh, with an iron-foundry, two woollen manufactories, glass-works, tile and brick-works, &c. The justice of peace, and sheriff courts for the county are held here. In a park adjoining the town are the ruins of a seat of the Earl of Mar, part of which consists of a tower of the 13th century, 90 feet in height. (*Revised at Alloo.*)

ALLOWAY KIRK: the church (Scottic Kirk) of a parish on the coast of Ayrshire, long united with that of Ayr, near the mouth of the Doon, on the road from Ayr. to Maybole, about 3 m. S. from the former. The Kirk has been for a lengthened period in ruins, but being prominently brought forward in Burns's inimitable tale of Tam O'Shanter, and having in its immediate vicinity the poet's birth-place, and the monument erected to his memory, it has become an object of great interest. Though roofless, the walls are in pretty good preservation; and the feelings with which they are now associated will protect them from depredation. The church-yard, which is still used as a burying-ground, contains the graves of Burns's father and mother; and, such is the *prestige* with which it has been invested, that latterly it has become a favourite place of interment. Between Alloway Kirk and Ayr, but much nearer the former than the latter, is the cottage in which Burns was born (on the 25th of February, 1759), a one-story house, of humble appearance, with a thatched roof, and long used as an inn. About 1 m. on the other side of the Kirk are the "Auld brig o' Doon," and the new bridge—the latter about 100 yards below the former, and built since the time of Burns; and on the summit of the acclivity of the E. bank of the river, about half way between the old and new bridges, is the monument of the poet. This elegant structure was finished in 1823, at an expense of about £3000. It is built in imitation of the monument of Lycabates at Athens, and consists of a triangular basement, on which rises a peristyle of nine Corinthian columns, 30 feet in height, supporting a cupola, surmounted by a gilt tripod. It is above 60 feet in height; is built of fine white freestone, and has a chaste, classical appearance. Independently of the peculiar associations connected with the place, the scenery around is equal in richness and variety to any in Scotland. The celebrated statues of Tam O'Shanter and Renter Johnnie are appropriately placed in a grotto within the grounds attached to the monument. (*New Statistical Account of Scotland, art. Ayr; Chambers's Land of Burns, &c.*)

ALLOWAYSTOWN, p. v., Upper Alloways t., Salem co., N. J., 60 m. S.S.W. Trenton, 171 W. It contains one Baptist and one Methodist church, five stores, two saw-mills, employed in cutting ship timber, and about eighty dwellings.

ALMADA, a town of Portugal, prov. Estremadura, on the Tagus, opposite to Lisbon. Pop. 4000. There is an old castle on a rock, an hospital, a Latin school, with large magazines for wine.

ALMADEN, a town of Spain, prov. La Mancha, in the Sierra Morena, 57 m. W.S.W. Ciudad Real. Within a very few miles of this town is a famous mine of cinnabar, whence mercury used to be obtained, to the extent of from 12,000 to 15,000 quintals a year, for the supply of the silver mines of Mexico. This mine is very ancient, and is believed, indeed, to have been wrought by the Romans. But the statements of Pliny (*Hist. Nat. Lib.*, 337) apply distinctly to Salsp in Bética, that is, to *Almaden de la Plata*, 27 m. N.N.W. Seville, where there is, also, a very productive mine. These are mines of the same sort in other parts of Spain.

ALMAGRO, a town of Spain, prov. La Mancha, 13 m. E.S.E. Ciudad Real. Pop. 8000. It has an important manufacture of blondes. The country round is celebrated for its mules and asses, of which there is usually a large fair.

ALMANZA, a town of Spain, prov. Murcia, 56 m. N.W. Alicante. Pop. 5000. It is well built, has broad streets, linen fabrics, and a great annual fair. In the neighbourhood of this town, on the 25th April, 1707, the French, under the Duke of Berwick, gained a complete victory over the allied forces in the interest of the Archduke Charles. The latter lost 5000 men killed on the field, and nearly 10,000 taken prisoners.

ALMAREZ, a town of Spain, prov. Estremadura, on the Tagus, 22 m. S.E. Plasencia. Pop. 1000. Towards the middle of the 16th century, a fine bridge, in the Roman style, was carried over the river at this point. In 1810, an obstinate conflict took place near this town, between an Anglo-Spanish and French force.

ALMEIDA, a fortified town of Portugal, prov. Beira, 34 m. W. by N. Ciudad Rodrigo. Pop. 6000. From its position on the frontier of the kingdom, it has always been deemed a military post of the greatest importance. In 1762, it was

## ALMELO.

taken by the Spaniards, after a long siege. In 1510, it was taken by the French under Massena: who abandoned it in the following year, after blowing up the fortifications.

ALMELO, a town of the Netherlands, prov. Overijssel, on the Vecht, 33 m. E.N.E. Deventer. Pop. 4000. It has a college, a commission of agriculture and manufacture, and Manches fine linen.

ALMERIA (an. *Margia*), a sea-port town of Spain, Granada, near the mouth of the river of the same name, and at the bottom of the gulf, lat.  $36^{\circ} 51' 39''$  N., long.  $3^{\circ} 33'$  W. Pop. 19,000. It is the seat of a bishop, and has fabrics of soda and salt-petre, and of cordage and other articles made of the esparto-rush. The harbour is large, well sheltered, and is protected by a castle; the water is so deep, that large vessels anchor half a mile from shore, in from 9 to 14 fathoms, and smaller vessels anchor, close in shore, in from 5 to 9 fathoms. The ancient sovereigns of Granada considered this as the most important town of their dominions, as well on account of the fertility of the surrounding country, as of its manufactures and commerce. But it is now much fallen off.

ALMODOVAR DEL-CAMPO, a town of Spain, with a castle, prov. La Mancha, 18 m. S.S.W. Ciudad Real. Pop. 3000.

ALMONBURY, a pa. and township of England, W.R. co. York, wap. of Agbrigg, divided by the Colne from the pa. of Huddersfield. The pa. is very extensive, containing 36,140 acres, with a pop. of 30,000. It contains several villages, of which Almonbury,  $1\frac{1}{2}$  m. S.E. Huddersfield, is the principal. Pop. of Almonbury township 7086, mostly engaged in the manufacture of woollens and cottons, especially the former. (See HUDDERSFIELD.)

ALMOND, p. t., Alleghany co., N.Y., 14 m. E. Angelica, 996 W. by S. Albany, 381 W. It is watered by Canistota river, and contains four stores, one fulling-mill, one grist-mill, three saw-mills, one furnace, twelve schools, 365 scholars. Pop. 1434. The village contains one Presbyterian and one Baptist church, sixty dwellings, and about 400 inhabitants.

ALMORA, a town of Hindostan, cap. Kumaon, in the N.E. part of India, 90 m. N. by E. Bareilly; lat.  $29^{\circ} 35'$  N., long.  $79^{\circ} 40'$  E. It stands on a ridge 5337 feet above the level of the sea, and is compactly built. The houses of stone, and slated, are generally two and some three stories high; the ground-floor being occupied as shops. The old Gorkha citadel stands on a commanding point of the ridge at the E. extremity of the town, and several mazzello towers have been erected on peaks to the eastward. This place was acquired by the British in 1815. The surrounding country is remarkably bleak and naked. (Hamilton's *E. I. Gazetteer*.)

ALMUNECA, a sea-port town of Spain, Granada, lat.  $36^{\circ} 47' 30''$  N., long.  $3^{\circ} 51'$  W. Pop. 2100. The surrounding country produces cotton and sugar. The anchorage is fit only for small vessels, and should not be used by them except in cases of emergency, as the E. winds common on this coast are dangerous.

ALMUNIA, a town of Spain, Arragon, 18 m. N.E. Calatayud. Pop. 3000.

ALMURADIEL, a town of Spain, in La Mancha, 8 leagues from Manzanares.

ALNA, p. t., Lincoln co., Me. 10 m. N. Wiscasset, 30 S. by E. Augusta, 598 W. Watered by Sheepcot river. It contains six stores, one fulling-mill, three tanneries, two grist-mills, four saw-mills. Pop. 990. Capital in manufactures, 32250.

ALNMOUTH, a village of England, in Northumberland, at the mouth of the Alne,  $5\frac{1}{2}$  m. E.S.E. Alnwick. It exports considerable quantities of corn and other produce.

ALNWICK, a m. town of England, cap. co. Northumberland, on a declivity near the river Alne,  $37\frac{1}{2}$  m. N. by W. London. Pop. 6783. There is a spacious square where a weekly market is held, and a large town-house, where the county courts meet, and the members for the county are elected; the houses, however, are not held here, but at Newcastle. Alnwick was formerly fortified, and vestiges of its walls and gates still remain. At the N. entrance to the town stands Alnwick castle, once a principal stronghold of the kingdom on the side of Scotland, and now a magnificent baronial residence of the Dukes of Northumberland. It underwent, not many years ago, a complete repair and renovation, executed in good taste. At the entrance to the town, a column is erected in honour of one of the Dukes of Northumberland. A cross, called Malcolm's Cross, stands on the spot where Malcolm III., king of Scotland, is said to have been killed, in 1093, by a soldier who came to offer him the keys of the castle on the point of a spear. (See Hall's *Annals of Scotland*, anno 1093, and Dr. Percy's note on the same subject.)

ALOST (Flem. *Alost*), a town of Belgium, prov. East Flanders, on the Dender, about half way between Brussels and Ghent. Pop. 14,807. It is surrounded by walls, and is

## ALPS.

clean and well built; the parish church, the largest in the country, is not finished; it has a college, and several other educational establishments; a town-house, remarkable for its antiquity, with manufactures of linen, cotton, lace, hats, &c., print-works and dye-works, breweries and distilleries, tanneries, soap-works, iron and copper foundries, and potteries. Vessels of small size come up to town by the river; and it has a considerable commerce in the produce of its manufactures, and in hope of an excellent quality, grown in the neighbourhood, rape-oil, &c. At Alost is the tomb of the celebrated Thierry Martens, the friend of Erasmus, who introduced the art of printing into Belgium. (Vander Maelen, *Dict. Geog. Flandre Orientale*, p. 3.)

ALPHEN, a town of the Netherlands, prov. S. Holland, cap. cant. on the Rhine,  $7\frac{1}{2}$  m. E. Leyden. Pop. 3900. It has manufactures of earthenware and pipes.

ALPNACH, a village of Switzerland, cant. Unterwald, on the S.W. arm of the lake of Lucerne. Pop. 1308. A very singular road, called the *Silte of Alpach*, is constructed in the immediate vicinity of this town, for conveying trees from mount Pilatus to the lake, from which they are forwarded to Holland, &c. (See *App. to Ingli's Switzerland*.)

ALPS (THE), constitute (Caucasus excepted) the most extensive, and, at the same time, the highest mountain system of Europe. They extend from the banks of the Rhone in France on the W., to the rivers Verbas and Narenta on the E.; of which the former falls into the Save, a confluent of the Danube, and the latter into the Adriatic. Hence they occupy the whole space between the 5th and 18th degree E. long., forming a vast semicircular bulwark which encompasses, on the N., Italy and the Adriatic sea. The extremities of this semicircle approach  $43^{\circ}$  N. lat., but the great body of the range occupies the space between the 46th and 48th degrees N. lat.

The Alps are closely united to two other mountain ranges; on the W. to the Apennines, which traverses Italy in its whole length; and on the E. to the Balkan, which covers Turkey and Greece with its numerous ramifications. The boundary line between the Apennines and the Alps is difficult to determine. It seems to be most expedient to suppose that the Alps begin on the W. side of the great road over the Bochetta pass (3550 feet above the level of the sea), which leads from Genoa to Novi in Piedmont. That portion of the range which begins at this road and extends E. to the sources of the Tinea, a tributary of the Var, is called the *Maritime Alps*, and does not contain any very high summits; but it is extremely steep, and is traversed only by one road practicable for carriages. This road connects the town of Nice with the town of Coni in Piedmont, and traverses three ridges by the *cols* or mountain passes of Brous, Brovis, and de Tende. The last col is in the main ridge of the range, and rises to 5024 feet above the level of the sea.

Between the plain of the Po and the valley of the Rhone, the mountain mass lies in its greatest extent S. and N., reaching from the shore of the Mediterranean, or from nearly  $43^{\circ}$ , to the lake of Geneva, or to nearly  $46^{\circ} 30'$  N. lat. Its length is here, consequently, about 230 m., and its width averages about 100 m. The watershed between the rivers falling into the Po, and those emptying themselves into the Rhone, does not traverse the middle of the mountain region, but is found at about 30 miles from its E. border. On it rise some very high summits. The most remarkable are, mount Viso, 13,653 feet above the sea, and on whose E. declivities the Po takes its origin; mount Genevre attains 11,784, mount Cenis 11,795, and mount Iserra 13,936 feet above the sea. Farther N. is the immense mass of rocks that constitute Mont Blanc, whose highest point, the *Basse de Dromedaire*, in lat.  $45^{\circ} 50'$  N., long.  $6^{\circ} 51'$  E., 15,748 feet above the sea, is the highest elevation to which the Alps attain. The valleys both to the E. and W. branch off at right angles from the watershed. Those to the east are short, straight, and deep, and terminate in the plain of the Po; those to the west are of much greater length, and rather winding. On this side, especially in the *dep. des Hautes Alpes*, between the upper branches of the rivers Isere and Durance, are placed a considerable number of very high summits; mount Loucy attains 14,451 feet, mount Loupilla 14,144 feet, mount Pelloux de Vallouise 14,119 feet, and at least twelve others rise above 11,000 feet. The peculiar disposition of the valleys in this portion of the Alps has rendered the communication between France and Italy comparatively easy. The roads follow the valleys up to the watershed, and have then only to traverse one high ridge. Three great carriage roads lead over it. The farthest to the S. is the road of mount Genevre, which ascends from the banks of the Rhone along the valley of the Durance to Briançon, and traverses the ridge N. of mount Genevre, where it attains 6197 feet above the sea; whence it descends in the valley of the river Dora to Susa. The second is the road of mount Cenis, which on the side of France may be said to begin at Grenoble. It ascends first the valley of the Isere,

## ALPS.

and afterwards of the Aro, a tributary of the former, and traverses the ridge N. of mount Osa, where it is 6784 feet above the sea. Hence it descends into the valley of the Dora to Saas. The latter is by far the most used of all the roads over the Alps; and it is stated that annually from 14,000 to 17,000 carriages of all kinds, and from 45,000 to 50,000 horses and mules pass along it. The third carriage road is that of the little S. Bernhard, which ascends the valley of the Isère, passes the ridge between mount Iseran and Mont Blanc, and descends in the valley of the Dora Baltea to Aosta. It attains in its highest point to an elevation of 7300 feet above the sea; and it is most commonly supposed that it was by it that Hannibal penetrated into Italy. This portion of the Alps comprehends what commonly are called the Cottian, Graian, and partly the Pennine Alps, together with those of Dauphiné and Savoy.

At Mont Blanc the direction of the range is changed. It runs hence E.N.E., and the N. ridges continue in that direction to their termination in the neighbourhood of Vienna. With the change of direction a change in the disposition of the valleys is observed. The range is divided into two or more ridges, running nearly parallel, and including extensive longitudinal valleys. From the ridges enclosing these longitudinal valleys short transverse valleys descend S. and N. to the plains which bound the mountain range. This disposition of the ranges renders the communication between Italy on one side, and Switzerland and Germany on the other, much more difficult than the communication between Italy and France; for the roads must either traverse two or more ridges, or great deflections must be made to avoid one of them.

E. of Mont Blanc the range is divided into two high ridges, which enclose the valley of Valais, and unite about 80° 30' E. long., at the sources of the Rhone. The southernmost of these ranges, which is immediately connected with Mont Blanc, contains nearly in its middle mount Rosa, the second highest summit of the Alps, being 15,170 ft. above the sea. W. of it stands mount Cervin, or Matterhorn, the third highest summit, rising to 14,778 ft. Then follow mount Combien, which has 14,130 ft., and mount Velan, which attains 11,040 ft. E. of mount Rosa, and near it, is the Cima de Sacl, 13,740 ft. high. This chain comprises the greater part of the Pennine and a portion of the Lepontine Alps, but is commonly called the Alps of Valais. In the chain which encloses the valley of Valais on the N. the greatest European glacier is found, not far W. of the source of the Rhone. Here a great part of the chain rises above the line of congelation, and is always covered with ice. It is stated to have an area of 900 sq. m. Many high summits rise out of it in the form of pyramids; and as the snow does not adhere to their steep sides, they form a sublime contrast with the sea of ice that surrounds them. The most famous of these summits are the Finsteraarhorn, 14,085 ft.; the Monch (Monk), 13,507 ft.; the Jungfrau (Virgin), 13,713 ft.; the Schreckhorn, 13,454 ft.; the Vischerhorn in Grindelwald, 13,323 ft.; and the Eiger, 13,033 ft. high. The glaciers of Grindelwald and Lauterbrunnen, which attract so many travellers, are only small detached portions of this immense glacier. W. of the great glacier the chain still contains many summits rising to 11,000, and even to 12,000 ft. of elevation; as the Alets, the Blümlisalp, and others. It may be considered as terminating on the W. with the Diablerets, or Teufels-hörner, which attains about 10,000 ft. of elevation. W. of them the mountains are of moderate height, and towards the lake of Geneva they sink into elevated hills. This chain goes commonly by the name of Alps of Bern (Bernier Alpen).

The depression of this chain at its western extremity has afforded an opportunity of establishing a carriage communication between Geneva and Bern in Switzerland, and Milan in Lombardy. The road runs along the shores of the lake of Geneva, and enters at its eastern extremity the valley of the Rhone or of Valais. It then ascends the valley as far as the town of Brig, and passes thence over the S. range by the pass of the Simplon to Domo d'Ossola and the shores of the Lago Maggiore. The highest point of this road is 6985 ft., the town of Brig 5323, and Domo d'Ossola 1603 ft. above the sea. This road, made by order of Napoleon, partly at the expense of France, and partly of the then kingdom of Italy, is a noble work. It is about 264 ft. wide, rising 12 inch each yard. In some places it is tunnelled to a considerable distance through the solid rock. It is the only carriage road over this range; but another road, used only by mules, has obtained celebrity by Napoleon having passed it in 1800, previously to his famous Italian campaign. This is the road of the Great S. Bernhard; it begins at Martigny on the Rhone, ascends the vale of the small river Drance to its source, where it passes over the chain near the celebrated hospice at an elevation of 8531 ft. above the sea, and descends hence to Aosta on the Dora Baltea.

E. of the sources of the Rhone is the only place in the Alps running W. and E. where the range is not divided by

longitudinal valleys, but is intersected by the two transverse valleys of the Reuss and Tessino. Hence there has existed time immemorial a line of communication in this point between Switzerland and Italy. This is the road of the S. Gothard, uniting Zurich and Lucerne with Milan, running first along the shores of the lake of the four cantons (or of Lucerne) to Altorf, and afterwards in the valley of the upper Reuss to Andermatt. It passes the ridge at an elevation of 6850 ft., descends to Aviglio on the Tessino in Val Leventina, and runs in this valley to the Lago Maggiore, and thence to Milan. This much-frequented road has only in modern times been rendered practicable for carriages, on account of the poverty of the small cantons which it traverses.

That portion of the mountain system which lies between Mont Blanc and the road of the S. Gothard is less broad than any other part. It probably does not measure more than 60 m. across in a straight line; but its valleys, both to the S. and the N., but especially the latter, known by the name of Highlands of Bern (Bernier Oberland), are considered as exhibiting the richest mountain scenery in the Alps.

E. of the road over the S. Gothard pass, the mountain system widens considerably; so that between 90° and 130° E. long., its average breadth may be estimated at between 120 and 130 m. But at the same time the high summits are less numerous, a few only attaining 12,000 ft., though a great number still exceed 10,000 ft., and pass the line of congelation. The height of the mountain passes shows evidently that the elevation of the whole mountain mass has rather increased than decreased, at least W. of the pass over the Brenner.

That portion of the range which approaches the pass of the S. Gothard is called the Rhaetian Alps, or the Alps of the Grisons. It is divided into four ridges, which enclose three longitudinal valleys; those of the Upper Rhine, of the Inn and Mera, and of the Adna. The central valley is divided by a high transverse ridge into two, of which the W. or shorter, called the vale of Bregaglia, is drained by the river Mera, which runs W., and falls into the lake of Como, or rather of Mesola; and the E. and much longer by the Inn, which falls into the Danube. The valley of the Upper Rhine, extending first E.N.E., turns afterwards suddenly N., and affords two openings towards the low country: one to the lake of Constance, and the other to the lake of Wallstadt. Thus the town of Chur or Coire, situated where the Rhine turns N., has an easy communication both with Germany and Switzerland. Though a small place, by far the greater part of the commercial intercourse between Bavaria, Wirtemberg, Baden, and Switzerland on one side, and Italy on the other, is carried on by the road passing through it. The canton of the Grisons, sensible of the advantage accruing from this commercial intercourse, has constructed three excellent roads over the range, which divides the affluents of the Rhine from those descending into the plain of the Po. A road runs from Coire along the Rhine to the place where the Vorder Rhein and Hinter Rhein join, and thence ascends in the valley of the latter to the village of Splügen in the Rheinwald. At this place the road divides in two. One continues to ascend the valley of the Hinter Rhein to a village called also Hinterrhein, and passes thence over the high mountain ridge to S. Bernardino; it is called the road of S. Bernardino. From this village it descends in the Val Misocco or Miso along the river Moos, which opens near Bellinzona into the small plain surrounding the N. extremity of the Lago Maggiore. This road, which rises to 6390 ft. above the sea, has been made in modern times to avoid the heavy duties which the Austrian government laid on the foreign commodities passing through its territories; for from Bellinzona they now can pass to Turin and Genoa without traversing any portion of the Austrian dominions. The other road leaves the Rheinwald at the village of Splügen, and directly passes over the mountain ridge to Val Giacomo, which opens into Val Bregaglia near Chiavenna. The highest part of this road between Splügen and Isola is 6580 ft. above the sea. Another road runs from Coire nearly directly S. over some mountains of moderate height, till it enters the valley of Oberhalbstein, which it ascends nearly to its upper extremity, where it divides into two branches, of which the E. passes mount Julier at an elevation of 7385 ft.; it leads to the valley of Engadine, and is not a commercial line of communication. The W. road passes over the Maloja and descends into Val Bregaglia, where it continues to the town of Chiavenna. It rises to 8230 ft. above the sea, and though practicable only for small carts, is much used.

The next road further E. is rather a military than a commercial line, and was recently made by the Austrian government to open a carriage communication between the newly-acquired Valteline and Tyrol. It begins at Innsbruck, ascends along the Inn as far as Finstermünz, near the boundary line between Tyrol and Switzerland; turns then southward, and passes the watershed of the Alps be-

## ALPS

Green Nanders and Zoschen, where its highest point is about 6800 ft. above the sea. Then it descends along the valley of the Adige to Giurins; but a few m. E. of this it leaves the valley, and turning S.W. traverses a very lofty lateral chain of the Alps, which at the place where it is crossed by the road is called Monte Stelvio. It then rises to the height of 8800 ft., being the highest elevation of any carriage road in Europe. From this point it descends rapidly into the valley of the Adda to Bormio and Sondrio, and thence to Milan. It is commonly 16 ft. wide, and has been made at a vast expense, and with great skill.

This road encircles on three sides an extensive mountain region, filled up by snow mountains and glaciers, occupying the greater part of the country between Innsbruck and Giurins, and displaying the wildest scenery of the Alps. Eternal snow covers here a space not much less in extent than that which surrounds the Finsterahorn and Virgin, and it is likewise overtopped by numerous steep summits of a pyramidal form, many of them rising to more than 10,000 ft. above the sea; as the Gebach Ferner, 13,988 ft.; the Wildspitze Ferner, 13,364 ft.; the Glockthorn, 11,264 ft., and others. Where the road traverses Monte Stelvio it passes near another mountain group, less in extent, but rising to a greater elevation. In it is mount Ortler or Ortels, the highest summit in Tyrol, 12,693 ft. above the sea; and near the latter, mount Hoch Isarnowald, 12,423 ft., and mount Zebur, 12,381 ft. high.

To the E., but at some distance from these mountain masses, is the road over the Brenner, which may be considered as the E. boundary line of the Rhaetian Alps. This road begins at Innsbruck, ascends the valley of the small river Rhil, and passes thence over the watershed between the Inn and the Adige, where, N. of Bozzen, it attains the elevation of 4643 ft. It then descends in the valley of the Eisack from Brizen to Bolzano or Bozen, and thence to Rovereto and Verona. It is one of the most frequented commercial roads over the Alps.

This road may be considered as separating the W. from the E. Alps. The latter are distinguished from the former by being more distinctly divided by longitudinal valleys running W. and E.; by the greater number of separate ridges; their greater width and lesser elevation; the number of snow-topped mountains being comparatively few, and none of them occurring E. of 14° E. long. The northern half of this mountain region is known by the name of the Noric Alps; and the southern by those of Carinthian, Crainian or Julian, and Dinarian Alps.

Not far distant from, and nearly parallel with, the N. border of this mountain region, extends a very long longitudinal valley from 11° to 15° E. long.; but it is divided by two transverse ridges into three valleys, in which flow the rivers Inn, the Upper Salzach, and the Upper Enns, all of them running E. To the S. of the valley of the Salzach is placed the highest part of the Noric Alps. Many summits rise above the snow line, and between them are many extensive glaciers. The highest summits are the Gross Glockner, 12,567 ft.; the Gross Wiesbach or Krummhorn, 11,844; and the Ankogel, 11,873 ft. above the sea. The longitudinal valley S. of this range is divided by a transverse ridge into two valleys, of which the W. is drained by the Eisack, which runs W. and falls into the Adige. The E. valley is drained by the Drave, running E., and one of the largest tributaries of the Danube. The mountain chain dividing these from the plain of Lombardy is much less elevated, rising only in a few summits to above 8000 ft., and none of them exceeding 9000 ft. above the sea. Only the Terglou, which rises near 14° E. long., at the sources of the Save, attains a height of 9894 ft., and is by many considered as the most E. snow mountain of the S. range of the Alps.

E. of 14° E. long. the Alps are divided into five ridges by four longitudinal valleys, all of them opening to the E. These valleys are traversed by the rivers Enns, Muhr, Drave, and Save. The Muhr suddenly turns S., and, running through a wide and open transverse valley, empties itself into the Drave. The ranges enclosing these valleys on their N. and S. sides gradually decrease in height as they advance towards the E.; so that, when arrived at 16°, they may rather be termed hills than mountains, except the ridge which divides the valley of the Drave from that of the Save, which preserves its mountainous aspect beyond 18° E. long.; where, at the confluence of the Drave with the Danube, it sinks into low hills, but rises again into mountains towards the confluence of the Danube and of the Save, where it takes the name of Sirmian mountains, or Fruzka Gora. This latter group may be considered as the most E. offset of the Alps, but rises hardly to more than 3600 ft.

The range which divides the valleys of the Muhr and of the Enns turns E., and continues for a distance in that direction, forming the E. boundary of the transverse valley of the Muhr; but on the boundary line between Styria and Hungary, it subsides into low hills, which are followed by flat high ground, connecting the Alps with the forest of Bakony.

This name is given to a low mountain range which separates the two plains of Hungary from one another, terminating where the Danube suddenly turns southward, and which may also be considered as one of the E. offsets of the Alps.

The most N. ridge of the Noric Alps, which skirts the valleys of the Salzach and Enns on the N., is broken through by these rivers, where they turn N. to run to their recipient, the Danube. This ridge may be considered to terminate with the Schneiberg, near Neustadt, rising 6808 ft. above the sea. This ridge sends numerous lateral branches to the N., which terminate close to, or at a short distance from, the Danube, between Linz and Vienna. But they rarely attain the height of 4000 or 5000 ft.

Through this part of the Alps lie the roads by which the towns of Linz and Vienna communicate with Italy and Trieste and Fiume. There are especially two great roads, with different branches; having, as central points, the towns of Villach on the Drave in Carinthia, and of Laybach on the Save in Carniola. The first, uniting Linz on the Danube with Italy and Trieste, runs in the beginning mostly along the banks of the river Traun, in a W.S.W. direction, to the town of Salzburg on the Salzach; it then follows the valley of the last-mentioned river up to the place where it is divided by a transverse ridge from that of the Enns, and then passes over that ridge to Radstadt. Hence it directly ascends the elevated range which separates the valley of the Enns from that of the Muhr, and is known by the name of the Tauern. The highest point of this road, at Hirschwand, rises to 9200 ft. above the sea. From S. Michael, in the valley of the Muhr, the road ascends again to pass over the third range, which divides the valley of the Muhr from that of the Drave. This chain, however, is much lower. The road leads to Spital on the Drave, and thence follows the banks of the river to Villach. From Villach it ascends the valley of the Gail, a tributary of the Drave, to Tarvis, where the roads leading to Italy and Trieste separate. The road to Italy turns W., traverses the most S. ridge by the pass of Ponteba, 3573 ft. above the sea, and descends through the valley of the Tella to Treviso and Venice. The road to Trieste runs from Tarvis E., attains its highest point at the pass of Predil (3940 feet high), and descends thence in the valley of the Isonzo to Goers or Gorizia, whence it turns S. to Veith and Trieste. This road is connected with that over the Brenner by a transverse road, uniting the valley of the Drave with that of the Eisack. It ascends along the Drave from Villach to Spital and Lenx, passes over the transverse bridge separating the valleys by the pass of Innich, and descends the Eisack in the wide valley of Puster to Brizen, where it joins the road over the Brenner.

The road between Vienna and the towns on the Adriatic runs in the beginning along the E. skirts of the Alps to Neustadt on the Leitha, whence it ascends the ridge called the Sommering, on whose summit it is 3337 ft. above the sea. Hence it descends along the small river Mürz to Bruck on the Muhr. Along the last-named river it passes through Gratz to Marburg on the Drave. It then traverses the range separating the Drave and Save, passing through Wendling, Teisritz, Cilli, and the Trojans pass to Laybach. Between this place and Trieste is the mountainous country called the Adelsberg and Karst. Near Adelsberg the road rises 2971 ft. above the sea; it thence descends to Benostach, and passing over the Karst arrives at Trieste. From the pass of Adelsberg a road branches off to Fiume.

Two carriage roads unite this road with that which connects Linz with Italy. The most N. runs in the valley of the Muhr westward, beginning at Bruck, and traversing Leoben, Idenburg, and Muran; at St. Michael it joins the other road. The S. runs in the valley of the Drave, between Marburg and Villach, and traverses Klagenfurt.

The Dinarian Alps, which may be considered as the link connecting the mountain system with the Balkhan mountains, occupy the country between the gulf of Quarnero or Fiume and the rivers Verbas or Verbriza and Narenta in Turkey, and have obtained their name from mount Dinara, their highest summit (near 44° N. lat.), which rises to 8046 ft. above the sea. The principal ridge runs nearly parallel to the Adriatic, at a distance of about 30 miles more or less, and forms at the same time the watershed between the rivers falling into the Adriatic or joining the Save. Lower ridges, mostly parallel to the principal ridge, fill the country between it and the sea; but those branching off towards the Save run nearly S. and N. Opposite the gulf of Quarnero, the higher mountains cover only a space of less than 80 miles from W. to E.; and as here the fertile plains of Hungary approach nearest the sea, the Austrian government, desirous of deriving some means by which the abundant produce of that country could be brought to the markets of the commercial world, made, in the last century, two roads over the numerous ridges which traverse the country. They are known by the names of the Caroline and Josephine roads; the former rising at one point to 4976 ft. above

## ALPS.

the sea. But the lines were not judiciously chosen. They ran over a succession of steep acclivities and declivities; and as they traverse a country destitute of water, they could only be used by light carriages and mules. But in the beginning of this century a company of private individuals constructed another and very superior road, on which all steep slopes have been avoided; so that it is practicable for carriages conveying the most bulky commodities from the interior of Hungary to the coast. This road begins on the coast at Fiume, ascends directly the mountains, passes through Kumenjak and Skerbuterjak, and terminates at Caristadt on the Culpa, where this river begins to be navigable.

On three sides the Alps are surrounded by plains. On the S. by that of Lombardy, on the N. by those of Switzerland and Bavaria, and on the E. by the great plain of Hungary. The plain of Lombardy is less elevated than those of Switzerland and Bavaria; for the Lago Maggiore is only 805 ft., and the lake of Como 807 ft.; while the lakes of Geneva, Zurich, and Constance are respectively 1307, 1310, 1304 ft. above the sea. The highest ranges of the mountains are much nearer to the plain of Lombardy than to the plains on the N.; and their descent is much steeper towards Italy than towards Switzerland or Germany. The mean elevation of the great plain of Hungary is only 300 ft. above the sea; and in it terminate the E. extremities of the ranges, which nowhere rise to a great height.

The central ridges of the Alps are composed of primitive rocks, especially of granite and gneiss, and are distinguished by their pointed peaks. On the N. side of this formation extends a slate formation of considerable width. This does not appear to accompany the range on the S., except along the E. Alps, where it has been observed to extend from Brixen on the Elz to Marburg on the Drave, skirting that river on the S. Beyond the slate formation, the chalk occupies a considerable space. It is found to occupy the greatest extent on the S.E. of the mountain system, the whole Julian Alps being composed of it. On the opposite or N.W. side, the sandstone formation extends from the lake of Geneva as far as the S. boundary of Bavaria. The chalk formation is distinguished by its summits, which do not rise in pointed peaks, but form either cones or cupolas.

All those parts of the numerous ridges which rise above the line of congelation are of course covered with snow all the year round. In many places the snow occupies a considerable space on the upper parts and summits of the rocky masses, and from these "eternal reservoirs" of snow the glaciers are derived. The sides of the rocky mass are usually furrowed by long narrow valleys; and in these masses of snow, descending from the upper parts under the form of ice, extend the farther downward the greater the mass and height of the snow from which they are derived. These accumulations of snow and ice form glaciers, many of which are from 15 to 30 m. long. Near the upper part, or at their origin, they are generally narrow, sometimes not much more than 100 yards across; but as the valleys grow wider as they proceed downward, the glaciers also extend in width, taking the shape of a fan, and in some places are 3 miles across. The thickness of the ice masses varies from 100 to, perhaps, 600 feet. Though the snow line in the Alps is found at an elevation of about 5000 ft. above the level of the sea, some of the glaciers descend so far downward that their lower extremity is not more than 3500 ft. above it. The ice of the glaciers does not resemble that with which our rivers are covered in winter. It consists of a great number of crystals measuring from half an inch to two inches in length, and somewhat less in width, united by having been pressed strongly together. It is difficult to remove one of these crystals without breaking it; but when the first has been removed, the others may be easily taken up. The surface of the glaciers is very various, and depends on the degree of inclination with which the valley descends. Where the descent is gradual, the surface of the glacier is nearly level, and offers few crevices; but where the declivity is rapid and uneven, the glacier is rent with numerous chasms, and covered with elevations, rising from 100 to 900 feet, having the aspect of a sea agitated by a hurricane. The chasms are frequently many feet wide, and more than 100 deep. Their formation, which never takes place in winter, but is frequent during summer, is accompanied with a loud noise resembling thunder, and a shock which makes the adjacent mountains tremble. These chasms are subject to change every day, and almost every hour, and it is this circumstance that renders the ascent of the glaciers so dangerous to travellers. Sometimes there are found in the glaciers pyramids of ice of a considerable elevation and a regular form, on the tops of which are placed large pieces of rocks. At the lower extremity of the glaciers is an excavation in the form of a grotto, frequently 100 feet high and from 60 to 80 wide, whence issues a small river, bringing down a bluish water. Though every single crystal of the ice of the glaciers seems perfectly white, the

whole mass is of a blue colour, passing through every shade from the most feeble sky-blue to that of the lapis lazuli; it is most pure and beautiful in the lower parts of the chasms. The glaciers impart one of the greatest charms to the scenery of the Alps, by the beauty of their colour, and their contrast with the surrounding country, their lower extremities being commonly contiguous to meadows covered with the finest grass and the most beautiful flowers, and the declivities of the mountains which enclose them exhibiting large tracts clothed with magnificent trees, especially fir.

Avalanches are more frequent in the Alps than in most other mountains, because of the steepness of their declivities. The most common consist of masses of snow, which, commencing their descent at the higher parts of the mountains, and increasing in magnitude and velocity as they roll down to the valleys, overwhelm, in their headlong career, men and cattle, destroy villages and forests, and dam up and obstruct the course of rivers. Four kinds of avalanches may, however, be distinguished. 1. The *drift* avalanche takes place when the upper parts of the mountains have been covered by a heavy fall of snow during a calm, followed by a strong wind before the mass has acquired consistency. An immense mass of loose snow is then suddenly brought by the wind into the valleys, where it frequently covers villages; but in general these avalanches do not occasion much damage, unless when they cause a compression of the air. This sort of avalanche usually occurs in the beginning of winter. 2. The *rolling* avalanches: these bring down great masses of compact snow, especially towards the end of the winter, when it begins to thaw. In their progress, they are increased by all the snow they meet in their descent; their impetus and mass being frequently such as to overwhelm and beat down everything, rocks not even excepted, that may interrupt their course. These, the most destructive of the avalanches, cause great loss of life and property. 3. The *sliding* avalanches are masses of snow descending slowly along the surface of a not very steep declivity. They take place in spring, when a long thaw has dissolved that portion of the snow which lies immediately on the rocks, and thus loosened the bond with which the whole mass is united to its base. They carry before them everything that is too weak to withstand their pressure. They sometimes occasion considerable loss, but not frequently. 4. The *ice or glacier* avalanches are formed by larger or smaller pieces of ice, detached from a glacier by the summer's heat. They are precipitated downwards with a noise like thunder. When seen from a distance, they resemble the cataract of a powerful river. As they generally descend into uninhabited places, they seldom do much damage.

The rolling and sliding avalanches expose travellers to the greatest dangers they have to incur in traversing the Alps. There are, in fact, certain localities on the most frequented roads to which they descend annually, and which are consequently very dangerous. To obviate the risk of accidents from this cause, in the construction of new roads, as of those of the Simplon and over Monte Stelvio, care has been taken at such places to excavate the mountains to a certain depth, and to cover over the road with strongly-built arches, which effectually provide for the safety of the traveller. A few places on the roads are also rendered unsafe by less or greater pieces of rock which descend with fearful velocity from the steep declivities of the mountains. This usually happens when, after some days' continued rain, a strong wind arises and shakes the higher portions of the mountains. Luckily, however, such places are not frequent. Travellers on the glaciers run the risk of falling into chasms, or of finding the ice under their feet suddenly opening in the progress of the formation of a new chasm.

The scenery of the Alps owes a part of its numerous charms to the great number of extensive lakes of which nearly every one is distinguished by some peculiar beauties. Most of them have an easy access, being situated on or near the outskirts of the range, as the lakes of Geneva, Constance, and Zurich; or partly within and partly without the range, as the lake of the Four Cantons, and the Lago Maggiore and that of Como, and the beautiful lakes in Austria. Innumerable are the small lakes which occur on or near the summits of the high ridges and glaciers. Most of the rivers and torrents have their sources in such lakes.

The chalk formation of the Julian Alps offers the most interesting natural phenomena. It consists of a fine-grained, much-decomposed primitive chalk, which is rent by a great number of transverse crevices and precipices, and frequently forms deep depressions, in the fashion of funnels. In it occur numerous caverns and subterraneous galleries of great extent, in which everywhere the finest and most fantastic stalactites are formed. More than a thousand such caverns are already known, and many have never been visited. The most remarkable are those of Adelsberg (which see). Magdalen in its neighbourhood, Zirknitz, &c. Numerous,

## ALPS.

are the rivers and torrents which suddenly disappear underground, precipitating themselves into a large chasm, and reappearing after a subterraneous course of many miles. Here are also many intermittent wells, which, at certain seasons, emit large quantities of water, and at others are dry. Several of them feed the lake of Zirknitz, which has acquired celebrity for being for several months quite dry, and for several others filled with water; so that it serves each year successively for tillage, pasturage, hunting, and fishing!

The Alps are not rich in metals, except iron. Some mines of gold and silver occur on the S. as well as on the N. declivity, especially in the Austrian dominions; but their produce is inconsiderable. Others of copper and lead are more productive; but they too are comparatively poor, except the Bleiberg (lead mountain) of Carinthia, which furnishes some of the best lead in Europe. The quicksilver mines of Idria, N.N.E. of Trieste, are reckoned among the richest of the globe. The iron mines of Styria, Carinthia, and Carniola are very productive, and their produce hardly inferior to any of Europe. Rock-salt occurs only in a very few places in the W. Alps; but on the N. side of the E. Alps are very rich layers of that mineral, running, as it seems, in a continuous line from the banks of the Inn at Halle to those of the Enns in Austria. They are worked with great industry at different places.

Vegetation covers the greater part of the Alps. The larger valleys, none of which rise to 5000 feet above the sea, contain some tracts fit for agricultural purposes. They consist, generally, of uneven ground, extending on both sides a river. Behind it the mountains rise with a steep and commonly inaccessible ascent, which is covered with high trees: in the lower parts with oak, beech, elm, &c.; and in the upper region with fir, pine, larch, and the *Fissus Combris*. Near the region of the pastures the trees dwindle down to low bushes. The pasture region, which occupies the next place, offers commonly a plain strongly inclined towards the valley, and is in general of considerable width. It is called in Switzerland *the Alps*. Here are found the huts or *seaux* of the herdsmen, inhabited only in summer, when the cattle are brought to these pastures. The upper part of the range is occupied by bare rocks, many of which rise above the line of congelation. This line occurs in the Alps between 8000 and 9000 feet above the sea, and is lower on the N. than on the S. declivity.

Corn is grown on the N. side, not above 3500 or 4000 feet; but on the S. it succeeds 1500 feet higher. The highest place at which barley ripens is Skala, in the Engadin, 5550 feet above the sea. High trees are found in some places not above 4500 feet, at others they ascend the declivities even to 7000 feet and more. Oak is found up to 4000 feet, elm to 4200, ash somewhat higher, beech to 5000, fir to 5300, mountain ash to 5600, birch to 5700, pine to 6500, and larch to 7000 or 7300 feet above the sea. Where the high trees begin to cease, the mountains are covered with bushes and the Alpine rose (*Rhododendron ferrugineum* and *hirsutum*).

The inhabitants of those ranges of the Alps which extend from the Mediterranean to the lake of Geneva are mostly of French origin, speaking a corrupt dialect of the French language. In the remainder of the mountain system the population is of Teutonic origin, only a few of the more open valleys, terminating in the plain of Lombardy, speaking a dialect of the Italian language. The most E. extremity of the whole range, between the rivers Mahr and Sava, and the Julian Alps, is partly inhabited by a population of Slavonian origin, called the *Wendes* or *Slowenz*. As the tracts of land are fit for agricultural purposes are of comparatively small extent, the rearing of cattle and the making of butter and cheese constitute the principal employment. Many of the inhabitants migrate, at certain seasons, to the neighbouring countries in search of work. Some of them return annually, some after the lapse of some years. Besides the dairy, the mines give employment to a number of inhabitants; but this is only the case in the E. Alps of Styria, Carinthia, and Carniola, where rich mines of iron and extensive layers of salt are found. In these districts, also, are some manufactures of hardware and iron utensils. In the other parts of the range manufacturing industry is almost unknown; but near its southern base on the N. side it has in later times become so diffused, that it hardly yields to any other part of the continent. The inhabitants of the mountains are distinguished by their love of liberty, their opposition to every kind of oppression, the frankness of their behaviour, their adherence to their old manners and dress, and their fidelity and honesty.

The Alps did not become well known till the reign of Augustus. That emperor finally subdued the numerous and savage clans which inhabited the Alpine valleys, and cleared the passes of the banditti by which they were infested. He improved the old roads, constructed new ones, and succeeded in establishing free and easy communications across the mountains. The chain was then divided into separate

portions, which have preserved their boundaries and denominations nearly to the present day.

See, for information on the Alps, *Saussure, Voyage dans les Alpes*, 1779; *König's Reise in den Alpen*, 1814; *Wyss, Reise in das Berner Oberland*, 1816 and 1817; *Reise in wenig besuchte Alpengegenden von Kirzli Escher*, 1829; *Bemerkungen einer Alpenreise über den Susten, Gotthard, Bernhard, Oberalp, Turka und Grimsel von Kastenhofer*, 1830. Travellers will find much useful and interesting information with respect to the Alps in *Ebel's Manuel du Voyageur en Suisse*, 1817.

**ALPS (LOWER), Basses Alpes**, a frontier dep. in the S.E. of France, having E. the Sardinian states, S. the dep. of the Var, W. dep. Vaucluse, and N. the depts. Drome and Hautes Alpes. Area, 682,643 hectares. Pop. 159,045. This dep. derives its name from its being principally occupied by the W. slope of the Alps. Its aspect is highly varied and picturesque: presenting a succession of high, rugged mountains, crowned with eternal snow, vast sombre forests, and low, rich, smiling valleys. The mountains, hills, &c., occupy about half the surface, and the woods about a sixth part; the extent of cultivated land is estimated at 155,000 hect. of meadows at nearly 18,000, and vineyards at 14,000 do. The principal river is that of the Durance, which traverses the dep. from N. to S.; it is also in part intersected, and in part bounded by the Verdon, and is watered by many mountain streams, the inundations of which often occasion great mischief. The climate varies, of course, with the elevation and exposure of the soil. There is a good deal of spade husbandry; and mules and asses are used in preference to either horses or oxen. Produce of corn crops insufficient for the consumption. Potatoes extensively cultivated. Olive, fig, and mulberry trees are all cultivated in the lower and warmer districts, and dried and other fruits make a considerable article of export. The lower mountains afford excellent sheep pasture. They belong partly to individuals, and partly to communes; and besides the stationary sheep, or those that belong to the dep., about 400,000 head are annually brought from the adjoining depts. of the Var and the *Bouches du Rhone*, to be depastured for about four months in summer on the mountain referred to. They pay at the rate of from 1 fr. to 1 fr. 25 cent. per head; and both their size, and the quality of their flesh and wool, are said to be materially improved by the change. The shepherds never quit their charge either by night or by day. Besides the sheep belonging to the dep., the breed of which has been materially improved, it has a great number of goats; and the rearing of bees is also much attended to. There are mines, but not very productive, of iron, lead, copper, and coal. Manufactures have not made much progress; but there are several silk filatures and silk looms, with manufactures of cloth, hats, earthenware, tanneries, &c. Great numbers of the poorer classes leave their homes for a portion of the year, to seek employment in the neighbouring depts. It has two electoral colleges, which return two m. to the Ch. of Deputies; and had, in 1838, 527 electors. Public revenue in 1831, 2,638,917 fr. Principal towns Digne, Sisteron, Barcelonnette, in the picturesque valley of the same name. Forcalquier, &c.

**ALPS (UPPER), Hautes Alpes**, a frontier dep. in the S.E. of France, on the N. side of the dep. of the *Basses Alpes*, and having on the E. the Sardinian States. Area, 553,964 hect. Pop. 131,163. This dep. differs in few respects from that just described, except that it is more mountainous and less fruitful. Some of the mountains rank, in fact, among the highest in the immense chain of which they form a part. Mont Peloux, the most elevated, rises 14,190 feet above the level of the sea, and Mont Olan 13,461 do. The mean elevation of the mountains may be taken at about 9000 feet; and the elevation of the highest *cote* or passes from one valley to another sometimes exceeds 7000 feet. There are several glaciers in the N. part of the dep. Agriculture similar to that of the *Basses Alpes*. Only 97,500 hect. of surface is cultivated; 77,000 hect. are occupied by woods and forests, and about 94,000 by meadows, the irrigation of which is an object of great importance. The valleys principally lie alongside the rivers Durance, Bruch, Drac, &c. Inhabitants poor and laborious; it is even said that women are sometimes seen yoked, *avec des aues*, to the plough! *Graines d'abondance*, are established in different communes, which make loans of seed and necessities to poor families. There are mines of iron, lead, &c. Manufactures principally confined to coarse cloth, linen, stockings, hats, &c., required for the use of the inhabitants. The cheese and butter of the Briançonnais are highly esteemed. Bread made of potatoes is extensively used. Families using rye bread commonly bake it only once a year; it keeps for fifteen or eighteen months; is hard, and has to be broken to pieces by a hatchet. Between 4000 and 5000 of the peasants leave the dep. every year in the beginning of October, and return early in June. It is estimated that, at an average, about a fifth part of those that emigrate never return, and that those

## ALRESFORD.

who do, bring back with them about 260 fr. a piece; the emigrants principally take to the trades of pedlars, shoemen, &c. It has two electoral colleges, which return two m. to the Ch. of Deputies, and had in 1835, 413 electors. Principal revenue, in 1831, 2,307,128 fr. Principal towns Gap, Briançon, and Embrun. (For this and the prev. dep., see *Hugo, arts. Bauges et Hautes Alpes*; the authorities there referred to; and the *French Official Tables*.)

ALRESFORD, a market town and two parishes of England; co. Hants, hund. Alton. The town is situated on the Itchen, at no great distance from its source, 87½ m. S.W. by London. It was formerly a place of much more importance than at present, and sent a member to the H. of C. Pop. of town and parishes, 1896.

ALSACE, a ci-devant prov. of France, forming the dept. of the Upper and Lower Rhine.

ALSACE, L. Berks co. Pa. Watered by Roush's creek, and contains two churches, common to Lutherans and Presbyterians, two fulling-mills, four grist-mills, three saw-mills. Pop. 2498.

ALSEN, a Danish island in the Baltic, separated by a very narrow channel from Sleswick, and by the Little Belt from Funen. Shape irregular, being about 30 m. long, and from 3 to 8 in breadth. Pop. 15,900. Surface pleasantly diversified with wood and open fields. All the country houses are surrounded by fruit-trees, and large quantities of fruit are annually exported. Principal towns Norborg and Sonderborg. Christian II., deposed by the states of Denmark in 1523, was confined for nearly seventeen years in a tower (since demolished) in the castle of Sonderborg.

ALSFELD, a walled town of Hesse Darmstadt, cap. Baulwick, on its N. frontier on the Schwalm. Pop. 3015. It has manufactures of rascens, flannels, and linen, with considerable bleach-works and print-works.

ALSBEN, a walled town and castle of Prussia Saxony, reg. Merseburg, on the Saale. Pop. 1700. The castle is the property of the Duke of Anhalt Dessau, to whom the town belongs.

ALSTEAD, p. t., Cheshire co., N.H., 14 m. N. Keene, 66 W. by S. Concord, 450 W. Watered by Cold river, and branches of Ashuelot river, and has four stores, one falling-mill, two grist-mills, three saw-mills, two academies, 59 students, fourteen schools, 454 scholars. Pop. 1454.

ALTAI MOUNTAINS (THE), a very extensive mountain range in Asia, extending from the eastern banks of the Irisk, a tributary of the Obi (80° E. long.), to the shores of the Pacific, at the S. extremity of the sea of Okhotsk, opposite the island of Tarakai (145° E. long.). Its length, therefore, is little short of 2500 m. The several chains which compose this mountain system are chiefly found between 45° and 52° N. lat., but some detached ridges advance to 45° and 57° N. lat. The breadth of the whole system is probably nowhere less than 350 m., and at some places it widens to 700 m. and upwards. It is, however, not possible to determine it with any degree of exactness, since only the N. declivities of the range have been visited by travellers, the S. declivities lying within the territories of the Chinese empire being inaccessible to Europeans.

The most westerly portion of the system, between the river Irisk and the river Tshilyshman, the upper branch of the Obi, is properly called the Altai mountains, which name has been afterwards used to indicate the whole system. This portion bears also the name of the Ore Altai, because it contains numerous veins of the precious metals. It consists of several ridges, which mostly run W.N.W. and E.S.E. These ridges advance their W. extremities close to the banks of the Irisk, where they are 300 or 600 feet high, but at a distance of about 15 or 20 miles from the river, they attain from 3000 to 5000 feet, which elevation may be considered as the mean height of the greatest part of the range; only where they approach the lake Teletskoi and the river Tshilyshman, they rise still higher, even to 10,000 feet, and this part is always covered with snow. It is called Altai Bishli, and is, so far as is known, the highest portion of the system.

Between the Tshilyshman and the great lake of Baikal, the mountains appear to form two great chains, running E. and W.; of which the S., which falls within the Chinese empire, and is called the Tangra Oola, or Tangra Shan, seems to be the principal range. It is divided from the N. chain by a long valley, in which run the Kamshick from W. to E., and the Ta-ken from E. to W.; after their junction, the river is called Yenesei, and breaks through the N. chain. The portion of the latter situated W. of the Yenesei river is called the Sayanskian range, but the E. chain bears the name of Ergik Targak Taiga. Both chains unite about 100° E. long., at a considerable distance W. of the lake Baikal, at the sources of the Selenga, the most considerable river which empties itself into the lake. The united chain is here called Goorbi Uuden Dzong, which name it preserves to 106° E. long., running in general E. On the E. side of the meridian of 106° E. long. and the river Selenga,

## ALTAI MOUNTAINS.

the direction of the mountain chains composing the Altai system is changed; they run N.E., and form a very extensive mountain region E. of the lake Baikal. This region is called the Baitshian or Daurian mountains; but the highest chain belonging to it, and lying within the Chinese empire, bears the name of the Great Khing-Khan. The most easterly portion of the Altai mountains, between 130° and 140° E. long., lies again nearly due W. and E.; but here it advances to 140° S. lat., and is called by the Russians Yablonski Khorbet, and by the Chinese Khing-Khan Tagerik.

The Altai mountains may be considered as a continuation of this latter chain. They separate from it at the sources of the river Aldan, a tributary of the Lena, enclose the valley in which it runs on either side, and continue on the E. side along the shores of the sea of Okhotsk up to the bay of Peshien, the most northerly corner of that sea. From this bay one branch runs N.E., and terminates at Behring's strait, with the East cape and the cape of Tshukotsh-Noss. Another branch turns abruptly S., and traverses the peninsula of Kamshatka, terminating at cape Lopetka. The highest summit of the Altai mountains, adjacent to the road connecting Yakutsk with Okhotsk, was found by Erman to be 4055 feet above the sea. But the chain traversing the peninsula of Kamshatka contains several volcanoes, some of which rise to a great elevation. Erman measured three of them. The highest peak of the volcano of Shivelusk (50° 40' 35" N. lat.) rises to 10,591 feet; the volcano of Khatavak (50° 4' N. lat.), 15,295 feet; and that of Tolbatsinsk, 6946 feet above the sea. If the Aldan mountains and the range traversing Kamshatka be considered as a continuation of the Altai chain, more than 1500 miles must be added to its length.

The country extending N. of the Altai mountains to the shores of the Polar sea is one continuous plain, sometimes of an undulating surface, but mostly exhibiting immense flat lowlands, called, as others of a similar description, *stepes*. This plain, at the foot of the range, is hardly more than 300 feet above the sea, to which it gradually slopes down. On the other hand, the countries lying S. of the Altai mountains constitute a portion of the great elevated table-land of upper Asia. Their surface is much more uneven, being traversed in many parts by ridges of rocks and hills, while others present themselves as immense plains covered with sand. The mean elevation of these countries seems to be from 3000 to 3000 ft. above the level of the sea.

*Roads.*—Two roads lead over the Altai, and one over the Aldan mountains. That most to the W. is the great road of Kiachta, by which the commerce between Russia and China is carried on. It begins at Irkutsk, the capital of E. Siberia, situated on the lower Angara, not far from the point where it issues from the lake Baikal. From this town, which is 1440 feet above the sea level, goods are carried in summer by water, and in winter over the ice of the lake, to Udinsk, and hence to Selenginsk, where they are landed, and transported to Kiachta, the Russian commercial establishment, and exchanged with the goods brought by the Chinese to Maimastin. The Chinese bring the goods to Urga, the provincial capital of the adjacent country; and, in advancing farther E., they attain the highest point of the range S. of Urga, on the mountain Dahlgulants, S. of the river Tola, where it rises to 5055 feet above the sea. They afterward descend to the table-land, and traverse the great desert of Gobi, or, rather, Gobi, sometimes called Shamo. The other great road leads from Udinsk, on the river Selenga, to the mining district of Nerchinsk. From Udinsk it runs E. in the valley of the river Uda, a tributary of the Selenga, somewhat more than 2500 ft.; then it traverses the highest part of the range near 115° E. long., and descends into the valley of the Ingoda, in which it continues to Gorodichsk, where the Ingoda unites with the Onon, and forms the Shilka river. On the banks of the last-mentioned river it continues to Nerchinsk. The great road over the Aldan mountains connects Yakutsk with Okhotsk. Yakutsk is only 857 feet above the level of the Polar sea. Between this place and the river Aldan, the road rises gradually, and attains, at Nohkhuak, on the heights, forming the W. bank of the Aldan river, 751 feet. In the valley of the Aldan it descends to 424 feet above the sea. E. of this river the road rises to 1531 feet at Garnastakh, and in the mountains passes six miles W. from Khonka to 9619. It continues nearly on this level for several miles, and then descends, with a rather steep declivity, towards the sea at Okhotsk. This latter place is only 15 ft. above the sea.

*Mines.*—The Altai mountains are richer than metals, especially in silver, gold, copper, and lead. The mines from which these metals are extracted have been worked on a large scale at some unknown period, and by an unknown nation. In the middle of the last century, the Russians, following the traces of the ancient mines, began to work them; but only at the W. extremity of the mountain system, between the Irisk and the Obi, and again on the

## ALTAMURA.

banks of the Shilka river, E. of the lake Baikal. The first mines are comprehended in the mining district of Barnaul, and the second in that of Nerzhinsk.

The mining district of Barnaul, called by the Russians that of Kolyvno-Woskresensk, comprises the mines in the Altai Ore mountains, where, at present, the richest mines are found in the valleys by which the W. declivity of the mountains, sloping towards the Irish, is furrowed. Here are the mines of Syryanowak, in the valley of the Bukhtarma, about 40 m. from the Irish, and at no great distance from the boundary of the Chinese empire; they are productive of silver and lead. Farther to the N.W. are the mines of Biddersk and Krukow, in the valley of the small river Uib, which, also, produce silver and lead, and are at present considered as the richest in this district. In the valley of the Uib, N.W. of Shamanichko, are the mines of Semenov, which produce silver and copper, but are not rich. In the valleys forming the N. declivity of the range are the mines of Schlangenberg, famous for the great quantity of silver extracted from them during the last century; but at present they are less considerable, and begin to be exhausted. W. of them are the mines of Loktewak, producing great quantities of copper. To the E. of the Schlangenberg are the mines of Woskresensk, which furnish copper, but at present are not worked. The ores from these mines were formerly carried to Barnaul on the Ob, where they were smelted; but smelting houses are now erected in the neighbourhood of the most considerable mines. They are all worked on the account and for the benefit of the Russian government; and an Imperial ukase directs that every year 950 pounds (24,500 lbs.) of gold and silver shall be sent to Petersburg from this district. Of this amount 920 pounds are silver, and 30 pounds of gold extracted from the silver. The quantity of copper and lead annually furnished by them is not stated. The former is partly coined in Siberia, in the mint of Samarkand. At Kolyvno Woskresensk are extensive polishing works, where granite, porphyry, jasper, agate, and marble are worked into tables, vases, chimney-pieces, basins, columns, &c. The material is brought from the river Korgon, and 300 workmen are employed in them at the expense of government. The mining district of Nerzhinsk, on the Shilka, a tributary of the Amur, is much less important. The number of mines is stated to amount to upwards of 50, but many of them have been abandoned. The ore is smelted in several large smelting establishments, of which that of Nerzhinsk is the most considerable. The silver is extracted from galena ore, a crt. of which contains from  $\frac{1}{2}$  to 2 ounces of silver. The annual produce is stated to be only 235 pounds, or 16,500 marks of silver; consequently, less than a fourth part of the annual produce of the mines of Barnaul. The ore, though poor, is very abundant; but the want of fire-wood and coal in the neighbourhood of the mines prevents the increase of their annual produce. (See *Pallas, Humboldt, Ledebour, Von Bunge, and Erman.*)

**ALTAMURA**, a town of Naples, prov. Terra di Bari, at the foot of the Appennines, 90 m. S.W. Bari. Pop. 16,000. It is surrounded by walls, has a magnificent cathedral, founded by Frederic II., an hospital, and a lyceum, and is one of the handsomest best built towns in the province. Having taken part with the republican party in 1799, it was taken by the royalists, and given up to military execution; but it has since recovered its former prosperity. Altamura is supposed to be founded on or near the site of the ancient *Leparia*.

**ALTAVILLA**, a town of Naples, prov. Principato Ultra, cap. cant., 7 m. N. Avellino. Pop. 3600. This also is the name of a town in the prov. Principato Citra, S. Campagna. Pop. 9400.

**ALTDORF**, a town of the grand-duchy of Baden, on the great road from Bale to Frankfurt. Pop. 1900. It is the property of baron Turkheim, who has here a fine castle and a valuable botanical garden.

**ALTDORF**, a town of Bavaria, circ. Herz, 13 m. S.E. Nuremberg. Pop. 3000. All sorts of wooden toys are manufactured here, and are exported to all parts of Europe and to S. America. There are also considerable breweries. The surrounding country is beautiful and fertile.

**ALTEA**, a town of Spain, Valencia, near the sea, 30 m. N.E. Alicante. Pop. 4800. It has glass-works, and the contiguous territory produces cotton, wine, flax, silk, and honey.

**ALTENA**, a town of Prussian Westphalia, cap. circ. same name, on the Senne. Pop. 4000, principally employed in wire-drawing and in the manufacture of needles, pins, thimbles, &c.

**ALTENAU**, a mining town of Hanover, prov. Grubenhagen, Harz mountains, about 1500 feet above the level of the sea. Pop. 1200. There are in the vicinity mines of silver, copper, and iron.

**ALTENBERG**, a town of the kingdom of Saxony, in the Erzgebirge mountains, 23 m. S. Dresden. Pop. 1400. It manufactures lace; the surrounding mountains abound in tin, and are covered with forests.

## ALTORF.

**ALTENBRUCK**, a town of Hanover, on the Weerne, near where it falls into the estuary of the Elbe, a little above Cuxhaven. Pop. 2400. It has some trade in corn and cattle.

**ALTENBURG**, a principality in the duchy of Saxe Gotha, divided into two principal parts by the lordship of Gera, and possessing several detached portions in other states. Area, 495 sq. m. Pop. in 1832, 113,677. The W. part, watered by the Saale, is hilly and woody; while the E. part, watered by the Pleisse, is flat and fertile. The inhab., who are descendants of the Wendes, are industrious, and are almost all Lutherans.

**ALTENBURG**, the cap. of the above principality, 24 m. S.S.E. Leipzig, near the Pleisse. Lat. 50° 50' N., long. 22° 27' E. Pop. 12,623. It is well built; has a gymnasium with a considerable library, a foundation for noble ladies, an orphan asylum, and a theatre; with manufactures of wool, tobacco, sealing-wax, gloves, and an extensive trade in wood, corn, and cattle.

**ALTENBURG**, a town of Hungary, 39 m. S.S.E. Knorzburg, in an island of the Frith, at the point where it unites with the right arm of the Danube. It has a gymnasium, and an old castle, now used as a corn-magazine. It was burned by the Turks in 1682.

**ALTENKIRCHEN**, a town of the Prussian states, prov. Rhine, cap. circ. on the Wied, 16 m. N. Coblenz. Pop. 1150. It has some fabrics of linen and cotton, and a forge. The vicinity of this town was, in 1796, the theatre of some obstinate conflicts between the French and Austrians; in one of which, on the 21st September, the brave general Marceau was killed.

Brief, brave, and glorious was his young career:  
His mourners were two hosts, his friends and foes.—Byron.

**ALTENSTEIG**, a town of Wirttemberg, circ. Black Forest, 5 m. W.N.W. Nagold. Pop. 1700. It is built on the declivity of a steep hill, at the summit of which is an old castle.

**ALTER-DO-CHAO**, a town of Portugal, prov. Alentejo, on the Avis, 14 m. W.S.W. Fátima. Pop. 2000. It is surrounded by walls.

**ALTKEIRCH**, a town of France, dep. Haut Rhin, cap. arrond., 34 m. S. Colmar. Pop. 3093. It is situated on a hill, at the bottom of which is the Ill; has some tanneries, and a cattle fair once a month.

**ALTMONTE**, a town of Naples, prov. Calabria Citra, 94 m. N.N.W. Cosenza. Pop. 9100. It is situated on an eminence, has good air, with mines of iron and silver, and a brine spring in the vicinity.

**ALTON**, p. t., Belknap co., N.H., 28 m. N.E. Concord, 509 W. Watered by Merrymeeting river, which enters Merrymeeting bay of Lake Winnepesaukee, which bounds it on the N.E. It contains seven stores, one grist-mill, twenty-five schools, 796 scholars. Pop. 2009.

**ALTON**, p. t. and city, Madison co., Ill., 28 m. W. by S. Springfield, 908 W. Situated on the E. bank of Mississippi river, and has an excellent steam-boat landing. It extends 9 m. along the river, and half a m. back, and has five public squares. It is regularly laid out, with streets from 60 to 180 ft. wide, and contains six churches, one each belonging to the Baptists, Presbyterians, Methodists, Protestant Methodists, Episcopallians, German Evangelical, and Unitarians, a bank, a lyceum, and a mechanic's association. Seven or eight steam-boats are owned here. It is finely situated for commerce, and has had a rapid growth. It contains four commission-houses, thirty-eight stores, one brewery, one flouring-mill, three saw-mills, three printing-offices, two weekly newspapers and one periodical, eight schools, 253 scholars. Pop. 3240.

**ALTON**, a m. town and parish of England, co. Hants, hund. Alton, on the Wye, 47 m. S.W. by S. London. It is a neat town, with manufactures of druggs and worsteds. Pop. 2742.

**ALTONA**, or **ALTENA**, a considerable city of Denmark, in Holstein, on the Elbe, 9 m. W. Hamburg. Pop. 36,400. It is well built, is a free port, and enjoys various privileges: it having been a favourite object with the Danish government to attract to it some portion of the wealth and commerce of Hamburg. But in this they have had but little success. Altona has, however, a good deal of trade; ship-building is also carried on to a considerable extent; and there are manufactures of cotton, silk, leather articles, &c., with sugar-houses, breweries, and distilleries. There is here a superior academy or college, a public library, a mint, an orphan-house, with numerous churches, &c. The inhabitants are mostly Lutherans. Altona was burned by the Swedes in 1713, under circumstances of great barbarity.

**ALTORF**, or **ALTDORF**, a town of Switzerland, cap. cant. Uri, delightfully situated in a narrow valley surrounded by lofty mountains, near the S.E. extremity of the lake of Lucerne, at the N. extremity of the pass over mount St. Gothard, lat. 46° 55' 10" N., long. 8° 37' 47" E. Pop. circa 1700. It suffered severely from a fire in 1799, but has since

## ALTRINGHAM.

been rebuilt on an improved plan. It has a handsome parish church, a town-house, and a Capuchin convent, with a library attached. Altorf is intimately associated with the true or fabulous history of William Tell. He is said to have been born in Burglen, a village close by; and an old tower, in the town of Altorf, covered with paintings in honour of Tell, is said to mark the spot whence he shot the apple off his son's head. (*Esch, Manuel de Voyages en Suisse; Agilis's Switzerland*, p. 105, &c.)

**ALTRINGHAM**, a town of England, co. Chester, 8 m. Manchester. Pop. 3708. It is a neat thriving town, with factories for the spinning of cotton, linen yarn, &c.

**ALTSÖHL**, a free town of Hungary, at the confluence of the Salatina with the Gran, lat. 48° 34' 55" N., long. 19° 7' 20" E. Pop. 3000. It is old, and is entirely occupied by Slavonians. On a hill in the neighbourhood are the ruins of a castle, said to have been a favourite residence of Matthias I.

**ALTSÄTTEEN**, a town of Switzerland, cant. St. Gall, 9 m. S. from the embouchure of the Rhine, in the lake of Constance. Pop. 1900. It is situated on the declivity of a mountain in a beautiful country, surrounded with corn-fields and vineyards; has a fine church, which serves both for Catholics and Protestants; a public library, a muslin manufactory, and three fairs annually.

**ALTURA**, a town of Spain, Valencia, 3 m. N.W. Segorbe. Pop. 3000. It has distilleries, potteries, and paper-mill. The country round produces a great deal of wine.

**ALVA**, a village and parish of Scotland, co. Stirling, 7 m. N.E. Stirling. Pop. 1300. The Devon iron company has considerable works here.

**ALVARADO**, a small town of Mexico, near the mouth of the river of the same name, 40 m. S.E.E. Vera Cruz, lat. 18° 34' 18" N., long. 95° 39' 15" W. The bar at the mouth of the river, about 1½ m. below the town, renders it inaccessible for vessels drawing above ten or twelve feet of water; large ships being in consequence obliged to anchor in the roads, exposed to all the fury of the N. winds, which often blow with much violence. During the period that the castle of St. Juan d'Ulloa continued in possession of the Spaniards, after Vera Cruz had thrown off their yoke, the trade of the latter was principally carried on through Alvarado; but upon the reduction of the castle by the patriots, it speedily reverted to its old channel.

**ALVINCZ**, a town of Transylvania, on the Maros, opposite Roberick, 7 m. S.W. Karlburg. Pop. 3300, almost all Magyars and Bulgarians.

**ALVITO**, a town of Naples, prov. Terra-di-Lavoro, 6½ m. S.E. Sora. Pop. 3300. It is built on the declivity of a hill, in a healthy situation; has an hospital, and several *monte-de-pieta'* for the marriage of young girls.

**ALWUR**, a large town of Hindostan, prov. Delhi, cap. dominions of the Macthery Raja, 90 m. S.S.W. Delhi, lat. 27° 44' N., long. 76° 33' E. It is situated at the base of a steep hill, and is strongly fortified. On the summit of the hill, about 1200 feet high, is a fortress containing several tanks.

**ALYTH**, a town and parish of Scotland, co. Perth, 18 m. W. Forfar. Pop. 3688. The soil is fertile, and the town, which is finely situated, carries on some branches of the linen manufacture.

**ALZEY**, a walled town of Hesse Darmstadt, on the Seiz, 18 m. S.S.W. Mayence. Pop. 3900. It has manufactures of linen and stockings, and tanneries.

**ALZIRA**. See **ALCIRA**.

**ALZONNE**, a town of France, dep. Aude, at the confluence of the Lampy and the Fresquel, near the canal of Languedoc, 19 m. W.N.W. Carcassonne. Pop. 1644. It has manufactures of fine cloths, caps, &c.

**AMAK**, a small Danish island, on which a part of Copenhagen is built. It is principally laid out in gardens and pleasure-grounds.

**AMALPHI**, a city and sea-port of Naples, 9 m. W.S.W. Salerno. Pop. 3500.\* This city attained during the early part of the middle ages to great distinction as an independent maritime republic; and was the first Italian state that traded with Egypt and the shores of the Mediterranean. In the zenith of her prosperity, in the 11th century, Amalphi is said to have contained 50,000 citizens; and her wealth, and the skill and intrepidity of her mariners, were then unequalled. But, after being reduced by the Normans, she was taken and sacked by the Pisans, in 1130; and from this period she rapidly declined, and not long after fell into obscurity. A unique copy of Justinian's Pandects, said to have been found by the Pisans among the spoils of this city, was believed, though, as Savigny has shown, without much foundation, to have led to the revival of the study of the civil law; and Amalphi is also famous for having been the

## AMATRICE.

birth-place of Flavio Gioja, supposed by some to have been the inventor of the mariner's compass, but who, it is certain, was only its improver. (*Gibbon's Decline and Fall*, cap. 36; *Rampoldi, Cosmographie dell' Italia*.)

**AMAND-LES-EAUX (ST.)**, a town of France, dep. du Nord, cap. cant., on the Scarpe, 7½ m. N.W. Valenciennes. Pop. 8556. This town is celebrated for its mineral waters, whence its name; it is very ancient, has a communal college, and the ruins of a celebrated abbey, destroyed at the Revolution. It is situated in a rich, well-cultivated country, where the flax is produced (*in vasa*) of which the finest laces are made. There are manufactured in the town, with woollen stockings, cotton coverlets, soap, linseed oil, chicory, &c. It has also distilleries, tanneries, and a great fair held on the 31st May.

**AMAND-MONT-ROD (ST.)**, a town of France, dep. Cher, cap. arrond., at the confluence of the Marmande with the Cher, and at one of the extremities of the canal, joining the Cher and Loire. Pop. 7262. It is well built, has a *tribunal de premiere instance*, a commercial college, and a theatre. It manufactures wooden clogs and leather; and there are forges, cannon foundries, and porcelain manufactures in the neighbourhood. It is the most commercial town of the dep.; the exports consist principally of the produce of the surrounding country, viz. timber, staves, iron, wine, chestnuts, cattle, leather, hemp, wool, goatkins, &c.

**AMAND (ST.)**, the name of several small villages in different parts of France.

**AMANDA**, t. Hancock co., O. It has three schools, 138 scholars.

**AMANDA**, p. L. Fairfield co., O. Twelve m. E. Circleville, 38 S.E.E. Columbus, 348 W. Pop. 1987.

**AMANDA**, t. Allan co., O. Watered by Anglaise river, and contains one school, 35 scholars. Pop. 380.

**AMANTEA**, a sea-port town of Naples, prov. Calabria Citra, cap. cant., 14 m. S.W. Cosenza. Pop. 7000. It is encircled by walls; has an old castle, four parish churches, some convents, and a school for *belle-lettres*. There are hot springs in its vicinity; and its territory has the appearance of a continued olive wood. It is supposed to occupy the site of the ancient *Nepesina*. It was taken by the French in 1806, after an obstinate defence.

**AMARANTE**, an ancient town of Portugal, prov. Minho, on the Tamega, 35 m. N.E. Oporto. Pop. 5000. It is situated in an agreeable valley, is well built, has a fine bridge, an hospital, an hospicio, two churches, and a Latin school.

**AMARUPURA** (vulg. *Ummarapura*), a city, and formerly the cap. of the Birman empire, on a peninsula between the Irrawadi on the one hand, and a deep and extensive lake on the other, 6 m. N.E. Ava, lat. 21° 55' N., long. 96° 7' E. In 1800, the pop. was estimated by Captain Cox at 175,000; but the seat of government having been transferred to Ava in 1819, it has since rapidly declined, and is now an inconsiderable place. It has a fort, which the Birmanese look upon as impregnable; but which a well-served battery would breach in a few hours. The circumstance of most of the houses consisting of wood and bamboo, accounts for the rapid decay of the place since 1819. Near the city is a temple, much frequented by devotees, containing the celebrated bronze statue of Guadma, brought from Arracan in 1784. (*Hamilton's E. I. Gazetteer; Cranford's Ava*, p. 274.)

**AMASIEH** (an. *Amasia*), an ancient city of Asiatic Turkey, cap. sanjak of same name, in the E. part of Natolia, on the Jekil Ermaik, lat. 40° 33' N., long. 36° 28' E. The situation is peculiar, being difficult of access, and having a citadel on a sharp-pointed rock, connected with the hills whereon the town stands. Outside the walls are some curious caverns; and in the upper part of the town are to be seen the ruins of a temple, a fountain, and aqueducts, mentioned by Strabo. Most of the houses are of wood, but many are of stone, and all are covered with tiles. Streets narrow and filthy. The mosque of Sultan Bayazid is a fine edifice, with two lofty minarets of hewn stone. Great quantities of silk and wine are produced in the surrounding country, and some branches of the silk manufacture are carried on in the town, which has a considerable trade. There is a great discrepancy in the accounts of the population. According to Fontanier, it has 10,000 houses; whence the population might be estimated at 50,000 or 60,000; but others do not estimate it nearly so high. Strabo, the most celebrated geographer of antiquity, belonged to Amasia, and has left a very minute description of this his native city.

**AMASREEH**, a sea-port town of Asiatic Turkey, Natolia, on the Black sea, lat. 41° 45' 37" N., long. 39° 21' E. It is built on the declivity of a hill, on a peninsula between two ports; but its proper roadstead is on the E. side of the isthmus, at a short distance from land, in 3 or 4 fathoms. Its commerce is inconsiderable. There are in the town the ruins of a temple of Neptune, and some other antiquities.

**AMATRICE**, a town of Naples, prov. Abruzzo Ultra II., cap. cant., on a pleasant hill, near the source of the Tronto,

\* Rampoldi says 11,000; but we have no doubt that this is very far beyond the mark. Most authors set down the population at from 2500 to 3500; and the amount given to it by Rampoldi seems quite inconsistent with the appearance to the eye of the place.

## AMAXICHI.

29 m. N. Angila. Pop. 5000. It has five parish churches, two *montes-de-piedra*, a school of *belles-lettres*, and a manufacture of counterpanes.

AMAXICHI, a sea-port town, cap. Santa Maure, one of the Ionian islands, near its N.E. extremity, on a bay of the narrow strait separating the island from the opposite coast of Albania, lat. (castle)  $36^{\circ} 50' 18''$  N., long.  $20^{\circ} 43'$  E. Pop. 6000. The access to the town by sea is defended on the N. by the strong castle of Santa Maure, dist. about 14 m., and on the S. by fort Alexander, on the narrowest part of the strait. The town is meekly built. Owing, probably, to the prevalence of earthquakes, most part of the houses are of wood, and only one story high; but those in the principal street are somewhat superior. It is the residence of the governor, and of a Greek bishop. Extensive salt marshes, or rather lagoons, lie between the town and the castle of Santa Maure, the communication with the latter being kept up by a causeway supported on low arches. The harbour, though improved by the construction of an extensive mole, is fit only for small craft. In summer, the town, owing to the neighbouring marshes, is unhealthy.

AMAZON, MARANON, or ORELLANA, the principal river of S. America, and perhaps the largest in the world. It is formed by the united waters of the Tunguragua and Ucayali; it being doubtful which of these should be considered as the main stream, though the precedence has generally been given to the first. The Tunguragua takes its rise from the lake of Lauricocha, in Peru, in  $10^{\circ} 30'$  S. lat., within 60 m. of the Pacific ocean, while the Ucayali is formed by the junction of the Apurimac and Paro, the source of the former being near Arequipa, in about the 16th deg. of S. lat. Both rivers flow at first a northerly course, inclining to the W., the Tunguragua till it reaches Jaen, in about  $51^{\circ}$  S. lat., and  $76^{\circ}$  W. long., and the Ucayali till it unites with the other at St. Miguel Yarupe, in about  $41^{\circ}$  S. lat., and  $72^{\circ}$  W. long. The course of the river is thence generally from W. to E. till it falls into the Atlantic, almost under the equator, in about  $51^{\circ}$  W. long. Taking the Apurimac for its source, and following its windings, its course may be stated at above 4700 m. It is studded with innumerable islands, many of which are from 10 to 15 m. in circ., and some much more. Its mouth, which is 180 m. in width, has the large island of Caviama in its centre, and marking its extreme limit. The rise and fall of the tide is distinctly felt at Obidos, 400 m. inland. At its mouth, two days before and after full moon, the phenomenon of the bore occurs in a very formidable shape; the water from the ocean rushing into the river, with a prodigious force and noise, in two, three, and sometimes four successive waves, each presenting a perpendicular front, from 10 to 15 ft. in height! No small vessel can encounter it without certain destruction.

Of the rivers which fall into the Amazon, after the junction of its two great branches, from the N., those most important are the Napo, Putumayo, Yapurá, and Rio Negro, the latter having a course of from 1400 to 1500 m. To the S. the principal tributaries are the Yavarí, Yutay or Yotán, Yurua, Madeira, Topokos, and Xingu. Of these the Madeira is by far the largest, and would anywhere, except in America, be reckoned a river of the first magnitude. Its course may be estimated at about 1800 m.

The Amazon and its tributaries afford, perhaps, the greatest extent of inland navigation of any river system in the world. Its amount may be moderately estimated at from 40,000 to 50,000 m. The Amazon itself is navigable to the E. part of the Andes, 3000 m. in a direct line from the sea. The navigation to the Pongo de Manseriche, in about  $74^{\circ}$  W. long., is not interrupted by a single cataract or rapid. Its channel is deep, and it may be navigated by vessels of almost any burden, up to the junction of its two great arms. During the swell in the rainy season the current is rapid, but at other times it may be seaward, not by steam only, but by the aid of the E. breeze, which blows perennially against the current. At Jaen, in  $7^{\circ}$  W. long., the level of the stream is only 1240 ft. above that of its estuary at Caviama, so that its descent is not at an average rate of a foot every 2 m.; and during the latter part of its course it is much less.

At present the vast and fertile country traversed by the Amazon and its affluents is nearly in a state of nature, being mostly covered with immense forests, affording cover to wild beasts and all descriptions of reptiles. During the period of the inundation, a great extent of the low country, on both sides the river, is laid under water. There can, however, be little doubt that, at some future period, all its immense basin, comprising above 2,400,000 sq. m., will be occupied by civilized nations. The Amazon will then be one of the most important and valuable, as well as extensive channels of communication in the world.

A communication exists between the waters of the Amazon and those of the Orinoco. In fact, Humboldt passed by water from the Rio Negro, the principal N. affluent of the former, into the Casiquiare, an affluent of the latter, and thence into the main stream of the Orinoco.

## AMBERT.

The mouth of the Amazon was discovered in 1500 by Vincent Yanez Pincon; but very little was known respecting the river till 1530, when Francis d'Orellana, a Spanish adventurer, having embarked on the Rio Napo, one of its remote tributaries, and, following the current, was carried down the stream to its embouchure. Orellana having reported that armed women were met with on its banks, it thence obtained its popular name of Amazon, though it be still sometimes called Orellana, from its explorer. The origin of the term Marañon is not certainly known. According to Condamine, it is the name of a Spanish officer, who visited the river previously to Orellana; but this is very doubtful, and the more probable opinion seems to be, that it is derived from an Indian nation of that name, which had inhabited some part of its banks. The Amazon was first accurately described by M. de la Condamine, who, having embarked upon it, in 1743, near Jaen, and followed its current to its mouth, gave an interesting account of the expedition, with a map of the river, in his *Voyage de la Rivière des Amazones*, Paris, 1745. See also *Humboldt's Travels*; *Journal of Geographical Society*, ii., p. 650; *Encyc. Britannica*, art. *America*, &c.

AMBAZAC, a town of France, dep. Haute Vienne, cap. cant., 19 m. N.N.W. Limoges. Pop. 3736.

AMBEER, a town of Hindostan, the ancient cap. of the Jeypoor territory, 5 m. N. by E. Jeypoor, lat.  $26^{\circ} 57'$  N., long.  $75^{\circ} 40'$  E. The town, romantically situated on the margin of a lake, is now in ruins. In its vicinity is a fine old fortified palace, and a large castle. The former has a noble hall of audience, and many beautiful apartments, enjoying from their windows, balconies, &c. one of the most striking prospects that can be conceived. (*Heber*, ii., p. 416.)

AMBELAKIA, a town of Turkey in Europe, sanjak Tricala, or Themali, on the W. declivity of mount Ossa, near the Peneus, 15 m. N.N.E. Larissa. This place was distinguished, during the latter part of the last and the first part of the present century, by the industry of its inhabitants, and the skill and success with which they carried on the business of spinning and dyeing cotton yarn. The townspeople, who were wholly Greeks, formed a sort of independent community, and either defended themselves from the exaction of the Turks, or were neglected by the latter. At first individuals carried on business on their own account, on the principle of free competition; but thinking that their profits would be increased by carrying it on in common, they formed themselves into an association on a joint stock principle. For a while this succeeded perfectly well; but, in the end, the parties quarrelled among themselves, and the fruits of their industry were swallowed up in expensive and protracted litigation. At length the staple trade of the place was totally annihilated by the importation of cheaper yarn from England; the produce of our spinning mills having not merely superseded the hand-spun yarn of Ambelakia in foreign markets, but in those of Turkey itself. The town and surrounding country have since become comparatively poor and depopulated. In the state of its prosperity it might have 7000 inhab. (*Ure's Spirit of the East*, ii., p. 14, &c.)

AMBERG, a town of Bavaria, circ. Regen, on the Vils, by which it is intersected, 31 m. N.N.W. Radshon. Pop. 8006. It was formerly the capital of the Upper Palatinat; streets wide and clean; and, though the houses be mostly of wood, it is pretty well built. It is encircled by a double wall, flanked with numerous towers. Principal public buildings, the electoral, now royal castle, arsenal, mint, salt-warehouse, town-house, church of St. Martin, &c. It has a lyceum, a gymnasium, a seminary for the education of teachers, some well-endowed hospitals, a convent for noble ladies, a public library, theatre, and house of correction. It is an entrepôt for salt, and has manufactures of firearms, tobacco, earthenware, &c. There are mines of coal and iron, with iron-works, forges, &c., and the principal glass-works in Bavaria are in its vicinity; its territory is also very productive of hops. It is the seat of a tribunal of appeal, a commissariat of police, a president and a chamber of finances.

AMBERIEU, a town of France, dep. Ain, cap. cant. Pop. 3900.

AMBERT, a town of France, dep. Puy de Dome, cap. arrond., on the Dore, 36 m. S.E. Clermont. Pop. 8016. The town is pretty well built, but the streets are narrow and crooked, and the houses, being principally constructed of granite, from the adjoining mountains, have a gloomy, dismal-looking appearance. Ambert, and the arrondissement of which it is the capital, are distinguished by their industry. The town is especially celebrated for its paper for printing and engraving, in the manufacture of which it employed, in 1834, 102 machines (*wees*), each of which required the assistance of 10 persons, and consumed annually about 23,000 kilog. of rags, and produced 11,000 kilog. of paper. Workmen employed in the paper trade earn about 1 fr. 60 cent. a day, and women from 50 to 55 cent. A combination has

## AMBLETEUSE.

admitted among the work-people in this trade since the 15th century, and they are said sometimes to give the law to their masters. There are also in the town very extensive manufactures of ribbands, lace, woollen cloths for the marines, called *étoffes de pavillon*, serge, linens, pins, &c. The value of the linen annually produced in the arrondissement is reckoned at 800,000 fr.; 2350 work-people are employed in the manufacture of lace, besides those in the ribband and other trades. The trade of the town is very considerable. It is the principal market for the famous cheese *dites d'Ambleteuse*. (*Hugo, France Pittoresque*, tom. ii., p. 3.)

**AMBLETEUSE**, a small decayed sea-port town of France, dep. *Pas de Calais*, 6 m. N. Boulogne. Pop. 581. It was formerly a sea-port of considerable importance; and both Louis XIV. and Napoleon endeavoured, by improving its harbour, to regain for it some portion of its ancient consequence. But, owing to the accumulation of sand, their efforts have had no permanent influence, and the town is almost deserted. James II. landed here after his abdication of the English throne, in 1689.

**AMBOISE** (an. *Ambocis*), a town and castle of France, dep. Indre et Loire, cap. cant., on the left bank of the Loire, 15 m. E. Tours. Pop. 4695. The castle occupies the summit of a rock, about 80 ft. in height. The town *singulièrement triste et laide*, lies principally between the bottom of the castle rock and the river; but it has suburbs on an island in the river, and on its right bank. The castle, which is of vast extent, was commenced under Hugh Capet, and finished under Charles VII.; it was a favourite residence of Louis XI., and in that Charles VIII. was born in 1470, and expired in 1498. It is also famous in French history as the birthplace of the conspiracy, *dite d'Amboise*, against the Guises, concerted in 1560. It suffered much during the religious wars, and was partly demolished during the revolutionary phrensy. The remaining portion is now converted into a depot for the flints for the use of the French army, brought from the quarry of Meunies, near St. Aignan. The views from its towers and battlements are superb.

A manufacture of files, graters, and cemented steel, established at Amboise in 1780, continues to flourish, and employed, in 1835, about 160 workmen. It consumes annually above 200,000 kilog. of fine steel, its products being estimated at 200,000 packets of files, *dites d'Allemagne*, 50,000 dozens do. after the English fashion, 2000 packets do. *dites de Nuremberg*, and 6000 *carreaux*. The manufacture is under the able direction of M. St. Bris. There is also in the town a manufacture of arms, with tanneries, &c. A handsome wooden bridge, with stone piers, erected in 1822, connects the town with its suburb on the opposite side of the river. (*Hugo, France Pittoresque*, ii., p. 104, &c.)

**AMBOOY**, a town of Hindostan, in the Carnatic, district S. Arcot, 108 m. W.S.W. Madras, lat. 12° 50' N., long. 78° 46' E. It is neat, and regularly built; the inhab., who are industrious, prepare a considerable quantity of castor oil for exportation. To the left of the town is a lofty isolated mountain, that was formerly surmounted by an all but impregnable fort; but its upper works have been destroyed since it came into the possession of the British, and the tower is used as a place of confinement for malefactors.

**AMBOY**, p. t., Oswego co., N.Y., 80 m. E. Oswego, 137 W.N.W. Albany, 386 W. Watered by Scriba and Salmon creeks, and contains two stores, two grist-mills, four saw-mills, eleven schools, 331 scholars. Pop. 1070.

**AMBOY**, Perth, N.J., see Perth-Amboy.

**AMBOY**, t., Lucas co., O. It has one grist-mill, seven saw-mills, five schools, 186 scholars. Pop. 452.

**AMBOYNA** (*Ambon*, Malay), an island of the E. Archipelago, in its third or E. division (*Craeford*), belonging to the Dutch. It lies in 3° 40' S. lat.; between 139° and 139° E. long. S.W. of Ceram, is 22 m. in length, and 10 in breadth; area 424 sq. m., pop. 45,000 (*Cannabich*, 1837). Its shape is irregular, being indented by a long bay (Binnen), which divides it into two very unequal portions, connected by a narrow isthmus. Surface mountainous. It is watered by numerous rivulets, and overgrown everywhere by trees and underwood, interspersed with clove plantations; its soil, a rich red loam, is of a darker colour in the valleys, and sometimes mixed with sand; climate healthy, the average heat of the year 82° Fah., the lowest temperature 72° F. The monsoons occur regularly, but their effects are quite the reverse of those experienced in Borneo, and the W. division of this Archipelago; the E. monsoon bringing rains, and tempests, and the W. dry weather. The Dutch appropriated this island to the culture of the clove, for the production of which it is especially calculated; and to secure to it a monopoly of this valuable product, barbarously compel the destruction of the trees in the other islands subject to their power. The clove (*gomode*, Tidor lang), thrives best in a dark loamy soil, but not very near the sea, on hills, on sandy or dark clay soil, or on sedgy grounds, and requires much care in its culture. The plant resembles a large pear-tree, from 30 to 40 ft. in height. In the Moluccas it bears at seven

## AMELIA.

or eight years, in Amboyna not till ten or twelve years old; about one third of the trees are infertile, the rest may continue to bear fruit for seventy years. The crops are gathered in Oct. and Nov.; they are very unequal in different years, but the produce of each tree may average from two or three to five pounds; the total annual produce is said formerly to have been 650,000 pounds. (*Hamilton*.) Sago forms the chief nourishment of the inhabitants, and very superior indigo, but inferior coffee, are also grown. Sago trees are seven years in arriving at full growth, and last about thirty; but they are generally cut down when about twenty years of age. When in full vigour, they yield from forty-two to forty-six pounds of sago a year. The wild animals of Amboyna are deer and wild hogs; there are no beasts of prey, but a multitude of birds and serpents. Buffaloes, cows, sheep, goats, and horses, were brought thither by the Portuguese, but cattle are rare. The inhabitants are of four distinct races, viz. 1. Hoorafors, the aborigines, who are in a savage state and live in the forests, whither they were driven by 2. Malays, who compose the bulk of the population; 3. Chinese, who are the principal merchants; 4. Europeans, mostly Dutch: they are expert fishers, in canoes from 10 to 30 ft. long; in war they use *korokors*, 80 to 100 ft. in length, and capable of containing eighty men. Their houses are of wood, roofed with palm leaves, and are mostly of but one story, on account of the prevalence of earthquakes. The prevailing religion is Mohammedanism, introduced A.D. 1515; but some of the Amboynese are Christians, and bear Portuguese names. The government is dependent on that of Batavia; its seat is at fort Victoria; the public revenues are derived from a monopoly of arrack, custom-house and port duties, taxes on merchandise, and licenses to keep an inn, and kill pigs. The exports consist of cloves, and other natural produce; the imports chiefly opium, and a few European and Indian goods. (*Craeford*, *Indian Archipel.*, iii., p. 495-503; *Hamilton*, *E. I. Gazetteer*.)

*History*.—Amboyna was first discovered by the Portuguese in 1515. It was taken by the Dutch in 1607, and by the English in 1615. The latter, who were soon after expelled by the Dutch, retained a factory in the island, till 1692. The destruction of this establishment by the Dutch, and the cruelties inflicted on the unhappy persons found in it, afforded a theme for lengthened negotiations, and for much declamatory invective. At length, under the vigorous administration of Cromwell, the Dutch were compelled to make some compensation to the descendants of those who suffered in the "Amboyna massacre." In 1796, the island was captured by the British, who restored it at the peace of Amiens. They recaptured it 1810, and held it till 1814, when it reverted once more to the Dutch.

**AMBOYNA**. The principal town in the above island, and the second in importance belonging to the Dutch in the E. Archipelago, on the S.E. side of the bay of Binnen, near fort Victoria, in 3° 40' S. lat., and 139° 15' E. long. Pop. 7000. It is regularly built; the streets, though not paved, are broad, and intersected by many rivulets; the houses, excepting the town-house, which has two stories, are all of only one story, constructed of wood and roofed with palm leaves. A long esplanade, reaching as far as the fort, is bounded by a handsome range of houses, and a double row of nutmeg trees. There are two Christian churches, a hospital, a fine garden, and menagerie, and several good bazars and markets. Fort Victoria is an irregular hexagon, surrounded by a ditch, but as it is entirely commanded by two neighbouring heights, its best defence is in the difficulty of anchorage in the contiguous bay. (See *Hamilton*, *E. I. Gazetteer*, p. 36; *Cannabich Lehrbuch*, p. 843.)

**AMBRIERES**, a town of France, dep. Mayenne, cap. cant., 7 m. N. Mayenne. Pop. 2434.

**AMBROIX** (ST.), a town of France, dep. Gard, cap. cant., 11 m. N.N.E. Alais. Pop. 3107. It manufactures coarse silk stockings, and has tanneries, and nail works.

**AMELIA** (an. *Ameria*), a city of the Papal States, deleg. Spoleto, 23 m. S.W. Spoleto. Pop. 5000. It stands on a small hill, is the seat of a bishopric founded in 1344, and has a cathedral, three churches, and some convents.

Ameria was one of the most considerable and ancient cities of Umbria. The famous comedian, Sextus Roscius, was a native of Ameria, which is frequently referred to by Cicero in his speech in defence of Roscius. It is said to have been founded 1045 years B.C., and became a colony under Augustus. (*Cramer's An. Italy*, i., 273.)

**AMELIA**, county, Va., situated centrally in the E. part of the state, and contains 300 sq. m. Drained by branches of Appomattox river. It had, in 1840, 6029 neat cattle, 7708 sheep, 12,664 swine, and produced 50,637 bushels of wheat, 244,785 of Indian corn, 1,871,134 pounds of tobacco, 6015 pounds of cotton. It had thirteen stores, three flouring-mills, eighteen grist-mills, one saw-mill, two academies, 50 students, seven schools, 156 scholars. Pop. whites 3074, slaves 7023, free coloured 223; total, 10,330. Capital, Amelia.

**AMELIA**, p. v., capital of Amelia co., Va., 45 m. S.W. by

## AMENIA.

W. Richmond, 102 W. It contains a court-house, jail, and other county buildings, and a few dwellings.

AMENIA ISLAND, Nassau co., Flor., lies off the N.E. coast of the territory, between St. Mary's and Nassau rivers, and is 15 m. long and 4 wide. The soil is generally fertile. Fernandina, the former capital of the co., has a good harbour, but is less flourishing than formerly.

AMENIA, p. t., Dutchess co., N. Y., 90 m. E.N.E. Poughkeepsie, 70 S. by E. Albany, 324 W. Watered by tributaries of the Housatonic river, and contains marble and magnetic iron ore. It has eight stores, two fulling-mills, two flouring-mills, four grist-mills, seven saw-mills, one furnace, one academy, 240 students, five schools, 159 scholars. Pop. 2179. It contains the villages of Amelia, Union, and Amelaville, at the former of which are a post-office two churches, two stores, one cotton factory, one woolen factory, one saw-mill, and thirty-five dwellings. The latter contains three churches, one Presbyterian, one Baptist, one Methodist; an academy, three stores, one grist-mill, one saw-mill, forty dwellings, and about 200 inhabitants.

AMERICA, or the New World of the W. hemisphere, one of the great divisions of the globe, surpassing all the others in magnitude, with the exception of Asia, to which, however, it is but little inferior. This vast continent stretches N. and S. a distance of about 9000 m., or from about the 72d degree of N. lat. to cape Horn, in about 56° S. lat. It is very irregularly shaped, being divided by the gulf of Mexico and the Caribbean sea into the two enormous peninsulas of N. and S. America, united by the isthmus of Darien, or Panama, not more than 28 m. across. Where broadest, N. America, excluding Greenland, is not less than 3500 m. across, and S. America not less than 3300 m. The estimates that have been formed of the area of America differ widely. Balbi supposes it to amount to 11,146,000 sq. m. of 66 m. to a deg., equal to 14,790,000 sq. Eng. m. of 60-15 to a deg. The following estimate, which is that given in the article America in the new edition of the *Encyclopædia Britannica*, does not differ materially from Balbi's; and the ability with which the article referred to is written, renders the statements of the highest authority.

|                                                |             |
|------------------------------------------------|-------------|
| North America                                  | sq. Eng. m. |
| South America                                  | 7,400,000   |
| Isthmus                                        | 6,500,000   |
| Greenland and the islands connected with it N. | 160,000     |
| of Hudson's Straits                            | 900,000     |
| Total.                                         | 14,960,000  |

This vast continent lies between the Atlantic and Pacific oceans, the former separating it from Europe and Africa, and the latter from Asia and Australia. All the distinguishing features of the American continent seem to be formed on the most gigantic scale. The chain of the Andes, which runs from one end of S. America to the other, and is prolonged under different names through the whole extent of N. America, is, in point of length, unequalled by any mountain chain in the Old World; and is far superior, in respect of altitude, to the Alps and every other mountain system with which we are acquainted, the Himalaya only excepted. The plains, rivers, bays, lakes, cataracts, and forests of America are of unrivalled extent and grandeur. Her mineral riches seem also to be superior to those of every other continent; and she possesses every variety of climate, from the extreme heat of the torrid zone to the eternal winter of the arctic circle. It is singular, however, that while inanimate and vegetable nature are developed on so grand a scale in the New World, the animal kingdom should be comparatively deficient. The native American is probably inferior even to the negro. Of the lower animals, neither the elephant, camel, nor lion is found in America; and it was originally destitute of the horse, the ox, and the sheep, all of which were carried thither by Spanish, British, and other European settlers.

N. America is more indented than any other of the great divisions of the globe, with immense gulfs and arms of the sea. One of the principal of these, in the N.E. part of the continent, consists of what Balbi has not unwisely called the sea of the Esquimaux, from its coasts being everywhere occupied with tribes belonging to that peculiar race. It consists of two great divisions, Davis's straits and Baffin's bay, separating Greenland from the rest of the continent; and Hudson's bay, lying more to the S. and W., but connected with the former by numerous channels, some of which have only been recently discovered. The navigation of these seas and inlets, even at the most favourable seasons, is extremely difficult, from their being constantly encumbered with ice; and it is only during a short period of the year that it can be attempted. The next great inlet of the sea on the American coast is the gulf of St. Lawrence, so called from the great river of that name which falls into its S.W. extremity. Passing over the numerous inlets and noble bays on the coast of the United States, we come to the gulf of Mexico and the Caribbean sea. This vast Mediterranean

## AMERICA.

is separated from the Atlantic by the peninsula of Florida, and the Greater and Lesser Antilles, or the West Indian islands. The latter are, as it were, a continuation of Florida; and are, it is probable, the only remaining points of what was once a broad belt of land, which has been broken to pieces and partly submerged in some of those tremendous convulsions to which the earth has been subject. But, however this may be, this great inland sea is divided into two portions by the peninsula of Yucatan and cape St. Antonio, at the W. extremity of the island of Cuba, which approach within a comparatively short distance of each other; that to the N. being called the gulf of Mexico, and that to the S. the Caribbean sea, or the sea of the Antilles. The isthmus of Panama is at the extreme S. limit of the latter, in about the 8th deg. of N. lat. It is believed that it would be by no means difficult to cut a canal across this isthmus, and consequently to unite the Atlantic and Pacific oceans.\* The gulf of California, separating the peninsula of that name from the main land, is the most important inlet of the sea on the W. coast of N. America.

S. America bears a striking resemblance in the form of its coasts to Africa. It is much more compact than N. America, and is comparatively little indented by arms of the sea. The great rivers, Amazon, La Plata, Para, Orinoco, &c., may, however, be looked upon as a species of inland sea; and are, in some respects, more serviceable than the latter. The W. coast of America, from the proximity of the Andes, has but few gulfs; and is, in great part, all but destitute of harbours. The S. extremity of S. America, or the country of Terra del Fuego, is properly an archipelago, being separated from the continent by the narrow and winding strait of Magellan, or Magalhaens.

*Mountains.*—Humboldt has shown that all the high elevations of the New World belong to that great chain which, under different denominations, extends from one of its extremities to the other, along its western coast, over a space of no less than 10,000 m. The American mountains may, however, be divided into eight systems, or principal groups, three of which belong to S., and three to N. America; and one each to the West Indian and Arctic archipelagos.

1st. Of these systems, that of the Andes, or Peruvian system, from the highest mountains being in the country formerly known by the name of Peru, is by far the most gigantic. This vast chain of mountains commences at cape Horn, in about the 56th deg. of S. lat., and following pretty closely the line of the W. coast of the continent, to which it forms as it were a huge bulwark, stretches N. to the bay of Panama, in about the 9th deg. of N. lat. But at Popayan, in about 24° N. lat., the chain is divided into three great ridges, of which the most westerly takes the direction above mentioned, while that farthest to the E. follows a N.E. direction, terminating a little to the E. of lake Maracaybo. The name *Cordillera*, sometimes given to the entire chain, belongs properly only to the highest ridge. In parts the chain consists only of one ridge, and in others of two or three, enclosing Alpine valleys of a vast height and sometimes of great extent. It has, next to the Himalaya chain, the highest summits known to exist; and its mean elevation may be taken at from 10,000 to 12,000 ft. Chimborazo, near Quilo, 21,400 ft. above the level of the sea, was formerly supposed to be the highest summit of the Andes; but the researches of Mr. Pentland have shown that it is far surpassed in altitude by Zorata and Illimani, near lake Titicaca, which respectively rise to the prodigious elevation of

\* The subject of a ship canal across the isthmus of Darien or Panama, has long engaged the attention of reflecting men, and recently some routes have been explored. One of these is by the river San Juan, which enters into the Caribbean sea, thence through lake Nicaragua, and thence by canal to the Pacific ocean. From the mouth of the river to the lake is 79 miles. Lake Nicaragua is 95 m. long and in its broadest part about 30 m. broad, with an average depth of 15 fathoms of water. The canal from the lake to the Pacific would be 19.5 m. In this distance, two deep cuttings and a tunnel, of the whole 3 m. in length, would be required. The sum of the amounts from the Pacific to lake Nicaragua would be 1067 feet 5 inches; of the descents, 919 feet 2 inches. The height of the lake above the Pacific, at low water, is 128 feet 8 inches. The river San Juan has rapids, but no falls; and by removing some obstructions, or by dams and locks, could be made navigable for vessels of a large class, or a canal could be constructed along its border. The cost of this great work is estimated at from 30 to 85 millions of dollars. It then appears, that at a cost of less than twice that of the Croton Water-works of the City of New-York, this great work might be constructed; and nothing but the unsettled state of the country through which it would pass, can delay it for many years. (See *Stephens's Incidents of Travel in Central America*, vol. I., p. 410.)

The French are said to have explored a route in New-Grenada, which would require much less labour and expense. M. de Humboldt is said to have made a communication to the Academy of Sciences at Paris in Dec., 1845, stating that the labour of cutting a canal across the isthmus of Panama is advancing rapidly, that the commission appointed by the government of New-Grenada has finished their examination, and that the chain of the Cordillera is broken through by a valley, favourable to the design of uniting the two oceans; and that the excavations beside the river, which could be made available, would not exceed 12.13 m. in length; and that the total length of the canal would be 49 m., and could be constructed to admit the passage of vessels of 1600 or 1400 tons burden, for less than three million dollars, or less than one third the cost of the Croton Water-works. The labour and expense, fruitfully employed to discover a north-west passage between the oceans, would long since have completed the work. — *Am. Ed.*

## AMERICA.

35,350 ft. (nearly 10,000 ft. higher than Mont Blanc) and 94,000 ft. (See *Andes*.) 3d. The system of La Parime, or Guyana, embraces the mountains scattered over the immense island formed by the Orinoco, Casiquari, Rio Negro, and Amazon. It consists of an irregular group of mountains, separated from each other by plains, savannas, and immense forests. The Sierra de Parime may be regarded as its principal chain. The peak of Duida, 8313 ft. in height, is the culminating point of the chain and of the whole system. 3d. The Brazilian system, embracing the mountains that lie between Amazon, Paraguay, and Rio de la Plata. The Sierra de Espinazo is its most elevated chain. It traverses, under different denominations, the provinces of Bahia, Minas-Geraes, Rio de Janeiro, San Paulo, and the northern extremity of the province of San Pedro. Its culminating points are Iambe and the Sierra da Piedade, nearly 6000 ft. high, in the province of Minas-Geraes. 4th. In N. America, the principal mountain system is that of the Mexican Alps, and Rocky mountains, which may be regarded as a continuation of the Andes. In Mexico, it is divided into three distinct ridges; within which, between the parallels of 19° and 24° N. lat., are immense plateaus elevated to the height of between 6000 and 9000 ft. The central cordillera of Mexico stretches N. 10° W. from the 25th to the 29th deg. lat., separating the waters of the Rio del Norte, flowing S.E. from those of the Colorado, flowing S.W. The highest peaks in the ridge in Mexico, are the volcanoes of Popocatepetl, 17,060 ft., and Orizaba, 16,365 ft. From about the 35th deg. the ridge, which then begins to be called the Rocky Mountains, stretches N. 99° W., till it terminates near the mouth of the Mackenzie river, on the Arctic sea, in about the 69th deg. of lat. and 128th deg. of W. long. Some peaks in this chain, between 32° and 33°, are said to be nearly 16,000 ft. above the level of the sea; and others between 37° and 39°, have been ascertained to be from 10,000 to 13,000 ft. in height. We have no accurate information respecting the height of the passes of the Rocky mountains, nor of the altitude of their base above the sea; but on their E. side is a very extensive tract, dry, sandy, and almost a desert. 5th. Parallel to the Rocky mountains, and at no great distance from the sea, a chain of mountains runs N. from the peninsula of California, till it is lost in Russian America. This chain, which has been called by Humboldt the Californian Maritime Alps, increases in altitude as it gets farther N. Mount Hood, near the 45th deg., on the S. side of the Columbia or Oregon river, is said to be about 16,000 ft. high; and Mount St. Helena's, about a degree farther N. on the N. side of the Columbia, has an elevation of 14,000 ft. Mount Fairweather, in the 50th deg., is also 14,000 ft. high, and Mount St. Elias, the loftiest in the chain, attains to an elevation of about 17,000 ft. The last two are volcanoes. Between the Rocky mountains and the Maritime Alps is an extensive prairie tract, 700 m. in length, by from 100 to 300 m. in breadth. The Rocky mountains and the Maritime Alps are connected by a ridge in about the 49th deg. lat., dividing the waters which now flow N. to the Columbia from those which flow S. to the Colorado. 6th. The mountains E. of the Mississippi do not at all approach the Rocky mountains in magnitude. They are included in what is called the Alleghany or Appalachian system, extending in a N.E. by N. direction from Alabama, on the N. confines of Georgia, to the banks of the St. Lawrence, being about 1200 m. in length, with a mean breadth of 100 m. The White mountains of New-Hampshire, 7300 feet above the level of the sea, are the highest in this range, which is crossed by the tidal waters of the Hudson river. The immense valley of the Mississippi lies between the Rocky and the Alleghany chains. 7th. Balbi proposes to embrace, under the denomination of Arctic system, all the mountains that are already, or that may hereafter be discovered within the Arctic archipelago. The culminating points of that system, in so far as they are at present known, are the Corn du Cerf, in Greenland, the height of which has been much exaggerated, but which is probably above 8000 ft., and the Aerack Teekull, in Iceland, 6649 ft. 8th. The system of the Antilles embraces the mountains in the archipelago of that name. Its culminating points are, the Antio-Sepo, in Hayti, nearly 9000 ft. in height; and the Sierra de Cobre, in Cuba, the most elevated summits of which attain about the same height.

**Plateaus.**—America has a great variety of plateaus, some remarkable for their prodigious elevation, and others for their immense extent. Under the former are included the plateau of Titicaca, divided between Bolivia and Peru, comprising an area of about 18,000 sq. m., with a mean elevation of above 13,000 ft. The populous and well-cultivated plateau of Quito is elevated about 9000 ft.; and the extensive plateau or table-land of Anahuac, in Mexico, from 6000 to 9000 ft. Among the latter, or those principally remarkable for their extent, may be mentioned the central plateau of S. America, embracing the vast province of Matto Grosso, with parts of Goyaz and San Paulo, in Brazil, the whole of Paraguay, Chaco in the consideration of the Rio de la Plata,

and a part of the lands of the Chiquito and Mame in Bolivia. Its elevation varies from about 750 to 1900 feet.

**Volcanoes.**—America has a great number of volcanoes, and some of the most elevated volcanic mountains in the world. The departments of the Equator and of Canea in Columbia, the states of Nicaragua, San Salvador, and Guatemala in central America, Chili, Russian America, and Iceland in Danish America, contain a great number of volcanoes. The most remarkable volcanic mountains are, Copocatepetl, Sangay, and Pichincha in the Columbian department of the Equator; Panto, Sotara, and Purace, in that of Canea; Guagua-Pitima, or the volcano of Arequipa, and Sehami in Peru; the volcanoes of Copiapo, Chilen, Antuco, and Petros, in Chili; those of Soccosomon, Guatemala, or Fuego, Agua, Pacaya, San Salvador, Granada, and Telica, near St. Leon, of Nicaragua, in central America; Popocatepetl, or the volcano of Puebla, Chilatepetl, or the volcano of Orizaba, the volcano of Colima, and that of Xorullo, in the Mexican confederation; St. Elias and Fairweather, in the Californian Alps; the two volcanoes of the peninsula of Alaska, and those of the Aleutian islands; with Hekla, and others in Iceland.

**Plains.**—In no other part of the world are the plains so vast. The immense space from the outlet of the Mackenzie river to the Delta of the Mississippi, and between the central chain of the Mexican system and Rocky Mountains, and the Alleghany, forms the largest plain, not of America only, but of the world; it embraces the basins of the Mississippi, the St. Lawrence, Churchill, or Nelson, almost the whole basin of the Missouri, nearly the whole basins of the Saskatchewan and Mackenzie river, and the entire basin of the Coppermine river. Four fifths of that portion of this vast plain, which lies beyond the 50th deg. of lat., is a bleak and barren waste overpread with innumerable lakes, and bearing a striking resemblance to N. Asia; but its more southerly portion, or that lying W. of the Alleghany chain, and N. from the gulf of Mexico, differs widely in character from the other, being well wooded and fertile on the E. side, bare but not infertile in the middle, and becoming almost a desert in the extreme W. The second great plain of the New Continent is that of the Amazon: it embraces the whole central part of S. America, comprising more than half Brazil, with south-west Columbia, the eastern part of the republic of Peru, and the northern part of Bolivia; its limits are nearly identical with those of the middle and lower parts of the immense basin of the Amazon and Tocantins. The plains of the Rio de la Plata extends between the Andes and their principal branches, and the mountains of Brazil, to the Atlantic ocean, and the straits of Magellan. It embraces the southwest part of Brazil, Paraguay, the country of the Chiquito, Chaco, with the greater part of the confederation of the Rio de la Plata, the state of Uruguay, and Patagonia. A large portion of it is known by the name of the Pampas of Buenos Ayres, or Rio de la Plata. The plain of the Orinoco, embracing the Llanos of New-Granada, and Venezuela in Columbia, extends from Casiqua to the mouth of the Orinoco, along the Guaviare, Meta, and lower Orinoco. In some of the flat parts of America large tracts of territory are met with, which, in respect of aridity of soil, and of the sand by which they are covered, may be compared to the deserts of Asia and Africa. The most remarkable and most extensive of these tracts, are the desert of Pernambuco, occupying a great part of the N.E. plateau of Brazil; the desert of Atacama, extending, with some interruptions, along the coast of the Pacific from Tarma in Peru, to Copiapo in Chili; and the desert of Nuttal, at the E. foot of the Rocky mountains, between the upper Arkansas and Paduca, forming part of the central plain of N. America.

**The Rivers of America** are on a much larger scale than those of any other portion of the globe, affording facilities of internal communication of vast importance, and quite unequalled anywhere else. The principal are the Amazon, Mississippi, Plata, St. Lawrence, and Orinoco. The Amazon flows E. through the broadest part of S. America, having its embouchure under the equator. Its entire course is estimated at about 4700 m., and it has several tributaries, larger than the Volga or the Danube. Uninterrupted by either rocks or shallows, it is navigable for vessels of considerable burden to the E. foot of the Andes, a distance, in a direct line, of above 9000 m. from the sea; and though civilization has as yet made little or no progress in the vast and fertile regions through which it flows, there can be no doubt that it is destined to become as it were a great highway for many powerful nations; and to have its banks thickly set with populous towns and emporiums.

The Mississippi, taken in connexion with the Missouri, the largest and most important stream, flows from N. to S., falling into the gulf of Mexico, about 100 m. below New-Orleans. Its course, including windings, exceeds 4900 m.; many of its tributaries, as the Arkansas, Red River, Ohio, &c., are of great magnitude; and it drains one of the largest and finest basins in the world. It is navigable for about

## AMERICA.

3,000 m. in a direct line from its mouth; and though civilization has only begun to strike its roots and scatter its seeds in the wide regions through which it flows, it is already a well frequented channel of communication. But the boldest flights of imagination can hardly figure what the Mississippi will be, when the rich and fruitful countries on its banks, and those of its affluents, are all fully peopled, and making use of its waters to send abroad their surplus products, and to import those of other countries and climates.

The Plata, which runs E. with a slight inclination to the E., is the grand channel of communication to a very large portion of S. America. Its course may be estimated at about 5500 m.; and its basin is inferior only to that of the Amazon or the Mississippi.

The St. Lawrence, with its connected lakes, or rather great inland sea, is the grand outlet of the largest freshwater system in the world. Including the lakes, its course exceeds 3000 m. It is remarkable for the equality of its current, which is nearly uniform throughout the year.

The Orinoco has a course of about 1800 m., and carries to the sea an immense body of water. There is a water communication between one of its affluents, the Casiquari, and the Rio Negro, an affluent of the Amazon.

Owing to the circumstance of the Andes, and of their prolongation in N. America, being generally within a comparatively short distance of the W. coast, there is not, in most parts, room in the intervening space for the formation of any very great river. Hence, notwithstanding the prodigious length of the W. coast, it only receives two large rivers, and these not of the first class; the Rio Colorado, falling into the bottom of the gulf of California, and the Columbia or Oregon. Their course may be estimated at about 1100 m. each.

The Mackenzie is the only great river flowing into the Arctic sea. It has a N.N.W. course; it is connected by a series of lakes and tributary streams with lake Superior, and consequently with the St. Lawrence.

**Lakes.**—No part of the world has so many lakes as N. America, especially that portion between 45° and 67° lat., which might be justly called the lake region. It presents not only the greatest masses of fresh water on the surface of the globe, but in many smaller lakes and morasses, that their enumeration is almost impossible. These lakes form a most important feature in the physical geography of the New World. In the rainy season, several of them overflow their banks; and temporary communications are then established between rivers whose embouchures are frequently at immense distances from each other. Some of these communications are permanent; as, for instance, that of the Mississippi or Churchill with the Mackenzie river. The great lakes of N. America are, lake Superior, Michigan, Huron, St. Clair, Erie, and Ontario. These, which are all connected together, discharge their superfluous waters by the St. Lawrence, and form that vast reservoir of fresh water, sometimes called the sea of Canada. (See the titles for a full description of these lakes.) The next in size and importance are lakes Winnipeg, Athabasca, Great Slave lake, and Great Bear lake, stretching N.N.W. from lake Superior to near the mouth of the Mackenzie river, and forming as it were a continuation of the Canadian lakes. There are some considerable lakes in the Mexican states, and the comparatively small lakes of Tezcuco, Xochimilco, &c., in the valley of Mexico, are remarkable for their elevated situation, their vicinity to the capital, and the superb works undertaken to prevent the damage caused by their frequent overflowing. The lake Nicaragua, in central America, is remarkable for its size, the beauty of its scenery, its volcanoes, and from its forming the basis of the works projected for uniting the Atlantic and Pacific oceans. The limited size of the principal lakes of S. America, strikingly contrasts with the dimensions of those of N. America. The lake of Titicaca, the largest and most celebrated of the S. American lakes, is situated near the N.W. frontier of Bolivia, or upper Peru, in an Alpine valley surrounded by ridges of the Andes. It covers an area of above 4000 sq. m., and is elevated 12,795 feet above the level of the sea! Manco Capac made his first appearance on the banks of this lake. The basins of the Rio Colorado, or Mendosa, and Rio Negro, present several very extensive lakes; but these are really rather vast morasses, than lakes properly so called.

**Islands.**—A multitude of islands belong to America. We shall briefly notice the principal, in the order of the seas in which they are situated. In the Atlantic ocean are, the archipelago of St. Lawrence or of Newfoundland, at the mouth of the gulf of St. Lawrence; its principal islands are Newfoundland, Anticosti, Prince Edward's island, and Cape Breton. The great Columbian archipelago, or Antilles, commonly called the West Indies, comprises a great number of islands and secondary groups, lying between the peninsula of Florida and the delta of the Orinoco. Its chief islands are, Cuba, Hayti, or St. Domingo, Jamaica, and Porto-Rico, called the greater Antilles; St. Cruz, Antigua, Guadalupe,

Martinico, St. Lucia, Barbadoes, St. Vincent, Tobago, Trinidad, and several others, called the smaller Antilles. The Lucayos, or Bahama islands, a vast secondary group, are situated to the N. of Cuba. Towards the southern extremity of the New Continent, are the Falkland or Malouine islands, which have no fixed inhabitants; in the southern ocean is the archipelago of Mangellan and Terra del Fuego, the most southerly inhabited part of the world. By its position, at the extremity of America, it belongs as much to the ocean, to which we have assigned it, as to either the Atlantic or Pacific ocean.

The Antarctic archipelago, or Antarctic lands, under which denomination we include all the islands situated beyond 50° S. lat., next claims attention. The greater part of these islands have been recently discovered; they are all uninhabited, are mostly covered with ice, and are important only to whale and seal fishers. The most remarkable islands and groups are, the island of St. Peter, called by Cook, S. Georgia; the archipelago of Sandwich, the Orkneys, S. Shetland, Trinity island, the small islands of Alexander I. and Peter I.; being at present the most southerly of the known parts of the world. The Pacific ocean has also a multitude of islands, lying in groups, of which we can only notice the following: the archipelago of Madre de Dios, on the W. coast of Patagonia; the Campana and Madre de Dios are the largest of these islands; the archipelago of Chiloe, situated to the S. of Chiloe, to which it belongs, and of which Chiloe island is the largest; the archipelago of Galapagos, situated under the equator, about 500 m. W. from the coast of Columbia, but which has no stationary inhabitants; the archipelago of Quadra and Vancouver, comprising a great number of islands, and that of King George III., on the N.W. coast of N. America, with the Aleutian archipelago in Russian America. In Behring's sea, are the group of Pribyloff and Nounivok, belonging to Russia. The Arctic ocean presents a vast number of islands, the majority of which, previously to the late voyage of discovery, were regarded as parts of the American continent. Baffin proposes to give to these islands the general denomination of Arctic lands or Arctic archipelago, and to subdivide them as follows: E. or Danish Arctic lands, comprising the great group of Greenland and Iceland, belonging to Denmark, and Jan Mayen's island, without stationary inhabitants; the W. or English Arctic lands, extending to the W. and N. of Baffin's and Hudson's bays, the principal groups of which are, N. Devon, N. Georgia, with the islands of Cornwallis, Melville, &c.; and the archipelago of Baffin—Farry, with the islands Cockburn, Southampton, New-Galloway, &c.

**The Climate of America** is nearly as celebrated for the predominance of cold as that of Africa for the predominance of heat. With the exception of the limited space along its W. shore, between the Andes in the S., and the maritime Alps in the N., the temperature of the New World, in the same latitude, is everywhere inferior to that of the Old. Countries which, from their geographical position, we should suppose to be mild and temperate, are exposed to long and severe winters, during which they are wholly covered with snow; and in point of fact, the entire continent of N. America above the 50th degree of latitude is all but uninhabitable. Even in the 45th parallel, on the N. side of the Canadian lakes, frost is continuous for more than six months. Occasional frosts occur as low down the Atlantic coast as the confines of Florida, near the 30th deg. of lat., in the parallel of Morocco, Cairo, and Suez. This predominance of cold is no doubt ascribable to a great variety of causes; among the most prominent of which may be placed the extraordinary elevation of the soil. Not only is the continent traversed from one extremity to the other by immense chains of mountains covered with perpetual snow, but in many parts, as in Mexico and Columbia, very extensive plains are found at an elevation from 6000 to 10,000 feet above the level of the sea! Thus the plain of Quito, immediately under the equator, has an elevation of above 9000 feet, and its mean temperature is said not to exceed 53° Fahr. In some parts, where the plateaus rise rapidly, there is often, within a few leagues, an extraordinary change of temperature. At Vera Cruz and Guayaquil, for example, on the borders of the plains of Mexico and Quito, and nearly on a level with the sea, the heat is often quite oppressive. These different climates have different vegetable productions. "Hence the traveller journeying down the deep descent of one of these magnificent ravines (leading from the plateau of Mexico), through forests of birches, oaks, and pines, finds himself suddenly on the level shores of the Rio Alvarado, surrounded by palms, and has an opportunity of seeing the animal products of the N. and S., of the Alpine regions and tropics, nay of the E. and W. hemispheres, mingled together. Wolves of northern aspect dwelling in the vicinity of monkeys; humming-birds returning periodically from the borders of the frozen zone, with the N. bustard and cock-feathered thrush, to settle near parrots; and our common European whistling-ducks and teal, swimming in lakes which

## AMERICA.

swarm with storks and Brazilian parrots and boobies."—(See Richardson's Zoology of N. America, in the *Sixth Report of the British Association*, p. 135.)

In addition to its vast mountain chains, and the prodigious elevation of many of its plateaus, the lower temperature of America may be partly ascribed to the great indentation of the sea between N. and S. America, and the want of extensive sandy deserts in the tropical regions, easily impregnated with heat. The place of the latter in the African continent is here occupied by vast forests, traversed in all directions by immense rivers. The forests, however, are not confined to the tropical regions; they extend over the greater portion of the continent, powerfully diminishing the influence of the solar rays upon the earth, and greatly increasing its moisture. A strong and abundant vegetation, the result of its greater humidity, is, in fact, the distinguishing characteristic of the New World.

We may add, with respect to N. America, that while but a very small portion of it is within the torrid zone, it reaches far within the Arctic circle, where it also attains to a great breadth. The N.W. wind prevails during winter. This wind, sweeping over a desolate country, overspread with marshes, forests, frozen lakes, and mountains, buried under eternal snows, contracts an intense degree of cold, and in its progress southward, passing over a wilderness, where the ground is shaded by forests from the solar rays, its original character is in no respect changed. It slowly yields to the dominion of the climate, and retains its temperature long after it has penetrated into the regions of heat. Throughout N. America the N. wind is accordingly felt to be keen and piercing. It increases the rigour of the seasons in the more northerly regions, and extends the influence of winter far into those latitudes, which, in the other hemisphere, are blessed with perpetual spring. The countries lying within the tropics are exposed to the inroads of the northern blasts; and the great heats felt at Vera Cruz and Havana are often suddenly reduced by strata of cold air brought by the N. winds from Hudson's bay. These winds blow from October to March, frequently bursting forth in tremendous hurricanes, and cooling the air to such a degree, that at Havana the centigrade thermometer falls to 0, or 30° Fah., and at Vera Cruz it falls to 10°, or to 60° Fah. At Zacatecas, within the tropic of Cancer, it frequently froze hard in the winter of 1835; and in the city of Mexico the thermometer has been known, though rarely, from the same cause, to fall below the freezing point. To the prevalence of these N. winds, therefore, combined with the extraordinary elevation of the ground, and the uncultivated state of the country, overspread with vast forests, the greater cold of N. America seems chiefly ascribable. In S. America nearly the same causes operate. The country is even more desolate: the climate is more inclined to moisture, and liable, beyond the 40th parallel, to dreadful tempests; while immense mountain ranges, rising far above the limit of perpetual snow, aid these effects, and greatly increase the rigour of the seasons. To these causes may be added the form of the American continent, which, being greatly contracted in breadth as it approaches the S., is, in consequence, exposed on every side, except towards the N., to the surrounding oceanic winds. To the S. of Cape Horn is the great Antarctic ocean, where cold prevails even to a much greater degree than in the N., so that the winds coming from those inhospitable seas bring to the American continent all the unmitigated rigour of the polar regions. The Andes and maritime Alps protect the strip of territory between them and the Pacific ocean from the freezing influence of the N.W. wind; and to this its greater mildness is partly, at least, if not wholly, owing.

**Minerals.**—The mineral riches of America are probably superior to those of any of the other great divisions of the globe. The discovery of the mines of Mexico and Peru effected an entire revolution in the value of the precious metals; and they have since continued to be the grand sources whence supplies of gold and silver have principally been derived. The produce of the American mines at the commencement of the present century, was estimated by M. Humboldt as follows:

*Annual Produce of the Mines of America at the commencement of the Nineteenth Century.*

| Political divisions.          | Gold.          |         | Silver.           |         | Value of both gold and silver in dollars. |
|-------------------------------|----------------|---------|-------------------|---------|-------------------------------------------|
|                               | Marks of Cast. | Kilogs. | Marks of Castile. | Kilogs. |                                           |
| Vice-royalty of New Spain.    | 7,000          | 1,806   | 2,335,220         | 587,512 | 23,000,000                                |
| Vice-royalty of Peru.         | 8,400          | 782     | 611,000           | 146,478 | 5,240,000                                 |
| Captain-generalship of Chili. | 12,212         | 3,807   | 28,700            | 6,827   | 5,000,000                                 |
| Vice-royalty of Buenos Ayres. | 2,200          | 506     | —                 | —       | 1,850,000                                 |
| Vice-royalty of New Granada.  | 30,505         | 4,714   | —                 | —       | 3,800,000                                 |
| Brazil.                       | 39,800         | 6,873   | —                 | —       | 4,800,000                                 |
| Total.                        | 75,217         | 17,291  | 3,460,940         | 795,561 | 43,500,000                                |

This sum of 43,500,000 dollars, at 4s. and 2d. a dollar, amounts to £9,942,750.

Mr. Jacob, author of the *Historical Inquiry into the Consumption of the Precious Metals*, estimated the annual average produce of the American mines, from 1800 to 1810, at 47,061,800 dollars. But the revolutionary struggles which began, in 1810, to disturb Peru, Mexico, and the rest of Spanish America, by causing the expulsion of most of the great capitalists, by whom the mines were principally carried on, speedily ceased some of the most productive among them to be entirely abandoned, and occasioned an extraordinary falling off in the supply of the precious metals previously obtained from the New World. Mr. Jacob estimates the average annual produce of the American mines, from 1810 to 1830, at only £4,036,000, being less considerably than half their produce at the beginning of the century; and though this estimate has been suspected of being somewhat undervalued, there are pretty good grounds for thinking that it is not far from accurate. (Jacob, ii. 307.) The failure of the companies formed in this country in 1835, for working the American mines, the instability of the revolutionary governments, and the continued anarchy and insecurity that has prevailed down to the present time in Mexico, and in all the old provinces of Spanish America, have hitherto prevented any very material additions being made to the supply of bullion from the American mines, which at this moment (1838) is certainly under £5,000,000.

The causes of this extraordinary decline being thus explained, it is plain that there are no grounds for supposing that it will be perpetual. It is believed, indeed, that some of the richest of the mines known to exist in Mexico have not yet been wrought; and it is more than probable that many mines will yet be discovered. The instability and weakness of the governments, and the consequent indisposition to embark capital in industrious undertakings, are the only obstacles that hinder the American mines from yielding greater supplies at present than at any former period.

Exclusive of the mines, the gold and silver washings of Brazil, and other parts of S. America and of the United States, are considerably productive. Besides gold and silver, most other metals are found in less or greater abundance in America. Chili and Cuba have some of the richest copper mines in the world; lead is found in different parts of the United States, particularly in Illinois, and in Mexico, &c.; iron is most abundant in the United States, and in many other parts of the continent; salt also is very widely diffused; and coal, including anthracite, is found in vast deposits in different parts of the United States, in British America, and in Chili. Europe may now be said to be wholly dependent on Brazil for supplies of diamonds, which seem to be more abundant there than anywhere else.

**Vegetation.**—Stretching, as America does, from the eternal snows of the Arctic to those of the Antarctic circle, and possessing soils of every elevation and quality, her vegetable products are necessarily of the most diversified description. Owing to the prevalent humidity and coolness of the climate, and the richness of the soil, her forests and pastures are unrivalled for extent, luxuriance, and magnificence. The forests consist generally of very heavy timber, including many species of pines and larches unknown in Europe, with an endless variety of oaks, maples, cypresses, tulip trees, mahogany trees, logwood, Brazil-wood, &c., &c. The Old World is indebted to the New for some of its most useful and widely-diffused vegetable productions. Potatoes, though probably not introduced into Europe for more than a century after the discovery of America, already form a most important part of the food of most European nations; and tobacco, though it also be of American origin, has been diffused from one extremity of the Old World to the other, and is, perhaps, the most universally esteemed of all luxuries. We also owe to America maize, or Indian corn, millet, cocoa, vanilla, pimento, copaliba, clovebark, or bark, so important in medicine, jalap, saffra, nuxvomica, &c. The *Cactus cochinitifera*, which furnishes the cochineal, is also peculiar to America. On the other hand, America is indebted to the Old World for a great variety of cereal grasses, trees, and fruits. At the head of the former may be placed wheat, barley, oats, and rice, all of which succeed admirably well in large portions of America. It seems pretty well established that the sugar-cane is indigenous to some of the W. Indian islands; but it is abundantly certain, not merely that the art of making sugar, but that the cane, now most generally cultivated in the islands and in continental America, was brought to them either from the E. Indies or from Madeira. America is also indebted to the Old World for the coffee-plant, now one of her staple products; and for oranges, lemons, peaches, and most descriptions of fruit trees. New-York apples, though now very superior to any produced in this country, are derived from plants carried from England. The vine has been raised in America; but either the soil or climate is not suitable for it, or, which is perhaps most probable, sufficient care has not been bestowed on the manufacture of the wine. The tea-plant has been tried in Brazil; but, owing to the dearth of labour, there is no chance of its

## AMERICA.

being probably cultivated there, or anywhere else in America.

The *Zoology* of America differs in many important respects from that of the Old World. Of about 1330 mammals that have been described and classified, America possesses about 540; but, with few exceptions, she is singularly ill provided with the useful animals. As already stated, neither the horse, ox, sheep, nor hog were found in America on her discovery by Columbus; and the want of them must, no doubt, have been a considerable obstacle to the advancement of the natives in the career of civilization. The elephant and the camel are also unknown in America; but she was not entirely destitute of useful animals. In Peru they had the llama, guanaco, paco, and vicuña, animals that bear a considerable resemblance to each other, if they be not of the same species. The first has a considerable analogy to the camel, though it be neither so large nor strong, and wants the hump. It was, and still is, employed to carry loads, and, being docile and sure-footed, makes its way over the most dangerous paths. Its pace is slow, seldom exceeding 12 or 15 m. a day, and it usually carries about 80 lbs. Its wool, or, rather, hair, which is generally, but not always, white, is spun and made into articles of clothing. The guanacos and Pacos are not so serviceable as beasts of burden as the llamas, and are comparatively little used. The vicuña, the smallest of them all, inhabits the least accessible parts of the Andes; it is chiefly prized on account of its wool, which is of a very superior quality. The flesh of these animals, though dry and coarse, is used as food. They are almost the only animals that the native inhabitants of America had been able to subdue, and to render subservient to their purposes. The bison, or American ox (*Bos Americanus*), the largest native quadruped of the New World, is principally found on the prairie lands of the Rocky mountains in N. America. It is rarely, if ever, seen to the S. of the Mississippi; and it is doubtful whether it was ever found on the Atlantic coast. The *Bos moschatus*, or musk ox, is found only in the most N. parts of America to the W. of Hudson's bay, from 66° to 73° N. lat. Its horns, which cover all the forehead, are often of great weight. The Rocky mountain goat, remarkable for the fineness of its wool, inhabits the Rocky mountains from Mexico to the extremity of the range. Several species of deer are found both in N. and S. America. The rein-deer is the most N. ruminating animal, being found in Greenland and the remotest of the Arctic islands. On the W. coast it descends as low as the Colombia river.

America possesses several peculiar species of the genus *Canis*, or dog. The physiognomy of the American wolf, when contrasted with that of its European namesake, is very distinct. There is a great variety of foxes. The fur of the *Canis lagopus*, or arctic fox, and of some other varieties of the same genus, is of considerable value. The best known variety of the American dog is the *Canis familiaris*, found in Newfoundland. This animal is now very common in England, and is deservedly a great favourite. It is strong and active, has long, fine glossy hair, a curved bushy tail, and webbed toes, by means of which it swims admirably well. The colour of the back and sides is generally black, with a white belly and legs, and frequently a white spot at the tip of the tail. It is naturally fitted, by its thick covering of hair, for a cold climate, and is more active and in better health in this country in winter than in summer.

The beaver (*Castor*) is more abundant, perhaps, in the N.W. parts of N. America than in any other parts of the world. But the great demand for, and high price of its fur, has led to a great diminution of its numbers, and to its nearly total extirpation in the more accessible parts of the country. The coypoo, known in commerce by the name of nutria, and the chinchilla, are found in S. America. They yield a highly esteemed fur, and immense quantities of their skins are now imported.

America has but few beasts of prey. The most formidable, the *Felis onca*, or jaguar, is found only in S. America. It is larger and stronger than the panther, but is inferior in size and ferocity to the Bengal tiger, with which it is generally compared. The *Felis discolor*, or puma, is found in both S. and N. America: though denominated the American lion, it is neither so large nor fierce as the jaguar. A number of bears, some of them of the largest and most formidable description, are found in Arctic America: two are peculiar to it.

Tropical America has a great variety of apes, but none of them approach so nearly to the human form as the orang outang, or chimpanzee, and none of them have the ferocity of the baboon. Many, however, have prehensile tails, endowed with so great delicacy of touch that they have been compared to the trunk of the elephant. This fits them admirably for travelling from tree to tree.

The vampire bat, frequent in S. America, is very dangerous. It attacks the larger animals, and even man himself, when asleep; and as its bite is not sufficiently painful to

awaken the victim, the bleeding it occasions sometimes proves fatal.

America is infested by an immense number of reptiles. Of these pests the rattle-snake is one of the most common, and also the most dangerous; but there are others little less venomous. The true *boa constrictor* is found of an enormous size in the marshes and swamps of tropical America. Centipeds, sometimes a yard in length, with enormous spiders, scorpions, &c., abound in these regions. According to Humboldt, the white ants and termites are even more destructive here than their congeners in the Old World.

The birds of America are exceedingly numerous. The condor, which inhabits the most inaccessible parts of the Andes, though of less dimensions than was formerly supposed, is the largest and most powerful of all the feathered tribes. There are also a great many eagles, vultures, falcons, and other birds of prey. A species of ostrich, but smaller than the African, inhabits the Pampas; and the woods of both Americas are the resort of vast flocks of wild turkeys, pigeons, &c.

The waters of America are well supplied with fish; and the rivers in the tropical regions produce also enormous lizards and alligators. In the lakes of the Caracas is found the electric eel.

Nothing, however, is so worthy of remark, in relation to the zoology of America, as the wonderful increase of the horses and cattle carried there from Europe. Had we not been fully aware of all the circumstances in regard to their immigration, it would certainly have been supposed that they were indigenous to America, and that it, in fact, was their native country. They here rove about in immense herds in a state of pristine freedom; and so numerous have they become that the slaughter of oxen, not for the carcass, but merely for the hide, is the principal business of many extensive provinces. (See PAMPAS.) In a single year above 800,000 hides have been exported from Brazil only, exclusive of those exported from Buenos Ayres, Montevideo, and other ports! In consequence, too, of the extraordinary increase of horses, the mode of existence of the natives in several parts has been wholly changed; they have become expert horsemen, and pass a considerable part of their time on horseback, approaching in this respect to the Tartars and Arabs of the ancient world. Sheep have not succeeded so well in America as cattle and horses; and their wool, in most parts, is generally of an inferior description.

*Races of Men.*—The native inhabitants of America differ in physical form, in language, and perhaps in intellectual character, from every other variety of the human race. Probably, however, the general agreement which exists among themselves is even more remarkable than their disagreement from other races. The *Red men*, as the Americans call themselves, in contradistinction to the European and African races (that is, to the *Whites* and *Blacks*, the only two they have any knowledge of), exhibit surprisingly little difference, although extending over 70° on the N. side, and 54° on the S. side, of the equator. Heat or cold, drought or moisture, elevation or depression of surface, have certainly no effect in the production, even of the small variations occasionally discoverable among them. "The Indians of New Spain," says Humboldt, "bear a close resemblance to those who inhabit Canada, Florida, Peru, and Brazil. Over 1,500,000 sq. leagues, from Cape Horn to the St. Lawrence and Behring's straits, we are struck at the first glance with the general resemblance in the features of the inhabitants. We think we perceive them all to be descended from the same stock, notwithstanding the prodigious diversity of their languages. In the portrait drawn by Volney of the Canadian Indians, we recognise the tribes scattered over the savannahs of the Apure and the Carony. The same style of features exists in both Americas." The general physical form is as follows: Skin dark, having more or less of a red tinge, usually called copper-colour, but thought to be more correctly characterised by that of cinnamon: hair of the head black, coarse, lank, shining, long, but not very abundant: hair on other parts of the body very deficient. The beard is seldom altogether wanting, but it is so uniformly scanty, as often to present the appearance of its being so. Forehead long; eyes deep sunk, small, and black. Face broad across the cheeks, which are round and prominent; nose well raised, and round at the apex; mouth large and lips thick; chest high, gulfs massy, legs arched, feet large, hands and wrists small. The height is nearly the mean stature of the European race, but the body is usually more squat and thick set. The countenance is hard-favoured, and the look stern, yet with a certain sweetness in the expression of the mouth which is a contrast to the rest of the features. It will appear, from this statement, that the races which the American most nearly resembles, are the Mongol, Malayan, and Indo-Chinese. The features of the face are, however, more amply chiselled than in any of these; the frontal bone is more flattened than in any of them, and the stature is greater than it is, at least, in the Malayan race. Although in

## AMERICA.

the tropical regions of America there are no black men, as in Africa or Asia, nor in its temperate regions any whites, as in Europe, all varieties do exist in an inferior degree: which may be compared to those which exist among Europeans, and among negroes. The most striking of these are found in the short, squat, and tallow-coloured Esquimaux, about the polar regions of the N., and the tall Patagonians towards the S. extremity of the continent. The first of these differ in no respect, as far as physical form is concerned, from the people of the same name in Asia and Europe. The Patagonians or Puschies, inhabiting the S.E. coast of the S. extremity of America, may be considered, after rejecting the exaggerations of early, and the contradictions of later travellers, as the tallest people in the world. - If with us the medium height of the male sex may be estimated at 5 feet 8 inches, that of the Patagonians may be taken at 6 feet. Other races, remarkable for their great stature, also exist among the Americans; as the Caribbees and Cherokees. But there are also races remarkable for their shortness, as the Peruvians, who are between the mean European standard and the Chaymas, whose average height, according to Humboldt, is 5 feet 2 inches, which makes them a full inch shorter than the Malayan race, yet much taller than the Esquimaux. Upon the whole it may be remarked that the American race exhibits a wider difference in stature than any other family of mankind, while this difference, at the same time, would not seem to be productive of any essential variation in physical or intellectual capacity. In point of colour there exists also considerable variety; the brownish tinge for the most part prevails; but in some cases its intensity approaches to black, and in others to the fulness of a southern European. The probability is, after all, that the number of distinct races of men in America is at least as great as in other portions of the world, although their smaller numbers, and obscurity of the tribes, make it more difficult to distinguish and class them. In this matter, languages, so useful a guide in Europe and Asia, have not, in America, on account of their multiplicity and intricacy, afforded as yet much assistance. The exceeding, and perhaps insurmountable difficulty of this branch of the inquiry may, indeed, be judged of when it is known that the number of distinct languages spoken by men whose numbers are not supposed to exceed 10,000,000 has been reckoned at no less than 435, and their dialects at 3000! The intellectual powers of the American family must, at first view at least, be considered as ranking it below all the other principal races of mankind. The Americans, when left undisturbed to the exercise of their native energies, had not tamed any of the useful animals, whether for food or labour, the llama and vicuña by one tribe excepted. The Peruvians used gold, found in its native state, and they appear also to have been able to smelt and harden copper—the utmost stretch of their ingenuity; but they knew nothing of the use of iron. The agriculture of the most civilized of the American tribes was of a rudeness and imperfection of which there can hardly be said to have been an example in the Old World. The Quichua, the most improved of their languages, had no words to express abstract or universal ideas, as *space, time, being, matter, substance, &c.*, or even such as *justice, honour, gratitude, freedom, &c.* They had invented no species of writing, and the contrivances by which they attempted to depict and record their ideas are more rude than anything handed down in the traditions of European and Asiatic nations. In all the respects now mentioned, the Americans evinced their inferiority to the nations of Europe and Asia, and, in all but the invention of a rude sort of hieroglyphics, to even the Negro nations of Africa. Nature had not, indeed, in many respects, been propitious to them: she had denied them nearly all the domestic animals which have conducted materially to the civilization of the inhabitants of the Old World; as the horse, ass, ox, camel, sheep, goat, hog, and most of our domestic poultry. But their want of ingenuity is sufficiently shown by their not availing themselves of such as they possessed; as the rein-deer, goose, duck, turkey, and other poultry, soon domesticated by the European settlers. For their want of ingenuity in not discovering the art of smelting iron, no plea can be shown; and, indeed, it might rationally be supposed that the paucity of useful animals for domestication would rather have had the effect of directing and concentrating their efforts in other quarters. Mere handfuls of Europeans, in comparatively rude ages, subdued the most numerous and warlike tribes of America, and these handfuls have now grown into the majority of the population.

Of the origin of the American race we are totally ignorant. Neither the evidence of physical form nor of arbitrary customs and institutions, which could spring only from a common source, or the testimony of language, connect them with any other race of men. The testimony of language on this subject is particularly clear. For example, incontestible evidence of a connexion exists among the great majority of those insular languages which extend over at

least 60° of latitude, and between Madagascar and Easter Island, over 300° of longitude; but the moment we quit the last-named island, which is but 45° from the coast of America, all farther trace of a Polynesian language ceases. We are not, indeed, unaware that the comparison of a great number of American with a great number of Asiatic languages has exhibited a small number of resemblances; but these we are disposed to consider as forced, fanciful, or accidental.

The moral character of the native Americans has been depicted under very different colours; but there can, we apprehend, be very little doubt that the bad features in it are decidedly predominant. Their capacity of enduring hardships and privations of all sorts, and even the most excruciating tortures without murmur or complaint, is well known; and is owing as much, perhaps, to physical causes, as to the training they undergo. They cannot be accused of ingratitude, or of a want of hospitality, but they are in the last degree vindictive, cruel, and treacherous. When not engaged in war, or hunting, or drinking, they sink into a state of torpor and apathy from which nothing can rouse them. They have all, or mostly all, an irrepressible rage for spirituous liquors; to obtain which they will sacrifice everything, and which has been too readily ministered to by Europeans. The state in which we find women may generally be taken as pretty indicative of the character of a people; and tried by this test, the American Indians will be found to be almost at the bottom of the scale of civilization. From the one end of the continent to the other, woman, with very few exceptions, is a slave; she has to perform all the laborious occupations of the tribe, and is, in fact, degraded almost to the level of a beast of burden. Polygamy is very generally practised; and it is only in some rare cases that chastity is held in any estimation. Their religion is a rude species of idolatry or fetishism. Cannibalism has undoubtedly prevailed over the whole continent, and is not yet entirely extinct. The Mexicans, the most advanced of the native nations, delighted in blood, and were accustomed, when invaded by the Spaniards, annually to offer up thousands of human victims on the altars of their gods! Even the Peruvians, the least sanguinary of all the Americans, though Sabians, or worshippers of the heavenly bodies, did not scruple, on the deaths of their monarchs, to immolate hundreds of human victims on their tombs!

The natural inferiority of the native Americans, and their incapacity to attain to anything like real civilization, are strikingly evinced by the result of the continued efforts of the Jesuits in Paraguay for their improvement. So long as the Jesuits resided among them, and could direct their efforts, and compel them to be industrious, all went on very well, and the golden age seemed to be restored. But the entire system was forced and fictitious. The moment the Jesuits withdrew, the fabric that had cost them so much pains and labour to raise, fell to pieces. Civilization had taken no real root among the Americans; and they relapsed forthwith into the indolence, improvidence, and idolatry, that seem natural to the race.

"From the moment," says an able writer, "that the Europeans landed in the New World, benevolence has been at work to instruct some portions of these tribes in religion and the arts, and flattering accounts have been published from time to time of the success of those humane persons who dedicated their lives to the task. But, after three centuries of incessant exertion, what is the result? Is there one tribe that exhibits the steady industry, the provident habits, the spirit of improvement, and the rational views of religion, which are to be found in any parish of England? We cannot find that there is. Many tribes, living near the whites, have adopted their habits and ideas to a certain extent, but merely under the influence of imitation. While missionaries and teachers are among them, everything wears a favourable aspect; but their civilization is never self-sustained. It is created by the agency of men of higher natural endowments, and, when they are removed, it moulders away, because it has no foundation in their character. Many parties of Indians, remnants of tribes once powerful, have lived peaceably, on reserves of land, enclosed amid the population of the United States for more than a century. No situation can be imagined better fitted to promote their improvement; but in no one instance, so far as we know, have they melted into the mass of the white population, or risen to anything near their level in knowledge and the useful arts. They live in huts in no material degree better than the wigwams of their wandering brethren. They are generally honest, but drunken, indolent, and ignorant, though teachers and missionaries are employed by the government to instruct them. Basket-making is almost the only trade they ply, and in their habits and character they may be aptly compared to the gypsies of Europe, who exist in the midst of civilization, without partaking of its spirit or its benefits. It should be observed that there is not the same reluctance in the whites to mingle their blood with the red men as with

## AMERICA.

the blacks. Much has been recently said of the progress made by the Cherokees; but we suspect that what is witnessed there is but a flimsy veil of improvement, spread over habits which are essentially savage. We are convinced, in short, that the Indian is truly the man of the woods; and that, like the wild animals he lives upon, he is destined to disappear before the advancing tide of civilization, which falls upon him like a blight, because it supplies new food to nourish his vices, while it demands intellectual and moral faculties in which he is deficient, and renders useless those qualities which predominate in his character. We would not discourage the attempt to meliorate the lot of the Indians; but this will succeed best when it is grounded on a true knowledge of their natural capacities. Some of them are much more susceptible of moral and religious improvement than others; but to instruct and reclaim them effectually, our belief is, that the system of the Jesuits is the only one that holds out a chance of success. They must not merely be taught and preached to, but they must be retained in a state of pupils, trained to their duties, controlled and directed in all their proceedings by intellects superior to their own; and there are many tribes too ferocious and intractable for even this method of tuition. We do not maintain that the character of the Indian nations is indelible; but to effect any considerable change in it, the lapse of a longer period would be required than the existence of these tribes is likely to extend to. Neither do we think that there is anything in the extinction of these people by natural means which humanity should mourn over. In every state of life man has but a brief span of existence allotted to him. Successive generations fall like the leaves of the forest; and it should be remembered that the extinction of a race of men by natural causes, means merely its non-renewal, or the suspension of those circumstances which enabled it to continue its existence."<sup>10</sup>—(*Encyc. Britannica*, ii., p. 631.)

**Population.**—Besides the original inhabitants, vast numbers of Europeans, of all nations, have emigrated to America since its discovery by Columbus, tempted originally, for the most part, by the *auri sacra fames*. It was this same passion, taking it in its most literal and degrading sense, that has made them fill the Antilles, and part also of the continent, with millions of negroes brought from Africa, and reduced, with their descendants, to a state of slavery. But at a later period America furnished an asylum for the victims

of political and religious persecution in the Old World; and for these many years she has offered an all but inexhaustible field for the profitable employment of its redundant capital, skill, and labour; and thousands upon thousands, who could hardly contrive to exist on this side the Atlantic, have attained, if not to opulence, at least to comfort and independence, in America. Hence she has long been, and still continues to be, the promised land of the poor but industrious man; and a city of refuge to all who happen to be discontented with the policy, or who have given offence to the rulers of the Old World.

The estimates of the population of America at different periods have differed very widely, in consequence of the vague and defective nature of our information with respect to it. Humboldt estimated the population of America, including the Antilles, at about 35,000,000. Balbi estimated it, for 1837, at 30,000,000; but we incline to think that this was below the mark even for the epoch to which it refers; and the population of the United States, British America, and Brazil, but especially the first two, has since increased prodigiously. At present we are well convinced that the population of America is not under, if it be not rather above, 47,000,000.

**Political Divisions.**—It would be useless to attempt giving any detailed outline of the existing divisions between the different states among which America is at present parcelled out: for the chances are that they will be materially altered in the course of a few months. In fact, ever since the commencement of the revolutionary struggles in 1810 down to the present moment, everything has been, in the greater part of America, in a state of transition. States have been formed, split into portions, and again consolidated. Hitherto, however, none of the new states formed out of the old Spanish provinces, seem to have acquired any considerable portion of stability, or to be in a condition successfully to oppose foreign invasion or domestic insurrection. No doubt a better order of things, and one more calculated to promote the improvement of those naturally fine countries, will be established; but, in the mean time, very little importance need be attached to the subsisting territorial arrangements.

The following account of the different American states, and of their extent and population in 1838, is partly taken from the *Weimar Almanac*; but we have altered, and we hope improved it in several particulars:

*Estimate of the Area and Population of the American States in 1838.*

| States.                       | Area in<br>Sq. m. | Total pop. 1838. | Whites and<br>Europ. Crosses.                       | Indians and Free<br>coloured Races. | Blacks and<br>Indian Slaves |
|-------------------------------|-------------------|------------------|-----------------------------------------------------|-------------------------------------|-----------------------------|
| <b>North America:</b>         |                   |                  |                                                     |                                     |                             |
| Hayti . . . . .               | 26,302            | 935,000          | 26,000                                              | 490,000                             | 405,000                     |
| Mexico . . . . .              | ?                 | 7,500,000        | 1,900,000 (1835)                                    | 5,800,000                           |                             |
| Central America . . . . .     | 908,351           | 1,900,000        | 475,000                                             | 1,425,000                           |                             |
| United States . . . . .       | 2,446,730         | (16,580,000)     | 10,535,232<br>(according to the<br>census of 1830). | 301,576                             | 2,000,050                   |
| Texas . . . . .               | ?                 | 100,000          | ?                                                   | ?                                   |                             |
| <b>South America:</b>         |                   |                  |                                                     |                                     |                             |

<sup>10</sup> It is believed that injustice is done to the intellectual character of the native Americans by the foregoing remarks. While they are acknowledged to have been rude and uncivilized, they are known, by those well acquainted with them, to display much native science. Before the removal beyond the Mississippi, the Cherokees had made some considerable advances in

civilization and mental cultivation. Elias Boudinot, one of their number, who was educated at the Foreign Mission School in Cornwall, Ct. for a number of years edited a respectable newspaper among them, which in point of editorial ability, would not suffer by a comparison with many respectable journals in the United States. Unhappily, he lost his life in the ap-

*Diseases of America.*—The Anglo-American population is subject to the same diseases as the people of England; but suffers more from intermittent and remittent fevers. Yellow fever sometimes prevails epidemically as far north as New-York and Philadelphia. Of 123,501 deaths occurring in New-York in the 31 years 1806-35, 7563 were ascribed to fevers of every type; 327 to intermittents; 1480 to remittent and bilious fevers; 477 to yellow fever; not less than 3368 deaths to dysentery; 1606 to diarrhoea; 5183 to cholera; and 4670 to cholera infantum, a malady more prevalent in America than England. The mean duration of life in the English race has been inconsiderably affected by the climate of America. We have calculated the mortality of the cities of New-York and Philadelphia, and it will be found to differ little from the mortality of English cities of the same extent.

The population of New-York increased from 75,770 to 270,069 in the 30 years from 1805 to 1835; the mean population deduced from seven quinquennial enumerations was 147,108; the total deaths in the 31 years 1805-1835 amounted to 123,501, exclusive of 6925 still born.\* The mean annual rate of mortality in New-York was therefore 2.698 per cent, nearly 1 in 37.

The population of the city and suburbs of Philadelphia was 119,325 in 1820, and 167,911 in 1830; the deaths in the 10 years, 1821-30 amounted to 40,506, exclusive of 2692 still-born. The mean annual rate of mortality was 2.663, nearly 1 in 38.†

Deadly epidemics decimate the Havana, Vera Cruz, and other cities in tropical America. The yellow fever begins to prevail epidemically at Vera Cruz in May, when the mean temperature rises to 75-80° of Fahrenheit's thermometer; it attains its maximum force in September and October. The disease is fatal to strangers, particularly to the inhabitants of the temperate and cold climates. In the intendancy of Vera Cruz, the yellow fever, which rages in the capital, has never been able to ascend above the farm of Encero, which Humboldt found to be 3044 feet above the level of the sea; and as the Mexican oaks do not flourish below this limit, it shows that the constant average temperature is of a true tropical character.‡ Humboldt also observes, that, while yellow fever rages at La Guayra, it never crosses the Cumbré and the Cerro de Avila.

The condition of the mothers, and the training of the children, exercise an influence upon the health and diseases of the native American tribes which cannot be overlooked. The women, though doomed to severe labour, are spared during the period of pregnancy. They seldom marry till they are about 30. Accouchements take place in private cabins, and the mother, after washing herself in cold water, returns in a few days to her usual employments. Sir W. Penn was assured, and correctly, that the American Indians plunge their infants into cold streams as soon as born, in all seasons of the year. This practice, which destroys the weaker bodies, and strengthens the survivors, has been generally adopted by the savages of cold and temperate climates. It was common in Greece; and Virgil makes one of the early Italians say, in the *Æneid*,

*Durum a stirpe genus: nato ad flumina primæ,  
Defertur, servoque gela durantes ut undæ.*

grey disputes which grew out of the exciting subject of their removal. A few years before their removal, a delegation of Cherokee visited Washington city, on the subject of their concerns with the United States government. At that time, a member of the Georgia delegation in the U. S. House of Representatives, after speaking disparagingly of the general state of the nation, remarked that there were men in that delegation, by whom he should be proud to be represented on the floor of that house. The friends of the Indians trembled for them, in view of their removal, lest the incipient germs of civilization should be nipped in the bud. But their fears have not been realized. The Indians themselves, and their best friends, would not now wish for their return to their former abode. They are advancing in civilization and general improvement, and promise yet to redeem the Indian character from the reproaches which have been cast upon it, and to be no mean appendage of the United States. The progress from barbarism to refinement is not the work of a year. It is progressing as fast as, under the circumstances, could be expected. Results are produced, such as the Jesuits, with all their labour and perseverance, could not have produced during the life of a Methuselah; results which are substantial in their character, and which are likely to be permanent.

The opinion of no man is deserving of greater respect on this subject, than that of Timothy Flint, the well-known geographer of the Western United States. In his "Recollections of Two Years in the Valley of the Mississippi," page 160, he says, "Whatever may be the estimate of the Indian character in other respects, it is with me an undoubting conviction that they are in no respect, as it regards combination of the noblest qualities of apprehension, inferior to uneducated white men. This inference I deduce from having instructed Indian children. I deduce it from having seen men and women in all situations, calculated to try and call forth their capacities. When they examine any of our inventions, steam-boats, steam-mills, and cotton-bories, for instance—when they contemplate any of our institutions in operation, by some quick analysis or process of reasoning, they seem immediately to comprehend the principle and the object. No object affords them more delight than a large and orderly school. They seem instinctively to comprehend, at least they explained to me, that they felt the advantage which this order of things gave our children over theirs."—*Am. Ed.*

\* Med. Review, Jan., 1836.

† Hazard's Register of Philadelphia, July, 1834.

‡ Dr. Christie, Practice of Physic, p. 225.

The Dorians and Pelasgians exposed their children; and Lycurgus regulated the practice by enacting that none but the infirm and diseased should be abandoned after a public examination. There are no deformed Indians or idiots; they are sacrificed, says an apologist of savages, by the severity of the Indian manners. To facilitate their transport from place to place, the children are tied to a board, where they lie upon their backs for 6, 16, or 18 months. By some tribes the heads are flattened by pressure. The child generally sucks its mother till it is two years old, and sometimes longer. The circulation of the blood is more languid in the Indians than in persons who are in the constant exercise of the habits of civilized life. Out of eight North American Indians, whose pulses Rush examined at the wrists, he did not meet with one in whom the artery beat more than 60 strokes in a minute.

The diseases of the Indians vary with the climate and locality. In the north, however, fevers constitute the most striking diseases. Pleuritis, peripneumonitis, and rheumatism are common. Dysentery is an Indian disease. Great numbers perish of famine, and the insupportable diseases generated by famine. In the temperate zone, ague, remitting and malignant fevers assail them in the endless forests, and in the marshes and effluvia atmosphere of the lakes and rivers. In the tropics, Humboldt says, they are exempt at Vera Cruz from the ravages of yellow fever, which proves so fatal on the coast and in the West Indies to Europeans. But thousands have been carried off in repeated epidemics, by a disease not very different from yellow fever, called *Mallazashett*. Small-pox, which is believed to have been introduced among them by the Spaniards, sometimes destroys half the heads of a tribe. Montezuma died of small-pox. It has been a generally received opinion that *lues venerea* was conveyed from the inhabitants of Hispaniola (Hayti), and acquired by the equipage of Columbus to Europe. The son of Columbus relates in his narrative that the islanders had a cutaneous affection, called *cazacoeroet*, which resembled a tetter (Teala); the historian, Ferdinand Oviedo de Valdes affirms that the Spaniards were infected with it by the Indian women, and communicated the disease to the Neapolitans in the expedition of Gonzalvo de Cordova. He ascribes its importation to the second expedition of Columbus. Various cutaneous affections had been described by earlier medical writers, confounded with leprosy, and attributed to impure intercourse; but, in 1493, syphilis appeared, with its striking and appalling symptoms, almost simultaneously all over Europe. Columbus disembarked from his first voyage, March 15, at Palos; and arrived at Seville in April. In the beginning of the summer, the disease was observed at Auvergne, in Lombardy, in the rest of Italy, and in Brunswick.\* Could lues venerea have travelled at this telegraphic rate? A learned Spaniard justly remarks, that neither the classical writers, nor the satirists of the 14th century, alluded to the effects of syphilis: in the words of the licentiate of Villalobos, it was, taken in its entire character, *jamas vista en metro, ni en prosa, ni en ciencia, ni istoria*. It still, however, remains a problem whether the outbreak of the malady merely coincided with the return of Columbus, or was conveyed from America. Rush affirms that the disease called by the English, morbus Gallicus; by the French, mal de Naples; by the Portuguese, Spanish disease; by the Spaniards, Indian disease, was communicated to the northern tribes of America by Europeans.

Violent deaths are common among the Indians. Their occupations expose them to accidents. They are engaged in an almost perpetual warfare; and entire tribes are sometimes exterminated. Their connexion with the European population has made them acquainted with spirituous liquors; and this has proved another prolific source of disorder.

Celsus says, *Medicina nuncupum non est*; and this holds among the American Indians. Their medical treatment for the infirmities to which they are subject, is simple, and often instructive. In fevers, they abstract all kinds of stimulating food; and allow their patients to drink plentifully of cold water. Sweating is a common remedy. The Indian mode of procuring this evacuation is as follows: the patient is confined in a close tent, or wigwam, over a hole in the earth, in which a red hot stone is placed; a quantity of water is thrown upon this stone, which instantly involves the patient in a cloud of vapour and sweat; in this situation he rushes out and plunges himself into a river, from whence he retires to bed. If the remedy has been used with success, he rises from his bed in four and twenty hours perfectly recovered from his indisposition. This bath is used not only to cure fevers, but to remove that uneasiness which arises from fatigue of body; and used for this purpose it is an excellent remedy. They purge and vomit: *Ipecacuanha* is one of the many roots they employ for the latter purpose. They confine bleeding to the parts affected. A piece of rotten wood

## AMERICA:

ly based upon the skin for the same purposes as the moxa. They attempt to staunch the flow of blood from wounds by plunging in cold water, and endeavoured to restore drowned people by suspending them by the heels. They have a great many specifics of uncertain value. The Indians attend to the sick for a certain season, but abandon them if the disease be protracted. When the northern Indian is unable, from sickness, to continue his journey, he is left behind by his companions, and covered over with deer skins; he is supplied with water, food, fuel, if the place will afford it, and informed of the track which his companions intend to pursue. (Hearne.)

Some of the most important drugs in the *Materia Medica* are derived from America. Guaiacum was introduced, at an early period, as a specific for syphilis in the place of mercury, which it superseded for several years. It is now fallen into disuse. Not so the root of the American sarsaparilla, which is consumed in great quantities, although it is exceedingly expensive. It is found in the hedges and swamps of Virginia. There are several species; the best, according to Humboldt, grows on the borders of a lake, two days' journey from Esmeralda. The columba root, jalap, copaliba, and ipecacuanha are derived from America. We are also indebted to the New World for Peruvian bark. These remedies are invaluable; they contributed, in the 17th century, with the introduction of syphilis, to destroy the blind adoration of Galen, and led to a revolution in medicine.

**Discovery of America.**—This is the most striking event in modern times, and has, perhaps, made the most important change in the condition of mankind. There is no rational ground for supposing that the ancients had the slightest idea of the existence of the American continent. The form of their vessels, flat-bottomed and impelled by oars, and their ignorance of the compass, allowed them to move only at a short distance from land. Their voyages, therefore, though in some instances extensive, were always along the coast of the great continents; nor is there the faintest record of any one having turned his daring keel into the vast abysses of ocean. Nothing could be less probable than that tempest or accident should drive any of the few vessels which then navigated the exterior seas of Europe to so immense a distance, or, if driven, that they could ever have returned.

But if we listen to some learned moderns, America would appear the general refuge of all who felt themselves straitened in the Old World. The Trojans, Syrians, Carthaginians, Cannanites, but above all the Jews, have been represented as the undoubted ancestors of its present people. These speculations proceed upon a total oblivion of the fact, that man has everywhere many things in common with his fellows. The division into tribes and respect for chiefs, the lamentations over dead relations, the love of ornament, are considered as habits which the Americans must have learned from the Jews. Garcia, observing that most of them honoured their parents, and considered theft and murder as crimes, thinks it clearly proved that they received the ten commandments from Moses. Others were obstinate, unbellying, and ungrateful; sure signs of their belonging to the stiff-necked posterity of Abraham. Attempts have been made to trace a similarity between the languages of the Old World and of America, but certainly with most slender success. Barton has collected 55 similar sounds, which Professor Vater has raised to 104, and Malte-Brun to 150; but to produce this it has been necessary to search through sixty languages in each world. These few, too, if we except the natural infantile sounds *Ata, Baba, Papa, &c.*, are, by no means striking; and it seems even singular, that chance should not have produced more coincidences. Attempts have been lately made to identify the style of Mexican architecture with that of ancient Egypt; but we can see no ground for this, unless in the dimensions of the former, and some forms which a regard for beauty or convenience might suggest to both.

The Welsh have put in a claim to the discovery of America. In 1170, Madoc, a prince of North Wales, sailed in quest of maritime adventure, and, after a long voyage, reached a "faire and large country" filled with wonderful objects: he then returned and took with him ten vassals and a larger party. This fact seems tolerably attested; but though affording a sufficient foundation for Mr. Stottley's poem, the idea of the region arrived at being really America seems scarcely to merit refutation. The intimation, that he left Ireland far to the north, makes it not improbable that he might have reached some part of Spain, no inconsiderable achievement in that age for a Cymric chieftain.

The claim of discovery by the Northmen from Iceland has been much more generally received. The Scandina-

vian writers have supported it as a point of national honour; and the learned in the rest of Europe have generally acquiesced in their authority. They would not, we think, have done so had they perused the original narratives in Torfæus, and the *Heimskringla*, or Saga, of King Olaf Trygvæson. Biörn, an Icelandic, in sailing across to Greenland, was overtaken by a tempest, and after being tossed about for several days, came in view of an unknown land. After navigating several days along the coast the wind became favourable, and in four days he reached his destination in Greenland. Can any one seriously suppose, that in this short passage he could have been driven upon Newfoundland, upwards of a thousand miles out of his way, or, if driven, could thus directly and rapidly have retraced his course? Numerous voyages to and from this new country, named Vinland, are then related, with no mention of particular difficulty or danger. One of them is stated, without any surprise, to have been performed in *twenty-four hours*; a manifest impossibility under the Newfoundland supposition. As to the term *Vinland*, very inappropriate even to Newfoundland, the Northmen probably, who could not be great connoisseurs on this subject, mistook for the grape one of those delicate berries which abound on the Arctic border. We are convinced then that Vinland was merely a southern part of Greenland; for the modern hypothesis, which places the colonies on the western coast, is by no means supported by good early authorities.\*

Another alleged discovery of much celebrity stands on the report of the Zemi, Venetian nobleman of distinction. Towards the end of the fourteenth century, they visited and spent a considerable time in Frisland, an insular country in the north of Europe, which Forster has shown to agree not ill with Orkney, Shetland, and the Ferö Islands. They there learned, that four fishing-boats being driven more than a thousand miles to the westward, had reached a coast named by them East-out-land, where they found cultivation, large cities, castles, and a Latin library in possession of the king. Thence they sailed to a more southern country, named Dropt, inhabited by a rude people, ignorant of iron, waging furious wars, and devouring each other. Reports were then made of a more civilized people to the south-west, who abounded in gold and silver, and had splendid temples, in which human sacrifices were offered. Forster, Malte-Brun, and for some time geographers in general, considered that these countries were undoubtedly Newfoundland, New-England, and Mexico. Mr. Murray was, we believe, the first to observe that even the distance of 1000 miles by no means corresponded; that the castles, libraries, and populous cities on the savage coast of Newfoundland were the reverse of credible, and that accounts of Mexico were little likely to have reached the Frisland fishermen. He argued, therefore, that, supposing the northern voyage correct, interpolation must have been practiced in what related to America. This has been corroborated by the research of Mr. Biddle, who, on comparing different posthumous editions of Ramusio's work, found that the narrative had been altered in accordance with successive and corrected accounts of the new continent. He therefore rejects the whole as a forgery; we rather incline to think that the northern voyage may be genuine, while all that relates to America is undoubtedly interpolated.†

In the maps constructed during the fifteenth century, some curious features appear, which have been referred to a western world. In 1424 one formed at Venice by Andrea Bianco has in the north-west Atlantic, not very remote from Newfoundland, the word *Stoka fixa* (Stock-fish). But it is to be observed that Iceland and the adjacent seas were then the seat of a great fishery, and the term may have been merely used to express the abundance of its finny tribes. Another remarkable object in this map, as well as in one long prior, and in a subsequent one by Martin Behaim, is a long range of territory west of the Canaries, named *Antilia*. It seems impossible to trace with certainty the origin of this term, which we strongly suspect to be a corruption of the *Atlantis of Plato*, and to have no other origin. The inhabitants of those islands are said to have confirmed the impression by asserting that, in certain states of the atmosphere, they saw in mysterious distance a great unknown land; the work either of imagination or of some optical deception.‡ These ideas, however, rested on no solid basis, and the sound judgment of Columbus appears to have been in no degree influenced by them; it was not to Antilia, but to other regions, that he directed his voyage.

Perhaps no individual ever stood so much alone as this navigator, in making a discovery that changed the face of the world. He conceived the design, and struggling against the opposition made by his age, singly achieved it. Yet,

## AMERICA.

like every other great revolution, it was doubtless prepared by previous circumstances. The progress of navigation and commerce, the enthusiasm excited by maritime discovery, its wide range along Africa and towards India, all tended to give this direction to his spirit of lofty and daring adventure. The invention of the compass, and improved celestial observations, rendered it no longer impossible to steer through an unknown ocean. Sound reasoning, aided by some errors, made him hope, by sailing westward, to reach, even at no very great distance, the coasts of Eastern Asia. Ptolemy, whose works were then the chief modern light, had, from errors of graduation, and exaggerated itineraries, carried Serica or China much too far east. Again, Cathay and Manzi, described in such splendid colours by Marco Polo, not being recognised as the same country, were supposed to be still farther east than Serica; as was also, on better grounds, his Xipangu, or Japan. This last, therefore, seemed likely to be at no immense distance from the western coast of Europe.

Columbus, being firmly impressed with this opinion, and being supported by the judgment of learned friends, made the first offer to Genoa, his native country; but the citizens, unused to oceanic expeditions, at once rejected it. He then applied to Portugal with seemingly every chance of better success; and king John accordingly referred it successively to a special commission, and to the council of state. There was then, however, a powerful party opposed to maritime enterprises altogether, as wasting the national resources; while their opponents merely defended a prosecution of the sure and successful career by which they had nearly rounded the southern point of Africa. The proposal was rejected, while John was persuaded to take the mean step of secretly sending a vessel on his own account, which, however, returned without any success. Columbus next repaired to Spain, then under the able sway of Ferdinand and Isabella. Here, however, cosmographical knowledge was much less advanced; the globular form of the earth was doubted by many, and even represented as against the authority of scripture and the fathers. Financial difficulties, caused by the war with the Moors, and the lofty demands of Columbus to have the office of viceroy and high admiral made hereditary in his family, operated against him: and five years' solicitation was vainly employed. Proposals were then made by his brother Bartholomew to Henry VII. of England, who received them more favourably; but as Columbus was on the point of setting out for this country, Isabella was persuaded to recall him, and, after some farther difficulties, she engaged in the undertaking with the utmost ardour, and even pledged part of her jewels to raise the necessary funds.

The expedition, after all, consisted but of three small vessels, and cost only £4000. Columbus sailed from the port of Palos on the 3d of August, 1492, and went by way of the Canaries. He encountered innumerable obstacles, arising chiefly from the timid and mutinous temper of his seamen, and, after exhausting every resource furnished by his extraordinary address and perseverance, had been obliged to promise to return in few days, if still unsuccessful. Signs of land, however, became frequent, and on the night of the 11th of October a light was observed at some distance, and the joyful sound of land! land! burst from the ships. But having been often deceived before, they spent the night in a state of the utmost anxiety. At noon, however, as morning dawned, their doubts and fears were dispelled; and the natives of the Old and the New Worlds found themselves, for the first time, in sight of each other! The land on which Columbus made his descent, and which had a pleasant, delightful aspect, was one of the Bahama islands, called by the natives Guanahani, and by the Spaniards San Salvador. Having landed, and taken formal possession of the country for the crown of Spain, Columbus became satisfied, from the poverty of the natives, that this was not the rich country of which he was in search. He therefore immediately set sail, and shaping his course a little more to the S., successively discovered the great islands of Cuba, and Hayti, or Hispaniola. After various transactions with the natives of the latter, he erected a fort, and leaving there a detachment of his men, set out on his return to Spain, arriving, after being obliged to take refuge in the Azores, and in the Tagus, at Palos, on the 15th of March, 1493, having spent seven months and eleven days in his memorable voyage. He brought with him pieces of gold, a party of natives, and specimens of the vegetable and animal productions of this new world. His arrival was hailed with an enthusiasm of wonder and admiration in Spain and in Europe, and he made his entrance into Barcelona almost in regal pomp.

Columbus found no longer any difficulty in equipping a new armament, to which volunteers flocked from every quarter. In September he set sail with seventeen vessels, several of large burden, and having 1500 persons on board. Though he found his colony involved in many troubles, he was not deterred from pushing his enterprises to the west-

ward. Having fallen in with Cuba, he sailed along its southern coast, then steering to the left, lighted upon Jamaica. He was delighted with the rich verdure and picturesque aspect of these *Isle Islands*, which he firmly believed to be parts of the Asiatic continent. Having returned to Spain, he set out, in 1493, on a third voyage. Having first proceeded southward to the Cape de Verd islands, and steering thence across the Atlantic, he came in view of the lofty mountains of Triana. Rounding the island into the gulf of Paria, he saw the Orinoco rolling by many mouths its mighty stream into the ocean. This discovery highly gratified him, and was, indeed, the first time that any part of the S. American continent had been visited by Europeans. He sailed along the coast as far as Margarita, and thence to Hayti. In 1502 he undertook a fourth voyage, seeking to push westward till he should arrive at regions belonging to India. In this course he struck against the coast of Honduras; where, instead of turning to the right, which would have led him to Mexico, he took the left, or N.W. course, as most promising for his object. He reached the gulf of Darien, but without seemingly gaining any intelligence of the South sea. He then returned to Spain, where, weighed down by hardships, and disposed by the ingratitude of Ferdinand, he closed, in 1506, his unrivalled career.\*

America had, in the interval, been explored from a different quarter. John Cabot, or Cabot, a Venetian, who had settled at Bristol, presented to Henry VII. a plan of western discovery. That monarch, who had nearly earned the glory of Columbus's voyage, gave his full sanction to the undertaking. The adventurer, it appears, was willing to defray the whole expense; but whatever regions might be discovered, he and his family were to rule them as lieutenants, and to enjoy the exclusive trade, paying, however, to the king 1/10th part of the profits. The patent was granted in 1493, but circumstances prevented him from sailing till 1497. Then proceeding due west, he arrived, on the 24th of June, at a land with an island adjacent, which appears to be Labrador and Newfoundland. This was the first discovery of the continent, since it was not till 1498 that Columbus reached the mouth of the Orinoco. Cabot brought home several of the natives, and, though the aspect of the coast was not very inviting, Henry was so much gratified that he next year granted a fresh patent, allowing him to take up any six ships within the realm, equip them at the royal expense, and receive on board any number of English subjects who might be pleased to accompany him. John, from some unknown cause, did not go out in person; but the expedition was led by his son Sebastian, who, though a youth, showed already the talents of a great navigator. According to the very imperfect accounts of his voyage, he had with him 500 men, and, sailing by way of Iceland, reached the coast of Labrador in about lat. 60°. Discouraged by its bleak appearance, he steered to the south, and continued in that direction till lat. 36°. There are reports of his having attempted to establish a colony, but without success.†

Meantime, in another quarter, important discoveries were proceeding. Vincent Yanez Pincon, in crossing the Atlantic from the Cape de Verd islands, in crossing the equator; and, after being bewildered for some time amid unknown seas, he came, in January, 1499, to the view of an unknown coast, which was that of Brazil, near Cape St. Augustus. Thence he coasted northward to the mouth of the Amazon, and viewed with astonishment the immense body of water poured by it into the ocean, justly inferring that it must have rolled through a continent of vast extent. Three months after, Alvarez Cabral, despatched to India to follow in the footsteps of Vasco da Gama, came upon a more southern part of the same coast, which he named Santa Cruz, and took possession of it in the name of the king of Portugal.‡

America had thus been reached in three different and distant quarters, on a scale which conveyed a high idea of its greatness, but without at all ascertaining its outline and limits. There was still ample unexplored coast to leave room for the passage to India, which continued to be the grand object in the discoveries that immediately followed. We shall begin with those most important ones, made by way of the gulf of Mexico. Even before the fourth voyage of Columbus, Alonso de Ojeda, on learning the results of the third, set out from Spain in 1499, and following up the career of his predecessor, explored the coast from Margarita to Cape de Vela. He was accompanied as pilot by Amerigo Vespucci, a skilful navigator, who, returning to Europe, published a narrative of the voyage, representing himself as the first discoverer of the continent. The relation was read with extraordinary interest, and the public adopted the name of America, yielding him an honour undoubtedly due

## AMERICA.

to Columbus. In 1492, Rodrigo de Bardeas explored the coast from Cape Vela to the point reached by Columbus in his fourth voyage, thus connecting a vast extent of continent. Ojeda and Nicuesa obtained grants of different portions; but their colonies, conducted rashly and violently, were almost entirely destroyed. A remnant was assembled at Darien by Vasco Nunez de Balboa, an officer of great enterprise, who, penetrating across the isthmus, came in view of the great Southern ocean. Vast prospects were thus opened; but the court of Spain ungenerously transferred the chief command to Pedrarias Davila, who, actuated by mean jealousy, persecuted and put to death his predecessor, without himself achieving anything of importance.

The discovery of the northern coast of the gulf was begun by Ponce de Leon. This officer, while in command at Porto Rico, was misled by the illusory report of a fountain, in which whoever bathed was restored from the most decrepit old age to all the bloom and vigour of youth. In pursuit of this chimera, he beat about from coast to coast, plunging into every pool, of course without success. In the course of his search, he came in view of an unknown coast, which he named Florida. Sailing along to a considerable extent, and turning the southern point, he ascertained it to be part of the continent, and the Spaniards long continued thus to name and to claim as their own the whole territory of Canada inclusive, though they were ultimately unable to maintain more than this southern extremity.

The main direction was still towards the west. In 1517, Cordoba from Cuba sailed along the coast of Yucatan, and collected some intelligence of the wealth and civilization of Mexico. He was followed next year by Juan de Grizalva, who, in the same direction, traced the entire coast of Mexico as far as Panuco. The fertile shores, well built towns, and abundance of gold, inspired the most flattering ideas of this coast, which was immediately dignified with the title of New Spain. In 1519, Garsy, governor of Jamaica, sent four ships under Pineda, who, beginning at Florida, traversed the whole coast as far as Vera Cruz. The entire survey of the gulf of Mexico was thus completed.\*

Velasquez, governor of Cuba, on receiving the flattering accounts brought by Grizalva, determined to lose no time in fitting out an armament for the conquest of New Spain. Jealousy, however, deterred him from employing the original discoverer; and he gave the command to Hernan Cortes, a personal favourite, but who possessed every quality fitting him for such an undertaking. In March, 1519, he landed at Vera Cruz, and, having burned his ships, marched into the interior with about 500 men. With this small force, seconded by his own superior sagacity and daring, Cortes subverted the empire of Mexico, put its sovereign to death, and annexed it to the Spanish crown. Having reached the South sea, he employed Alvarado to march along its coast, which he did for the space of 400 miles, till he reached Guatimala. Nunez de Guzman afterwards penetrated the northern provinces to New Galicia, now Guadalajara and Zacatecas. Cortes himself, having equipped a fleet in 1536, discovered the peninsula of California, with its deep gulf, commonly named in that age the Vermilion sea.†

The discovery by Balboa of the South sea remained long without any result, through the weakness or dilution of the officers employed. The most tempting accounts were, however, received of the wealth of Peru, and the abundance of its precious metals. In 1531, Pizarro, a daring adventurer, who had sailed with Ojeda, after one unsuccessful attempt, succeeded in assembling a band of brave and fierce followers, with whom he sailed to attack that great country. By a union of boldness and treachery, he seized the empire and treasure of the Incas; and Peru became an appendage of the Spanish crown. Almagro, the companion and rival of Pizarro, pushed southward into Chili, but he met there with great difficulties, and was recalled by the affairs of Peru. Pedro de Valdivia, however, having the government of that country conferred upon him, marched to the southern border of his fertile territory, as far as 40° S. lat. Vadillo, in 1537, made a march from Darien to Peru, through the fine countries of New Granada and Quito. Expeditions to conquer the latter were undertaken by Banalcamar and Alvarado, who, after contending for his possession, agreed to divide it between them. In 1540, Gonzales Pizarro, brother to the conqueror, undertook an expedition through the Andes to the west of Quito, in hopes of discovering a country said to abound in fine cinnamon. After numerous hardships, he came to the banks of the great river Amazon. Having followed its course for some distance, he employed Orellana, one of his officers, to descend the stream in a light bark to search for provisions. Orellana, inspired by the spirit of adventure, continued his voyage, and traced the whole of its immense course down to the ocean.

While the above-mentioned events were in progress, dis-

covery proceeded, though in a less brilliant train, along the eastern coast. In 1514, Juan Diaz de Solis, a skilful mariner, was sent to sail round America, and reach the opposite side of the isthmus of Darien. Solis, beginning with St. Augustine, the limit of Pincon's discovery, surveyed the whole coast of Brazil, and then came to the grand opening of the Rio de la Plata. But, having incautiously ventured on shore with a small party, he was surprised by the natives, and, with several of his party, experienced the dreadful fate which awaits those captured by the cannibal tribes of this continent. The remaining crews, on witnessing this catastrophe, were struck with dismay, and immediately returned home. Three years after, Fernando Magalhans, or Magellan, a Portuguese, discontented with his treatment in his native country, offered his services to Charles V. The immediate object was to reach the Moluccas from the west, and thus, according to the papal grant, establish a claim to those islands which were then much valued. A fleet of five sail being equipped, he sailed in September, 1519, and, having proceeded along the coast of Brazil, reached port St. Julian, where he wintered. In October, 1520, he entered the strait bearing his name, and, after a few weeks' navigation, saw the great Pacific opening before him. He stretched directly across, and came to the Philippines, where he was killed in a contest with the natives; but his vessel had the honour of being the first that circumnavigated the globe. In 1536, Sebastian Cabot was sent out to the La Plata, where he ascended the Parana and the Paraguay, and, notwithstanding the opposition of the Portuguese, established two or three forts. In 1535, Juan de Mendoza, an opulent Spaniard, founded the city of Buenos Ayres, and in 1537 Jdm de Ayolas penetrated across the Andes to Peru. Thus the great outlines of southern America were traced in every direction.\*

Discovery in the north did not proceed with the same rapid steps. We have already noticed the important voyages made by the Cabots. This excited the rivalry of the Portuguese, and in 1500 Gaspar de Cortereal, a nobleman of that nation, set sail and surveyed a considerable extent of the coast of Labrador. He carried off about 50 of the natives, to employ them as slaves; but the enmity of the people, thus justly roused, probably led to the fatal result of his next voyage, from which he never returned. His brother Michael, sailing in search of him in the following year, met the same fate, which was shared also by another expedition sent in 1503.

The reign of Henry VIII. was unfavourable to nautical enterprise. The discovery of the Cabots was not followed up, and Sebastian sought the service of Spain. He was sent out, however, in 1517, as pilot to an expedition commanded by Sir Thomas Pert, which, it appears, actually entered Hudson's bay; but the commander then lost courage and returned, to Cabot's great indignation. This discovery attracted little notice, and was soon forgotten.

France now entered on the career of American discovery. In 1534, Francis I. employed Giovanni Verazano, a Florentine navigator, who sailed along and described the coast from Carolina to Newfoundland. Unhappily, in a subsequent voyage, he fell into the hands of the natives, and suffered a cruel death. Ten years after, Jacques Cartier, a seaman of St. Malo, performed several voyages, in which he entered the gulf of St. Lawrence, and ascended the river as high as Montreal. Attempts were then made to colonize these countries, for some time without success; however, in 1604, De Monts founded the colony of Acadia, and Champlain, in 1608, that of Canada. The latter, engaging in warlike expeditions, penetrated southward to the lake bearing his name, and westward beyond lake Huron.†

The Spaniards, meantime, as already observed, had, under the title of Florida, claimed nearly all north America; nor were they wanting in vigorous efforts to make good their title. In 1539, Lucas Vasquez de Ayllon discovered and attempted to form a settlement on South Carolina; but having begun by entrapping and carrying off a number of the inhabitants, he excited such a fierce enmity, that many of the settlers were killed, and the rest returned to Hispaniola. In 1534, Estevan Gomez sailed as far as the latitude of New-York, whence he brought off a cargo of slaves. A more important expedition was undertaken in 1538 by Narvaez, the rival of Cortes, and sent to supersede him, but who had been vanquished and made prisoner. He now sought to indemnify himself by a kingdom in Florida. He landed with a force of about 600 men, and advanced about 800 miles into the interior, baffling all attempts to oppose his progress. The natives, however, irritated by his violent and domineering conduct, posted themselves in the woods, and harassed him by constant attacks and surprises. The Spaniards, completely exhausted, and in extreme want, were obliged to seek the nearest coast. Unable to reach

## AMERICA.

their ships, they constructed frail barks, which, on coming out to the open sea, were wrecked, and almost the whole number perished. Alvaro Nunez, the treasurer, being cast ashore, contrived, by conciliating the Indians, acting as a merchant and physician, and even pretending to work miracles, to make his way to Mexico, after a seven years' pilgrimage. The land route was thus traced between that country and Florida.

This catastrophe did not prevent another attempt. Fernando di Soto had been an associate of Pizarro in the conquest of Peru, where he distinguished himself by the capture of Cuzco, and other exploits. He returned to Spain with a high name and a princely fortune; but, instead of sitting down to enjoy these, he resolved to make them instruments for conquering an empire for himself. His reputation attracted many of the most distinguished Spanish youths as volunteers; and in May, 1538, he landed in Florida, with a more powerful armament than those which had conquered Mexico and Peru. The exploits of Soto surpassed, in daring valour and brilliant achievement, those of Cortes and Pizarro, but his fortune was far different. There was here no great empire, no central point to strike at. He struggled on amid a succession of fierce and petty tribes, whom he always vanquished, but who rose around and behind him, and never left to his troops more than the ground which they covered. He was lured on by reports and specimens of the gold formation of North Carolina; but arriving there in a most exhausted state, and finding only ridges of naked hills, he turned back. He afterwards pushed far to the westward, crossed the Mississippi in about lat. 35°, and proceeded northward to near the present site of New Madrid. Finding no report of gold or rich kingdoms, he made a dash at the extreme west, passed the heads of the White river, then descended the Washita and Red river to the Mississippi. Here, overpowered by fatigue and disappointment, he sunk into the grave. The miserable remnant of his men, anxious to conceal his death from the Indians, carried the body at dead of night into the middle of the river, and sunk it beneath the waters: afterward, putting together some rude barks, they made their escape to Mexico.\*

The wanderings of Alvaro had attracted the attention of the Spaniards to the regions immediately north of Mexico. A friar, Marco di Nizza, set out with a party to explore them, returned with a romantic account of a city, named Cevola, having 30,000 splendid houses, and its most common utensils of gold, silver, and the richest jewels. Mendoza, the viceroy, hoping to emulate the glory of Cortes, fitted out two large expeditions, one to proceed by land under Vanez Coronado, the other by sea under Fernando Alarcon. Coronado, after a most arduous march through rugged and desolate mountains, reached the plain of Cevola, and, notwithstanding a most desperate resistance, forced an entry, but found a mere village of 400 houses, with nothing at all splendid; the jewels were only pebbles and rock-crystal. In hopes of achieving something, he marched 300 leagues to the coast, where he found a city of somewhat greater consequence, named Quivira, which cannot now be identified. Alarcon, unable even to join his associate, returned equally disappointed. Cabrillo, a Portuguese seaman, was then employed by Mendoza to explore the coast. He reached as high as 44° N. lat., but brought back a gloomy account of the aspect of the region, and the difficulties of navigating this northern sea.†

The zeal of Spain now slackened; but, in 1573, Drake, in his expedition round the world, traced the north-western coast as high as lat. 49°. There is a narrative by a Spaniard named Junn de Fuca, who boasts that, in 1596, he reached a similar latitude; and his report, long discredited, has been confirmed, in a great measure, by the discovery of a strait closely answering his description, and now bearing his name. In 1596 and 1603 the Copde de Monterey employed Sebastian Viscayo, who did not, however, reach so far as Cabrillo. There is also a narrative by De Fonte, who boasted that, in 1640, he had reached the latitude of 53°, where he found numerous islands separated by narrow straits, which he named the Archipelago of St. Lazare, and within them a large lake named Belle. This account is generally branded as fictitious; yet we cannot but observe, that it strikingly agrees with the numerous chain of islands found by Vancouver in the same latitude, while lake Belle may be the interior sea between them and the main.‡

The power of Spain having declined, she was unable to maintain the vast pretensions she had advanced in relation to Florida. Britain, now become a much more formidable maritime power, established colonies in Virginia and New-England in defiance of Spain. In doing so, although there was not room for great discoveries, she acquired a far more

accurate knowledge of this long range of coast. The expectation was still entertained that some of its openings might lead into the South sea, and this was even viewed by the Virginia company as one of their leading objects. But the laborious survey of Chesapeake bay, by Smith, in 1606, nearly put an end to these hopes.

The British, however, made indefatigable efforts to discover a passage to India by the north. Sir Martin Frobisher, in 1576, found means to equip two slender barks of 35 tons for this arduous attempt. Passing the southern extremity of Greenland, he reached the coast north of Hudson's strait; but, after sailing about for some time without perceiving any opening, and the season being advanced, he returned. One of the party brought home a shining black stone, which some ignorant persons pronounced an ore of gold. The utmost enthusiasm was thus kindled, and a larger expedition was easily fitted out next year. Frobisher then discovered the straits bearing his name, leading into Hudson's bay; but he was arrested in them by the ice; he carried home, however, a store of the black stone. The hopes of the nation were higher than strong, and the queen sent him back with fifteen ships, a strong fort in frame-work, and 100 men to form a colony. In approaching the place, however, he was attacked by so furious a tempest, with islands of ice driving against the vessels, that he had the utmost difficulty in saving and bringing them home. These disasters, and the discovery that the appearances of gold were illusory, caused a suspension of this series of enterprise.

In 1585, a number of leading merchants fitted out two vessels under John Davis. Steering farther N. than Frobisher, he crossed from Greenland the straits bearing his name, and came upon the American land in about 66° N. He sailed somewhat farther N., and surveyed different parts of the coast, but was obliged by the lateness of the season to return. His report, however, being favourable, he was sent out again next year. Though much retarded by the encounter of a huge field of ice, he reached his former station, and steered thence S.E. till he came to Labrador, having passed numerous islands, as appeared to him, but probably the coasts bordering on the sounds and inlets leading into Hudson's bay. Being assailed by tempests, he returned to England, still giving such favourable hopes that, though many of the adventurers held back, Mr. Sanderson, his zealous patron, procured for him a smaller armament. He pushed to the yet unattained point of 73° 12' N., on West Greenland; thence he steered 40 leagues across, but was arrested by the fixed field of ice in the middle of the bay. He vainly attempted to round it, and was pushed southward to his former station on the American coast. He penetrated 60 leagues up Cumberland strait; then being obliged to return, he observed, without entering, the entrance of Hudson's bay. He returned home as sanguine as ever, but the perseverance of the merchants was exhausted.\*

The Muscovy and Levant companies, in 1602, sent out John Weymouth; but the mutinous spirit of his crew prevented his achieving anything. They employed, in 1606, John Knight, who was surprised and killed in Labrador by the natives. In 1607, Sir Dudley Digges, Sir John Westenholme, and other gentlemen fitted out Henry Hudson, a celebrated navigator, who had already made three arctic voyages. Though furnished only with one ship of 55 tons, he penetrated, after many difficulties, into the bay, or rather inland sea, which bears his name. He surveyed a considerable extent of its eastern shore; but as November had arrived, was obliged to winter there. Much hardship being endured till spring, a mutiny arose among his crew, who exposed Hudson and his friends to perish on this inhospitable shore, and, with thinned numbers, made their way to Ireland.

Notwithstanding these melancholy circumstances, a great opening had thus been traced, and, in 1612, the company sent out Sir Thomas Button, accompanied by Bylot, one of Hudson's companions. Sir Thomas having entered the bay, steered directly across through such an extent of open sea, as made him hope that he was now in the Pacific, when he suddenly saw himself arrested by a long line of coast, to which he gave the name of Hope checked. He wintered in Nelson's river, sailed up Boe's Welcome, surveyed various points on Southampton island, and returned to England. After a fruitless attempt by Gibbons, Bylot and Baffin were sent, in 1615; but they were arrested by the eastern coast of Southampton island. In 1616, they went to try the more patent route of Davis's straits. They made then the complete circuit of that great inland sea, which has since been named Baffin's bay; but returned with the conviction that it was enclosed by land on every side, and afforded no hope of a passage. The search in this direction was discontinued; but, in 1631, Fox was sent out by the king, and James by the Bristol merchants, to try again the route of Hudson's bay. Fox, after vainly attempting a western route, sailed

## AMERICA.

up the channel bearing his name, the most direct route to the strait of the Fury and Hecla, but stopped much short of that point. James stood to the southward, and being entangled in the eastern coasts of the gulf, was obliged to winter there, when his crew suffered the utmost extremity of cold.

The north-western coast of America, notwithstanding the Spanish discoveries, remained still almost unknown. But after Russia had overrun Siberia, and reached the shores of the eastern ocean, her active rulers felt an interest respecting the opposite continent. It was even doubted whether it was separated from that of Asia; but this, in 1788, was nearly ascertained by Behring, who reached the eastern extremity of the latter continent, on the straits which bear his name. He saw the land then stretching N.W., but did not discover any part of America. A few years after, Krupshof, a Komo, from Kamtschatka, described, and sailed along it for two days. In 1741, Behring and Tchirikoff were sent thither to make a careful survey. They were separated; the former reached the coast, and landed about the latitude of 59°. He could not accomplish his object of surveying it to 65°, and being obliged to winter on one of the Aleutian islands, suffered severe hardships, to which he fell a sacrifice. Tchirikoff came in view of it in about lat. 59°; but being unable to land, and having lost two boats in attempting to communicate with the natives, he returned to Kamtschatka. On this voyage the Russians found their claims to the American coast N. of 59°; and their traders soon established along it a chain of settlements with a view to collecting furs and skins of the sea-otter.

Capt. Cook employed his last voyage in examining the north-west boundaries of America, and in attempting to effect a north-west passage. He traced the coast from 50° northwards, till he came to cape Prince of Wales, the western limit of the continent; then steered north-east till, in about 70°, he was arrested by an unbroken chain of ice islands. He returned, naming the adjacent promontory Icy cape; and King and Clerke next season in vain attempted to penetrate farther. The information obtained in this voyage induced many English ships to resort to this coast with a view to the capture of the sea-otter, for whose rich skin there is a regular demand in the China market. Dixon and Meares, in this pursuit, explored Nootka and the adjacent coasts. The Spaniards attempted to oppose this trade, and even captured the Argonaut, a British vessel; but were obliged to withdraw their opposition. They now sent several expeditions, particularly one under Ayala and Manrille; but these could make no discovery which had not been anticipated. In 1791-2, Vancouver was employed in making a careful survey of these coasts, in the hope of finding a passage into the Atlantic, through one of their numerous bays; but this he proved to be impracticable. Broughton, under his direction, ascended the Columbia for about 90 miles. Capt. Gray, employed by the United States, had before been at its mouth, and given it its name; but he is said never to have entered the actual channel of the river.

Meantime some straggling attempts after the passage were made from the Atlantic. In 1608, the Hudson's bay company was formed, and undertook to make exertions for this object. There is, however, no record of any till 1791, when Knight, governor of one of their forts, prevailed on them to supply him with the materials for a voyage. Unfortunately, being obliged to winter on Marble island, he and his whole crew fell a sacrifice to sickness and famine. In 1741, Mr. Dobbs, a gentleman of influence, and imbued with the most ardent zeal on this subject, prevailed on the Admiralty to send out Capt. Middleton with the Furnace bomb-ketch. That officer, in 1742, sailed to the head of Sir Thomas Roe's Welcome, where he found on one side Repulse bay, on the other a frozen strait between Southampton island and the mainland. Having also looked up Wager inlet, he pronounced a passage in this direction impossible. Dobbs and others loudly accused him of carelessness and even treachery, and kindled such a spirit that £10,000 was raised by subscription, and parliament voted a bounty of £30,000 to the subscribers in the event of their success. Two vessels were sent out under Captains Morr and Smith, who however merely examined the Wager inlet, ascertaining that there was no passage, and then returned.

Maritime expeditions were now suspended, but some important discoveries were made by land. Ever since Baffin's last voyage, the impression had prevailed that North America stretched indefinitely towards the pole. But in 1769, Mr. Hearne, sent by the Hudson's bay company, descended Coppermine river, and found it to terminate in a sea at about 65° N. lat. In 1788, Sir Alexander Mackenzie, an agent of the North-West Fur Company, descended, much farther westward, the great river bearing his name, and came to what he termed a lake, but which, from its having tides

and containing whales, was very decidedly judged to be also a sea. There was thus found great room to suppose that, in a latitude between 60° and 70°, America was bounded by a great Arctic ocean: while from these observations combined with those of Cook, the estimate of its breadth was greatly enlarged.

These considerations produced little influence, till, after the peace of 1815, when the energies called forth during the late war sought a different direction. Sir John Barrow proved that the impression against the existence of a passage, derived from former failures, rested on very slight grounds. Under his auspices, Capt. Ross was sent out in 1818, with the Isabella and Alexander, to make a more full trial in Baffin's bay. He sailed entirely round it, but returned decidedly reporting that navigator's opinion to be correct, and that it afforded no western passage. Lieut. Parry of the Alexander, however, and other officers, were of opinion that the spacious opening of Lancaster sound had been quitted without due examination, and afforded a favourable promise. He was therefore sent out next year, and though he did not reach the sound till August, found all his expectations fulfilled. The ships, during the first day after entering the sound, had an unobstructed run of upwards of a hundred miles. After sailing a little farther, he was arrested by ice, and obliged to turn southward along the eastern shores of Prince Regent's inlet. Being arrested there, he returned northwards, and was gratified to find the passage to the west coast quite clear. He ran along it to beyond 110° W. long, thus entitling the crew to a royal bounty of £5000. He was then obliged to make arrangements for spending the winter, during which, notwithstanding the most rigorous cold, the health and spirits of the crew were surprisingly preserved. He was defeated in his attempt next year to penetrate farther west, and obliged to return.

Capt. Parry was again sent out the following year; but it was now reserved to try the channel by the northern head of Hudson's bay, which Middleton was considered as having by no means completely explored. He found no reason to doubt the accuracy of that navigator; but by pushing up the Fox channel, he arrived at a strait, named after his vessels the Fury and Hecla, which was ascertained to afford a passage into the Polar sea. It was so blocked up with ice, however, that his utmost efforts during two successive seasons, could not force a passage. Having returned to England, he was sent out a third time, in 1824, to endeavour to penetrate through Prince Regent's inlet into the open sea of which he had now fully ascertained the existence. The season, however, being peculiarly rigorous, it was not till next summer that he reached the western coast; and the Fury, being then squeezed between two masses of ice, sustained so severe an injury, that it became necessary to abandon her, and give up all attempts to proceed farther.

Other means were at the same time resorted to for exploring the northern boundary of America. Lieut. Franklin and Dr. Richardson undertook to proceed to the mouth of the Coppermine river, and thence attempt to trace the whole coast, from the strait of the Fury and Hecla to the Icy cape of Cook. They sailed from England in May, 1820; were obliged to winter on the Athabasca lake, and in July, 1821, embarked on the Arctic ocean. They turned to the eastward, but were forced to take a very circuitous course through deep sounds and inlets, particularly the great one named Coronation gulf. Hence, on reaching point Turnagain, in 109° 25' W. long, though the sea continued open, they found it necessary to return, from the exhausted state of the equipment. The party, being obliged to travel by land over a range of naked territory broken by lakes and rivers, endured the utmost extremes of human misery, and several perished before they could reach fort Enterprise on the Coppermine. They returned, however, with unbroken spirits and determination, and government liberally furnished the means of renewing their efforts. At the same time, Capt. Beechey was sent by way of the Pacific ocean to follow in the steps of Cook, and meet them from the westward. Franklin's new expedition set sail in 1825, wintered on Great Bear lake, and early next year were at the mouth of the Mackenzie, whence they now proposed to begin their survey. From this point Capt. Franklin proceeded W.; Dr. Richardson E. The former explored a considerable extent of coast bordered by ranges of the Rocky mountains; but, after passing Foggy island, in long. 147° W. the obstacles became so serious as made it necessary to turn back. Meantime, however, Capt. Beechey had passed Behring's straits; and, though the ship could not be navigated beyond the Icy cape of Cook, Mr. Elson, in a boat, reached 156° 31' W. long, where a cape stretched into lat. 71° 23' N. The expeditions were thus within nine short degrees of long, from each other; of which, had they been aware, they would at every cost have pushed through. Dr. Richardson succeeded in exploring the whole coast between the Mackenzie and the Coppermine, connecting his discoveries with those of the former voyage, and leaving unknown only two com-

## AMERICA.

sively small portions between Franklin's extreme points and those reached by Beechey on one side, and Parry on the other.

Capt. Ross, regretting the mistake by which he had failed to discover the entrance into the Polar sea, anxiously sought the means of retrieving this error. These were furnished by a public-spirited friend, Sir Felix Booth, and the resources of steam navigation were called forth. They were not of much avail; but Capt. Ross, through many difficulties, made his way into Prince Regent's Inlet, and reached considerably farther than Parry on its eastern limit. He thrice wintered there, and explored a great extent of the adjacent coasts. He found himself on what appeared a peninsula, named Boothia, reaching to 74° N. lat., and connected with the continent by a narrow isthmus. A considerable extent of the American coast to the westward was also explored, but without reaching Franklin's Turnagain. Commander Ross is considered as having ascertained the site of the magnetic pole on the western coast of Boothia. Capt. Ross, in attempting to reach home, was obliged to spend another winter near the northern point of the peninsula. His arrival, in 1833, occasioned a joyful surprise, as the most melancholy forebodings had prevailed as to his fate.

During the alarm felt at his long absence, an expedition to discover and release him was fitted out, partly by government and partly by private subscription. It was intrusted to Capt. Back, a companion of Franklin, with the hope that he might also make some farther discoveries. Having left England in February, 1833, he wintered at the eastern end of Great Slave lake, and next summer descended a river named the Thlew-ee-chop. It terminated in a spacious bay, at the end of which the coasts appeared to stretch, one S.E., the other due W. From Cape Ogilby, where this last direction began, was seen the E. an apparently boundless expanse of sea. By the observations then made it appeared probable that Boothia did not form part of the American continent, but was connected with a more southerly peninsula which, along with it, formed one great land.

In 1838, the public were surprised by the intelligence that one of the blanks still left in American geography had been filled up. The Hudson's bay company, now certainly an active and liberal body, determined to explore what was yet unknown in their own territory. Under the intelligent direction of Mr. Simpson, the resident governor, Messrs. Dease and Simpson, in the summer of 1837, went over the intermediate space between the points reached by Franklin and Beechey. It was found to run in a nearly direct line, presenting no remarkable feature except the efflux of two large rivers. The same gentlemen were employed, in 1838, to explore from Cape Turnagain to the strait of the Fury and Hecla: a more difficult task.

The first important steps in the discovery of the interior of N. America were made by the French from Canada, under the government of Count Frontenac. Under his auspices, Jolyet and Father Marquette, in two Indian bark canoes, undertook to explore the vast regions on the Mississippi. Lake Michigan then formed the extreme boundary of European knowledge. From it, ascending the Fox river and descending the Ouisconsin, they reached the central stream, and were astonished at its grandeur, and the majestic forests on its banks. In proceeding downwards, the first people they met were the Illinois, who received them hospitably. Afterwards they were struck by the influx of the mighty stream, deeply tinged with mud, of the Missouri (named by them Pekotani). Under the name of Oushiakou, they describe the united stream of the Wabash and Ohio. They came next to the Akameas (at the mouth of the Arkansas), but perceiving now that the river must terminate, not, as had been supposed, in the gulf of California, but in that of Mexico, they were afraid of the Spaniards, and returned.

When the two travellers arrived at Quebec, there happened to be in that city an enterprising young Frenchman, of some birth and fortune, named Sieur de la Salle, who conceived an enthusiastic desire to prosecute this career of discovery. Through influence at court, he procured ample means. After some time spent in erecting forts upon the lakes, he reached the Mississippi by a new route, ascending the Miami and descending the Illinois. On reaching the Arkansas, he hesitated not to prosecute his voyage, and passed along the territory of the Taenecas, Natchez, and Quinipimas. Soon after, by the vast breadth to which the waters expanded, their brackish taste, and the shells on the shore, he discovered, with exultation, that he was at the mouth of the Mississippi. He hastened back by the same route to Canada, and thence to France, where he was received with the highest distinction, created governor of the region he had traversed, and sent out with four ships and 260 men. He went by the W. Indies; but, unfortunately, he could not distinguish the entrance of the river, and, while searching for it, a mutiny arose among his men, in which he was killed.

About this time Hennepin also attempted to reach the source of the Mississippi; but, after passing the falls of St. Anthony, he was taken prisoner by the Indians, detained long in captivity, and thought himself happy in making his escape. Some time after, Baron Lahontan reported his having ascended a great tributary, which he calls Long, but which appears to be the St. Peter's. He met some members of a distant tribe, who described a chain of high mountains lying to the westward, beyond which was a great salt lake, a term which the Indians often apply to the sea. These correct statements seem to absolve the baron's reports from the suspicion of fiction, which has been sometimes attached to them.

The English colonies on the Atlantic had made a great advance in population and wealth, before they attempted to penetrate across the Alleghany. An opinion had, indeed, long prevailed, that this range formed an insurmountable barrier. In 1714, however, Spotswood, governor of Virginia, sent a party, who made their way into the western territory. It was still some time before the colonies made any attempts to settle there, and when they did, they were vigorously opposed by the French, who, in a virtuous settlement of Canada and the discovery of the Mississippi, claimed the whole region. They drove out a company who attempted an establishment on the Ohio, and erected on the present site of Pittsburg, fort Duquesne, which struck a general alarm through the provinces. The conquest of Canada, and the peace of Paris, in 1763, removed this opposition. Still the settlement was made, not by any combined or official movement, but by Boone, and other daring adventurers, who maintained a series of bloody struggles with the natives, by whom the English were kept in perpetual alarm. It was not till some years after the war of independence that Kentucky was received into the union, and that the great tide of emigration began, which has covered the valley of the Mississippi with so many populous and flourishing states.\*

The Americans having, in 1804, purchased Louisiana from Napoleon, claimed under that vague title the whole region to and beyond the Mississippi, and commenced operations for exploring that vast territory. An expedition was arranged by Mr. Jefferson, then president, and was led by Captains Lewis and Clarke, the former of whom was his private secretary. On the 16th of May, 1804, they began their voyage on the Missouri. They passed its great tributary the Osage, inhabited by a numerous people of that name; then the Kansas, more than half its own breadth; lastly, the large and rapid stream of the Platte. Having ascended 1600 miles, and reached the foot of the Rocky mountains, they found the season too far advanced for crossing that great chain. They therefore built a fort named Mandan, where they spent the winter. Early in April, they were again in movement, and in nine or ten days came to the influx of the Yellowstone, almost equal to the main stream. They next reached two great branches or forks, without knowing very well which to take, but chose the southern and largest, and were assured of being right when they saw the great falls of which they had been apprised, and which formed a most magnificent spectacle. They ascended, till they could boulder this mighty river, and found the spring head whence it welled, about 3000 miles above its confluence with the Mississippi.

Having now reached the crest of the great rocky chain, the travellers descended rapidly, though not without difficulties, from the ruggedness of the road and the want of provisions. They at length, however, embarked on the southern branch of the Columbia, which they named Lewis, and, after passing its falls, saw it spread into a wide channel, and ultimately open into a bay, where they exultingly heard the sound of breakers from the Pacific. They wintered at the mouth of the river, and hastened back by the same route in the following spring. They were not, however, the first who had crossed the entire breadth of the continent. This had been effected in 1792 by Sir Alexander McKenzie, in a more northerly quarter; and in 1803 the agents of the Montreal company had crossed the mountains, and formed trading posts on the northern branches of the Columbia.†

\* Fillet, Indian War of the West, Cincinnati, 1820.

† See Journal of D. W. Harmon (Andover, 1820).—[This is not correct, as Mr. Harmon's Journal states so much fact.] The British fur traders made their first establishment beyond the Rocky mountains in 1805. An expedition for this purpose had been contemplated by them in the preceding year, in consequence of information respecting the views of the American government, obtained while Lewis and Clarke were spending the winter of 1804-5 at the Mandan town on the Mississippi, but it was not carried into effect until the spring of 1805, when Mr. Simon Fraser, a partner of the North-west company, established a trading post on Fraser's lake, near the 54th parallel, in the country since called New Caledonia.† The statements in this paragraph are derived principally from D. W. Harmon's Journal of his voyages and travels in the northern parts of America, published in Andover, Mass., in 1820. At p. 81 he says, "That part of the country west of the Rocky mountains, with which I am acquainted, has, ever since the North-west company first made an establishment there, which was in 1805, borne the name of New Caledonia," &c. In many parts of his work he speaks of Mr. Simon Fraser as having led the first party of traders beyond the Rocky

## AMERICUS.

## AMHERSTBURGH.

The American government sent, in 1805, another expedition under Major Pike, to trace the yet unknown head of the Mississippi. It was found in a direction almost due north, not rising from any great natural range, but in a flat, marshy region, and passing through a number of little lakes, the chief of which, named Leech and Red Cedar, contend for the honour of giving birth to this leading American water. Its length, too, proved to be at the mutual junction little less than half the Missouri, which therefore ought properly to rank as the main stream. Pike, on his return, was sent to explore the course and origin of the Arkansas and Red rivers. The former he found very broad, flowing through a country richly stocked with game, and having its source in the Rocky mountains. He first conveyed an idea of the loftiness of that chain, which he compared, though with exaggeration, to the Cordilleras. He attempted then to descend the Red river, but entered by mistake on the Rio del Norte, and proceeding into the Mexican territory was made prisoner by the Spaniards, but well treated and soon released. About the same time, Mr. Dunbar and Dr. Hunter, from Natchez, sailed to a considerable height up the Red river and its tributary the Washita, surveying the fertile country on their banks.

After a long suspension, the American government, in 1819, recommenced this career. Major Long and Dr. James were sent to explore more precisely the western territory, southward of the Missouri. They discovered with regret that a great sandy desert extends for a breadth of about 400 miles eastward from the Rocky mountains. That chain was carefully examined, and its highest peak found not much to exceed 12,000 feet. Seeking to descend the Red river, by a fresh fatality they mistook for it the Canadian, the longest tributary of the Arkansas, by whose channel they regained the Mississippi. Meantime General Cass was employed in a more careful examination of this last river, tracing in his way the southern shore of lake Superior. Major Long, on his return, ascended St. Peter's river, already visited by Lachontian and Carver. He found, rising from continental sources, the northern Red river, which flows into the British territory, and ends in lake Winnipeg. These successive expeditions conveyed to the United States government a pretty correct idea of the interior of their vast territory, including those parts of the continent which had hitherto been most imperfectly known.

AMERICUS, p. v., capital of Sumpter co., Ga., 104 m. S.S.W. Milledgeville, 760 W. Situated 16 W. Flint river, and contains a court house, an academy, seven stores, and about ninety dwellings.

AMERKOTE, a town and fort of India, territory of Sindh, in the desert 85 m. E. Hyderabad, lat. 25° 30' N., long. 69° 49' E. The emperor Achar was born here in 1541.

AMERSFOOT, a town of the Netherlands, prov. Utrecht, on the Eem, which becomes navigable at this point, 12 m. E.N.E. Utrecht. Pop. in 1830, 11,782. It is well built and well fortified; has a court of original jurisdiction, a college, a commission of agriculture, with manufactures of fustians, dimities, bombazines, &c. It is the mart for the corn and tobacco cultivated in the contiguous territory, and has a considerable transit trade in produce from Germany, embarked here in flat-bottomed boats from Amsterdam. The distinguished statesman and grand pensionary, Barneveldt, sacrificed, in 1617, to the fanaticism of the people and the hatred of Prince Maurice, was a native of Amersfoot.

AMERSHAM, a bor. and pa. of England, co. Buckingham, near the Colne, 26 m. W.N.W. London. Pop. of parish, 2816. The town consists of one long street crossed by a shorter one, having the church at the point of intersection. The living is a rectory, and one of the best in the country. There is a free-school, to which are attached three exhibitions at Corpus Christi college, Oxford, with almshouses, and three charities. A good deal of black lace is manufactured, and the market is well attended. Previously to the Reform Act, by which it was disfranchised, this borough sent two members to the H. of C., the right of voting being in the inhabitants paying *scot and lot*; but these being all tenants of the lord of the manor, it was, in fact, a nomination borough.

AMES, p. v., Canajoharie t., Montgomery co., N.Y., 56

mentioned in 1808." See a memoir, historical and political, of the north-west coast of North America, and the adjacent territories, by Robert Greenhow, translator and librarian to the department of state, Washington, submitted to the United States senate, Feb. 18th, 1840, a most able document, which deserves to be read by every scholar for the general information which it contains, and by every citizen of the United States who wishes to understand the grounds of the claim of his country to the Oregon territory. The writer of this note was intimately acquainted with Mr. Greenhow, having prepared his work for the press by writing it wholly over, and he knows that Mr. H., while stating the above facts, had not the least suspicion that they could ever have the important bearing they are now seen to have on the claim to the Oregon territory. He resided during eight and a half years near Fraser's lake, Stuart's lake, and the vicinity, but neither he nor McKensie ever approached to the branches of the Columbia river. Mr. Greenhow's book was reviewed by the *London Quarterly Review* in January, 1842.—*Am. Ed.*

m. N.W. Albany, 305 W. It contains two churches, an academy, one store, one grist-mill, twenty-five dwellings, and about 175 inhabitants.

AMES, t., Athens co., O., 84 m. S.E. Columbus, 387 W. It contains one store, three saw-mills, nine schools, 218 scholars. Pop. 1431.

AMESBURY, or AMBRESBURY, a m. town and par. of England, co. Wilt. The town is situated on the Avon, 7½ m. N. Salisbury. Though inconsiderable, it is noted for the ruins of an abbey, the vicinity of Stonehenge, and for having been the birth-place of Addison. The parish comprises 6060 acres, with a pop. of 944.

AMESBURY, p. l., Essex co., Mass., 44 m. N.E. Boston, 475 W. Bounded S. by Merrimac river. The outlet of a large pond, covering 1000 acres, and Powow river, afford water power. It contains five churches, one Congregationalist, two Baptist, one Friends', and one Episcopal, fifteen stores, ten fulling-mills, two woolen-factories, four grist-mills, two saw-mills, one academy, 40 students, fifteen schools, 666 scholars. Pop. 9471.

AMHARA, a division of Abyssinia, which see.

AMHERST, a sea-port town of the Brit. prov. of Martaban, India beyond the Ganges, and the chief British military and commercial station in the provinces E. the Than-lyng river, on a point of land in the N.E. angle of the gulf of Martaban, facing the mouth of the Than-lyng and the lake of Balu to the N. Lat. 16° 4' 48" N., long. 97° 35' 24" E. Pop. in 1827, 1000; now (1838) probably 5000. It was founded in 1828, after the restoration of the town of Martaban to the Birmees, in the view of serving as a military post and a commercial establishment, and as an asylum for such refugees as might choose to emigrate from the Birmees dominions. The apex of the promontory, which is the highest spot in the town, is occupied by the church, governor's house, court of justice, fortifications, and other public buildings; on the higher ground around it are the European and Chinese quarters; and the lowest are by choice inhabited by the natives. The military cantonments are about 1½ m. distant, in a dry, level, and elevated spot. The harbour is spacious and secure, with 3 fath. water at low neap tides; rise and fall above 19 ft., with a flow of 6 m. an hour, and perfectly still for two hours both before and after high water. Ships may lie within 100 yards of the shore. Mangrove and a kind of oak are abundant here, and there are teak forests at no great distance. Good water is found everywhere six feet below the surface. (*Hamilton, E. I. Gazetteer*, p. 47.)

AMHERST, p. l., Hancock co., Me., 113 m. N.E. Augusta, 695 W. It contains one saw-mill, two schools, 54 scholars. Pop. 196.

AMHERST, p. l., capital of Hillsborough co., N.H., 30 m. S. Concord, 459 W. Souhegan river affords good water power. Incorporated in 1780, and contains six stores, one grist-mill, seven saw-mills, eleven schools, 513 scholars. Pop. 1565.

AMHERST, p. l., Hampshire co., Mass., 82 m. W. Boston, 7 E. by N. Northampton, 385 W. Two branches of Connecticut river afford good water power. It contains three Congregational churches, a bank, fourteen stores, two woolen-factories, two grist-mills, two saw-mills, one academy, 87 students, eight schools, 596 scholars. Pop. 2550. Amherst college, located here, was founded in 1821, incorporated in 1825, has a president and ten professors or other instructors, 157 students, and 15,000 vols. in its libraries. The philosophical apparatus is very complete, and it has a valuable cabinet of natural history, including mineralogy. It has four fine collegiate buildings, pleasantly located, and it has rapidly risen to great respectability. The necessary expenses are from \$115 to \$137 annually. Indigent students are gratuitously supplied with furnished rooms.

AMHERST, t., Erie co., N.Y., 10 m. N.E. Buffalo, 283 W. Albany. Watered by Tonawanda and Ellicott's creeks. It contains ten stores, three flouring-mills, seven grist-mills, one furnace, two potteries, one brewery, one distillery. Pop. 2451.

AMHERST, p. l., Lorrain co., O., 8 m. W. Elyria, 121 N.N.E. Columbus, 392 W. It has one store, one grist-mill, six saw-mills, seven schools, 273 scholars. Pop. 1184.

AMHERST, county, Va., situated in the central part of the state, and contains 418 sq. m. It had, in 1840, 8352 neat cattle, 6235 sheep, 16,913 swine. It produced 112,677 bushels of wheat, 11,031 of rye, 381,146 of Indian corn, 2,106,149 pounds of tobacco, and contained eighteen stores, ten flouring-mills, forty grist-mills, sixteen saw-mills, twenty-four distilleries, seventeen academies, 408 students, eleven schools, 266 scholars. Pop. whites, 6426; slaves, 5577; free coloured, 373; total, 12,576. Capital, Amherst.

AMHERST, p. v., capital of Amherst co., Va., 15 m. N.N.E. Lynchburg, 115 W. Richmond, 176 W. It contains a court-house, jail, and county offices, all of brick, two stores, fifteen dwellings, and about 130 inhabitants.

AMHERSTBURGH, a town of Upper Canada, on De-

## AMIENS.

troit river, 3 m. above its embouchure in lake Erie, and 14 m. below Detroit. It was founded during the administration of Lord Amherst, and was named after his lordship.

AMIENS (an. *Semerivria*), a city of France, cap. dep. Somme, on the river of that name, 73 m. N. Paris. Lat.  $49^{\circ} 53' 41''$  N., long.  $2^{\circ} 18' 11''$  E. Pop. 32,391. Amiens has a citadel constructed by Henry IV. It is well built; streets for the most part straight and clean; and it has some fine squares and promenades. The old Gothic cathedral, in excellent preservation, is one of the finest in Europe. It is 396 feet in length, and 139 in height. Among the other public buildings may be specified, the Royal College, theatre, Hôtel de Ville, corn-market, courts of justice, barracks, seminary of St. Acheul, château d'Eu, &c. It is the seat of a bishop, has a *cour royale*, a court of assizes, a commercial tribunal, a custom-house, a public library containing above 40,000 vols., an academy, an academy of sciences and belles-lettres, a free school of design, a botanical garden, &c.; manufactures very considerable. They consist principally of kerseymeres, cassimeres, merinos, serges, &c., made partly of home, and partly of German and Spanish wool. The linen trade is also considerable; but it is now surpassed by that of cotton. There are annually produced about 60,000 pieces of cotton velvet, the aggregate value of which is estimated at about 8,000,000 fr.; and about 400 looms are occupied in the production of velvets, *dites d'Utrecht*. There are also several mills for the spinning of cotton and flax, with dye and bleach-works; manufactures of machinery, best-root sugar, and chemical products; tanneries, soap-works, paper-mills, &c. The *patés de Canard* made here are highly esteemed. Flat-bottomed vessels, drawing from forty to fifty tons, come up the river to the town, which is the centre of a very considerable trade, as well in its own productions as in those of the surrounding country. Amiens is very ancient, being supposed to have existed anterior to the invasion of Belgium by the Romans. It is known in diplomatic history from the circumstance of a definitive treaty of peace between England and the French Republic having been signed in it on the 25th March, 1802. It is the birth-place of Peter the Hermit, the apostle of the first crusade; of Duncange, author of the *Glossarium ad Scriptores media et infima Latinitatis*, a work of wonderful research and labour; and of Delambre, the late learned author of the most accurate, though not the most eloquent history of astronomy. (Hugo, *France Pittoresque*, art. *Somme*, &c.)

AMITE, river, La., rises in Miss., and flowing S., unites with the Iberville at Galveston, to which place it is navigable for vessels requiring five feet of water. It thence flows E. until it enters lake Maurepas, after a whole course of about 100 m.

AMITE, county, Miss., situated in the S.W. part of the state, and contains 800 sq. m. Watered by the Amite river and its branches. It contained in 1840, 13,904 neat cattle, 5213 sheep, 29,438 swine, and produced 311,270 bushels of Indian corn, 18,905 of oats, 90,215 of potatoes, 167,497 pounds of rice, 5,066,605 of cotton, and contained twelve stores, thirty-four grist-mills, nine saw-mills, and had two printing-offices, one weekly newspaper, six academies, 149 students, eleven schools, 190 scholars. Pop. whites 3741, slaves 5741, free coloured 39; total, 9511. Capital, Liberty.

AMITY, p. t., Aroostook co., Me., 210 m. N.E. Augusta, 805 W. It contains one grist-mill, one saw-mill, two schools, 77 scholars. Pop. 169.

AMITT, t., Alleghany co., N.Y., 6 m. S. Angelica, 255 W.S.W. Albany. Watered by Genesee river, and contains two stores, two grist-mills, six saw-mills, one fulling-mill, ten schools, 503 scholars. Pop. 1354.

AMITT, t., Erie co., Pa., 18 m. S.E. Erie. Watered by French creek, and contains one grist-mill, four saw-mills, one fulling-mill, four schools, 175 scholars. Pop. 560.

AMITT, t., Berks co., Pa. Mantawny and Manokory creeks afford water power. It has two churches, one Presbyterian, and one common to Lutherans and Presbyterians, four stores, six grist-mills, five saw-mills, one fulling-mill. Pop. 1664.

AMJIRA, a town in Malwa.

AMLWCH, a sea-port town of N. Wales. N. shore of the island of Anglesea, which has risen from the state of an inconsiderable fishing village, in consequence of the discovery of the famous copper mines in the adjoining Pary's mountain, in 1768, to be a town with about 6000 inhab. It has a pretty good port, excavated from the solid rock. During the flourishing period of the mines, they produced above 3000 tons a year of pure metal; but they have been gradually declining for these several years past, and do not now produce above 700 tons a year. It is not, therefore, probable that Amlwch, which depended almost entirely upon the mines, is destined to make much farther progress. It is united with Beaumaris, Holyhead, and Llangoed, in returning a m. to the H. of C. Pop. of parish, 6285.

AMMAN (the *Rabbat* of the Scriptures, and *Philadelphía* of the Greeks), a city of Syria E. of the Jordan, deserted

## AMOR.

and in ruins; lat.  $36^{\circ} 8' N.$ , long.  $36^{\circ} 8' E.$ ; 25 m. N.E. Dead sea, and 30 m. E. Richa (an. *Jericke*).

The remains of Amman are very extensive, but none of them seem to be older than the era of the Greek power in Syria. They consist of theatres, temples, and colonnades, of great beauty and high finish, some of them being in very perfect preservation. A great number of private houses still remain, but there is not a single inhabitant.

This is one of the most ancient cities mentioned in Jewish history. It was the capital of the Ammonites, a people undisturbed by the Israelitish settlement in Palestine, and with whom the Jews lived in a state of suspicious truce till the era of Jephthah, about 1161 B.C. Thenceforward the two nations were almost in constant hostility, generally to the disadvantage of the Ammonites; and in 1035 B.C., David took their capital. But notwithstanding this untoward event, and the unsuccessful war they waged against Jehoshaphat (B.C. 896) and Jotham (B.C. 760), they continued to be a powerful people, and about 600 years B.C. supplied Nebuchadnezzar with a strong auxiliary force to assist in the destruction of their old enemies. Amman was subsequently included in the Assyrian and Persian empires; and after the battle of Issus (B.C. 333), it passed, with the rest of Syria and Palestine, into the hands of the Greeks. In 218 B.C. Palestine was the scene of war between Antiochus the Great and Ptolemy Philopater, the former of whom utterly destroyed Amman. Having been rebuilt by Ptolemy Philadelphus, it received from him its Greek appellation of Philadelphia. It became a Roman town in the last century B.C., and remained such till the conquest of Palestine by the Saracens, A.D. 638. Under the Christian emperors of the East, Amman appears to have been a bishop's see, but it was declining before its capture by the Arabs; and Abul-Feda, in the early part of the 14th century, describes it as already deserted.

The ruins of Amman stand on the banks of a brook, which, issuing from a large pond at the S.W. corner of the town, flows (partly underground) over a stony bed into the Zerka (an. *Jabbeck*), an affluent of the Jordan. The water of this stream is excellent, a circumstance which renders the spot a desirable halting-place for caravans, the drivers of which use the ancient temples and buildings as shelter for their beasts, literally fulfilling the denunciation of Ezekiel, "I will make Rabbah of the Ammonites a stable for camels and a couching-place for flocks." (*Numbers to Chronicles, passim*; *Polybius*, lib. v., cap. 5 and 6; *Robinson*, II., 173-175.)

AMMERSCHWIHR, a town of France, dep. Haut Rhin, 4 m. N.W. Colmar. Pop. 2136.

AMMONOOSUC, Lower, river, N.H., rises in the White mountains, and flowing W., enters Connecticut river at Bath. It is about 50 m. long.

AMMONOOSUC, Upper, river, N.H., after a course of 50 m., enters Connecticut river in Northumberland.

AMOL, a city of Persia, prov. Mazunderan, on the Heraz, about 12 m. above where it falls into the southern part of the Caspian sea, lat.  $36^{\circ} 30' N.$ , long.  $53^{\circ} 25' 55'' E.$  Pop. differs at different seasons; but in winter, when greatest, is estimated by Mr. Frazer at from 35,000 to 40,000. The principal object worth notice is a mausoleum erected by Shah Abbas over the remains of a former distinguished sovereign of Saree and Amol, who died in 1378. This magnificent structure has, however, been injured by an earthquake, and is rapidly decaying. There is a bridge of twelve arches over the Heraz, and there are in the vicinity of the town many mounds and other remains of Persian antiquities. The bazars are extensive, and well supplied with certain articles; but it has little trade or industry. Mr. Frazer could not find tea either here or at Balfoosh, and the inhabitants had never heard of coffee. *Chillaz* and *was*, that is, plain boiled rice and sour curds, is the common food of the people, some of whom season it with a little salt fish. (*Frazer's Southern Banks of the Caspian Sea*, &c., p. 101.)

AMOR, or AMUR, a large river of E. Asia, which has its sources in Mongolia. It is formed by the junction of two great rivers, the Onon or Chilkha, which rises nearly under the 110th deg. of E. long., and the 50th deg. of N. lat., and the Kerlon or Argoun, which rises nearly under the same meridian, but about 24 deg. more to the S. The latter river traverses the great lake of Koulon, and, issuing from it, and pursuing a N.E. course, forms, for a considerable distance, the line of demarcation between the Russian and Chinese empires. The Kerlon and Onon unite near the fort of Ruklanova, in about the 130th deg. E. long. The combined river having taken the name of Amor, flows E. and S.E., till, at its most S. point, it is joined by its large tributary, the Songari, flowing N.E.: the Amor, having suddenly taken the same direction, preserves it during the remainder of its course, till it falls into the arm of the sea opposite the N. end of the island of Saghalien, or Tchoka, in about the 53d deg. of lat., and the 140th deg. of long. The entire course of the river, to the source of either of its principal branches,

## AMORBACH.

may be estimated, inclusive of its windings, at about 2200 m.; but the distance in a direct line from its sources to its embouchure does not exceed 1400 m. In the lower part of its course it flows through a comparatively rich, well-cultivated country; but the country round its sources, and the upper part of its course W. of the Kluga Yaio mountains, being contiguous to the great desert of Shamo or Gobi, has the same characteristics. The Russian fort of Neretchinsk stands on the Neretcha, near where it falls into the Chilkha. (*Bitter's Erdkunde Von Asien; Arrowsmith's Map of Asia; Cockburn's Travels.*)

**AMORBACH**, a town of Bavaria, 94 m. S. Aschaffenburg, with a castle, formerly a very rich abbey.

**AMORGO** (an *Amorgos*), an island of the Grecian Archipelago, about 36 m. in circumference, lying S.E. from Euxia, in about 36° 59' N. lat., and under the 36th deg. of E. long. Pop. estimated at between 2000 and 3000. It is in part mountainous and rocky; but antiquity it was noted for its fertility, and it is said by Tournefort to be well cultivated, and to produce more corn and wine than the inhabitants can consume. It contains a town of the same name. Fort St. Anna, on the N. shore of the island, is an excellent harbour, with good anchoring ground in from 18 to 20 fathoms. Simonides, famous in antiquity for his lambs, was a native of Amorgos. (*Tournefort, Voyage en Levant*, l. p. 238.)

**AMORGO POULO**, an uninhabited islet, 6 m. W. Amor-

**AMOSKEAG**, p. v. and Falls, Hillsborough county, N. H., 17 m. S. by E. Concord, 464 W. The Merrimack river here falls 48 feet 3 inches in half a mile, by three separate pitches, and affords great water power. The village is situated on the W. side of the river, in Goffstown, and has considerable manufactures. A canal, one mile long, with nine locks, overcomes a fall of 45 feet in the river, and cost \$50,000.

**AMOUR (ST.)**, a town of France, dep. Eure, cap. cant. 9 m. S.W. Louviers-Saunier. Pop. 2831. It has a forge, a nail-work, a considerable marble-work, tanneries, &c.

**AMOY**, a sea-port town of China, prov. Fokien, with a commodious and secure harbour, lat. 24° 10' N., long. 118° 10' E. Though situated one of the least fertile districts of the empire, the merchants of Amoy carry on a very extensive intercourse with Formosa, whence they import provisions, with the other Chinese ports to the N. and S., and with Siam, Java, Singapore, the Sooloo islands, &c. This port was open to Europeans till 1734, when all trade with them was suppressed. It was visited by the Ship *Amherst*, in 1832; but the authorities prevented that commercial intercourse from taking place to which the people seemed to be extremely well disposed. (*See Report of the Voyage of the Ship Amherst.*)

**AMPTING**, a village of Bavaria, 6 m. W. by N. Muhl-dorf. A great battle was fought in the vicinity of this village, on the 28th September, 1322, between Louis, duke of Bararia, emperor of Germany, and Frederic, archduke of Austria, when the latter was entirely defeated and made prisoner. (*Pfeiffer*, anno 1322.) It was from this point also that Moreau commenced his famous retreat in 1800.

**AMPLEPUIS**, a town of France, dep. Rhone, 19 m. W.S.W. Villefranche. Pop. 4381. It has manufactures of linen and cotton, particularly the latter.

**AMPTHILL**, a m. town and p. of England, co. Bedford, 6. Redbourn, 454 m. N.W. London. Pop. 1688. It is nearly built, has a charity school for thirteen poor children, and an hospital for ten poor men and women. Ampt-hill Park, a magnificent mansion, the property of Lord Holland, is situated a little to the W. of the town.

**AMPURIAS**, a town and castle of Spain, N.E. part of Catalonia, on the Llobregat, near the sea, 24 m. N.E. Gerona. Pop. 2900.

**AMRAN**, a walled city of Arabia, in the Dejebel, or mountain land of Yemen, being the chief town of a district of the same name, lat. 15° 33' N., long. 43° 38' E. 25 m. N.W. Sanaa, and 104 N.E. Hodeida. Pop. unknown, but may probably amount to from 1500 to 2000. It stands near a mountain, in a fertile country, in the centre of the coffee lands, the dep. to which it gives name being a part of Haschid-u-Bekel, one of the most noted divisions of Yemen for the growth of coffee. Amran is not, however, politically united with the state of Haschid-u-Bekel, but under the government of the Imam of Yemen Proper. (*Nichols, Des d'Ar.*, par. 8, p. 127-130.)

**AMRITSIR or UMBITSIR (Pool of Immortality)**, a town of India, the holy city of the Sikh nation, 44 m. E. Lahore, lat. 31° 23' N., long. 74° 48' E. Pop. not stated. It is an open town, about 8 m. in circ.; streets narrow; houses lofty, and built of burned bricks, but the apartments are small. Manufactures inconsiderable; but being situated on the high road between Cabool and Delhi, and Cachmere and the Deccan, it enjoys an extensive trade, and in the residence of several rich merchants and bankers. It is defended by a fort built by the present Sikh ruler, Runjeet

## AMSTERDAM.

Singh, who has also united it to the Ravee by a canal 34 m. in length.\*

The town derives its entire celebrity from its being the principal seat of the Sikh religion. Amretsar, or the Pool of Immortality, is a basin 135 paces square, built of brick, in the midst of which is a temple, covered with "burnished gold" (*Burnes*), dedicated to the warrior saint, Gooroo Govind Singh, the principal founder of the religion and power of the Sikhs. Within this temple is preserved, under a silken canopy, the *Prithak Sahib*, or sacred book of the Sikhs, being a code of laws and ordinances, principally compiled by the above saint. The temple is tended by a numerous body of priests, who are supported by the voluntary offerings of the devotees, by whom it is frequented. Immersion in the sacred pool is believed by the Sikhs, and many tribes of Hindoos, to purify from all sin. (*Hamilton's East India Gazetteer; Burnes*, &c.)

**AMSTERDAM, or AMSTELDAMME** (dam of the Amstel), a famous marit and commercial city of Holland, cap. prov. N. Holland, and of a district as cant. of the same name, on the S. bank of the Y, an inlet or arm of the Zuyder Zee, where it is joined by the Amstel, lat. 52° 25' 17" N., long. 4° 53' 15" E. Being situated in marsh, its buildings are all founded on piles driven from 40 to 50 feet into a soil consisting of alluvial deposits, peat, clay, and sand. The canals by which it is everywhere intersected, are along which all heavy burdens are conveyed, are said to divide it into 90 islands, and are crossed by about 250 bridges, partly wood and partly stone. Its form is that of a crescent or half moon, the horns on either side projecting into the Y, and inclosing the port. On the land side it is surrounded by walls having 26 bastions and a wide ditch; but its ramparts have been planted with trees, and converted into public walks and boulevards; the only defence of the town consisting in the facility with which the surrounding country might be laid under water. It is from 8 to 9 m. in circ. and covers a space of about 900 acres. The Amstel, which runs through the city, divides it into two nearly equal portions; thus to the E. of the river being termed the old, and that to the W. the new city. In the centre and oldest portion of the city, on both sides the Amstel, is a cluster of irregular streets and canals; but the streets and canals round this central nucleus are mostly regular, and parallel to each other. Three of these streets, the Heeren, Keyzers, and Prinsen Gracht, are not easily to be matched in any other city of Europe for their length, width, and the grandeur and elegance of their buildings. They are each about 2 m. long, about 280 feet broad; and following the direction of the outer wall of the city, which is that of a polygonal crescent, have all the lines perfectly straight between the angular points. The houses are large and well built; a canal, crossed by numerous stone bridges and bordered with trees, runs down the middle of each of these streets, and is indeed the case with all the other streets. The principal shops are in the Kalvers Straat, the Nieuwendyk, and the Warmoes Straat. The quarter occupied by the Jews is the dirtiest part of the town. Many artisans and others belonging to the poorer class inhabit cellars under the houses of the more opulent; and a great many reside constantly on the water, in comfortable apartments built on the upper decks of their trading vessels, more particularly those employed in inland navigation. The houses, which are all of brick, are generally 4 or 5 stories high, and have their gables to the street. Many of them are constructed in an elegant style; and some of them are splendidly fitted up.

Of the public buildings, the palace, formerly the stadthouse (town-house), is the most magnificent. It stands in an open space or square called the Dam. This fine structure, regarded by the Dutch as the eighth wonder of the world, is erected on a foundation of 13,650 piles; it is 232 feet in length, 235 in depth, and 116 high, exclusive of the cupola, which is 41 feet higher, and from the top of which there is an excellent view of this singular city. With the exception of the ground floor, which is of brick, it is built of freestone. The ball-room, represented as one of the finest in Europe, is said to be 130 feet long, 55 in width, and 90 in height. The foundations of the stadthouse were laid in 1648, and it was finished in the short space of 7 years. Among the other public buildings are the exchange, founded in 1603, and capable of accommodating 4,500 persons; the *Hotel de ville*, formerly the admiralty; the museum, containing an excellent collection of about 500 pictures, including several master-pieces, principally of the Dutch and Flemish schools; the arsenal, built on the island of Kattenburg; the buildings of the society of *Philis Moritia*, having a superb concert hall, &c. Of the churches, that most worthy of attention, the New Church, was begun in 1408. It contains some fine monuments, particularly one in honour of

\* This is Hamilton's statement. Captain Burnes says it was made by one of the emperors of Hindostan, and that it is 80 m. in length. (*Travels in Bokhara*, &c., vol. i., p. 150, 152no ed.)

## AMSTERDAM.

the brave admiral De Ruyter. The painted glass windows of the Old Church, dedicated to St. Nicholas, are among the finest in Europe. There are in all about 50 places of worship, among which are several synagogues, the Jews being supposed to amount to about 15,000. The principal bridge over the Amstel, near where it enters the city, is 610 feet in length by 64 in breadth, with 11 arches, through which large ships pass. The barracks, built by the French, three weigh-houses, and two ancient towers, called herring towers, deserve to be noticed. In 1822 the warehouses originally built for the East India Company, being heavily laden with corn, their foundations gave way, and they sunk half way down in the earth.

Among the literary institutions is the Athenæum, or college, with 10 or 12 professors, a good library, an anatomical theatre, and a botanical garden. In 1836 it had 33 students of law, 25 of theology, 25 of medicine, &c. There are here also a school of navigation; a royal academy of the fine arts, founded in 1817, with six professors; the Amsterdam Institute, or Society of *Felix Meritis*; a society of Public Utility, founded on an extensive scale, in 1797, &c. Schools of the best description, for the gratuitous education of the poor, are found in every part of the town; and instruction may be said to be universally diffused. There are three theatres. The workhouses, hospitals, infirmaries, the house of correction or rasp-house, the orphan-house, the establishment for widows, the lunatic asylum, with the numerous other charitable establishments, may be cited as models of good order, cleanliness, and economy. The hospital for the old and indigent of both sexes, on the quay of the Amstel, is admirably contrived for the comfort and convenience of its inmates. The building is 960 feet long, by 230 deep, and three stories high. It has galleries and a garden where its occupants enjoy the fresh air. There is here, and in other Dutch towns, a class of provident institutions or asylums, which admit aged persons of both sexes on payment of a comparatively small sum. Masters and mistresses frequently reward old and faithful servants, by paying for their admission into one of these excellent institutions.

The mouths of the canals opening into the Y and of the Amstel are provided with strong floodgates; and on the side of the town nearest the sea a new dyke has recently been constructed to guard against inundations. The harbour is spacious and secure; the largest ships coming close to the quays and warehouses. It has recently been much improved by the formation of docks and basins. At the point where the Y joins the Zuyder Zee there is a bar, called the Pampus, which cannot be crossed by large ships unless previously lightened. To obviate the inconveniences arising from this circumstance, and the dangers and delays occasioned by the shallowness and difficulty of navigating the Zuyder Zee, a ship canal has been constructed from Amsterdam to the Heider. This noble work is about 50½ m. in length; and being 90 feet 9 inches deep, admits large ships. Its level is that of the highest tides, the only locks it requires being one at each end; but it has two sluices in the intermediate space. It was begun in 1819, and finished in 1823, at an expense of about 1,600,000*fl.* The dues are moderate; and it has been of the greatest service to Amsterdam, by giving it, as it were, a deep-water harbour on the most accessible part of the Dutch coast.

The manufactures of Amsterdam, besides various branches of those of wool, linen, cotton, and silk, comprise sail-cloth, refineries of sugar, borax, sal-ammoniac, sulphur, &c.; with distilleries and breweries, tanneries, tobacco manufactures, iron foundries, rope-walks, annals-works, gas-works, soap-works, oil-mills, &c. Ship-building is extensively carried on. The art of cutting diamonds and other stones for the lapidaries has here attained to great perfection: there are at present (1838) five principal, besides several smaller establishments devoted to this business, being mostly carried on by Jews. Jewellery, gold lace, &c. are also largely produced. But Amsterdam is far more distinguished as a trading than as a manufacturing city. Throughout the 17th century, and the first half of the 18th, she was what London is at present, the metropolis of the commercial world. Gradually, however, partly in consequence of the oppressiveness of the public burdens, but more, perhaps, of the growth of commerce and navigation in England and other countries, she lost the greater part of the carrying trade, which she had nearly engrossed, at the same time that her fisheries and foreign trade progressively fell off. During the subjugation of Holland by France, her colonies fell into the hands of England, her ships disappeared from the sea, and the trade of Amsterdam was almost annihilated. But notwithstanding these untoward events, and the exactions to which she was repeatedly subjected, she preserved her industry and a vast amount of capital; and no sooner had peace been restored and Holland had recovered a portion of her colonies, than the commerce of Amsterdam began rapidly to increase; and though still far short of its ancient importance, it is now of very considerable extent and value.

The imports principally consist of sugar, coffee, spices, tobacco, cotton, tea, indigo, cochineal, wine and brandy, wool, grain of all sorts, timber, pitch and tar, hemp and flax, iron, hides, linen, cotton and woollen stuffs, hardware, rock-salt, tin plates, steel, dried fish, &c. The exports consist partly of the produce of Holland, partly of the produce of her possessions in the East and West Indies and other tropical countries, and partly of commodities brought to Amsterdam as to a convenient entrepôt from different parts of Europe. Of the first class are cheese and butter (very important articles); madder; clover; rape, hemp and flax seeds; rape and linseed oils, Dutch linen, &c. Geneva is principally exported from Schiedam and Rotterdam; oak bark principally from the latter. Of the second class are spices; Mocha and Java coffee; sugar of Java, Brazil, and Cuba; cochineal, indigo, cotton, tea, tobacco, and all sorts of eastern and colonial products. And of the third class, all kinds of grain; linens from Germany; timber and all sorts of Baltic produce; Spanish, German, and English wools; French, Rhenish, and Hungarian wines, brandy, &c. The trade of Amsterdam may, indeed, be said to comprise every article that enters into the commerce of Europe. The total value of the imports and exports are respectively estimated at about £3,500,000 and £4,000,000. From 220 to 230 large ships belong to Amsterdam, employed in the trade to the E. and W. Indies, the Baltic, &c. There is little coasting trade; the communication with most other Dutch towns being principally kept up by canals. The total number of ships of all sorts entering the port amounts, at an average, to about 9300 a year.

The merchants of Amsterdam were formerly most extensive dealers in bills of exchange, and in all sorts of funded property and government securities; but London is now, in this respect, far superior to her old rival: the latter, however, still enjoys a large share of the exchange business of the Continent, and many of her capitalists are large holders of foreign securities.

The old bank of Amsterdam, founded in 1609, and so celebrated among the mounted institutions of the 18th century, ceased to exist in 1796, on the invasion of Holland by the French. The present bank of the Netherlands was established in 1814. Insurance business is extensively carried on.

The city is supposed to contain above 96,000 houses. In 1785 the pop. is said to have amounted to 235,000. It had declined in 1814, the epoch of its greatest depression, to 180,000; and at present it amounts to about 307,000. Notwithstanding the city is surrounded on all sides with water, and that the greatest care and attention are required to prevent its being submerged, it labours under a total want of spring water. The water in the river and canals being filthy, brackish, and totally unfit for use, the inhabitants are partly supplied by rain water carefully collected in tanks, and partly by water brought in a peculiar description of barges from the Vecht, 6 or 7 m. distant. It is curious that despite this want of good potable water, the humidity of the atmosphere, and the effluvia generated in warm weather from the water of the canals, the town is free from epidemic disorders, and the inhabitants healthy and robust. Most probably this is owing in a considerable degree to the comfortable mode of living of the bulk of the people; the prevalence of cleanliness, in which the Dutch are superior to all other nations; and the absence of extreme poverty and destitution.

The toleration that prevails at Amsterdam, does equal honour to the people and the government. There is here every variety of sects; but they are distinguished by nothing so much as by their abstinence from theological discussions, and by their apparent respect for the opinions of others. "It must not, however, be inferred that the toleration existing here and in the rest of Holland—a toleration perfect in fact as well as in law—has its origin in any degree of apathy with respect to religion, or in any irreligious tendencies on the part of the people; such a conclusion would be utterly erroneous. Generally speaking, the Hollanders, whatever may be their particular religious profession, are firm believers, and devoted to the practice of piety. This virtue pervades all classes of society in Amsterdam." Hence, notwithstanding the defects of its climate and situation, Amsterdam is a most desirable place to many persons. For ages it has been a "city of refuge" to the oppressed and persecuted of all nations; and therein lies one of the main causes of its wealth and prosperity.

The city police is well regulated, and robbery and house-breaking are of rare occurrence. A drunk person, or one in rags, is a very unusual sight. No loose women are permitted to infest the streets; which are, also, quite free from beggars. The disgusting dens of profligacy, known by the name of *spiel* houses or *musicas*, still exist; but they are frequented by few, except the dregs of the populace.

In every part of Holland, but nowhere more than at Amsterdam, do we find proofs of the astonishing power of industry, industry, and perseverance. This great city is not

## AMSTERDAM ISLAND.

merely built in a marsh, but is constantly exposed to the risk of being overwhelmed by the influence of high tides and storms. But this danger has been effectually provided against; and the waters by which the city is all but surrounded, and which penetrate every one of its streets, are under complete control, and made to contribute to the comfort and accommodation of the inhabitants. The works necessary for the public safety and protection require, however, to be watched over with unceasing vigilance; and a large annual expenditure is incurred in keeping them in good repair, and in dredging and clearing the port and canals.

It is a curious fact, that notwithstanding the superabundance of water, there is not, owing to the fatness of the soil, a single water-mill in Holland. There are, however, immense numbers of wind-mills, employed frequently to pump up water from the low grounds, as well as to grind corn, crush seeds, &c. There is a large wind-mill on every one of the bastions by which Amsterdam is surrounded.

Amsterdam has been sometimes called the Venice of the North; and in respect of situation, number of canals, and the magnificence of the public and private edifices, it certainly bears a very striking resemblance to the Venice of the South. But each of these great cities has, notwithstanding, a perfectly original and distinctive character.

In the 13th century, Amsterdam was only a small fishing village; in 1483, it was fortified. At the outset of the revolutionary struggle with Spain, the Duke of Alva having expelled the Protestants from the city, and committed the government to zealous Catholics, it supported for a lengthened period the cause of the Spaniards; and it was not till 1578 that it joined the confederation. From this epoch it began rapidly to increase. The most complete toleration being granted to all sects, it became an asylum for those driven by persecution from the other towns of the Low Countries and elsewhere. The closing up of the Scheldt, in 1648, transferred the greater part of the trade of Antwerp to Amsterdam, and raised the latter to the highest pitch of prosperity. (*Dict. Géographique, art. Amsterdam*; *Baltic*, 3d ed.; *Barrow's Family Tour through S. Holland*, &c., p. 92-133; *Murray's Handbook for N. Europe*; *Mculloch's Commercial Dictionary*; *Chamber's Edinburgh Journal* for 1838, &c.)

AMSTERDAM, p. L. Montgomery co., N.Y., 32 m. W. Albany, 400 W. Bounded S. by Mohawk river. The village is situated on the N. side of the river, and contains four churches, one Presbyterian, one Baptist, one Methodist, and one Universalist; a bank, an academy, with 130 students, a female seminary, fourteen stores, two grist-mills, two furnaces, a carpet factory, a scribe and other manufactories, a printing-office, 250 dwellings, and about 1700 inhabitants. There are in the town, including the village, fifteen stores, two flouring-mills, four grist-mills, ten saw-mills, one fulling-mill, one distillery, one brewery, seven schools, 367 scholars. Pop. 5333.

AMSTERDAM ISLAND, a small but remarkable island in the S. Indian ocean, lat. 37° 47' S., long. 76° 54' E., being 4½ m. in length, by 2½ in breadth, and 700 feet high. It is obviously of volcanic formation. A large portion is occupied by what has undoubtedly been a magnificent crater; but the sea having made an irruption into one of its sides, it is now converted into a circular harbour, the only accessible one in the island. The surface is everywhere light and spongy, and in parts burning hot. There are several hot springs, having temperatures varying from 80° Fah. to the boiling point; with the exception of a single chalybeate spring, having a temperature of 119°, all the springs in the island are brackish. Some of the hot springs are so near the water's edge, that it is no exaggeration to affirm that fish taken with the one hand may be boiled with the other! The surrounding seas swarm with various species of fish, particularly with crayfish. No trees or other fruit-bearing plant, nor quadrupeds, nor land-birds, are found on this island; but it is resorted to by vast numbers of sea-birds. Seals and sea lions abound on its shores and in the adjoining sea, which makes it be occasionally visited by ships engaged in the seal fishery. It was discovered by a Dutch navigator, Van Vliaming, in 1693, and was visited by Mr. Barrow in 1793. (See the *Voyage of the latter to Cocks China*; and the *Philosophical Transactions*, vol. xx.)

AMSTERDAM, New, a town and harbour of S. America, English Guiana, near the m. of the Berbice river. Pop. 1600. Being founded by the Dutch, it is built in their fashion, and intersected by numerous canals. The private houses are mostly of wood, covered with bamboo leaves, but the government offices are of brick, and handsomely built. The entrance to the river, in lat. 6° 30' N., long. 57° 11' W., is defended by three forts. There is only seven feet water on the bar at low ebb. The canals being filled and emptied by the flow and ebb of the tide, all impurities are swept off, and the health of the town is preserved notwithstanding the heat of the climate. (*American Coast Pilot*.)

AMTZELL, a village of Wirttemberg, circ. Danube. Pop. 2120.

## ANAM.

AMWELL, t., Hunterdon co., N.J., 16 m. N. Trenton. Watered by the S. branch of Raritan river and its tributaries. It contains two Presbyterian churches, sixteen stores, nine grist-mills, six saw-mills, one oil-mill, one woollen factory, six distilleries, one brewery, eleven schools, 331 scholars. Pop. 3671.

ANWICK, t., Washington co., Pa., 10 m. S. Washington b. Bituminous coal is abundant. It has two stores, two saw-mills, four distilleries, ten schools, 300 scholars. Pop. 1536.

ANACAPRI, a town in the N.W. corner of the island of Capri, in the gulf of Naples, on the N. side of mount Solaro, nearly 9000 feet above the level of the sea. Pop. 1800. The ascent to it is very steep, and is effected by a stair of 559 steps, called *la scalinata*. It has a church, a convent, and a castle in the neighbourhood; there are also two ancient towers, and the remains of some edifices, ascribed to Tiberius. The prospect from the castle is extensive, and singularly rich and beautiful, commanding the Tyrrhenian sea, the gulf of Naples, Vesuvius, &c. The inhabitants are said to be much attached to the situation; and some, it is affirmed, have never descended *la scalinata*.

ANAGNI, a town of the Papal States, 36 m. E. by S. Rome. Pop. 5500. It stands on a hill, and has a very fine prospect; but its interior is mean and miserable. It is the seat of a bishopric, founded in 487.

ANAM or AN-NAM (EMPIRE OF), a country of Asia, occupying the E. portion of the great E. peninsula of S. Asia, or India beyond the Ganges, comprising Cochin China and Tonquin (to which only the name of An-nam properly belongs), with the E. and S. part of Cambodia, and many small islands in the Chinese sea. It lies between 8° 45' and 33° 32' N. lat., and 103° to 109° E. long.; having N. the Chinese provinces of Quang-tong, Quang-ai, and Yun-nan; W. Laos and Siam; and in the rest of its extent, the ocean. It is 965 m. in length, varying in width from 415 m. to 80 m. Area, probably about 98,000 sq. m. (*Crossfield*). Pop. variously estimated at 15 to 15 or 20 millions! The lowest estimate, which is that of Mr. Crawford, is probably the most accurate.

The country is subdivided as follows:

1. **Cochin China** (called Dang-traoing, or Central country).  

| Province.                                                          | Chief cities.                                                             |
|--------------------------------------------------------------------|---------------------------------------------------------------------------|
| Bao-tien, Nha-trang, Phu-Yen, Qui-choan, Quang-ai, Quang-nam, Huu. | Huu, the capital (pop. 60,000, <i>Crossfield</i> ), Tuen, <i>Pai-Si</i> . |
2. **Tonquin**. (Dong-kiuh, External country).  

| Province.                                                                                                                                                      | Chief cities.                                                  |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Ke-cho, Ting-long, Wait-ah, Sang-mi, King-pai, Sing-Kwang, Hing-wha, Koping, Loong-nam, Ching-wha, La-nan ist, La-nan ist, Hai-yong, Aw-dwong, Man-sing-choan. | Ke-cho (Cochao), 150,000 inhabitants. Huu, 30,000 inhabitants. |
3. **Cambodia** (called Ko-men by the natives).  

| Province.                                                  | Chief cities.     |
|------------------------------------------------------------|-------------------|
| Yi-tung, Sing-fong, Po-nan, Wui-chung, Ho-sin, Yang-chang. | Sai-gum, 100,000. |

(*Crawford, Journal of an Embassy*, &c., 4to, Lond. 1823, p. 458, 459, 464; *Chapman's Voyages*, &c., in the *Asiatic Journal*, vol. xii. (1823), p. 120; *Baltic*; *Adrien, Abrégé de Géographie*, 3d ed. 8vo, Paris, 1837-4, p. 768, 769.)

**Mountains.**—The principal chain, an offset from the Himalaya range, runs through the central and southern parts of the country, forming the W. boundary of Cochin China, and the E. one of Laos and Cambodia, and terminates at Cape St. James, in lat. 10° 10' N. Between this range and the sea, Cochin China consists of a succession of others, gradually decreasing in height as they approach the shore, and inclosing a great number of fertile valleys. These mountains have not been measured by Europeans. The summits of the principal chain are acuminate, sterile, and most probably granitic; but their steep sides are clothed with extensive forests, and the inferior ranges are often cultivated nearly to their tops. (*White's Voyage to Cochin China*, p. 73; *Finlayson's Mission to Siam and Huu*, p. 325.)

**Plains.**—Tonquin and Cambodia are both immense alluvial basins of great fertility, and traversed by large rivers; in addition to these, there are a few small flats around the mouths of the rivers in the central provinces. The plain from the mouth of the Oubouemme to Cape St. James is but little above the level of the sea, and subject to inundation at every spring tide.

**Rivers.**—The Menam-kong, or river of Cambodia, is one of the largest in Asia; it rises in the Chinese province of Yun-nan, is joined by some large streams from Tibet, and running nearly due S. through the centre of Laos and Cambodia, forms, for some distance, the W. boundary of the Anamese dominions, and discharges itself in lat. 9° 35' and 10° 15' by two principal mouths (the farthest N. being called the Japanese river, the S. one the Oubouemme), and by many smaller ones. The Sang-koi (*Balti*) or river of Tonquin, has a shorter course; it rises in the mountains of Yun-nan, runs mostly S. E. through Tonquin, passing by Ke-cho, and falls into the gulf of Tonquin by two principal mouths, between 90° and 91° N. lat. Both these rivers, as well as that of Sai-gum (which is ½ of a mile in width near that

city), have deltas at their mouths: they are navigable generally for large ships; but, owing to sand banks at both its mouths, it is reported that the Tonquin river is available to none above 300 tons burthen, though Crawford doubts this statement as respects the N. mouth. (*Crawford, Journal, &c.*, p. 450-462.) There are several other considerable rivers in Tonquin; as the Li-Sing-Kiang: along the Cochinchinese coast they are all much smaller, and with a shorter course; the river of Hué (on which the capital is situated) is one of the most considerable, has a fine estuary, and is navigable by vessels of 300 tons burthen. (*White, Voyage, p. 188-231.*)

**Lakes.—Harbours.**—Europeans have described no lakes of any magnitude; but the shores of Cochinchina abound with some of the finest harbours in the world. From cape St. James to the bay of Turon, there are no less than nine of these, safe and accessible with every wind: that of Turon, in the opinion of Mr. Crawford and others (though not in that of M. de Bougainville), is not surpassed by any in the East.

**Coast and Shores.**—The coast here is generally bold, and presents many promontories, like that of cape St. James, which is 300 feet in height; the precipices occasionally alternating with a narrow sandy beach. The anchorages are everywhere good; but at no great distance from the shores, sand-banks and rocky islands are often very prevalent.

**Geology and Minerals.**—The primitive rocks, of which the principal mountain chain is almost wholly composed, are granite and syenite: the lower hills contain quartz, marble, and mountain limestone. In the S. provinces, the granite is seamed in every direction; on the rounded sides of the hills it alternates with syenite, and both rocks are penetrated by veins of iron ore: near Hué, all the hills are granitic, and their peaks in the highest degree sharp, rugged, and uncovered. There is a great diversity of upper soils in the valleys; some being dry, friable, and sandy; others of a stiff clay. The soils of the central provinces are however mostly sandy: those of Tonquin and Cambodia are, as already stated, alluvial. Around their shores there are extensive and fertile mud-flats.

Tonquin is the only part of the empire rich in metals; it produces large quantities of gold, silver, copper, and iron: with the latter it supplies all the country except the most S. part. Its mines are worked by Chinese, and about 100 piculs (or 17,800 lbs. Troy) of silver are produced yearly. Cochinchina has no metallic wealth: silver only is said to be found at Cape Avarella; Cambodia is poor in metals. It produces iron, but in inadequate quantity for its own use, and it is therefore imported from the neighbouring countries to the W. of it: the central provinces yield salt. (See *Crawford, p. 473*; *Finlayson, p. 304, 330-351*; *Asiatic Journal, vol. xix., p. 194.*)

**Climate.**—Is generally fine and healthy, the heat being tempered in the maritime districts by the sea breezes; in the winter it is even cool in Cochinchina, but in Tonquin the heats of summer are excessive, and the cold of winter proportionally severe. At Hué, M. Chaigneau, who resided there for some time, reports that the greatest heat of summer was 103°, and of the cold of winter 57° F. During the wet season of August, Mr. Crawford found that the thermometer in the shade ranged in one day from 79° to 89° F. at Sai-gon. In the S. the seasons follow the same order as in Malabar, Bengal, and Siam; viz., the rains prevail with the S.W. monsoon from May or the beginning of June, to September: the same takes place in Tonquin. But in Cochinchina, between 11° and 18° N. lat., the rains set in with the N.E. monsoon, and last from October till March; the high mountain range protecting this country from wet weather by intercepting the clouds at the converse season of the year. The general height of the barometer at Hué is 29.83". Immense inundations last sometimes for three or four days at a time: Tonquin is subject to heavy fogs and violent hurricanes. (See *Crawford, p. 470*; *Chapman's Voyage, in the Asiatic Journal, vol. iv., p. 125.*)

**Vegetable Products.**—The forests of Cochinchina produce a variety of scented woods, as sandal, rose, eagle-wood, &c. The true cinnamon (*Laurus cinnamomum*) is indigenous to this country, and valued by the Chinese more than that produced in any other: it is found wild chiefly in dry and sandy soils. The banks of the Sai-gon, and the other large rivers, are thickly covered with jungle; among which are teak, iron-wood (*Syzygium*), a kind of Calophyllum, as straight as a Norway fir and well adapted for ship's masts, mangrove, &c. In the forests of Cochinchina, cedar, walnut, peltay, cocoa, areca, betel, bamboo, rattan, ebony, and most of the products of British India. Cambodia yields gamboge, the finest cardamoms, aniseed, areca, indigo, &c.; the central provinces, pepper, and two sorts of sugar cane; Tonquin, many kinds of varnish trees, areca palm, &c. Cotton, rice, and the mulberry tree are almost universal. Among the fruit are oranges of a blood-red pulp and delicious flavour, bananas, figs, pomegranates, pine-apples, guava,

vas, mangoes, shaddock, lemons, limes, plantain, yam, &c. Ginger, and spices of various sorts, are also indigenous. An inferior sort of tea, with a leaf twice or thrice as large as that of Bohea, grows wild in the hilly parts of Quang-ai, and is sold at from 6 to 20 quans (300 to 1000 cents), the picul (133½ lbs.). (*Crawford, Journ., p. 474-476*; *Barrow, Voyage, &c.*, p. 341-346; *Asiatic Journ.*, xix., p. 123, 124; *White, Voyage, p. 150, 200, 210.*)

The cocoa-nut tree, next to the bamboo, is the most useful of any. The trunk is used for house and ship building; the husk produces cordage and cables superior to any other; the leaves are used for roofing, and for making paper, and wicker work; the oil for lamps and painting; the shell for cups, &c.; and the nut furnishes both food and drink.

**Scenery.**—The interior of Cambodia has been little explored by Europeans, but its surface is believed to be covered, in great part, with extensive forests. The banks of the river Sai-gon are covered with mangrove trees, and no cultivation appears until within from 30 to 30 m. of that city. *Bien-thuan*, the most S. province of Cochinchina, extends to about 13° N. lat., and is most remarkable for its soils. *Nha-trung*, which succeeds it, is an elevated and ill-cultivated region, but produces silk. *Phu-yen*, which reaches as far as lat. 14°, is the richest and the most highly cultivated and peopled province of all: it is full of fruitful valleys and gently undulating hills, on which rice is grown in terraces, almost to their summits, and bounded W. by lofty mountains, crowned with towers and pagodas, or having their pinnacles enveloped in fleecy clouds. *Qui-nhon* is a province of great extent, and well cultivated: *Quang-ai* and *Quang-nam*, extending from 14° N. to nearly 17°, are almost exclusively the countries of the sugar cane and the tea tree. The banks of the river of Hué, though beautiful, are more indebted to art than to nature; they abound in ornamental gardens, laid out among groves of coconuts, areca, banana, and bamboo, and rows of hibiscus. At Turon, and in most of the N. of Cochinchina, there is a degree of sterility not met with in the S.; but the whole country is apparently inferior in fertility to that of Siam. Tonquin has been very imperfectly examined by Europeans, but is the most populous province; therefore, most probably, of superior fertility and cultivation. (*Crawford, Journ., p. 460, 461*; *Finlayson, p. 290, 340*; *White, Voyage, p. 74*; *Arrowsmith's London Atlas.*)

**Animals.**—The elephant, rhinoceros, tiger, leopard, buffalo, bear, horse, deer, goat, &c., are natives of Anam. There are no jackals nor foxes; nor hares, but a profusion of other kinds of game. Great numbers of monkeys and baboons are found in the woods: one large and powerful species seems to be peculiar to Cochinchina. The dog and cat, which are also natives, are domesticated: elephants are used in war. Peacocks, parrots, and a variety of birds of the richest plumage, inhabit the forests; curlews, plovers, &c., the shores; and aquatic birds of all descriptions, the rivers. Alligators inhabit the larger rivers; the cobra-de-capelle, and several other large and venomous serpents, infest the country. The seas abound with an inexhaustible supply of fish, and afford subsistence to a large portion of the population; among the species are the flying-fish, scorpion-fish (remarkably and beautifully variegated), mango-fish of Bengal, &c., with soles, mullets, and many others familiar to us; shrimps and crawfish are very fine; and molluscs, in large quantities, are taken for food. Mosquitoes and other insects abound in great quantities. (*Crawford, Journ., p. 473, 479*; *Barrow, Voyage, p. 312*; *Finlayson, p. 411*; *White, Voyage, p. 63-191, 257-311*; *M. de Bougainville, Journal de la Navigation autour le Globe, 2 vols. 4to, Paris, 1837, vol. i., p. 363.*)

The People consist of several races: 1. the Cochinchinese, Tonquinese, who are similar in person, and most of their habits and customs, to the Chinese; 2. the Cambodjans, in physical qualities, manners, &c., more resembling the Siamese; 3. the *Mot* race, inhabiting the mountainous country between Cochinchina and Cambodia; believed by some to have been the aborigines, said to be black like the Caffres, and in a savage state. Besides the native races, there are 25,000 Chinese, who work the mines and trade in metals in Tonquin, and many others who are settled in the commercial towns, but mostly in the N. provinces; the other strangers are chiefly Malays, about 5000 in the S. parts of Cambodia, and Portuguese. (See *Crawford, p. 464-470*; *Asiatic Journ., iv., 340.*)

**Physical Qualities.**—According to Mr. Finlayson, the majority of the inhabitants are of Malay origin.\* He observes, "that the men average 5 feet 2½ inches in height, which is below the ordinary standard of the Malays and Siamese; they are less bulky and clumsy than the latter, but of a somewhat squat figure. Their upper extremities are long, their lower ones short and stout; they are not fat; their muscular system is large and well developed. Head and

\* Mr. Finlayson was a surgeon, who accompanied Mr. Crawford in his embassy in 1822, and, as an anatomist, his opinion is deserving of the greatest attention.

face both nearly round; the longitudinal and transverse diameters of each being nearly equal; forehead short and broad, cheek-bones wide, but not particularly salient, chin large and broad; but the *coronoid process* of the lower jaw has not the fulness apparent in the Malays and Siamese, and the affinity in this respect to the Tartar race is still less. Eyes rounder and smaller than those of the Chinese and Siamese, more lively and intensely black; lips moderately thick; hair on the scalp copious, black, and coarse; beard grizzled and thin, and no hair on the cheeks. The colour of the skin is olive, and very often, especially in the females (who are sometimes really handsome), the complexion is no darker than that of the inhabitants of the S. of Europe." (See *Finlayson*, p. 298, 374-375.) They are intelligent—without much originality or invention; but exhibiting a very great aptitude for imitation. Of their disposition, such conflicting statements have been made by those who have experienced either a handsome or unhandsome reception from them, that it is difficult to come to any conclusion. They are sprightly, animated, good-humoured, and altogether destitute of the solemn reserve of the Chinese; always laughing and chattering, volatile, capricious and changeable, vain, and endowed with considerable national pride. Crawford and Finlayson say that they are mild, docile, and inoffensive; (no travellers have accused them of ferocity;) affable, kind, and attentive to strangers; and the lower orders not rapacious, although a despotic, illiberal, and avaricious government has unquestionably made all within the influence of the court the most arrant thieves. In their manners and behaviour, the Anamese are polite and graceful; but punctilious and ceremonious. (*Ibid.*, p. 296-299, 374, 383, 384; *Crawford*, p. 461, 493, 499; *White, Voyage*, p. 299; *Barrow, Voyage*, p. 297.)

**Occupations, &c.—Agriculture.—Rice.**—Rice, which is here the "staff of life," forms the main article of culture. There are six different sorts grown; two on the uplands, used for confectionary, and yielding only one crop annually; the other sorts yield from two to five crops a year; but generally two, one in April, and another in October; or three, where the inundations have been profuse. Maize, cotton, yams, sweet potatoes, pulse, and fruit, are the other articles of general culture.

**Sugar.**—The sugar-cane is cultivated by the Cochinchinese only, and a very inferior, dark, clayey produce obtained. Most of the cinnamon that is exported is cultivated; tobacco, capaicum, pepper of a very good quality in the central provinces, are other chief objects of tillage: no coffee is grown, except in a few gardens near Hué.

**Silk.**—Raw silk is produced in large quantities in Tonquin and Cochinchina. The ground is but indifferently tilled; near Sai-gon, it is in many small patches of about half an acre, the rice grounds being bounded by ditches. Agricultural labour is almost wholly performed by women; they guide the plough, which is drawn by a buffalo, plant the rice, build and repair the cottages, &c., and are entrusted with all the household concerns. Their pay, as well as that of labourers of the other sex, is one mass a day with food, or two mass without it. (*Barrow*, p. 301, 315, 316; *White, Voyage*, p. 193-202; *Crawford*, p. 474-476, 533; *Finlayson*, p. 294-295.)

**Cattle Breeding.**—The buffalo is domesticated, and is useful in agriculture; the ox is of a small reddish-brown kind, but not used as food, beef not being commonly eaten: a small species of goat is kept; but sheep are very rare and extremely inferior. The hog is a very favourite animal; the breed is the Chinese, and remarkably fine: at Hué, hogs are always stall-fed, and seldom suffered to roam at large. The horse, of an inferior breed, is used only for riding, being unfit for cavalry service: there are neither asses nor mules.

**Poultry.**—Poultry, in large numbers, are kept everywhere: those at Sai-gon are said to be among the finest in India; geese are not so common as ducks or fowls; the game-cocks are trained for fighting. (See *Crawford*, p. 473, 479; *Barrow*, p. 310; *White*, p. 250-254.)

**Food, &c.**—The diet of the people is to European ideas often gross and disgusting in a high degree. Rice, legumes, and fish, form the chief part of their food; but dogs and alligators' flesh, rats, mice, worms, frogs, and other reptiles, maggots, centails, and putrid meats, are among their favourite dishes. Pork, boiled ducks and fowls, boiled and stewed yams, and sweet potatoes, sugar-cane, fruit, and much confectionary, compose great part of the rest, and tea, and rice-whisky (of which a great deal is drunk), compose their usual beverages; fish-pickle is their favourite condiment, into which nearly every morsel they eat is plunged; elephants' flesh is eaten only by the sovereign and nobility. Milk is not used at all, and eggs are not valued until they are rotten, or nearly hatched. They take two meals a day; one at nine or ten o'clock in the morning, the other at sunset. These they take in the open air, generally in front of their houses, and eat with chop-sticks tipped with ivory or metal, porcupine quills, and a pottery spoon.

**Habits.**—The tobacco that is grown is all used in this country; all the men smoke, and, as well as the women, chew betel and areca, which either they or their attendants (if rich) always carry with them in boxes or large purses for the express purpose. In their persons they are extremely dirty, notwithstanding their frequent ablution: their under garments are never washed nor changed until they drop to pieces; their nails are never cut; their length being an indication of rank.

**Diseases.**—The country they inhabit is healthy enough; but their habits engender leprosy, scurvy, erysipelas, and scrofula; the diseases owing to the climate are mostly of a febrile and intermittent character. (See *Barrow*, p. 297-316; *White*, p. 296-297, 295; *Finlayson*, p. 300; *Crawford*, p. 437, 488; *White*, p. 36, 84-86, 300; *Bougainville*, vol. I., p. 261, 262.)

**Arts and Manufactures.—House-building.**—The inferior dwellings consist of mud walls, thatched or covered with bamboo leaves; the better sort of houses are of wood or brick, and tiled, but the bricks are only baked in the sun, and glazed windows are unknown. The huts of the peasants near Sai-gon consist of wattled floors, raised about 3 or 4 feet above the ground, and contain two or three compartments, one of which is a common room; in the others the family sleep on mats on a kind of raised platform, ranged around the walls. A superior residence, visited by Mr. White, was 30 feet in length by 25 broad, consisting of one story, the sides of wood and bamboo frame-work. The roof of bamboo leaves projected 10 feet, and screens of matting were attached to the eaves. Under this verandah was the general parlour; inside the walls a corridor ran all round the building, inclosing a stack of dormitories in the centre; at one extremity of the house was a large kitchen, furnished with a huge wooden pestle and mortar for grinding rice, several small fire-places of rough stones, and a small platform where meals were taken. The ordinary furniture of a cottage consists of a coloured matting for the floor, an earthen stove, an iron rice-pot, and some very rude porcelain and other earthenware articles. (See *Barrow*, p. 310-316; *White*, p. 177-223; *Finlayson*, p. 300-350.)

**Ship-building.**—The art in which, above all others, the Cochinchinese excel is that of ship-building. Their vessels, the construction of which, were it not for their rude materials, would not disgrace Europe, are built of from five to one hundred tons burthen, but mostly between sixteen and thirty tons; sharp at either end, and the deck  $\frac{1}{2}$  longer than the keel. Their bottoms mostly consist of wicker-work, covered on the outside by a coating,  $\frac{1}{2}$  inch thick, of galgal, a close and durable mixture of pitch, oil, lime, &c. The sides and deck are bound together with cross-bulk heads, and as the larger vessels usually belong to a joint-stock company of merchants, there are as many separate holds as owners. The fishing boats and others, 50 feet in length, are made of five long planks extending from stem to stern, their edges mortised, tightened with wooden pins, and bound together by twisted bamboo fibres: at each end they are raised much higher, and painted, gilded, and ornamented with figures of dragons and serpents. They often carry a covered cabin, built like a house upon the deck; from one to three sails of matting, which in the N. provinces are often square and more like those of Europe; a wooden anchor with one fluke, shrouds and cables of rattan, and cordage of coir. During the unfavourable monsoon, the boats are taken to pieces, and the larger vessels drawn up on shore to some distance. The mode of rowing is by pushing, and not pulling, the oars against the water (*White*, p. 209): when there are many rowers, they push in regular succession, beginning with the one at the stern. The government rowers, who are selected from the army, are paid but 1 quan per month; the boats that ply for hire are chiefly conducted by women; but the very unfair and ungalant custom prevails, that the men pay no fare, they being all supposed on government service. They have no wheeled carriages; but people of distinction are carried in a palanquin, formed of a cotton net hammock, with a mattress and pillows inside, covered by a large varnished canopy, in form like a tortoise-shell; the whole slung upon a long pole, and carried on the shoulders of two, four, or six men. (See *White*, p. 213-253, 319; *Barrow*, p. 317; *Finlayson*, p. 314-409.)

In most manufactures the Anamese are very far behind, and are superseded by the Chinese, from whom they derive most of their useful articles. Sword-handles, with very good flint-glass work, boxes of lacquered ware, inlaid with pearl or gold, purses, matting, baskets, coarse silk, and very durable cotton stuffs, bells, cannon, iron nails, scissars of a rude kind, varnish, &c., they can make; but they cannot temper iron or steel, print calico, or make a matchlock, and depend for all their arms on European nations. (*Crawford*, p. 422; *Finlayson*, *Mission*; *White*, p. 261; *Barrow*, p. 317.)

**Trade.**—The Chinese are the butchers, tailors, confectioners, bankers, money-changers, and pedlars of the empire.

## ANAM.

and are met with in all the towns with an elastic pole across their shoulder, and at either end a basket containing their wares. In the bazars, gilt paper, fans, porcelain, drugs, and other China produce, tools, necessities of life, and the other articles yielded by the country, are sold. Provisions are cheap. Mr. White found that at Sai-gon, pork was 3 cents per lb.; beef, 4 c. (American); fowls, 50 cents per dozen; a fine deer, 1½ dollar; rice, a dollar a picul (133 lbs. Eng.); shaddocks and lemons, 50 c. per hundred; oranges, 30 c. per hundred. Tea of Hue is sold in boats on the rivers, as well as varnish, which, with other combustible matters, is not allowed to be kept on shore, and the varnish merchants live constantly in their covered houses, built on bamboo rafts. The foreign trade is comparatively trifling, and almost wholly with the Chinese; very little with the Siamese or Europeans. (Finlayson, p. 371; White, p. 212-227, 250-261; Crawford, p. 510.)

**Exports.**—From 20,000 to 60,000 piculs of sugar; 250,000 to 300,000 lbs. of true cinnamon not freed from its epidermis, at 50 to 60 quans per picul; 3000 piculs of aniseed from Cambodia; raw silk at ¾ to 5 quans the cattay (2½ lbs.), 900 piculs from Fai-fu, 60 p. from Hue, and 1000 p. from Ca-chao annually; cottons superior to those of Bengal; areca, spices, cardamoms from Cambodia, hops' lard, scented woods, rice, edible birds' nests, and molluscs, and the precious metals, are exported to China; gamboge, red dying wood from Tonquin, ivory, pearl, horns, hides, gum-lac, gold-dust, and other metals in smaller quantities to other parts of the world. When Barrow wrote, sugar at Turon fetched 3 dollars, pepper of Cochinchina, 6 to 8 dollars, and rice half a dollar the picul of 133½ lbs. British manufactures then sold usually at 30 to 35 per cent. profit, and were paid in silver ingots. Ke-cho was formerly the centre of the eastern trade, and at the end of the 17th century the English and Dutch had factories there, whence they exported largely.

**Imports.**—The imports are chiefly manufactured silks, porcelain, drugs, a great quantity of gilt paper, and fine teas for the upper classes, with household, &c., utensils from China; spices, sandal-wood, and tin, from Malay; opium (which is however prohibited) from India, 150 chests annually, two thirds of which are consumed in Tonquin; cottons from Canton and Singapore (but none of a variety of colours in the same place, nor chinizes); British woollens, chiefly scarlet, some yellow or green, and all coarse; a few serges, and camlets, iron and arms from Europe; but altogether amounting to very little. The China trade is chiefly in Ke-cho, Sai-gon, Hue, and Fai-fu, but the whole scarcely amounts to 90,000 tons annually, being little more than half the Chinese trade with the single city of Bangkok in Siam.

**Canals.**—The transport of goods between Ke-cho and Hue is facilitated by a canal, 180 miles in length, 90 yards in breadth, and almost straight; said to be constructed by the reigning monarch in 1815: near Hue it is used for irrigation as well as conveyance. (Crawford, p. 473-477; Asiatic Journal, xix. (1835), p. 194-196; Barrow, p. 340; Finlayson, p. 404; White, p. 510.)

**Weights, &c.**—The picul is about 133½ lbs. Eng., and divides into 100 catties, each equal to 1½ lb. Eng. A bag of rice weighs 50 catties.

**Money.**—The current coin is the sepeck, cast at Ke-cho, of a compound brittle metal, called *tsen-kuang*, the base of which is zinc. It is about the size of a shilling, and pierced with a square hole; by which they are strung in numbers together, and as they are the only coin used, they form a very bulky and inconvenient medium. Accounts are thus reckoned: 60 sepecks = 1 mas (5 cents), 10 mas = 1 quan (50 cents), the two latter units are imaginary. A Spanish dollar is valued at 1½ quan; an ingot of silver, at from 97 to 98 quans; there are also gold ingots of the same and of double value, but the currency is subject to very capricious and rough changes. (See White, *Voyage*, p. 257-259; Crawford; Chapman's *Voyage in Asiatic Journal*, iii. (1817), 543.)

**Public Revenues** are derived from—1, a capitation tax of 1 and 1-10th quan, paid by every male above 15 years of age; 2, a land-tax; 3, the crown lands, which are farmed by different tillages; 4, various contributions, imports on foreign trade, &c. These imports are small, and there is none on exported sugar: those in the service of the government are exempted from them. The king has monopolies of gold-dust, ivory, and rhinoceros' horns. (See Crawford, p. 490; White, p. 250-257.)

**Government** is an hereditary military despotism, in which, however, primogeniture is more attended to than legitimacy. The sovereign has the title of emperor. The central administration under him is conducted by six mandarins, ministers who have charge of the archives, religion, justice, war, finance, and woods and forests. Besides these, the viceroys of Tonquin and Cambodia, and the *Mandarin of Elephants*, who is prime minister, and minister of foreign affairs, have seats in the supreme council. Each province

is divided into three departments, called *Ho-yen*; each *dept.* into three or four districts, called *Tsu*. The provincial governments are under a viceroy of the 1st class of mandarins (or military class), who has two civil mandarins under him; each *Ho-yen* is governed by two, and each *tsu* by one civil mandarin: the villages are governed by officers elected by the peasantry, who are answerable for the taxes of their constituents.

**Ranks, &c.**—All rank is official, and, although in part hereditary, descends a step in each succeeding generation. Each functionary has power to inflict punishment on all inferior to him in rank, and unlimited obedience to this power is displayed among all classes. (See Crawford, p. 490; Finlayson, p. 361; White, p. 264-279; Asiatic Journal, xix., p. 126.)

**Army.**—The royal guard consists of 30,000 men and 800 elephants, besides the provincial troops, the number of which varies. All males are liable to serve, and one out of three is generally a soldier. There is continually a levy of those between seventeen and twenty; and those who are obliged to serve, cannot leave the army till age or infirmity compel them. They are in active service for three successive years, and then have leave of absence for the three next, which they spend with their families, employing themselves in the tillage of a small allotment of land granted by government to each. The standing army was formerly 150,000 men; but when Crawford visited the country, it was only between 40,000 and 50,000 men. Finlayson says, "they are robust, smart-looking troops, clothed in British scarlet woollens, sometimes turned up with blue or yellow, and wear a conical helmet of basket-work, lacquered and gilt: their other arms are swords, muskets with bayonets, shields, and long spears, decorated with a tuft of red horse hair. Their cartouche boxes, and other accoutrements, bear a similarity to those of Europe, the defensive arts of which, discipline, &c., were introduced by the French during the last century, who once supplied them with 10,000 stand of arms. Much progress was made in military affairs by the Cochinchinese, and the late king cast a number of cannon. Hue, Sai-gon, and some other cities, are strongly fortified. (Crawford, p. 491, 492, &c.; Finlayson, p. 343, 344; White, p. 266.)

**Navy.**—consists of about 200 gun-boats, carrying from sixteen to twenty-two guns. 100 large galleys of from fifty to seventy oars, with several small swift galleys, and a twelve or twenty-four pounder at the prow, and 500 smaller galleys somewhat similarly armed. The seamen are classed in regiments the same as land troops, six of which are on duty at the capital, and one at each of the other principal ports. (Crawford, p. 492.)

**Religion.**—Of the mass of the people is a species of Buddhism; the upper orders follow the religion of Confucius. Christianity was introduced in 1624 by the Portuguese Jesuits; and there are about 425,000 Christians in the empire (Crawford), viz.: 300,000 in Tonquin, 100,000 in Cochinchina, and about 25,000 in Cambodia; but they are the most abject of the population, and possess no political weight whatever. The religion of the Anamese does not affect their morals or mode of life. Its ceremonies seem to consist in offering first fruits, scented woods, &c., to idols, in burning great quantities of gilt paper at certain times, sticking inscriptions on posts, trees, and houses, and carrying about phylacteries and other sacred objects. The Cochinchinese are very superstitious, and endeavour to appease the evil spirit more than they venerate the beneficent one. They have pagodas, and a *penthouse*; but their idols and temples are most commonly an image of the Chinese god Fo, inclosed in a small house of wicker-work, hung up in a tree, or elevated on four long posts, and approached by a ladder. Their priests are few, and but little respected by a people who treat many of their gods with contempt. In Chiampa (*Triam*), the S. part of Cochinchina, Indians and not Chinese gods are the objects of worship. (Barrow, p. 398-331; Crawford, p. 487-490, 492; Finlayson, p. 399; White, p. 50, 512, 575-577.)

**Morals.**—Mr. White observes, that theft is universal, and murders not uncommon. All travellers agree in the want of chastity among unmarried females; their open prostitution neither degrades them in public opinion, nor prevents their becoming married, after which, however, a strict watch is kept over them. (White, p. 391, 392; Finlayson, p. 300.)

**Jurisprudence.**—The police of the villages and the laws are administered by the village chiefs already spoken of; in the towns, one of the principal inhabitants of each street is chosen by the rest as *head of the street*, and is answerable for the good behaviour of all the rest over whom he is an arbitrator. In capital cases, judgment rests with the governors of the *Ho-yen*, or there may be appeal from them to those of the province, and ultimately to the royal council; where all the evidence is scrupulously re-adduced. The judges write and seal their individual opinions separately, and the emperor himself determines on the case. No dis-

## ANAM.

tion is made between natives and foreigners; the latter being under the protection of the minister of strangers. The several chiefs give audience, and receive petitions every day; but presents to each are necessary to obtain a hearing. (See *Crawford*, p. 498; *White*, p. 293.)

**Punishments.**—The bamboo is constantly at work, and the *casagras*, or yokes, for other minor crimes, which is composed of two pieces of wood 10 feet long, fastened across by two others, and worn somewhat tightly round the neck. All capital crimes, as murder, robbery, sometimes corruption (excepting adultery), are punished by decapitation: the criminals are brought into the bazar, or public place, and placed in rows, each opposite a placard, declaring the nature of his crime; then, with one blow of a two-handed sabre, their heads are successively struck off. Parties convicted of adultery are tied together and thrown into the sea. (See *White*, p. 44, 281; *Crawford*, p. 498.)

**Customs, &c.**—Polygamy is allowed; the first wife is the chief, the others being mostly of inferior rank; the children of all are, however, equally legitimate. The richer classes marry at 15, the poorer at 20 or 30 years of age, or when they can afford to buy a woman from her friends; but women cannot be married against their own consent. Marriages is but a verbal contract, ratified by exchanging presents before witnesses, and dissolved as readily by merely breaking a pair of chop-sticks, or porcupine quills, before a third party. The remains of the dead are often laid out with much pomp under a pavilion covered with silks, and surrounded with tables of the choicest fruits, areca, &c., and a band of music, for 15 days. White garments are worn, and much gilt paper is burned at these times. No native nor foreigner, if married there, is allowed to quit the country. (*Crawford*, p. 498-520; *White*, p. 292-300; *Asiatic Journal*, iv., p. 15.)

**Amusements, Public Taste, &c.**—The Anamese are very fond of dramatic representations, which are performed in pavilions for several days together with little intermission, and to which no entrance-money is required, the actors depending on voluntary contributions. The plays consist of historical operatic pieces, or of a light and comic dialogue, interspersed with cheerful airs, each concluding with a common chorus. Their dancing and music is in exact time, the latter not destitute of melody, nor unlike some Scotch airs. The instruments in use are gongs, drums, violins, flutes, guitars, and trumpets sufficiently harsh and grating; but the applause is always in proportion to the noise made. They have some notion of sculpture, the best specimens of which are seen on tombs. They are fond of shuttlecock and football, cock and quail fighting, the tricks of jugglers, &c.; and the upper ranks of elephant, tiger, or buffalo hunting, and fire-works, cards, dice, &c., without, however, being addicted to gambling. (See *Barrow*, p. 295-300; *White*, p. 301, 302, 320.)

**Dress.**—Is the same as that of the Chinese before the Tartar conquest, consisting of loose trousers, tied round the waist with a sash; several loose frocks of different lengths, the upper one the shortest, and having long loose sleeves, a small close collar, and five buttons and loops; a broad basket-work hat, or a turban of crape; slippers by which the feet are not cramped like those of the Chinese; hair long, and turned up in a knot on the top of the head. The dress of both sexes is alike, only in that of the women the frocks are longer, and they wear bracelets and armlets of pearl or ivory, earrings, and other ornaments. Dress is an object of great attention with all classes. (*Crawford*, p. 415; *Barrow*, p. 301-308; *White*, p. 298; *Finlayson*, p. 378.)

**Language.**—The language of the Cochins Chinese, like their dress, &c., has been derived from that of China: it is monosyllabic, destitute of inflexions, its written character like the former, although it possesses several elements, as the B, D, and R, which the Chinese are unable to pronounce. The Cambodians speak a different language, and the people of Tiamapa another distinct from both. Literature is confined to Chinese books, chiefly on medicine, and the works of Confucius. (*Crawford*, p. 464, 467, 484; *Barrow*, p. 396.)

**History.**—In 234 B.C. this country was conquered by the Chinese, who held it till A.D. 963. In 1406 it was re-conquered by the Chinese, who abandoned it again in 1493. In 1471, Cochins China was completely subdued by Tonquin; but in 1553, threw off the yoke, and, until 1743, was governed by both a nominal and real sovereign, the latter of whom was a military commander and regent. The nominal sovereign then obtained the mastery, and ruled in the midst of anarchy till 1774, when, in the reign of Caung-shung, the revolution of Nhac (*Yingay*) and his brothers overturned their power. Bishop Adran, a French missionary, the tutor of the late king's son, obtained for him the alliance of Louis XVI., and with the aid of a few of his countrymen, was the main cause of the restoration of his pupil Gi-long to the throne of his ancestors, on which he was finally seated in 1802. Adran reformed the jurisprudence, commenced public works, surveyed the coasts, promoted trade, establish-

## ANCONA.

ed naval arsenals, and new disciplined the king's army; but dying soon after, many of his wholesome reforms sank into disuse. Gi-long died in 1819, and was succeeded by an illegitimate son, who was invested, in 1831, by the court of Peking with the empire of Tonquin and Cochins China. (*Crawford*, p. 505-510; *White*, p. 84-94.)

**ANAMICKEE**, county, Mich., situated in the N.E. part of the peninsula, and contains 576 sq. m. Bounded E. by lake Huron, from which Thunder bay sets up. Watered by Thunder bay river and its branches. It has been recently formed and is unorganized.

**ANAPA**, a sea-port town and fortress of European Russia, Circassia, on the N.E. coast of the Black sea, 47 m. S.E. Yenikale, lat. 44° 54' 53", long. 37° 16' 21" E. Pop. ex. of military, 3000. The fortress, constructed by the Turks in 1784, was taken by the Russians in 1791, and in 1807, and finally in 1838, since which it has been definitively ceded to them. The houses are mostly mere cabins, built of wood and mud. The inhabitants consist of Circassians, Turks, Tartars, Greeks, Jews, Armenians, Russians, &c. The port, or rather road, is nearly open, with bad holding ground, and so shallow as to admit only ships of small burden. Anapa is at present principally important as a military post; but were tranquillity restored in Circassia, it would most likely become the seat of a considerable commerce. The exports are grain, tallow, and butter, hides, peltries, wax, &c. (*Klaproth, Tableau du Caucase*, p. 160; *Spencer's Circassia*, i., 256.)

**ANASTASIA**, island, Flor., extends from the little bar of Matanzas to St. Augustine, and is 21 m. long and 3 broad. It contains a few hundred acres of good land, on a part of which is a fine orange grove. A light-house occupies the place of the old Spanish tower on its N. end, and is in 30° 50' N. lat., 42° 30' W. long. from W. It furnishes an abundance of fine building stone.

**ANCENIS**, a town of France, dep. Loire Inférieure, on the Loire, 21 m. E.N.E. Nantes. Pop. 3667. It is well built, has a handsome college, an hospital, and barracks. There are coal and iron mines in the neighbourhood; and it has a good deal of trade in wine, vinegar, brandy, timber, &c. Its port serves as an entrepôt and station for the vessels navigating the Loire. The town is commanded by a Gothic castle placed on a steep hill.

**ANCERVILLE**, a town of France, dep. Meuse, 11 m. S.W. Bar-le-Duc. Pop. 2211.

**ANCHOIME** (Isle of), see LINCOLNSHIRE.

**ANCIAONS**, a town of Portugal, prov. Tras-os-Montes, 12 m. W. Torre de Moncorvo. Pop. 1900. It is encircled by walls, and has a castle and mineral springs.

**ANCONA**, a marit. city of Italy, the third in the Papal states, cap. leg. same name, on the Adriatic, 174 m. S.E. Sinigaglia, 15 m. N.N.W. Loreto, and 188 m. N.E. Rome, lat. 43° 37' 42" N., long. 13° 30' 35" E. Pop. 94,000, of whom many are Jews, Greeks, and Mohammedans. It is the seat of a civil tribunal, of a tribunal of original jurisdiction, and of a bishopric; is built amphitheatric-wise, on a sloping ground, declining to the sea, between two hills, on one of which stands its cathedral, on the other its citadel; streets narrow, dirty, and irregular; but many houses spacious and elegant; quay, fine; port formed by a mole 2000 feet in length, 100 do. in breadth, and 65 above the sea, having at its extremity a lighthouse, with a handsome revolving light. The mole being hooked at the extremity, vessels may lie immediately within the harbour in from 7 to 8 fathoms; but it shoals rapidly, and vessels drawing more than 15 or 16 feet water should anchor within a short distance of the entry. There is good anchorage-ground about 4 m. without the mole, in 10 and 13 fathoms. On the mole stands a noble ancient triumphal arch, in honour of the Emperor Trajan, who improved and embellished the town and port; it is formed of large blocks of white marble; and it has also another arch in honour of Pope Benedict XIV. The cathedral, situated on a bold promontory on the site of an ancient temple of Venus, has a curious porch, supported by two lions of Egyptian granite; a very ancient altar, and many fine marble pillars. There are ten other churches, containing many good paintings; fifteen convents, a college, and two hospitals. The palace of the delegate, the exchange, the town-house, and the fortifications, particularly the citadel, are also worthy of notice.

Its manufactures, chiefly in the hands of the Jews, consist principally of wax, tallow, silk hats, and paper. The harbour is well adapted for building and repairing ships, and is frequented by those of all nations. It was made a free port by Clement XII., and has a more considerable trade than any other town on the W. coast of the Adriatic, Venice excepted. Outside the harbour is a fine lazaretto, on an artificial island, communicating with the town by a bridge. The market-place is spacious, and the town is well furnished with cheap and good provisions. The women are said to be remarkable for their beauty. Thomson (*Two Journeys in Italy, &c.*) observes, "It was an amusing

## ANCRAM.

scene to pace along the wharfs, to listen to the strain of the tiny mandoline or the deeper tones of the guitar, joined to the patriotic song of some poor Greek, or the more refined Italian ditty; while a medley group were sometimes seen collected in a Greek mystica, or an Italian *seleoca*, dancing, whirling, and stamping to the music of some half dozen voices, or the tinkling of the Spanish guitar."

Ancona is said, by Strabo, to have been founded by a colony of Syracusans in the time of Dionysius. The Romans established themselves in it, B.C. 268. Being justly regarded as a naval station of great importance, Trajan expended large sums upon it, and built the mole. A.D. 502, it was occupied by the Lombards; in 839 it was sacked by the Mussulmans; and it afterwards formed an independent republic till 1532, when Bernardino Barba, under pretext of defending it against the Turks (having built the citadel which entirely commands the town), placed it in the hands of the pope. In 1799 it was taken by the French, and in 1809 formed the chief city of the dep. of the Metauro. In 1814, it was restored to the Papal see. In Feb. 1832, a detachment of French troops landed unexpectedly, and took possession of the citadel, which the French government announced its resolution to retain so long as any Austrian troops remained within the Papal territories; the latter, however, having been withdrawn, the French evacuated the town in the course of 1830. (*Rampoldi Corografia dell'Italia*, vol. i. p. 80; *Ferrighi's Italy*, 1816; *Thompson's Two Journeys in Italy*, &c. Lond., 1835, p. 230 to 253.)

ANCEAM, p. L. Columbia co., N. Y., 45 m. S.E. Albany, 340 W. Drained by Ancram creek, which affords water power. It contains extensive iron works, and a lead mine, at present not extensively wrought. The iron ore is chiefly brought from the margin of Salisbury, Ct., and it is of a superior quality. The town contains three stores, one grist-mill, one saw-mill, one furnace, ten schools, 474 scholars. Pop. 1770.

ANCY-LE-FRANC, a town of France, dep. Yonne, cap. cant. on the canal of Burgundy, 10 m. S.E. Tonnerre. Pop. 1413. It is neat and well built, but is chiefly remarkable for the magnificent castle in its vicinity, built after the designs of Primaticcio, belonging to the descendants of Louvois, minister of Louis XIV. It is surrounded by a beautiful park, and has fine gardens. (*Hugo*, art. *Yonne*.)

ANDAD KHAN, a town of Independent Tartary, Khanat of Khokan, on the Sihoun (*Jazartes*), 55 m. E. Khokan, lat. 41° 20' N., long. 71° 27' E. It is surrounded by gardens, and is a place of considerable size and antiquity.

ANDALUSIA (so called, either from the Vandals who settled here in the fifth century, or from an Arabic word, signifying *Land of the West*, the most S. division of Spain, comprising the four Moorish kingdoms of Seville, Cordova, Jaen, and Granada, between 36° 0' and 36° 38' N. lat. and 10° 37' and 7° 24' W. long., having N. Estremadura and La Mancha; E. Murcia; W. Portugal; and S. the Atlantic ocean, the straits of Gibraltar, and the Mediterranean: length, E. to W., about 350 m.; greatest breadth nearly 300 m.; area, 27,153 sq. m. Pop. about 2,400,000. It is at present divided into eight provinces, viz. Seville, Cadiz, Cordova, Granada, Jaen, Malaga, Almeria, and Huelva. Its chief cities are Seville, Cadiz, Cordova, Jaen, Almeria, Granada, Malaga, Huelva, and Gibraltar. Two ranges of mountains traverse it from E. to W.: the most S. of these ranges is the loftiest, and has several points covered with perpetual snow; the highest, Mulhacen, being 11,678 feet above the level of the sea. The Sierra Morena belongs to the N. chain, and forms part of the N. boundary of the district. Between these two ranges flows the Guadalquivir, by far the largest of the Andalusian rivers, and swelled by numerous streams from the lateral valleys opening into its basin. There are numerous small lakes. On the coast, the climate is hot and oppressive; but N. of the Sierra Nevada, the temperature is more equable, and cooler, although it never freezes. The primitive rocks of the high S. mountains are chiefly micaceous, gneiss, and clay-slate, covered in some parts by black transition limestone, containing sulphuretted lead. Serpentine marble, and alabaster, are found in Granada; and there are numerous mines, that either produce, or have produced, gold, silver, copper, antimony, mercury, iron, lead, vitriol, coal, and sulphur; but, with the exception of the lead mines of Adra, near Malaga, they are at present mostly in a neglected state. The vegetation partakes of the European and African characters: mastic, olive, myrtle, palms, bananas, &c., abound in the central parts of the country, but on the S. shores those common to Europe almost wholly disappear, and the sugar-cane and cotton are cultivated. Wheat, barley, fruits of all sorts, and wines, are abundantly produced; the chief wines are those of Xeres (sherry), Pajarete, Malaga, Montilla, &c.: silk is also an article of considerable culture. There are many rich pasture-lands; and the cattle and horses, especially the latter, are renowned as among the best in Spain. The wolf and bear are the only formidable wild animals; there is plenty of game, an abundance

## ANDAMAN ISLANDS.

of fish, and none of the most venomous reptiles: the cochineal insect is successfully cultivated near Cadiz. Most part of the country is parcelled out into vast estates, belonging to grandees, the church, and corporations. Agriculture is in a very backward state. The greater part of the country is appropriated to pasture, the traveller often journeying many miles without seeing a single house, or any symptoms of cultivation; and, notwithstanding the fertility of the soil, there is annually a considerable importation of corn from the opposite coast of Africa, Sicily, and the Black sea. The occupiers of the land mostly live together in towns and villages; their rents are usually paid on the *metayer* principle, and they are at once ignorant and poor; the inhabitants of the mountainous and less fertile districts are, as might be expected, the most industrious. The chief manufactures are those of woollens, silk, and leather; and but for oppressive customs laws, there would be a considerable trade both with other parts of Spain and foreign countries. Cadiz is the chief port.

The Andalusians are a mixed race, descended from Africans, Carthaginians, Romans, Goths, Vandals, and Moors. They retain much resemblance, both in person and manners, to the latter; although light hair, eyes and complexions, are by no means unrequent. When they have any motive to exertion, they are not deficient in industry, and are intelligent and imaginative. Andalusia has produced many good poets and distinguished men in all ages: Trajan, the Senecas, and Silius Italicus were natives of this prov. with Murillo, the painter, and some of the best lyric authors of modern Spain. (*Ménezo*; *Townsend's Spain*, ii., 236; *Malte-Brun*, &c.; and see SPAIN.)

ANDAMAN ISLANDS, a lengthened narrow group of islands, none of which are of any very considerable magnitude, in the E. part of the bay of Bengal, stretching N. and S. between 10° 30' and 13° 40' N. lat., under about 92° 30' E. long. They are within the full sweep of the S.W. monsoon, and are washed for eight months a year by incessant rains. They produce many large trees, that might furnish timber and planks for the construction of ships, and for the finest cabinet work. The quadrupeds are but few, consisting principally of a diminutive breed of swine and rats. Among the birds is the swallow, that produces the edible nests so highly esteemed in China. Fish are generally plentiful, but occasionally scarce. The inhabitants, who are not supposed to exceed 2500 or 3000 in number, seem to be a peculiar race in the lowest state of barbarism. They seldom exceed 5 feet in height, have protuberant bellies, limbs disproportionately slender, skin a deep sooty black, hair woolly, nose flat, lips thick, eyes small and red, their countenances exhibiting the extreme of wretchedness—a mixture of famine and ferocity. They go quite naked, and are insensible to shame from exposure. They have made no effort to cultivate the ground, and are found only on the seacoast, depending principally for subsistence on fishing. Their implements are of the rudest texture; but they use them with great dexterity, particularly in spearing and capturing fish. They have no utensil that will resist fire, and dress their food by throwing it on the live embers, and devouring it half broiled. Their habitations display little more ingenuity than the dens of wild beasts. Being much incommoded by insects, their first occupation in the morning is to plaster their bodies all over with mud, which, hardening in the sun, forms an impenetrable armour. They paint their woolly heads with red ochre and water, and, when completely dressed, have a most hideous appearance. They have an intense hatred of strangers, with whom they cannot be persuaded to hold any intercourse. They are supposed to worship the sun and moon; and during storms and tempests, endeavour to avert the wrath of the demon by whom they suppose them to be produced. Their language is peculiar, and is not known to have the slightest affinity to any spoken in India, or in any of the Indian islands. They have been said to be *anthropophagists*, but this is doubtful. Some have supposed them to be a race of degenerate negroes; but this is a matter as to which it is impossible to arrive at any definite conclusion.

A British settlement was established at Port Cornwallis, on the largest of the islands, near the N.E. extremity of the group, in 1793. The harbour is excellent; and the settlement was designed for the reception of convicts from Bengal, and for the security of shipping during the monsoons; but the situation turned out so very unhealthy, as to occasion its abandonment in 1796. Since then they have been but seldom visited, except in 1824 and 1825, when some of the ships, on their way to Rangoon, touched at the islands. On one of these occasions, the natives attacked a party watering, with the utmost fury; and were not repulsed without great loss on their side, and after they had killed one soldier, and wounded three others. (The above particulars have been selected from the excellent account of these islands, given by *Symes*, *Gazetteer to Java*, p. 137-139, 4to ed.; see also *Hamilton's Embassies*.)

## ANDELYS (LES).

**ANDELYS (LES)**, two towns of France, within a very short distance of each other, dep. Eure, cap. arrond., one on the Seine, and the other a little inland, 10 or 11 miles E. Louviers. Pop. 5065. The greater Andely is ill built, with narrow crooked streets; but it has a fine collegiate church. The lesser Andely has to boast of the magnificent ruins of the Château Gaillard. There are manufactures of fine cloth, kerseys, merinos, rades, cotton yarns, and paper, with tanneries, &c. Nicholas Poussin, the famous painter, was born in the hamlet of Villers, near the greater Andely, in 1594; and a monument has been erected to his memory in that town.

**ANDENNES**, a town of Belgium, prov. Namur on the Maase, 13 m. E.N.E. Namur. Pop. 4303. There are manufactures of earthenware and porcelain, and of pipes formed of the clay found in the neighbourhood.

**ANDERLECHT**, a neat well-built town of Belgium, near Brussels, of which it is, in fact, a suburb. (See Brussels.)

**ANDERNACH** (the *Antunacum* of the Romans), a town of the Prætorian prov. of Lower Rhine, on the left bank of the Rhine, 10 m. N.W. Coblenz. Pop. 3000. It is situated in a volcanic country, its massive towers, turrets, and ruined walls being admirably suited to the sombre scenery by which it is surrounded. Streets narrow and ill paved, and the houses gloomy, old, and out of repair. There is a fine old archway, supposed to be Roman, forming the gate of the town on the side next Coblenz; and below it, in a line towards the river, are the ruins of an extensive palace or castle, supposed to have been built by the Goths soon after the expulsion of the Romans. It exports two singular productions, viz., mill-stones made of porous lava, and large quantities of pounded tufa, decomposed *trass*, a cement which, when mixed with water, becomes as hard as stone. The former are in great demand in most parts of Europe; the latter is principally used by the Dutch in the construction of their dikes, but is also exported to other countries. Immense rafts of timber from the German forests, destined for the Low countries, are formed near Andernach. (*Barrow's Tour through Hesse, &c.*; and *Schreiber's Rhine*.)

**ANDERSON**, dist. S.C. Situated in the N.W. part of the state, and contains 800 sq. m. It lies between Savannah and Saluda rivers, by branches of which it is drained. It contained in 1840, 18,499 neat cattle, 10,387 sheep, 26,381 swine, and produced 106,105 bushels of wheat, 668,518 of Indian corn, 2,349,054 pounds of cotton, and had twenty stores, one cotton factory with 1306 spindles, thirteen flour-mills, thirty-eight grist-mills, twenty-nine saw-mills, twenty-six distilleries, eight tanneries, five academies, 323 students, twenty-nine schools, 637 scholars. Pop.: whites 12,747, slaves 5083, free coloured 31; total, 18,493. Cap. Anderson.

**ANDERSON**, p. v., capital of Anderson, dist. S.C., 137 m. N.W. Columbia, 546 W. It contains three churches, one Presbyterian, one Baptist, and one Methodist, two academies, six stores, forty dwellings, and about 500 inhab.

**ANDERSON**, county, Ky. Situated in the central part of the state, and contains 170 sq. m. Drained by Salt river and its branches. It contains in 1840, 4418 neat cattle, 8518 sheep, 14,237 swine, and produced 24,536 bushels of wheat, 7685 of rye, 231,574 of Indian corn, 34,476 pounds of tobacco. It had five stores, nine grist-mills, seven saw-mills, eight distilleries, seven schools, 173 scholars. Pop.: whites 672, slaves 1088, free coloured 21; total, 5432. Capital, Lawrenceburg.

**ANDERSON**, county, Tenn. Situated in the central part of the state, and contains 750 sq. m. Drained by Clinch river. It contained in 1840, 5493 neat cattle, 5463 sheep, 18,655 swine, and produced 18,003 bushels of wheat, 335,665 of Indian corn, 5409 pounds of tobacco, 8386 of cotton, 5034 of sugar. It had seven stores, one flouring-mill, fifteen grist-mills, six saw-mills, eighteen distilleries, one academy, 14 students. Pop.: whites 3218, slaves 425, free coloured 15; total, 5658. Cap. Clinton.

**ANDERSON**, Hamilton county, O., 10 m. E. Cincinnati. Bounded S. by Ohio river. Pop. 2311.

**ANDERSON**, t., Rush co., Ia. It has two schools, 60 scholars. Pop. 1422.

**ANDERSON**, t., Warwick co., Ia. It has three schools, 100 scholars. Pop. 348.

**ANDERSONTOWN**, p. v., cap. of Madison co., Ia., 39 m. N.E. Indianapolis, 548 W. Situated on the S. side of the W. branch of White river. It contains a court-house, jail, several stores, and about 195 inhab.

**ANDES (THE)**, an immense mountain range, runs along the whole W. coast of S. America, covering, with its chains, declivities and valleys, about a sixth part of that continent. The *Cordillera*, a name sometimes given to this chain, is properly applicable only to the innermost and highest ridge of the range.

Cape Horn, on cape Horn land, in about 56° S. lat., may be considered as the S. extremity of the Andes. The most

## ANDES.

northern chain of the mountains is the *Paramo de las Rocas*, which extends to the E. of lake Maracaybo, and terminates at about 9° N. lat. The whole system is thus found to extend lengthwise over 45 degrees of lat. Its width varies very much; in some parts it occupies only between 30 or 40 miles across; in others it covers with its branches and valleys a country extending 300 miles and upwards from E. to W.

Beginning our survey of this mountain system at its southern extremity, we find that it commences at the cape of Good Success, on the W. shores of the straits of Le Maire, in about 70° W. long. Even the high rocky mass which constitutes the island of Staten Land, and extends more than a degree farther E., may be considered as a continuation of this range, from which it is separated only by the straits of Le Maire, between 30 and 40 m. across. From the cape of Good Success the range runs W. along the S. shores of King Charles's Southland, the most extensive of the islands constituting the S. Archipelago of America, commonly called *Terra del Fuego*. It covers about a third part of the surface of that island, as well as the whole of the islands lying S. of it: as Navarin, Hoste, Wollaston, Hermit, and Cape Horn. Towards the straits of Le Maire, the range consists of rocky hills, of no great elevation; but farther W. they rise to an altitude of 3000 or 3000 ft. Cape Horn itself is a conspicuous rock, with a steep ascent, upwards of 3000 ft. high. Mount Sarmiento, near Magdalen channel, is the highest summit, and rises about 8000 ft. above the sea.

In the W. part of King Charles's Southland, the range extends over the whole district S. and W. of Admiralty bay. Farther W. it changes its direction, running in a N.W. direction as far as the frith of Senalid (Ancon Simalid, of the Spaniards), 59° S. lat., and 73° W. long. This part of the range, whose mean width may be about 100 or 120 m., is longitudinally divided by that portion of the strait of Magalhães which extends from cape Froward to cape Victoria. Two transverse channels divide the south portion into two islands. The E. or Magdalen channel, separates Clarence island from King Charles's Southland; and the W. extends between Clarence island and South Desolation; the latter bears the name of Barbara Channel. That part of the range which lies to the N.E. of the strait is intersected by two deep transverse inlets. The southeastern, called Jerome Channel, terminates on the E. in two large lagoons, called Otway and Skyring waters, which are both situated on the eastern side of the Andes in the plains of Patagonia. By this extensive inlet, Brunswick peninsula is divided from King William's Land. The N.W. transverse inlet bears the name of Smyth's Channel, and divides first King William's Land from Queen Adelaide's archipelago, and afterwards joins the frith of Senalid, which likewise penetrates through the whole chain of the Andes, and terminates with its numerous branches in the plains of Patagonia. S. of this frith the mountains rise somewhat higher than on King Charles's Southland, but their mean elevation does not exceed 4000 ft. above the sea.

The mountain range south of the frith of Senalid may be called the *Magalhães Andes*, extending principally on both sides the strait bearing that name. It consists of islands and peninsulas intersected by deep but narrow arms of the sea. The summits of the mountains are covered with eternal snow, the snow line occurring in these countries at about 3500 feet above the sea. The lower parts of the mountains, and the steep and rocky shores of the islands, are partly covered with evergreen woods; except towards the ocean, where they present the aspect of bare black rocks.

At the frith of Senalid begins the uninterrupted chain of the Andes. At this place it again changes its direction, running due N. with slight bends as far north as the Bight of Arica (18° S. lat.). It comprehends the Patagonian Andes between 35° and 43° the southern Chilean Andes between 43° and 53°, and the northern Chilean and Atacamean Andes between 35° and 30° S. lat.

The Patagonian Andes extend from the frith of Senalid to the N. corner of the gulf of Ancud, opposite the island of Chiloe. They are only known from the side of the ocean, whence they rise to a considerable height with an extremely steep ascent. It would seem as if the range in this part had once occupied a much greater breadth, and that by some extraordinary convulsion the whole of the

\* *Paramo*, rendered *desert* in the dictionaries, signifies in S. America neither a desert nor a heath, but, like the Peruvian word *puna*, denotes a mountainous place covered with dense fogs, exposed to the winds, and in which a daisy cold perpetually prevails. Under the torrid zone the *paramos* are generally from 10,000 to 12,000 feet high. They are, in fact, the lower summits of the Cordilleras. Snow often falls in them, but it remains only a few hours. In this respect they are distinguished from the *nevaes*, which suffer the limits of perpetual snow. The *paramos* are almost entirely enveloped in a cold thick fog; so that, when a thick small rain falls, accompanied with a depression of the temperature, they say at Bogota or at Mexico, *caen un paramo*. Hence has been formed the provincial word *emparramado*, to be as cold as if one were on a *paramo*. (*Humboldt, Pers. Hist.*, li, p. 288; *Modern Traveller*, xxi, p. 14.)

## ANDES.

Western declivity, with the summits of the range, had been broken down and buried in the ocean, so that only the eastern declivity has remained standing. The numerous and rocky islands which skirt this shore in all its extent, except at the protruded cape of Tres Montes, appear to support such a supposition. The eastern declivity of the range has not been examined; but what we know of it seems to be sufficient to warrant the supposition that in this part the Andes occupy a width of only from 30 to 40 miles. The mean height of the Patagonian Andes may be estimated at about 5000 or 6000 feet. None of its summits which have been measured exceed 9000 feet. But snow mountains, and even glaciers, are stated to be frequent. The lower part of the declivity is covered with trees and shrubs, the upper part bare, as also those portions of the shore which are exposed to the immediate effects of the gales blowing from the Pacific.

The *Southern Chilean Andes* extend from the most N. corner of the gulf of Ancud ( $49^{\circ}$  S. lat.) to the high peak of Tupungato (near  $33^{\circ}$  S. lat.). Towards the S. extremity, the Andes keep, for some extent, a distance of about 150 m. from the shores of the Pacific, the greatest which they attain in their whole course; but towards the N. they gradually approach it to within about 100 miles. Between the Andes and the shore are extensive plains, from 1900 to 2000 feet above the sea; and from these plains the mountains rise, with an extremely steep declivity, to the mean elevation of 13,000 or 14,000 feet above the sea. Some summits attain 15,000, and even 15,500 feet. Though our knowledge respecting this part of the Andes be very scanty, it would seem that they form one extensive mass from 60 to 80 miles across, which, however, in its upper part is furrowed by a longitudinal valley, divided by short transverse ridges into several shorter valleys. This great mass of rocks is mostly clothed with forest trees and a rich vegetation; but in the interior it presents only bare rocks, nearly without plants of any description.

Three passes are known to traverse the Chilean Andes. That farthest S. skirts the high volcano of *Antuco*, between  $37^{\circ}$  and  $38^{\circ}$  S. lat., leading from the small town of Tucapel to the great plains E. of the Andes. It is also used by the aborigines inhabiting these plains, who bring to Chile salt and some commodities. The second road traverses the *Paso del Planchon*, which crosses the mountain ridges near  $35^{\circ}$  S. lat., beginning on the west at the village of Curico, and leading to the territory of the *Pehuenches*, who occupy the E. declivity of the Andes, and thence to Mendoza. It is said to be the lowest of the mountain passes of the Andes, vegetation ascending up to the highest part of the road; it is farther stated to be more gentle in its ascents and descents. Yet it is little used, except by persons trading with the Indians in the Pampas. The third pass is that of *Portillo*, which at first runs along the river *Maypo*, S. of Santiago, the capital of Chile, and afterward crosses the two ridges of the Andes, which enclose the valley of *Tunuyan*. On the west ridge the road rises to 14,362, on the E. to 13,210 feet above the level of the sea. From the latter it descends to the plains, and leads to Mendoza. It is the nearest way between the last-mentioned town and Santiago, the capital of Chile, and is therefore sometimes, but not frequently, used.

The high peak of Tupungato may be considered as forming the boundary between the S. and N. Chilean Andes. N. of this summit the Andes, which farther S. form only one enormous mass of rocks, divided into two masses, which enclose long and wide valleys considerably lower than the surrounding ridges. The first valley of this description is that of *Uspallata*, which extends about 180 or 200 miles S. and N. It is traversed by two rivers: the *Rio de Mendoza*, which flows S.; and the *Rio de S. Juan*, which runs N. The watershed between them lies N. of  $33^{\circ}$  S. lat. This valley is about 15 m. in width, and presents an undulating surface. It is about 6000 feet above the level of the sea. The range E. of it, called the *Paramillo de Uspallata*, seems not to exceed 10,000 ft.; but the W. or principal range attains 14,000 ft. and upwards. The former is about 25, and the latter more than 70 m. across. The E. range has two narrow breaks, by which the two rivers of the valley find their way to the plains extending E.

Over these two ranges, and through the valley of *Uspallata*, lies the most frequented mountain road crossing the Andes. On the W. it begins at the town of Santa Rosa, in the valley of the *Quillota* river (3614 feet above the sea); it next follows the bed of that river for a great distance, and then crosses the high range nearly at equal distances from the mountain summits of *Tupungato* and *Aconcagua* (between  $33^{\circ}$  and  $39^{\circ}$  S. lat.). The *Cumbre*, or highest point, is 12,454 feet above the Pacific. Hence the road descends along the *Rio de Mendoza* into the valley of *Uspallata*, passes the *Paramillo* range, and enters the plains near *Villa Viecosa*, whence it runs along the last-mentioned mountain chain to *Mendoza* (2608 feet above the sea); from *Mendoza*

it leads over the *Pampas* to *Buenos Ayres*. Though much frequented, it cannot be passed by carriages, and only mules are used for the transport of commodities, and by passengers. In winter (from June to September) the passage is very dangerous, on account of the heavy falls of snow, which cause frequent losses of life and property. The pass is by some named that of the *Cumbre*, and by others of *Uspallata*.

N. of the valley of *Uspallata* the Andes continue to form two ranges, including extensive longitudinal valleys. The first in order is that of *Aguilata*, of which we know only that its soil is sterile, but its mountains rich in metallic ore. Then follows the valley of *Andalgalá*, which is entirely unknown. The latter extends to  $23^{\circ}$  S. lat. A great number of mountain passes are stated to exist over the western range enclosing these valleys, which would indicate that the mean elevation of the Andes is here much less than in other parts. But none of these passes seem to be much used, nor has any of them been visited by European travellers. It is, however, known, that towards the Pacific this range does not descend with a short and rapid declivity, as in the S. Chilean Andes, but by table-lands in the form of terraces, which near the principal chain are 5000 feet and more above the sea, but lower by degrees as they approach the ocean, where they still form a shore from 300 to 500 feet high. Being furrowed by deep water-courses, these table-lands, when seen from the banks of the rivers, appear frequently like mountains of considerable height.

From their farthest S. point as far as the N. point of the valley of *Uspallata*, the Andes do not send out lateral branches. But from the E. range, including the valleys of *Aguilata* and *Andalgalá*, several ranges branch off into the E. plains, and extend in a S. and E. direction to a distance of from 300 to 350 miles. By these lateral chains the countries extending E. of the Andes, between  $33^{\circ}$  and  $23^{\circ}$  S. lat., are rendered hilly, and in some districts even mountainous. In the S. districts the height of the ranges is not considerable, but farther to the north it increases greatly; and the chain, which branches off at the north end of the valley of *Andalgalá*, and forms at present the boundary between the republics of *Buenos Ayres* and *Bolivia*, may attain a height of 10,000 feet above the sea. It terminates at no great distance from the point where the *Rio Grande* enters the *Rio Vermejo*.

Between  $33^{\circ}$  and  $30^{\circ}$  S. lat., the principal range of the Andes seems to constitute a single chain, rising to a mean height of above 15,000 feet. In it stands the *Nevalado de Chorolque*, which is stated to rise 16,548 feet above the sea; but it is probable that it is at least 1000 feet higher. From this chain several lower and narrow ridges run E. 120 or 150 m. The S. districts of *Bolivia* are in consequence rendered a succession of valleys and mountains. However, these ridges do not attain a great elevation over the plains on which they rise. A road traverses the principal chain; it begins on the coast of the Pacific at *Cobija*, or *Puerto de la Mar*, the principal harbour of *Bolivia*, passes over the high Andes of *Lipez* near the volcano of *Atacama*, and descends to *Tupiza*; hence it runs to *Potosí* and *Chuquisaca*. This road is not much used, on account of the sterility of the surrounding country, and the difficulty of procuring provender for the mules and other animals of burden. In some parts water too is extremely scarce.

Near  $20^{\circ}$  S. lat. is the mountain knot of *Porco*. Here begins the *Bolivian Andes*, which extend to  $14^{\circ}$  S. lat., and may be considered as constituting the central portion of the whole mountain system. In no other part do the mountains attain an equal height, nor do they extend to such a considerable breadth. They present here one immense mass of rocks, extending in length over six degrees of latitude, and measuring in breadth at the S. extremity more than 250, and at the N. about 900 miles. The upper part of this enormous mass is between 13,000 and 14,000 ft. above the level of the sea. On its edges are placed numerous mountain summits, which rise many thousand feet above the upper surface of the mass, so that the whole presents to the eye a plain surrounded everywhere by high ridges. The mountains enclosing the plain at its S. extremity rise to a great elevation, but not so high as those towards the N. The famous *Cerro de Potosí* is only 16,037 feet high, and that of *Porco* 15,913 feet. In summer they have no snow upon them. The W. range contains summits of much greater elevation. The volcano of *Gualatieri* (near  $19^{\circ}$  S. lat.) rises 22,000 feet, and the *Nevalado de Chuquebamba* (near  $13^{\circ}$  S. lat.) to 21,000 feet above the sea. The E. range is still higher. Between the *Cerro de Potosí* and  $16^{\circ}$   $50'$  S. lat. none of its summits attain 17,000 feet of elevation, which here constitutes the snow line. But farther N. a great number of snow-topped peaks raise their heads above the clouds. At  $16^{\circ}$   $40'$  stands the *Nevalado de Illimani*, which attains 24,000 feet; and farther N. the *Nevalado de Zorata*, which is about a thousand feet higher. The elevation of these two summits has been determined by Mr. Pentland; but he

## ANDES.

states that there are others which seem not much lower, especially the Nevado de Yani, N. of mount Zorita. These two high ranges run nearly parallel to one another; south of  $17^{\circ}$  S. lat. nearly due S. and N. but N. of that parallel S.S.E. and N.N.W. At their N. extremity ( $14^{\circ}$  S. lat.) they are united by a transverse range, which extends N.N.E. and S.S.W., and is known by the name of Andes of Vilcanota. This latter range has several summits covered with perpetual snow, but their elevation has not been ascertained.

The country enclosed by these ranges forms an immense Alpine valley, whose lowest parts are nearly 13,000 feet above the sea. It does not present a level plain; for those portions of it which are contiguous to the ranges are covered with mountains, or, rather, hills, rising several hundred and in many places even a thousand feet above their bases. But the internal districts preserve a sufficiently level surface to be called a plain. This is known under the name of the valley of Titicaca, or of the Desaguadero. The first denomination is derived from the lake of that name which occupies the N. portion of the valley, covering about 4000 sq. m. It is famous in the history of Peru for the miraculous appearance of Manco Capac, the founder of the Inca dynasty. From its S. extremity issues a river, called the Desaguadero, which traverses the whole valley from  $15^{\circ}$  to  $16^{\circ}$  S. lat., where it is lost in a small lake. The length of the valley is upward of 300 m., but its width varies. In the parallel of Puno ( $15^{\circ}$   $50'$ ) it exceeds 60 m., and in lat.  $16^{\circ}$   $50'$  it is still wider; but from this point to its S. termination it gradually narrows, so as in the parallel of Oruro ( $17^{\circ}$   $58'$ ) not to exceed 35 m. According to the statement of Mr. Pentland, the area of this valley, including the lake, exceeds 18,000 sq. m., of which the lake covers between a fourth and a fifth part. The surface of the lake is 12,795 ft. above the level of the sea.

The ranges enclosing the alpine valley of Titicaca are traversed by several mountain roads, of which the following are the most frequented: That through the pass of *Potosí*, traversing the Puerto between the Cerro de Potosí and that of Huayna Potosí. It leads from Potosí to Oruro, and rises in its highest point to 14,390 feet. The road over the pass of *Cowder Pacheta*, between Oruro and Cochabamba, rises in its highest part to 13,950 ft. above the sea. The road through the pass of *Pacavasi*, leading from La Paz to the countries east of the ridges, rises to 15,226 ft. The most used road is over the western range, and that through the pass of *Las Guatillas*, leading from Arica on the coast, and Tacna, to La Paz, in the valley of Titicaca; it traverses the range at  $17^{\circ}$   $50'$  S. lat., S. of the Nevado de Chipicani, where it rises to 14,830 ft. Farther N. ( $16^{\circ}$   $9'$  S. lat.) is another road, which, connecting Arequipa with Puna, attains in the pass of *Alto de Toledo* an elevation of 15,528 feet above the sea.

Several lateral ridges run off from this great mass of rocks to the E.; but none of them seems to be distinguished by its height or extent, except the Sierra de Santa Cruz, which detaches itself from the principal range about  $17^{\circ}$   $10'$  S. lat., and terminates near the banks of the Rio Guapal or Rio Grande, within a few leagues of the town of S. Cruz de la Sierra. It extends about 300 miles, and is of considerable elevation in its western part, where it forms the Nevado de Tanaica, near Cochabamba; farther east it becomes gradually lower.

The *Peruvian Andes* occupy the next place, extending from  $14^{\circ}$  to  $6^{\circ}$  S. lat. Between these latitudes they measure from 400 to 450 m. in width, and their area does not probably fall short of 200,000 sq. m. On their borders extend two ranges; of which the E., separating the mountain region from the great plains extending south of the Amazon, branches off from the E. extremity of the Andes of Vilcanota in a N. direction. It divides the affluents of the Ucayali from those of the Yavarí, and terminates near  $7^{\circ}$  S. lat., about 160 m. from the Amazon. We know very little of this range, but it does not seem to rise any where to a great height; probably none of its summits exceed 10,000 ft. above the sea.

The W. range of the Peruvian Andes, which, with its W. declivities, approaches the Pacific ocean to a distance of 50 miles or less, must be considered as the principal chain, on account of its height and breadth, and because it forms with the N. parts of the Andes an uninterrupted chain. It may be said to commence near the Nevado de Chuquebamba, where the Andes of Vilcanota join the W. range of the valley of Titicaca. It is remarkable that the Peruvian Andes seem to be rather a continuation of the Andes of Vilcanota than of the great W. chain; for near  $16^{\circ}$  S. lat. and between  $71^{\circ}$  and  $75^{\circ}$  W. long., the Peruvian Andes extend in a direction E. and W., whilst three degrees farther S. the Bolivian Andes run S. and N. In this portion of the Andes are some very high summits. Besides the Nevado de Chuquebamba, already noticed, are the Cerro de Huando and the Cerro de Parinacocha, whose elevation, however, has not

been determined. Near  $75^{\circ}$  W. long., the principal chain of the Andes declines to N.W., and runs in that direction to the neighbourhood of Capo Farina, the most W. extremity of S. America. In the S. portion of this chain several summits rise above the snow line, but the elevation of none of them has been determined. The best known are the Toldo de la Nieve, seen from Lima, to the S.E. of which it is situated; the Altunachaga, near  $10^{\circ}$  S. lat.; and the Nevado de Hasylllas,  $7^{\circ}$   $50'$  S. lat. But between the last-named snow-peak and mount Chimborazo, in the Andes of Ecuador, or *Ecuador* ( $9^{\circ}$  S. lat.), there is no summit which attains the snow line.

The country lying between the two outer ranges of the Peruvian Andes presents a continual succession of high ridges and long valleys, here and there intermixed with plains of moderate extent. It forms the best portion of the republic of Peru. The most remarkable district seems to be the plain of Bombon, near  $11^{\circ}$  S. lat., which is 13,500 feet above the level of the sea, and extends about 18 miles in width from E. to W., and 40 or 50 from S. to N. A great part of this elevated plain, which is enclosed by two ridges of mountains, and on which the arid Cerro de Pasco is situated, is covered with swamps. The water running off from them, and from the elevated ground, which frequently is covered with snow, is collected in several lakes, of which three are especially noticed, as giving birth to three considerable rivers. The farthest N. is the lake of Lauricucha, from which the Amazon rises; the farthest S. is called the lake of Quilacocha, which gives birth to the Sanja or Maturo, one of the principal branches of the Ucayali. Between these lakes is that of Chiquicola, whence the Rio Huallaga issues. The plain of Bombon is farther to be considered as a mountain knot, from which different ranges branch off in different directions. Besides the principal range of the Peruvian Andes, which lies contiguous to it on the W., two mountain chains run off like it to the N., and one to the S. The most W. of the two N. chains runs nearly parallel to the principal range of the Peruvian Andes, and forms the E. boundary of the valley of the Marañon or Upper Amazon. It rises to a great elevation, but does not enter the snow line. One of its farthest N. branches extends close to the banks of the Amazon, where it forms the famous Pongo (cataract) of Manseriche. A lateral ridge of this chain, branching off from it at about  $7^{\circ}$ , runs E., and terminates on the banks of the Rio Huallaga, where that river forms its great cataract, or *pongo*. The farthest E. of the N. chains separates the valley of the Huallaga from the *pampas* of S. Sacramento, traversed by the Rio Ucayali. It is towards its beginning in the mountain knot of Bombon of great height, but lowers considerably farther N., terminating between  $6^{\circ}$  and  $7^{\circ}$  S. lat. at the Pongo of the Huallaga. The S. chain, issuing from the plain of Bombon, runs S.S.E., nearly parallel to the principal range of the Andes, and encloses the rich valley of the Rio Sanja. It terminates in the most S. bend of that river, about  $13^{\circ}$  S. lat. and  $74^{\circ}$  W. long.; and nearly opposite another range of high mountains, which issue from the Andes of Vilcanota, and run N., separating the valley of the Rio Apurimac from that of the Rio Quillabamba or river of Cuzco. The valleys enclosed by these several chains of mountains seem to have a mean elevation of from 3000 to 5000 feet above the sea.

The roads traversing the Peruvian Andes are very imperfectly known. That most to the S. leads from Arequipa (near  $16^{\circ}$   $30'$  S. lat.) on the coast to Cuzco in the valley of the Quillabamba, and traverses very high ranges of mountains. Another road leads from Lima to the town of Tarma, in the valley of the Sanja, and thence to Guancavelica, Huamanga, and Cuzco. It rises on the principal chain at the Portacuelo de Tucto to 15,700 feet above the sea. Farther north is the road passing over the plain of Bombon to the Cerro de Pasco. It traverses on the principal range two mountain passes; of which the W., called Alto de Tacabamba, attains an elevation of 15,135, and the E. or Alto de Lachagual, 15,480 feet above the sea. Another road connects the town of Truxillo with the valley of the Marañon. It traverses the great range near the Nevado de Guayillas, and leads to Huamachuco and Caxamarquilla; but we are not acquainted with its particulars.

The *Andes of Ecuador*, or the *Ecuador*, extend to the N. of the Peruvian Andes. Their commencement may be fixed opposite the Punta de Aguja ( $6^{\circ}$  S. lat.), and the place where the Marañon changes its N.N.W. course into a N.N.E. In the same parallel the chain also changes its direction. It runs between  $6^{\circ}$  S. lat. and the equator, nearly due north. This portion of the mountain system closely resembles the Chilean Andes. It constitutes one enormous mass of high rocks, of about 80 or 100 miles in width, overtopped longitudinally by a double series of very elevated summits, so that between them a succession of high valleys is formed. These Andes are also distinguished from those between  $33^{\circ}$  and  $6^{\circ}$  S. lat. by their not sending off to the E. lateral branches. Their eastern declivities are supported by short

## ANDES.

centreforts, which probably nowhere extend beyond 80 m. into the E. plains.

It is remarkable that the elevated valleys occupying the middle of the range rise in elevation as they advance farther N. That portion of the range which lies between  $5^{\circ}40'$  and  $24^{\circ}8'$  S. lat. is occupied by an extensive mountain knot, the Andes of Loja, which, however, at no place attains the snow line. Then follows the longitudinal valley of Cuenca, which extends from  $3^{\circ}15'$  to  $9^{\circ}30'$ , and rises to about 7800 feet above the sea. On this side no snow mountains occur. The mountains of Asamay, which form the N. boundary of the valley of Cuenca, extending between the two outer ranges, rise to 15,500 feet above the sea, and enter the snow line; but they are narrow, occupying only about 3 min. of lat. (between  $9^{\circ}27'$  and  $9^{\circ}30'$ ). To the N. of them extends the longitudinal valley of Alausi and Hambato, which extends between  $9^{\circ}27'$  and  $40'8'$  S. lat., and rises to about 7930 feet above the sea. The summits of the ranges which enclose it on the E. and W. rise to a great elevation. On the western range stands the famous Chimborazo, rising 21,430 ft. above the level of the sea. It was until lately considered as the highest summit of the Andes; but it is now known that the high peaks of the Bolivian Andes, the Nevado de Zorata and the Illimani, rise from 3000 to 4000 ft. higher. On the E. range stand the volcanoes of Sangay, Collanes, and Llanganates. On the N. the valley of Alausi and Hambato is bounded by a narrow transverse ridge, the Alto de Chisínche, which hardly rises 300 ft. above the adjacent level ground. But at its extremities, and precisely on the lateral ranges, rise two very high summits; on the E. the volcano of Cotopaxi, attaining 18,800 ft.; and on the W. the Yllinza, attaining 17,375 ft. above the sea.

The valley of Quito extends from  $40'8'$  S. lat. to  $20'N.$  lat., and has an elevation of 9000 ft. above the sea. It likewise is skirted by very high summits, on the E. by Antisana, which attains 18,136 ft., and by Cayambe Urua, which attains 19,648 ft. above the sea. The summit of the latter mountain is traversed by the Equator. On the W. range the highest summits are the Pichincha, rising to 15,936 ft., and the Cotacachi, 14,448 ft. above the sea.

The three longitudinal valleys of Quito, Alausi, Hambato, and Cuenca, being only separated from each other by very narrow transverse ridges, may be considered as one valley, extending 940 miles in length, with a mean breadth of from 12 to 16 miles. They form the most populous and richest portion of the republic of Ecuador.

The northern boundary of the valley of Quito is formed by a transverse ridge between the Nevado de Cotacachi and the volcano of Imbabura ( $21'N.$  lat.). To the N. of it lie the Andes of los Pastos, an extensive mountain region, which extend to  $10^{\circ}13'N.$  lat., and is crowned by several high summits and volcanoes; as the volcanoes of Cumbal, Chiles, and Pasto. The narrow valleys which lie between the different ridges by which it is traversed are, at a medium, 10,000 feet above the sea.

This portion of the Andes is directed from S.W. to N.E., and may be considered as the centre of the N. Andes; for it is here that the chain begins to divide into two principal branches; the western of which is called Cordillera de la Costa or de Sindagua, whilst the E. bears the name of Andes de los Pastos.

The Andes of Sindagua have a break at about  $10^{\circ}20'N.$  lat., by which the Rio de las Pintas carries off the waters descending from the Andes de los Pastos and those which collect in the valley of Almaguer. This valley extends between  $10^{\circ}13'$  and  $10^{\circ}56'N.$  Its surface is very uneven, and its mean elevation may be about 6900 feet above the sea. In the mountains which extend to the E. of it is a large alpine lake, the Ciénaga de Sebondoy, in which the Rio Putumayo or Ica, a large tributary of the Amazon, takes its origin. This E. chain expands considerably to the N. of  $10^{\circ}56'N.$  lat., so as to form a mountain knot, which receives the name of Paramo de las Papas. A little farther north ( $30'5'N.$  lat.) the knot divides into two chains of mountains, which, advancing N., enclose the valley of the Rio Magdalena, as we shall see afterward. From the mountain knot of the Paramo de las Papas a transverse ridge branches off westward, uniting the eastern chain of the Andes with the cordillera of Sindagua, and separating the valley of Almaguer from the great valley of the Cauca. Near the place where this transverse range leaves the mountain knot of los Pastos is the volcano de Puracé, 14,544 feet above the sea. This volcano may be considered as the most N. point of the Andes of Ecuador, comprising those of Quito and of los Pastos.

The countries lying on both declivities and at the foot of the Andes of the Equator are very thinly inhabited, and almost entirely by aboriginal nations, unacquainted with civilization and commerce. But the elevated valleys lying between the two ranges are comparatively well peopled, partly by the descendants of Europeans, and partly by Indians who have made some progress in civilization, and are

acquainted with the advantages of commerce. Hence the great commercial road which traverses this portion of the Andes runs longitudinally over the internal valleys, beginning on the north at Popayan ( $9^{\circ}28'17''N.$  lat.) in the valley of the Cauca, and terminating at Truxillo ( $6^{\circ}5'40''S.$  lat.) on the Pacific. From Popayan (5794 ft. above the sea) it ascends the Alto de Roble (8176 ft.), and then the Alto de Quilquesa (6416 ft.). Hence it descends to the Rio de Guachichil (3043 ft.), whence it rises again by degrees to the town of Almaguer (7440 ft.) in the valley of Almaguer. It next enters the mountains of los Pastos, passing over the Paramo de Paraguary (9408) to the village of Pamo (8578 ft.). S. of this it descends to the Rio de Guaitara (5456 ft.), and again ascends a steep declivity to the village of Guachichil (18,230 ft.), whence it passes to the village of Tulian (10,112 ft.). Having traversed the Paramo de Boliche (11,504 ft.), and the Alto de Pucara (10,400 ft.), it descends by a steep declivity to the river Chota, which is passed at the Ponto de Chota (5930 ft.), and hence it leads upward to the town of Quito (9536 ft.).

From Quito the road runs over the plain to the Alto de Chisínche, which has a little more than 10,000 feet of elevation. It next passes through the valley by Hambato (8884 ft.), Riobamba Nueva (9473 ft.), Guamate (10,594 ft.), and Alausi (7984 ft.). Between the last-mentioned place and the town of Cuenca is the famous and dangerous pass over the Paramo de Asamay, which in its highest point, the Ladera de Cadul, rises to 15,536 ft., and is above the snow line. More or fewer lives are annually lost on this paramo. Cuenca is 8640 ft. above the sea. Leaving this town the road descends to the Rio de Saraguro (7375 ft.), and again rises to the Alto de Fula (10,000 ft.), whence it passes to Loja (6768 ft.).

From Loja the road passes to the W. declivity of the Andes, where it traverses Ayavaca (5993 ft.) and Otterus (4768 ft.), whence it repasses the range by the Paramo de Guamani (10,960 ft.), and enters the valley of the Marañon. In this it traverses Guancabamba (6360 ft.), Zulcan (4338 ft.), the Paramo de Yacoca (8768 ft.), the Paso de Pucara (3532 ft.), Montan (8690 ft.), and Caxamarca (9200 ft.). From the last-mentioned place it again passes the Andes to Guanamara (8000 ft.), and runs hence to Caenas (4384 ft.) and Los Mokinos (608), terminating at Truxillo (900 ft. above the sea). Thus this long road runs continually over mountains in traversing  $94^{\circ}$  of lat.

From Guayaquil a road leads to Quito. From the first-mentioned place it runs through the low grounds skirting the Rio de Guayaquil to Caracal, and then along the banks of the Rio Ojibá to Caluma, where the ascent of the mountains commences. The declivity is extremely steep between Caluma and Chimbo, which is situated on an elevated country S. of the Chimborazo. From Chimbo the road leads to Mocha and Hambato, where it joins the great mountain road.

There exists a road between Quito and the harbor of Carondelet over the pass de Malibucha, but we are not acquainted with the particulars relating to it.

We observed above, that at about  $10^{\circ}30'N.$  lat. the Andes of Sindagua branch off from the mountain knot of los Pastos. The E. range divides again at about  $9^{\circ}5'N.$  lat. into two high mountain ranges. Thus we find N. of the latter parallel the Andes divided into three distinct chains, which enclose the valleys of the rivers Magdalena and Cauca. These chains are called the E., Central, and W. Andes.

The Eastern Andes of New Granada run between  $30'5'$  and  $50'30'N.$  lat., nearly parallel with the central range N.N.E.; but N. of  $50'30'$  they incline farther E., running due N.E. Though none of its summits, except the Nevado de Chita ( $50'50'N.$  lat.) and the Nevado de Mucuchies ( $50'12'$ ) enter the line of perpetual congelation, its mean height is commonly above the region of trees; and the paramos, which extend on its summits, have a scanty vegetation, and rise to an elevation of between 12,000 and 14,000 ft. Las Rosas, the most N. of these paramos, terminates near  $9^{\circ}N.$  lat., and may be considered as the most N. extremity of the Andes; for the hilly country lying farther N. about the towns of Tucuyo and Barquisimeto is not known to contain summits exceeding 4000 or 5000 ft. In elevation, and on that account alone cannot be considered as a continuation of the gigantic mountain system of the Andes.

The eastern declivity of this range is so precipitous that it affords no space for agriculture, and can only be ascended with great difficulty; but on its W. declivity recline several extensive table-lands, exhibiting a more or less level surface, and rising to an elevation of from 6000 to 9000 ft. above the sea. Such are the rich and fertile plains of Bogota, with those of Tunja, Socorro, Sogamoso, and Pamplona. These table-lands terminate rather abruptly, and at a little distance from the banks of the Rio Magdalena. The river Funza, or Rio de Bogota, when issuing from the plain, precipitates itself at Tequendama, at two bounds, down a perpendicular height of 650 feet. In no other cataract is

## ANDES.

there so great a mass of water precipitated from so great a height; and the solitude of the place, the luxuriance of the vegetation, and the dreadful roar, present a scene of unparalleled sublimity.

The E. Andes are twice traversed by the road leading from Bogotá to Caracas. From the capital of New Granada it runs over the table-land of Bogotá and Tunja to the sources of the Tegrá, a tributary of the Sogamoso, where it passes over the Paramo de Almocadéro, on the summit of which it attains an elevation of 12,850 ft. above the sea. It then descends towards the E. plain; before attaining which, it again ascends the range to the town of Pampluna, which probably is not less than 9,000 ft. high. To the N. of this it traverses the upper part of the range, and passes to Rosario de Cucuta. From the last-named place the road is made over the high grounds which skirt the N.W. declivity of the chain, passing through Merida, Mendoza, and Truxillo, to Tocuyo. From Tocuyo it traverses the hilly region by which the Sierra de la Costa is united to the Andes, passing through Barquimé, S. Carlos, Valencia, and Victoria, to Caracas.

The Central Andes of New Granada run N. with a slight declivity to the E., and form between their commencement and 5° 15' one great mass of rocks, about 40 or 50 m. in breadth, whose sides are only furrowed by ravines, but not intersected by valleys. Its mean height seems to be rather greater than that of the E. Andes, and it contains several summits which exceed the snow line. The most remarkable of them are from S. to N.; the Nevados de Huila, de Baraguan, de Tollima (which attains 18,336 ft.), and de Hervio. In the vicinity of the latter (5° 15') the range expands to about double its width, separating at the same time into several ridges, so as to form a mountain knot, with intervening valleys. This mountain region, known under the name of Sierra de Antioquia, forms in its upper valleys a high country, from 9000 to 7000 ft. above the sea, on which the ridges rise 9000 ft. and more. It approaches very close to the Rio Cauca, so as to skirt its bed for about 150 m. Opposite to the high banks formed by these ridges, other mountains, belonging to the W. Andes, approach as near to the river, which runs for nearly 150 m. in an immense cleft, over a rocky and rugged bottom, and forms a series of cataracts and rapids between Salto de S. Antonio and Bocca del Espíritu Santo. In all this space the river is quite unfit for navigation, and travelling by land is in this country very fatiguing, and not without danger. The ridges which issue from the mountain knot of the Sierra de Antioquia approach the Rio Magdalena to a distance of a few miles, and terminate not far from the place where that river joins the Rio Cauca, about 8° 30'.

That portion of the central Andes which forms one undivided mass is crossed by two roads, one leading from Bogotá to Popayan, and the other to Cartago. The first runs, after descending from the elevated plain of Bogotá to the banks of the Rio Magdalena, in the valley of this river to the S. as far as the town of La Plata, whence it turns W., and crosses the range over the Paramo de las Guanacas, on which it rises to 14,705 ft. above the sea. It then descends into the valley of the Cauca to the town of Popayan. The road between Bogotá and Cartago descends from the plain of Bogotá (8736 ft.), crosses the Rio Magdalena at the pass of Guayacana (1900 ft.), passes through the town of Ibagué (4420 ft.), and crosses the range by the famous mountain pass of Quindiu, between the Nevados de Baraguan and Tollima; at its highest point, the Garito del Paramo, it attains an elevation of 11,504 ft. above the level of the sea. It descends afterwards to the town of Cartago in the valley of the Cauca (3152 ft.).

The Western Andes of New Granada are the same range, which, farther S., is called Sierra de la Costa or de Sindagua. It lowers considerably in advancing to the N., so that between 2° 30' and 5° N. its mean elevation does not exceed 5000 or 6000 ft. above the sea, or from 2000 to 3000 ft. above the valley of the Cauca; nor is its breadth considerable, probably not more than from 15 to 30 m., but it rises with a very precipitous declivity. N. of 5° the range is higher, and its breadth more considerable. Its highest summit is the Torre del Choco, S.E. of Novita, which, however, is far from attaining the snow line, and probably does not rise to much more than 10,000 ft. N. of this summit the range approaches close to the Rio Cauca, forming its high banks between the Salto de S. Antonio and the Bocca del Espíritu Santo, and constituting with the opposite ranges of the central Andes, as it were, one mountain knot. The western Andes end from this point a range towards the Caribbean sea, which skirts the Rio Cauca on the W., extending to the N., of 8° N. lat., and contains the Alto de Viento, a summit which attains more than 9000 ft. of elevation.

From the W. Andes a ridge branches off near 6° N. lat. It runs to the W., and separates the sources of the Rio de S. Juan, which falls into the Pacific, from those of the Atrato,

which runs to the Caribbean sea. This range soon turns to the N.N.W., and advances in that direction between the Rio Atrato and the Pacific. Its elevation seems not to be considerable at the beginning, and it grows lower as it advances farther N. It seems to disappear entirely between 7° and 8°, opposite to the harbour of Cupica on the Pacific; for no mountain range is found on the isthmus of Panama, where it is narrowest.

Six roads are said to cross the W. Andes, but they can only be used with great difficulty, on account of the extreme steepness of the ridges. They are commonly impracticable for mules, and travellers as well as goods are brought over on the backs of Indians. The roads most used are that of Las Juntas, which leads from Cali in the valley of the Cauca to Buenaventura, a harbour on the Pacific; the road of S. Augustin, connecting Cartago with Novita; and that of Verraz, by which the town of Citara, in the valley of the Atrato, communicates with Antioquia on the banks of the Cauca.

The Geology of the Andes is very imperfectly known. Only a small portion of their immense extent has been visited by scientific travellers; and the information obtained from them teaches only a few isolated facts, which do not justify general conclusions. We are, however, informed, that the most frequent of the primitive rocks of the Alps—granite and gneiss—are by no means frequent in the Andes, which are composed mostly of porphyry and mica-slate. Porphyry is by far the most widely-extended of the unstratified rocks of the Andes, and occurs through the whole range at all elevations, and frequently the highest summits are composed of it. Next to porphyry and mica-slate, trachyte and basalt are most frequently met with.

Volcanoes are frequent in certain portions of the range. Capt. B. Hall observed a phenomenon, which induced him to think that a volcano exists on one of the larger islands N. of Cape Horn, and that the observed phenomenon was produced by an eruption; but Capt. King, who surveyed these islands about ten years ago, seems not to have found a volcano in Terra del Fuego, nor in any other portion of the range S. of 46° S. lat. But farther N. they occur in great numbers. Four volcanoes are visible from the island of Chiloe: they lie on the opposite coast, between 46° and 49° S. lat. Still more numerous are the volcanoes in the Chilean Andes, not less than nineteen being known to be there in a state of activity. The most N. is that of Coquimbo, somewhat to the S. of 30° S. lat. But between this volcano and that of Atacama (between 21° and 23° S. lat.), no volcano is stated to exist, that of Copiapó, which appears on our maps, being unknown in the country. Farther N. the volcanic mountains occur only in the W. range of the Bolivian Andes; none of the high summits of the E. range having ever been known to have made an eruption, or emitted smoke. It is not known whether volcanoes exist in the Andes between 14° and 5° S. lat., but it is certain that in this part of the range they are not numerous, as no mention of them has been made by travellers. That portion of the Andes in which volcanic agency is most active lies between 34° S. lat. and 9° N. lat. The number of summits whose eruptions are recorded is here very considerable; and Humboldt is inclined to think that the valleys N. of the pass of Assuay are to be considered as being placed on an extensive volcanic basis, and that most of the numerous summits surrounding them have once served, and may again serve, as channels for the subterranean fire communicating with the atmosphere. The farthest N. of these volcanoes is that of Puracé in the neighbourhood of Popayan, where the Andes begin to divide into three ranges; which seem to be, in their present state, quite exempt from volcanic agency, none of their summits having ever made an eruption.

No portion of the globe is subject to such frequent and frightful earthquakes as the countries embosomed within the range of the Andes, and those lying between them and the Pacific ocean. The towns of Bogotá, Quito, Riobamba, Callao, Copiapo, Valparaiso, Concepcion, and others, have, at different times, been more or less destroyed by their agency; and some more than once.

*Line of perpetual Congelation.*—The observations made by Humboldt in the Andes induced him to fix the snow line near the equator, at an elevation of 15,750 ft.; and he thought that, near the tropic, it would be found at about 14,000 ft., or somewhat higher. But Mr. Pentland found it near 17° S. lat., at nearly 17,000 ft.; and later observations fix it near 19° S. lat., at about 16,400 ft. above the level of the sea. It is further remarkable, that though a great number of summits rise above the snow line, glaciers are of rare occurrence in the Andes. This is partly to be attributed to the relative position of their summits, which generally form a continuous line, without having other summits on their sides; and partly to the considerable distance which everywhere is found to intervene between two summits. It is only in the narrow ravines by which some of the sides of the giant summits are furrowed, that glaciers of small extent are met with.

## ANDES.

**Vegetation of the Andes.**—The different plants and trees peculiar to the different regions of the globe appear in regular succession, as we ascend from the level of the ocean to the heights of the Andes. In the lower grounds, between the tropics, from the level of the sea to the height of from 3000 to 5000 ft., cassava, cacao, maize, plantains, indigo, sugar, cotton, and coffee are cultivated. Indigo and cacao, the plantain or the banana tree, and the cassava root require great heat to be brought to maturity, generally a climate of which the mean temperature is 70°. But cotton and coffee will grow at a considerable elevation, and sugar is cultivated with success in the temperate parts of Quito. Maize is cultivated in the same climate as the banana; but its cultivation extends over a much wider sphere, as it arrives at maturity at an elevation of 6000 ft. above the sea. The low country within the tropics is also the region of oranges, pineapples, and the most delicious fruits. Between the altitudes of 6000 ft. and 9000 ft. lies the climate best suited for the culture of all kinds of European grain. Wheat, under the equator, will seldom form an ear below an elevation of 4500 ft., or ripen if above that of 10,000 ft. At the same time it must be observed, that the European colonists have not sufficiently varied their agricultural experiments to ascertain exactly the minimum of height at which European cereals would come to maturity in the equinoctial regions of America. Humboldt mentions that in the Cañecos he saw fine harvests of wheat near Victoria, in the latitude of 10° 13' N., at the height of 1640 and 1900 ft., and at Cuba wheat flourishes at a still smaller elevation. Rye and barley, especially the latter, resist cold better than wheat; they are, accordingly, cultivated at a greater elevation. Barley yields abundant harvests at heights where the thermometer rarely keeps up during the day above 57° Fah. Within the limits in which European grain flourishes is to be found the oak, which from an elevation of 9000 ft. never descends, near the equator, below that of 5500 ft., though it is met with in the parallel of Mexico at the height of only 9000 ft. Beyond the limit of 9000 ft. large trees of every kind begin to disappear, though some dwarfish pines are to be found at the height of 13,000 ft., nearly 9000 ft. from the line of perpetual snow. The grasses clothe the ground at an elevation of from 13,000 ft. to 15,100 ft.; and from this to the regions of ice and snow, the only plants visible are the lichens, which covers the face of the rocks, and seems even to penetrate under the snow.

In districts as elevated as the valley of Titicaca, agriculture is confined to potatoes, onions, and capicum, and to the grain called *quinua* (*Chenopodium quinua*, Lin.); barley and rye are only cultivated as fodder. On the plain of Bogota a farinaceous root, called *aracacha*, is cultivated, and lately some attempts have been made to introduce its culture in England. Trees are found to ascend to 12,000 ft., or 14,000 ft. on the declivities of the mountains; but their summits, which commonly form plains of some extent, are nearly bare of vegetation, nourishing only two or three kinds of low plants.

Among the vegetable productions of the Andes, none has obtained greater celebrity than the *cinchona*, or Jesuits' bark, which is now known to grow not only on different parts of the Andes, but also on the other high mountains of S. America. The best bark, however, is collected on the Andes between 50° N. lat. and 50° S. lat., where the trees grow at an elevation of from 10,000 to 14,000 ft. above the sea.

**Zoology of the Andes.**—This we are very imperfectly acquainted with. The most remarkable genus is that which comprehends the guanacos, llamas, and vicuñas, of which the llamas are used as animals of burden; but they are slow, making only about twelve miles a day, and carrying about seventy pounds of burden. The vicuñas give a very valuable kind of wool. Among birds, the *condors* have always attracted the attention of travellers, on account of their enormous size. They are a species of vulture.

**Mineral Wealth.**—If the high table-land of Anahuac in Mexico be excepted, no mountain range can vie with the Andes in mineral riches, especially in the precious metals. Many of the rivers descending from the Andes between the tropics contain small particles of gold in their sand. The particles of gold deposited in the alluvial soil skirting the beds of some of these rivers have attracted the attention of Europeans, and at some places the soil is carefully washed. The alluvial soils richest in gold are those lying to the W. of the central Andes of New Granada, on both sides of the Rio Cauca; as also in the provinces of Barbaças and Choco along the Pacific. In the latter districts platinum also occurs; and, till within these few years, when it has been found in the Ural mountains, these were considered as the only places in which it was to be met with. Alluvial soils rich in gold are also found along the rivers which descend from the range of the Bolivian Andes, between 14° and 17° S. lat.; and here, too, considerable quantities of gold are extracted. The annual produce of the *lavaderos* and gold mines of the Andes is stated by Humboldt to have amounted, in the be-

ginning of the 19th century, to 253,480 oz.; equal, at £4 per oz., to £1,132,716.

Silver occurs in many places of the range between 33° and the equator; but it is commonly found at an elevation where vegetation nearly ceases, which renders the working of the mines very expensive, and frequently disappoints the otherwise well-founded expectations of the undertakers. The number of mines which have been worked and abandoned is very great; many of them, however, are still worked. The most celebrated silver mines are those of Potosi and Pasco. The former are in the Cerro de Potosi (19° 36' S. lat.), which rises to 16,037 ft. above the sea. This mountain is perforated in all directions; and it is said, though the statement be probably exaggerated, that there are no fewer than 5000 excavations in it. The Cerro de Pasco is a hill, rising on the high plain of Bombon (about 11° S. lat.). It has been worked for more than two centuries, and may now be considered as the richest silver mine of America; unless, which is doubtful, it be surpassed by the silver mines discovered in N. Chili in 1830, about 30 or 40 m. S. of the town of Copiapo, where silver ore is said to be very abundant, and so rich as to yield forty or even seventy ounces in each cerge. At the beginning of the present century, the annual produce of the silver mines of the Andes was stated by Humboldt to amount to 601,493 lbs. troy; which, if we take the silver at five shillings the ounce, gives a sum of £2,074,475. It is not easy to estimate its amount at present, but probably it is not much fallen off.

Mercury or quicksilver occurs in many places N. of 14° S. lat. and S. of the equator; but since the destruction of the mines of Guancavelica, we are not sure whether it be anywhere worked. These, which were extremely rich, yielding from 4000 to 6000 cwt. a year, were unfortunately ruined in 1788, through the ignorance and mismanagement of a superintendent.

Copper seems to occur very frequently S. of 14° S. lat. Large masses of nearly pure copper are stated to exist on the surface of the S. extremity of the valley of Titicaca, but the expense of bringing them down to the coast is at present so great that they cannot be turned to advantage. In the N. provinces of Chili several mines are worked with advantage. Miers estimated the quantity of copper exported from these countries in 1894 at 40,000 cwt.; in 1899 it rose to 60,000, and has since materially increased. It is mostly exported to China, India, and the U. States.

Ores of lead, tin, and iron are said to exist in various parts; but they are not worked.

**Population of the Andes.**—It is a characteristic feature of S. America, that its extensive plains, which comprise more than three fourths of its surface, are very thinly inhabited; nor does it appear likely that large portions of them should ever be brought to such a state of cultivation as to maintain a dense population. At present, far the greater number of the inhabitants are met with on the table lands, and in the valleys of the Andes. It has been doubted whether the whole population of S. America exceeds 12,000,000; but this, we have little doubt, is below the mark. We are inclined to think that the inhabitants of the Andes, including the coast of the Pacific, amount to more than 6,000,000. This coast is favoured with an excellent climate, and that portion of it which lies between 40° and 30° S. lat. has in general a good soil; but between 30° and 50° S. lat. it is a complete desert—a circumstance mainly attributable to the entire want of rain, a single drop never refreshing its arid soil. In this respect it forms a singular contrast with the coast extending between the equator and the Isthmus of Panama, where hardly a day passes without rain, and where at certain seasons it pours down in such abundance as to change all the lower lands into swamps, and to render the country extremely unhealthy. The whole coast along the Pacific does not probably contain 1½ million inhabitants: so that more than 4½ millions live within the mountain system.

The state of these countries seems to have been little different at the time when America was discovered. In the Andes only was found a government regularly arranged, and a nation which had made a considerable progress in civilization, and which chiefly subsisted by the produce of its agriculture. Here only the Spaniards were able to conquer the country; in the other parts of America they established colonies, and tried by various means to subject the savage nations in their neighbourhood: these attempts succeeded in some instances, and in others not.

The population of the Andes is composed of the descendants of the Spaniards, and of the ancient Peruvians. Negroes have also been introduced in the N. districts, and are pretty numerous in the valleys of the Rio Magdalena and Rio Cauca; they are also found on the coast in the provinces of Barbaças and Choco, and, in small numbers, on the remainder of the coast as far S. as Arica (13° S. lat.). The whites constitute the great bulk of the population in the valleys of the Rio Magdalena and Cauca; in the latter no aborigines are met with. But on the high valleys of Equador,

## ANDES.

on the plain of Bomben, on the table land of Titicaca, and in the valleys which extend to the E. of the great chain of the Andes, the ancient Peruvians are by far the most numerous class of inhabitants, the whites being there probably much less than a fourth part of the population. The Peruvians belong to the copper-coloured race spread nearly over the whole American continent. They speak different languages; but the Quichuas, sometimes called the language of the Incas, is understood or spoken by most of them. Travellers in general admit their frugality and industry in agriculture, working the mines, and some branches of manufacturing industry; but they are altogether deficient in that activity, spirit of enterprise, and desire to excel by which Europeans are distinguished.

*Travelling in the Andes.*—The improvement of the countries embosomed within the Andes is much retarded by the want of easy communication. Sometimes the intercourse between places in the immediate vicinity of each other is interrupted by *quebradas*, or rents, generally narrow, sometimes of a vast depth, and with nearly perpendicular sides. The famous natural bridge of Iaconama, in Colombia, leads over a small *quebrada*: it is elevated about 319 feet above the torrent that flows in the bottom of the chasm. Most of the torrents that are passed in travelling over the Cordilleras are fordable; though their impetuosity is such when swollen by the rains as to detain travellers for several days. But when they are too deep to be forded, or the banks too inaccessible, suspension bridges are thrown over them, of a singular make; but which, notwithstanding their apparently dangerous and fragile construction, are found to answer the purposes required. Where the river is narrow, with high banks, they are constructed of wood, and consist of four long beams laid close together over the precipice, and forming a path of about a yard and a half in breadth, being just sufficient for a man to pass over on horseback. These bridges have become so familiar to the natives that they pass them without apprehension. Where the breadth of the river will not admit of a beam being laid across, ropes constructed of *ajoncs*, a species of thin elastic cane, of the length required, are thrown over. Six of these ropes are stretched from one side of the river to the other; two, intended to serve as parapets, being considerably higher than the other four; and the latter being covered with sticks laid in a transverse direction, the bridge is passed by men, while the mules, being divested of their burdens, are made to swim across. All travellers have spoken of the extreme danger of passing these rope bridges, which look like ribands suspended above a crevice or impetuous torrent. But this danger, according to Humboldt, is not very great when a single person passes over the bridge as quickly as possible, with his body leaning forward. But the oscillations of the ropes become very great when the traveller is conducted by an Indian who walks quicker than himself; or when, frightened by the view of the water seen through the interstices of the bamboos, he has the imprudence to stop in the middle of the bridge, and lay hold of the ropes that serve as a rail. Some of the rivers of the higher Andes are passed by means of an invention or bridge denominated a *tarabita*. It conveys not only the passengers, but also their cattle and burdens; and is used to pass those torrents whose rapidity and the large stones continually rolling down, render it impossible for mules to swim across. It consists of a strong rope of *hejaco*, extended across the river, on each bank of which it is fastened to stout posts. On one side is a kind of wheel or winch to straiten or slack the rope to the degree required. From this rope hangs a kind of moveable leathern hammock, capable of holding a man, to which a rope is fastened for drawing it to the side intended. For carrying over mules two ropes are necessary, and these much thicker and stiffer. The creature being suspended from them, and secured by girths round the belly, neck, and legs, is shoved off, and dragged to the opposite bank. Some of these *hejaco* bridges are of great length, and elevated to a great height above the torrent.

A bridge of this sort was constructed by the 5th Inca over the Desaguadero, or river that issues from lake Titicaca, where it is more than 300 feet in width; and, on account of its utility, is still kept up. Sometimes, instead of being made of *hejacos* or cobs, these suspension bridges are made of twisted strands or thongs of bullock's hide. Mr. Miers passed along one of this sort in Chili, 325 feet in length, by 6 feet wide; it conveyed over loaded mules, and was perfectly secure. (*Ullas, Voyages en Amerique*, i. 358; *Miers, Chili*, i. 325; *Humboldt's Researches*, ii. 73.)

The ruggedness of the roads in the less frequented parts of the Andes, can hardly be described. In many places the ground is so narrow, that the mules employed in travelling have scarcely room to set their feet, and in others it is a continued series of precipices. These paths are full of holes, from two to three feet deep, in which the mules set their feet, and draw their bellies and their riders' legs along the ground. The holes serve as steps, without which the precipices would be in a great measure impracticable; but, should

the creature happen to set its foot between two of these holes, or not place it right, the rider falls: and if on the side of the precipice, inevitably perishes. This danger is even greater where the holes are wanting. The tracks are extremely steep and slippery, and in general chalky and wet; and where there are no holes to serve as steps, Indians are obliged to go before with small spades to dig little trenches across the path. In descending these places where there are no holes or trenches, and which are sometimes many hundred yards deep, the instinct of the mules accustomed to pass them is admirable. They are sensible of the caution requisite in the descent. On coming to the top of an eminence, they stop; and having placed their fore feet close together, as if in a posture of stopping themselves, they also put their hind feet together, but a little forward, as if going to lie down. In this attitude, having, as it were, taken a survey of the road, they slide down with the swiftness of a meteor. The rider has only to keep himself fast in the saddle, without checking his beast; for the least motion is sufficient to disorder the equilibrium of the mule, in which case they must both unavoidably perish. The address of these creatures is here truly wonderful; for in this so rapid motion, when they seem to have lost all command of themselves, they follow exactly the different windings of the path, as if they had previously reconnoitred and settled in their minds the route they were to follow, and taken every precaution for their safety. There would otherwise, indeed, be no possibility of travelling over places where the safety of the rider depends on the experience and address of his beast.

The valleys of the Cordilleras, which are deeper and narrower than those of the Alps and Pyrenees, and present scenes of the wildest aspect, give rise also to several other peculiarities in the mode of travelling. In many parts, owing to the humidity of the climate, and the declivity of the ground, the streamlets which flow down the mountains have hollowed out gullies from about 20 to 35 feet in depth. The pathway which runs along those crevices is frequently not above a foot or a foot and a half in breadth, and has the appearance of a gallery dug and left open to the sky. In some places the opening above is covered by the thick vegetation which grows out from both sides of the crevice, so that the traveller is forced to grope his way in darkness. The oxen, which are the beasts of burden commonly made use of in this country, can scarcely force their way through these galleries, some of which are more than a mile in length; and if the traveller should happen to meet them in one of the passages, he has no means of avoiding them but by climbing the earthen wall which borders the crevice, and keeping himself suspended by laying hold of the roots which penetrate to this depth from the surface of the ground. "In many of the passes of the Andes," says Humboldt, "such is the state of the roads that the usual mode of travelling for persons in easy circumstances is in a chair strapped to the back of one of the native porters (*cargueros*), or men of burden, who live by letting out their backs and loins to travellers. They talk in this country of going on a man's back (and *en carguero*), as we mention going on horseback. No humiliating idea is annexed to the trade of *carguero*; and the men who follow this occupation are not Indians, but mulattoes, and sometimes even whites. It is often curious to hear these men, with scarcely any covering, and following an employment which we should consider so disgraceful, quarrelling in the midst of a forest, because one has refused the other, who pretends to have a whiter skin, the pompos title of Don or *Su Merced*. The usual load of a *carguero* is six or seven arrobas; those who are very strong carry as much as nine arrobas. When we reflect on the enormous fatigue to which these miserable men are exposed, journeying eight or nine hours a day over a mountainous country; when we know that their backs are sometimes as raw as those of beasts of burden; that travellers have often the cruelty to leave them in a forest when they fall sick; that they earn, by a journey from Ibague to Cartago, only 18 or 14 piastres in from 15 to 25 days; we are at a loss to conceive how this employment of a *carguero* should be eagerly embraced by all the robust young men who live at the foot of the mountains. The taste for a wandering life, the idea of a certain independence amid forests, leads them to prefer it to the sedentary and monotonous labour of cities. The passage of the mountain of Quindia is not the only part of South America which is traversed on the backs of men. The whole of the province of Antioquia is surrounded by mountains so difficult to pass, that they who dislike entrusting themselves to the skill of a bearer, and are not strong enough to travel on foot from Santa Fe de Antioquia to Bocca de Nares or Rio Samana, must relinquish all thoughts of leaving the country. The number of young men who undertake the employments of beasts of burden at Choco, Ibague, and Medellin, is so considerable, that we sometimes meet a file of fifty or sixty. A few years ago, when a project was formed to make the passage from Nares to Antioquia passable for mules, the *cargueros* presented formal

## ANDLAU.

summonances against mending the road, and the government was weak enough to yield to their clamour. The person carried in a chair by a cargero, must remain several hours motionless, and leaning backwards. The least motion is sufficient to throw down the carrier; and his fall would be so much the more dangerous, as the cargero, too confident in his own skill, chooses the most rapid declivities, or crosses a torrent on a narrow and slippery trunk of a tree. These accidents are, however, rare; and those which happen must be attributed to the imprudence of travellers, who, frightened at a false step of the cargero, leap down from their chairs." (*Recherches*, l. 69.)

In order to protect travellers, when they are sojourning in this desert country, from the inclemency of the weather, the cargeros provide themselves with several hundred leaves of a plant of the banana species, which they pluck in the mountains before they begin their journey. These leaves, which are membranous and silky, are of an oval form, 2 foot long, and 16 in. in breadth. When the travellers reach a spot in the midst of the forest where the ground is dry, and where they propose to pass the night, the cargero lop a few branches from the trees, which they make into a tent. In a few minutes this slight timber-work is divided into squares by the stalks of some climbing plant, or by the threads of the algae. The banana leaves having in the mean time been unrolled, are now spread over the above work, so as to cover it like the tiles of a house. These huts, thus hastily built, are cool and commodious; and Humboldt mentions that he passed several days in the valley of Boquia under one of those leafy tents, which was perfectly dry, though exposed to violent and incessant rains.

No doubt the access to the Andes will, in the course of time, be facilitated by the establishment of steam packets on the Amazon and its tributaries. That this has not been attempted are now is, we apprehend, a consequence rather of the revolutionary anarchical state in which the country has been plunged since the overthrow of the Spanish government, than of any natural difficulties in the way of such navigation. Anarchy, however, must in the end exhaust itself; and either a free government or a despotism be established in its stead. And it is hardly possible to suppose that any regular government, whatever may be its character, should be established for any considerable period without turning its attention to the means of developing the extraordinary resources of these fine countries: and of these none can be either so effectual, or so obviously indispensable, as the opening of improved communications with the coast, and with the great navigable rivers of the interior.

ANDLAU, p. t. Delaware co., N. Y., 67 m. S.W. Albany. 334 W. Watered by Papacot branch of Delaware river. The village contains two churches, one store, and about twenty dwellings. In the town are six stores, one woollen factory, two grist-mills, twelve saw-mills, seventeen schools, 731 scholars. Pop. 9178.

ANDLAU, a town of France, dep. Bas Rhin, arrond. Schelestat, on the Andlau, 10 m. N.N.W. Schelestat. Pop. 2357.

ANDORRE (REPUBLIC OF), a small independent state on the S. declivity of the Pyrenees, between the dep. of Artois in France, and the district of Urgel in Spain. It stretches from N. to S. about 36 m., and from E. to W. about 30, comprising 3 mountain valleys, and the basin formed by their union. These valleys are among the wildest and most picturesque in the Pyrenees, and the mountains, with their immense peaks, by which they are enclosed, among the highest and least accessible. It is watered by several small rivers; the largest of which, the Embalat, having received the others, falls into the Segre, an affluent of the Ebro. Pop. from 7000 to 8000, divided among six communes. Andorre, the principal town, has about 2000 inhab. It has but little arable land, but a considerable extent of excellent pasture grounds, sheltered by vast forests of fir. The inhab. depend principally on their flocks and iron mines, the produce of the latter finding a ready market in Spain. This little state, though connected in some degree with both its powerful neighbours, has preserved its independence for about 1000 years. The government is composed of a council of 24 members, chosen for life, each commune electing four. The council elect two Syndics (*Huys*), who enjoy considerable authority, convoking the assemblies, and carrying on the government when they are not sitting. It is to Charlemagne that Andorre owes its independence. In 1190, that prince having marched against the Moors of Spain, and defeated them in the neighbouring valley of Carol, the Andorrians are said to have rendered themselves so useful to the French army, supplying them with provisions, and taking care of their wounded, that the Emperor, by way of recompense, made them independent of the neighbouring princes, and permitted them to be governed by their own laws. After him Louis le Debonnaire ceded to the Bishop of Urgel a part of the rights over Andorre which Charlemagne had reserved to himself and his successors. In virtue of this

## ANDORRE, REPUBLIC OF.

grant, the Bishop acquired right to a part of the tithes of the six communes, and a spiritual jurisdiction over the country, which he still exercises.

In 1763, the rights exercised by the sovereigns of France in Andorre being considered as feudal, were abandoned, and the republic was for a time completely separated from that country; but notwithstanding this temporary independence, the Andorrians continued to preserve their attachment to France. They resisted the violation of their territory by the Spaniards, and furnished to the French armies during the late war, guides and assistance of every kind. At the same time they anxiously solicited the establishment of the ancient order of things; and Napoleon yielded to their wish. By a decree of the 30th of March, 1808, Andorre was declared to be a republic connected with France; its viguer, or criminal judge, was to be a Frenchman, of the dep. of Artois; and it was allowed to import certain quantities of certain specified articles, free of duty, on payment of the trifling sum of 960 fr. a year. Except, therefore, as regards the spiritual jurisdiction of the Bishop of Urgel, which cannot be said to interfere with its independence any more than the Pope's ecclesiastical authority over Catholic countries can with theirs, Andorre is altogether independent of Spain; and, as regards France, the annual payment it makes to her is not a tribute, but an inadequate compensation for a valuable privilege; and there being little crime in Andorre, the appointment of a Frenchman for criminal judge was more with a view to deter French criminals from taking refuge in this neutral territory, than to assert any superiority Andorre may, therefore, be justly considered as the oldest free republic in existence. The people all belong to the Church of Rome, and are very religious. Their clergy, and the more wealthy of the inhabitants, are educated at Toulouse or Barcelona. Each curé, in addition to his pastoral duties, has charge of a school, where the poor are instructed gratuitously; but this does not give him much extra trouble, few of the peasants thinking it necessary to send their children to school to acquire what, in their land of shepherds and labourers, they imagine can be of little consequence in their future lives. Hence the great majority of the people can neither read nor write.

The Andorrians are simple and severe in their manners, the vices and corruptions of cities not having hitherto found their way into their valleys. They live as their forefathers lived a thousand years before them; the little they know concerning the luxuries, arts, and civilization of other countries, inspiring them rather with fear than envy. Their wealth consists in their sheep or cattle, or in the share they may have in iron forges, only a very few of their number being the proprietors of any land beyond the garden which surrounds their cottage. Each family acknowledges a chief who succeeds by right of primogeniture. These chiefs, or eldest sons, choose their wives from families of equal consideration with their own, reprobating *moeurs*, and looking little to fortune, which, besides, is always very small upon both sides. They never leave the paternal roof until they marry; and if they marry an heiress they join her name to their own; unless married, they are not admitted to any share in the management of public affairs.

When there are only daughters in a family, the eldest, who is heiress of the entire property, and succeeds as an eldest son would do, is always married to a cadet of another family, who adopts her name, and is domiciliated in her family. By this arrangement, the principal Andorrian houses have continued for centuries without any change in their fortunes, *ni plus riches, ni plus pauvres*. The poorest inhabitants are not so badly off as in most other countries; their wants are few and easily supplied, the opulent families taking care of those who are not; and the latter honouring and respecting their benefactors.

The Andorrians are in general strong and well proportioned; the greater part of the diseases proceeding from the moral affections are unknown, as well as those originating in vice and corruption. The costume of the men, composed of coarse brown cloth made from the wool of their own sheep, resembles that worn by the peasants of Bigorre, with this difference, that the Andorrians wear the flowing red cap of the Catalans. There would seem to be but little gallantry among these mountaineers, for the women are not admitted to any of the assemblies where public affairs are considered; nor even to the dances performed upon the reception of the bishop or judge. Crime of every kind is rare, and punishments, though mild, are effectual. There are no law-suits relative to paternal successions; and should disputes of any kind arise, they are at once referred to the Syndics, whose decision is never controverted. The men are all liable to serve in the militia, should they be required; and every head of a family is obliged to have in his possession at all times a musket, and a certain quantity of powder and ball.

Commerce of every kind is free; but, with the exception of iron, of which it has some mines and forges, its manufactures are all of the coarsest and rudest kind. (For further par-

## ANDOVER.

See also the art. on *Andover in Hugo, France Piterroque, art. Andover: Mr. Murray's Summer in the Pyrenees, &c.*

**ANDOVER**, a borough and m. town of England, co. Hants, near the Anton, on the great road from London to Salisbury, being 63 m. W.S.W. of the former, and 17 N.E. of the latter. The Parl. borough and subordinate district, which last includes 10,780 acres, has 4983 inhab., of which the borough may have about 4000. It is compactly built, extending on either side about one-third of a mile from the market place, in the centre of which is a modern town hall, supported on arches, under which are held the markets. The church, an old Gothic building, is on the N. side of the town. There is an hospital for six poor men, a free school founded in 1589, and a charity school for 30 boys. Some trade is carried on in malting, and the manufacture of silk; but the principal support is derived from its being a considerable thoroughfare, and the only market for the surrounding country. It is in a thriving condition; and contains several good shops and respectable private houses. The great annual fair of Weyhill (which see) is held within a short distance. There is a canal from the town to Southampton. It returns two members to the H. of C. From 1828, down to the passing of the Reform Act, the right of voting was in the bailiff and corporation. No. of £10 houses, 225; Parl. constituency, 1836-37, 329. (*Parl. and Municipal Boundary Reports*.)

**ANDOVER**, p. t. Oxford co., Me., 22 m. W.S.W. Augusta, 624 W. Watered by a branch of Androscoggin river. It has one store, one grist-mill, two saw-mills, six schools, 105 scholars. Pop. 551.

**ANDOVER**, p. t., Merrimack co., N. H., 22 m. N.W. Concord, 467 W. Watered by Blackwater river. It has an academy, with a fund of \$10,000, three stores, one grist-mill, two saw-mills, nine schools, 344 scholars. Pop. 1193.

**ANDOVER**, p. t., Windsor co., Vt., 20 m. S.W. Windsor, 91 S. Montpelier, 453 W. Drained by head branches of Williams river. It contains four churches, one Congregational, one Baptist, one Methodist, and one Universalist; two stores, two grist-mills, one saw-mill, one falling-mill, nine schools, 263 scholars. Pop. 877.

**ANDOVER**, p. t., Essex co., Mass., 21 m. N. Boston, 16 N.W. Salem, 454 W. Bounded N.W. by Merrimack river. Watered by Shawheen river. Great Pond, in the N.E. part, covers 450 acres. The principal village is in the S. parish, and contains a bank, a fire insurance company, a bank for savings, and five churches, one Congregational, one Episcopal, one Baptist, one Methodist, and one Universalist—Phillips academy, and the Andover Theological Seminary. Phillips academy was founded in 1778, and has a fund of \$50,000. The number of students is limited to 130, all of whom study the learned languages. It has several instructors. The edifice is 80 by 40 feet. The Andover Theological Seminary was founded in 1807, and opened in the autumn of 1808. The buildings consist of three dwellings for professors and three public edifices, of brick: Phillips Hall, 90 by 40 feet, four stories high, containing 32 rooms for students; Bartlet Chapel, 90 by 40 feet, containing a chapel, library, and three lecture rooms; and Bartlet Hall, 104 by 40 feet, four stories, containing 32 suits of rooms for students. It has five professors—one of sacred literature, one of Christian theology, one of sacred rhetoric, one of sacred rhetoric and ecclesiastical history, and one assistant professor. The course of study includes three years, and the students are divided into three classes, junior, middle, and senior. Tuition and room-rents are free to all, and farther assistance is afforded to the indigent. A public examination and commencement are held on the 4th Wednesday of September, annually. There are two vacations of six weeks each. The number of students is 120; whole number educated 785, and it has 17,500 vols. in its libraries. Funds to the amount of about \$400,000 have been contributed by a few liberal donors. A teachers' seminary was founded here in 1830, which is flourishing. The village has an elevated and commanding situation, and contains many handsome dwellings. There were in the town in 1848, fourteen stores, five falling-mills, six woolen factories, three grist-mills, five saw-mills, four academies, 379 students, twenty-three schools, 1153 scholars. Pop. 5207.

**ANDOVER**, p. t., Alleghany co., N. Y., 127 m. W. by S. Albany, 317 W. The village contains one Presbyterian and one Baptist church, twenty-five dwellings, and about 130 inhabitants. There are in the town two stores, one falling-mill, one grist-mill, four saw-mills, eight schools, 946 scholars. Pop. 863.

**ANDOVER**, t., Ashutubs co., O. It has seven schools, 313 scholars. Pop. 861.

**ANDRACIO**, or **ANDRACY**, a town of Spain, on the S. W. coast of the island of Majorca. Pop. 3500. It is situated at a little distance from the sea, but it has a small port accessible to vessels drawing little water. Its territory is productive of olives.

**ANDRE (ST.)**, the name of various small towns and villages in different parts of France.

## ANDREW'S, ST.

**ANDRE**, or **ENDRE (ST.)**, a town of Hungary, on the right bank of the Danube, opposite to the island of the same name, 111 m. N. Buda. Pop. 8,000. It has one Catholic and seven Greek churches. The hills in the vicinity produce excellent wines, and the island in the river is celebrated for its fertility.

**ANDRE D'ARCHON (ST.)**, a village of France, dep. Loire, 8 m. W. Roanne. Pop. 1740.

**ANDRE-DE-CUBSAC (ST.)**, a town of France, dep. Gironde, cap. cant. 19 m. N.N.E. Bordeaux. Pop. 3389. It is situated at a little distance from the Dordogne; but it has a port, Cubzac, on that river. The high road from Bordeaux to Paris crosses the Dordogne at this point, passengers and carriages being conveyed across in a large ferry boat of a new construction.

**ANDRE DE SANGONIS (ST.)**, a town of France, dep. Hérault, 19 m. W. by N. Montpellier. Pop. 2150.

**ANDRE DE VALBOURGNE (ST.)**, a town of France, dep. Gard, cap. cant., 42 m. N.W. Nîmes. Pop. 1790.

**ANDREA (ST.)**, a village of Naples, prov. Principato Ultra, 3 m. S.E. Conza. Pop. 3900.

**ANDREASBERG**, a town of Hanover, principality of Grubenhagen, in a district which has mines of iron, cobalt, copper, and silver. Pop. 3400. It has a college, a council of mines, and manufactures of lace and thread.

**ANDREW'S (ST.)**, an ancient and celebrated city and sea-port of Scotland, co. Fife, finely situated on a low eminence on the German ocean, 31 m. N.E. Edinburgh, lat. 56° 30' N., long. 9° 50' W. Pop. 4465. It chiefly consists of three principal streets, leading in a W. direction from the cathedral, is in general well built, and has been much improved during the present century. St. Andrew's was long the metropolitan see of Scotland; and is highly interesting from its numerous remains of other ages, and the historical associations connected with it, many highly important events having occurred within its precincts. Its splendid cathedral, founded in 1160, and completed in 1318, was reduced to a ruin in 1559 by the barbarous zeal of the reformers. The castle, long the residence of its archbishops, and a place of considerable strength, stood on a precipice overhanging the sea. The famous Cardinal Beaton was assassinated in it in 1546, in revenge of the share he had in bringing Wishart, a preacher of the reformed doctrine, to the stake in the previous year. Its picturesque ruins now serve as a landmark for ships. There are also, among others, the ruins of a chapel, and a square tower 108 feet high, called the chapel and tower of St. Rule or St. Regulus, supposed to be the most ancient of the existing fabrics. The priory of St. Andrew's was one of the best endowed in Scotland; and part of a gigantic wall, intended to inclose the grounds of the priory, 870 feet long, 22 high, and 4 thick, with 14 turrets, erected by Prior Hepburn in 1516, is still in good preservation, and is not one of the least interesting relics of bygone times. The parish church, founded in the 13th century, but rebuilt in 1757, has a monument to Archbishop Sharpe, assassinated in 1679. The university of St. Andrew's, the most ancient in Scotland, and now the principal support of the city, was founded in 1410, by Bishop Wardlaw, and confirmed by a papal bull dated the following year. It originally consisted of three colleges, St. Salvador's, St. Leonard's, and St. Mary's; of which the two former were united in 1747, when the buildings of St. Leonard's were pulled down. The two colleges are in different parts of the town, and their professors and discipline are quite distinct. The United College consists of a quadrangular edifice, in which some excellent rooms were recently erected at the expense of government. This institution is appropriated to the study of languages, philosophy, and science, and St. Mary's to that of theology. The chapel of the United College, founded by Bishop Kennedy in 1458, is a fine specimen of the light Gothic; but though used as the college chapel, and as a parish church, it is in a very bad state of repair. It has a tomb of the founder, on opening which, in 1693, six silver maces were found, of which three were sent to the other Scotch universities, and three retained in the college. St. Mary's College is a handsome stone structure. A library contiguous to the latter, and containing 45,000 volumes, is common to both colleges; and until the privilege was commuted, in 1836, for £450 a year, it was entitled to a copy of every work entered at Stationer's Hall. The United College and St. Mary's have together eleven professors; each college has a principal, and the university is presided over by a lord-rector and a chancellor. The endowments are considerable, each professor receiving at an average about £230 a year, exclusive of fees from pupils. The average number of the latter during the ten years ending with 1836-37 has been 172, of whom 43 have belonged to the theological college of St. Mary, and the remaining 130 to the United College. The fee for attending one of the literary classes is £2 3s.; students in the theological classes pay no fees—with the exception of a fee of 5s. on matriculating, which is common to both establishments. The United College has 21 bursaries, of the gross

## ANDRIA.

annual value of about £300, and St. Mary's seven bursaries, of the gross annual value of £300. Recently a very large addition has been made to the facilities for education already enjoyed by St. Andrew's, through the liberality of Dr. Bell, of Madras, who bequeathed the sum of £45,000 three per cent. stock for the erection of a seminary on a comprehensive plan in this his native city. A fine building for this school has been erected at a little distance from St. Mary's College. The number of teachers in the *Madras College* (the name given to Dr. Bell's establishment) is nine, exclusive of assistants. This seminary affords instruction gratis to the poor; and the fees are very low even to the rich, being only 7s. 6d. per quarter for Latin and Greek; the same for German and French; the same for mathematics, and the same for drawing: 5s. per quarter for geography: 3s. for writing: 2s. 6d. for arithmetic: and 2s. for English. Students may attend one or more classes, and pay accordingly. The average number of pupils at this seminary has been about 800, but it is rapidly increasing. Of this number above a half are strangers, attracted to the city by the deservedly high character of this excellent institution, the best probably of its kind in the empire. The harbour, partly formed by two piers, is on the E. side of the town, extending about 430 yards inland; and it dries at low water, and the access to it being difficult, it is little frequented by shipping. The society of St. Andrew's is comparatively good; the advantages afforded for education, and the cheapness of living, having attracted to it a considerable number of gentry families, whose circumstances may not be sufficiently prosperous to permit of their residing at Edinburgh or other expensive towns. It has no manufactures worth notice, unless it be that of *golf-balls*, or balls for playing the game of golf, which employs about six or seven men, who produce annually about 1100 dozen balls, of which about 800 dozen are sent to other places, the rest being consumed in St. Andrew's, which has been long famous for this game. A good workman makes eight or nine balls a day. St. Andrew's unites with the two Anstruthers, Crail, Cupar, Killybeggy, and Pittweem in returning a member to the H. of C. No. of £10 houses, 313; constituency in 1838, 250.

**ANDRIA**, a town of Naples, prov. Terra di Bari, cap. cant., 9 m. S. Barietta. Pop. 13,500. It stands in a plain on the edge of the enclosed country, and its environs are far from unpleasant. It is the seat of a bishopric, has a superb cathedral, a royal college, and three *monasterii*. It was founded in 1046 by Peter, count of Trani, and acquired its name from the *antre*, or caverns occupied by the first settlers. (*Swinhurn's Two Sicilies*, l. p. 399; *Dict. Geog.*)

**ANDRO**, or **ANDROS**, an island of the Grecian Archipelago, lying to the S. of Negropont, and immediately to the N. of Tino, from which it is separated by a very narrow channel. It extends about 27 m. in a N.W. and S.E. direction, but its breadth does not exceed 7 or 8 m. Though mountainous, it has several extensive, fertile, and well-watered valleys, and a number of villages. The pop. has been estimated at from 12,000 to 16,000. Wine is the principal article, the annual product amounting to 390,000 gals.; exclusive of which there is a considerable export of silk, oil, oranges, citrons, &c. The corn raised in the island generally suffices for the consumption of the inhabitants. Andro, or Castro, the capital, a considerable town, with about 5000 inhabitants, is situated on the E. coast of the island; its port, which is defended by a castle, is too shallow to admit any but the smallest description of vessels. Port Gaurio, or Gaurio, on the W. side, is a much better harbour. The Andrians took the part of the Persians on the latter invading Greece, for which they were afterward chastised by Themistocles. (*Thurnesford, Voyage du Levant*, l. p. 347; *Consular Returns*.)

**ANDROSCOGGIN**, river (or Ameriscoogin), Me., is formed by the junction of Magalloway river and the outlet of Umbagog lake. It runs S. into N.H., and then E. into Me., and enters Kennebec river in Merrymeeting bay, 18 m. from the ocean. It is 140 m. long, 100 of which are in Me.

**ANDROS ISLANDS**, or **ISLES DEL ESPERITU SANTO**, a group of islands among the Bahamas, which extend about 120 m. from N. to S., lat. 24° to 29° 30' N., long. 77° to 79° W.

**ANDUJAR**, a town of Spain, Andalusia, on the Guadalquivir in a plain at the foot of the Sierra Morena, 20 m. N.W. Jaen, lat. 39° 1' 33" N., long. 3° 59' 33" W. Pop. nearly 14,000. Mr. Townsend says that, in 1786 it contained 6800 families, which, if accurate, would show a great decline in the interval. (*Travels in Spain*, ii. p. 307.) It is supposed to be built of the ruins of the ancient *Forum Julium*; it is defended by an old castle, and has numerous churches and convents, a theatre, and an old bridge of fifteen arches over the river. Its environs are fruitful, and the inhabitants are mostly employed in agriculture; but there are tanneries, and manufactories of wine and water coolers, made of a peculiar species of white clay found in the neighbourhood.

## ANGERS.

**ANDUZE**, a town of France, dep. Gard, cap. cant., on the Gardon, 26 m. N.W. Nismes. Pop. 5403, mostly Protestants. It is ill built, but agreeably situated at the foot of the Cevennes, between rocks and hills planted with vines and olives. It has a tribunal of commerce, with manufactures of hats, silk, hosiery, cloth, earthenware, and glue, a silk manufactory, and tannery.

**ANET**, a handsome town, dep. Eure et Loire, cap. cant., 9 m. N.N.E. Dreux. Pop. 1433. It is principally celebrated for the ruins of its fine castle, built by Henry II. for Diana of Poitiers, and destroyed during the revolutionary phrensy in 1793. There are in its environs forges and paper-mills.

**ANST**, a village of Switzerland, cant. Berne, on a hill, 17 m. W. by N. Berne. Pop. 2400. Roman antiquities are found in the neighbourhood.

**ANGELICA**, p. t., capital of Alleghany co., N.Y., 262 m. W. Albany, 235 W. The village contains a court-house, jail, a bank, three churches, one Presbyterian, one Episcopal, and one Methodist, 130 dwellings, and about 300 inhabitants. The town contains eleven stores, two fulling-mills, one woollen factory, two grist-mills, four saw-mills, nine schools, 317 scholars. Pop. 1257.

**ANGELO** (ST.), the name of several towns in Italy, of which the principal are St. Angelo in the Lombardo-Venetian kingdom, prov. Lodi, 7 m. S.W. Lodi. Pop. 6000. St. Angelo in the same kingdom, prov. Padua, 11 m. N.E. Padua. And St. Angelo in Naples, *Principato Citra*, 16 m. S.S.E. Capua. Pop. 2500.

**ANGELO DE LOMBARDO** (ST.), a town of Naples, *Principato Ultra*, 43 m. E. Naples. Pop. 6000. It is the seat of a bishopric, has a college, and two parish churches. In 1664 it was almost entirely destroyed by an earthquake.

**ANGERBURG**, a town of Prussia, prov. E. Prussia, cap. circ., on the Angerap, 60 m. S.E. Königsberg. Pop. 3000. It has a castle and manufactures of woollen stuffs and leather. The Angerap falls, a little to the S. of the town, into the large, irregularly shaped, shallow lake of Mauer, celebrated for the abundance and excellence of its eels.

**ANGERMUNDE**, a town of the Prussian states, prov. Brandenburg, reg. Potsdam, cap. circ., on the lake Munde, 43 m. N.N.E. Berlin. Pop. 2600. It has manufactures of hats, woollen stuffs, tobacco, &c.

**ANGERS** (the *Julianus* of Caesar, afterward *Andragoria*, and hence *Angers*) a very ancient city of France, dep. Maine et Loire, of which it is the capital, on the Mayenne, which divides it into two portions, near its confluence with the Loire and the Sarthe, lat. 47° 28' 9" N., long. 0° 33' W. Pop. 29,066. The town is surrounded by massive walls, built in 1214 by John, king of England. Speaking generally, it is ill built, and is mean looking; houses partly of wood and partly of slate, streets narrow and crooked; but since 1814 it has been in several respects improved, and some good streets have been opened. Principal objects of attraction, cathedral and castle. The first, begun in 1225, and of large dimensions, has its front ornamented by two symmetrical spires, each 225 feet high. It contains the monument of Margaret of Anjou, daughter of René, king of Sicily, and wife of Henry VI. of England. The old castle, the former residence of the dukes of Anjou, stands on a rock having the river at its foot: its plan is that of a vast parallelogram, surrounded by high massive walls, defended by deep fosses cut out of the rock, and by eighteen towers: but these, with one exception, have now been reduced to the height of the walls. The castle serves at present as a prison for the city, and a powder magazine: on the side next the river it is becoming ruinous. Angers is the seat of a royal court for the depts. of Maine et Loire, Sarthe, and Mayenne; has a tribunal of original jurisdiction, an academy, a royal college, a school for deaf and dumb, a secondary school of medicine, &c. It has also a school of arts and trades, being, with the exception of that at Chalons-sur-Marne, the only school of the kind in France. Of the pupils, 450, nominated by the minister of commerce and public works, receive their instruction wholly or partly at the expense of the state. The other pupils pay 500 fr. a year. Each department is entitled to send three pupils to this school—the instruction of one to be entirely gratuitous, the others paying, one a fourth part, and one a half of the ordinary pupils. It has also a school of design; an agricultural society; a public library, containing 25,000 volumes; a museum with about 600 pictures, many of them good; a botanical garden; a cabinet of natural history; a theatre, &c. There is a royal manufactory of sailcloth, a cotton mill, with manufactures of linen, serges, handkerchiefs, hosiery, starch, &c., a sugar refinery, a wax refinery, and tanneries. The town has two mean bridges, and it labours under a deficiency of water, that of the Mayenne not being fit for use. Mr. Ingis describes Angers as a place where provisions of all sorts, including fruit, vegetables, and wine, are extremely cheap, and states, that for £10 a year a very commodious house may be had. But there are no villas in the vicinity, and the town is itself far from agreeable. Previously to the revolution Angers was the seat of a university.

## ANGERVILLE.

Founded in 1793: it had also a celebrated academy of *belles lettres*; and such was the fame of its riding-school, that it was attended by *Pont de la Grande*. It suffered severely during the wars of *La Vendée*; but, as previously stated, since the peace of 1815 it has been comparatively prosperous, and various improvements have been effected. Angers has produced several distinguished persons, among whom may be specified *Bodin*, the author of the work *De la République*, published in 1576, *Ménage*, and *Bernier*, the famous traveller.

The slate quarries in the vicinity of Angers, whence the town is built, and which also supply large quantities of roofing slates to other departments, are immense excavations; but for details with respect to them, see the art. *MAINES ET LOIRE*. (*Hug. France Pittoresque*, art. *Maines et Loire*; *Ingis's Switzerland*, p. 246, &c.)

ANGERVILLE, a village of France, dep. Seine et Oise, 23 m. S. Versailles. Pop. 1530.

ANGHIARI, a town of Italy, prov. Arezzo, near the Tiber, 19 m. E. Arezzo, Toscana. Pop. 3000. It is celebrated for the victory obtained near it in 1440 by the Florentines under Piccinino over the forces of the Duke of Milan. This also is the name of a village of the Veronese, and of a decayed city on the banks of the Lago Maggiore.

ANGLES, a town of France, dep. Tarn, cap. cant., 16 m. E.S.E. Casteln. Pop. 970. This is the name of several small villages in other parts of France.

ANGLESEY (the *Mona of Tactus*), an island and co. of N. Wales in the Irish Sea, separated from the mainland of Britain by the Menai Strait. It is of a triangular form, extending, Holyhead included, about 37 m. from E. to W., by about 30 from N. to S.; area, 173,440 acres; surface gently undulating; climate temperate, but liable to fogs; there is in most parts a great deficiency of wood, and it has generally a bare, uninviting aspect.

Since 1789 Anglesey has been famed for its mineral riches, the celebrated copper mines in the *Parys* mountain having been discovered in the course of that year; but they have now greatly declined. (See *Amlwch*.) Lead ore and asbestos have also been found; and coal is wrought to some extent at *Malltraeth*. Soil various, but principally a fine loamy sand, which, when properly cultivated, is highly productive. Agriculture is not, however, in an advanced state. So late as 1810, it was no uncommon thing to take five white crops in succession, most of which were so poor as hardly to pay their expense; but an improved system is being gradually introduced. The stiff loams of which the extent is considerable, are usually manured with a sort of shelly sand. Principal crops, oats, barley, wheat, and potatoes, the latter being grown more extensively than in any other part of N. Wales. Grazing is the principal object of the farmer's attention. About 4500 head of cattle are annually sent from the island to the mainland, exclusive of considerable numbers of sheep. Average rent of land, in 1810, was 7s. 6d. an acre. Manufactures unimportant, consisting merely of some of the coarser descriptions of woollens. Chief towns, *Beaumaris*, *Holyhead*, *Amlwch*, *Llanerchymedd*, and *Llangefni*. It is divided into three cantreds, six *commotes* or hundreds, and seventy-three parishes. The pop., which in 1776 amounted to 12,780, had increased in 1841 to 50,800. It returns a m. to H. of C. for the co., and one for the boroughs of *Beaumaris*, *Holyhead*, &c. Co. constituency in 1836-37, 1439.

Anglesey seems to have been a principal seat of the Druids. The *Romans*, under *Suetonius Paulinus*, having taken it after a fruitless resistance, A.D. 61, cut down the groves of the Druids, *sevis superstitionibus sacri*, and seem to have exterminated both the priests and their religion. (*Tacit. Ann.*, lib. 14, § 30.) It was subjugated along with the rest of Wales, by Edward I., and was incorporated with England and made a county by Henry VIII. The two most important events in its recent history are the discovery of the *Parys* mines, in 1776, and the building of the Menai bridge in 1825. (See *Davies' N. Wales, passim*; *Beauties of England and Wales*, art. *Anglesey*, &c.)

ANGLET, a town of France, dep. Basses Pyrénées, near Bayonne, famed for its excellent white wine. Pop. 2944.

ANGOLA, DONGO, or AMBONDE, a kingdom of the W. coast of Africa, extending from 9° 30' to 15° S. lat., and from 14° to 19° E. long. On the N. it is separated from Congo by the Danda; on the S. the *Comana* divides it from the districts of *Quissima* and *Lilolo*; on the W. it has the Atlantic ocean; and on the E. it is joined by the territories of *Gegeo* and *Dala Quileuca* (the W. portion of the *Matamba* of the Jesuits), and the powerful interior kingdom of *Matamba*. It is rectangular shaped, lies nearly parallel to the equator, being about 350 m. in length from E. to W., 50 or 60 m. in width from N. to S.; containing an area of probably not less than 18,000 or 20,000 sq. m. (*Bleau. Geog.*, ix. 129; *Barbot's Voy. to Congo*, 515; *Lebat*, i. 59; *Benedict. Map of Congo, Angola, and Benguela*; *Acc. of Dioc.*, 22, 143.)

This country is properly a part of Congo, from which, however, it has been politically separated since the middle

## ANGOLA.

of the 16th century, when a chief, whose name or title was *Angola*, made himself independent of the king of Congo, and gave its present designation to his new kingdom, the native name of which was *Dongo*, or *Ambonde*. (*Lebat*, ii. 427; *Barbot*, 593.) It is very powerful among the neighbouring states; the paramount authority of its monarch being acknowledged by several districts, some of them greatly exceeding itself in extent.

*Physical Character*.—Angola is extremely mountainous, with no plains, except upon the sea shore, and some small plateaus on the sides and in the gorges of mountains. The land appears, however, to be making advances on the sea, and forming islands, which are wholly of an alluvial and level character; such is the *Isle of Loanda*, lying a short mile from the coast, and forming, with the *Cabo Palmareinho*, one of the most convenient harbours on the W. coast of Africa. The cape itself is also a plain of the same nature, and very evidently in a state of progress westward. (*Piga. Lett. Dal Regno di Congo*, 10; *Morville, Viaggio del Congo* 70; *Barbot*, 581; *Lebat*, 50.)

The country is extremely well watered (as, indeed, is the whole of Congo); the principal streams are the *Comana*, *Benga*, and *Danda*, which run nearly parallel to each other, and to the equator; the first and last forming the S. and N. boundary of the country.

*Soil, Climate, &c.*—The worst soil in Angola is that upon the coast, and the more recently formed islands, which is sandy, but by no means desert; for, at any time, by digging to the depth of a foot, or less, an abundant supply of good water may be procured. It is, however, a remarkable fact, that at the ebb tide these temporary wells are always found rather brackish, while at the flood their contents are perfectly sweet. (*Piga. Lett.*, 10; *Lebat*, i. 50.) The mountain sides, and the valleys of the rivers, present all the richness of soil common in equatorial countries which are well irrigated, though the useful productions of the land are said to be chiefly owing to the agricultural labours of the Portuguese. (*Barbot*, 516.) The climate is excepted by *Adams* (*Remarks*, 500) from the general charge of malignity towards Europeans under which the rest of tropical Africa labours; and *Piga. Lett.* expressly states that the "habitation is excellent, the air beyond all credit temperate." *La stanza vi benissima, l'aire oltre ad ogni crudenza temperata* (p. 6). He adds also, what would imply that the mountains are of no great height, that the heat on their summits is not less than that in the plain. Situated so near the equator, Angola might be expected to have two dry and two rainy seasons in each year; but this does not appear to be the case; and, indeed, the accounts of travellers on this point are sufficiently conflicting. *Piga. Lett.* says (p. 7) that the rainy season is from April till August; *Lebat* (i. 107), that it occupies November, December, and sometimes January. *Barbot* (323) leaves it uncertain, but makes the dry season extend from May to September, though he remarks that this period is not without an intermixture of pleasant showers; and to add to the uncertainty on this point, *DeGrandpré* (*Voyage à la Côte d'Or d'Afrique*, i. 4), says that rain seldom falls, and never abundantly; that the showers are irregular, and that no one time is more subject to them than another! The same author remarks, that the abundant dews are fully sufficient for the development of vegetation, and in this he is borne out by all the other authorities. The trade wind blows steadily from S.W. to S., the sea breezes commonly from W.S.W., and the land wind from E. by N. Angola is, however, sufficiently remote from the internal deserts to prevent the ill effects that might be otherwise feared from this breeze. Tornadoes are not unfrequent; and at such times the wind shifts violently to all points of the compass, settling, finally, into the direction of the trade. (*Barbot*, 523; *Piga. Lett.*, 7.) Gold and silver have been discovered in the mountains near the coast; but no gold dust is found, though it appears to have existed formerly. Iron is produced plentifully through the energy of the Portuguese; and copper is said, but upon no clear evidence, to exist in the interior. (*DeGrandpré*, i. 38; *Bowditch*, 19.) Lead, sulphur, and petroleum are among the mineral treasures; but there is no mention of precious stones. The natives are reasonably good miners, under European direction; and it is ascertained that the subterranean exhalations produce no sensible difference in their colour, as the same cause is known, in many cases, to effect in that of Europeans. (*Lebat*, i. 95.)

Vegetation has the magnificence observable in all well-watered tropical regions. A species of the *Ficus*, called by the natives *Essada*, and possessing the property of dropping its branches to the ground, where they take root and form a new plant, is very abundant. Some of these trees, resembling small thickets more than individual plants, extend to more than 1800 paces in circumference, and are

\* If this be accurate, the discrepancies of the other authorities may arise from their observations having been made in different years; though it must be remarked that *Lebat* asserts ten or twelve days to be the utmost difference ever observed in the recurrence of the rainy season. (i. 106.)

## ANGOLA.

said on good authority to be capable of sheltering 3000 men! The ensade is an extremely useful plant; the fruit, which resembles an ordinary fig, is an important article of food; its outer bark assists in the construction of huts and boats, and an inner coating, being washed and beaten, is manufactured into cloth. (*Barbot*, 521.) The date, and every other species of palm, the citron, orange, lemon, anana, guava, banana, cocoa, tamarind, mangrove, and every fruit and forest tree common to the equinoctial regions, grow here spontaneously, and reward the least expense of labour with the most abundant return. The same remark holds good with regard to yams, potatoes, and the whole race of roots; and though the climate be too hot for the production of European grain, yet four species of wheat, Turkish, Sarasin, Mamingo, and Luno, are raised in great abundance. Pulses of all kinds are likewise plentiful; and the sugar-cane, pepper-vine, and a plant called mandiocca, of which a very good bread is made, absolutely struggle with man for the possession of the soil. Many trees produce fine gum or resins; and, in a word, there is scarcely a vegetable production which Angola does not, or under reasonable care might not be made to produce. (*Lebat*, I, 112-153; *Barbot*, 518; *De-grandpré*, I, 5-14.) The woods and mountains shelter lions, tigers, leopards, hyenas, and wolves; of smaller wild animals, there are foxes, wild cats, &c. Of the useful animals, there are hares, rabbits, all the species of antelopes, stags, goats, and hogs of the Chinese variety. The sheep, cow, horse, and ass are strangers to the country, and known only as importations from Europe; but the zebra, elephant, and rhinoceros traverse the woods, and the hippopotamus is found in the rivers. The civet cat is also a native of this country, which likewise abounds in monkeys of all kinds, among which is the chimpanzee, the most intelligent of the tribe. A species of wild dog is said to be found in the woods.

To enumerate the birds of this part of Africa, would be to give a list of almost interminable length; all that are found in other tropical regions, and some that are peculiar, flourish here. The falcon and the sergo, or honey bird, are among the latter, and with whole hosts of pelicans, and nearly every variety of parrot, constitute the chief characteristic of Angolan ornithology. Reptiles numerous, consisting of centipedes, scorpions, and exceedingly venomous serpents. Some of the lizard tribe, as the camoleon, are less dangerous than these; but the rivers swarm with two or three species of crocodiles, which make fishing dangerous, and bathing all but fatal. Life is as abundant in the waters as on the land; and besides the usual tenants of the deep, as whales, sharks, dolphins, mackerel, oysters, crabs, &c., the coasts and rivers possess an endless list of creatures, the very names of which are unknown in Europe. Insects are as numerous, beautiful, and destructive as in other tropical climates; and among the last-named class, termites or white ant stands pre-eminent. (*Lebat*, I, 152-206; *De-grandpré*, I, 14-38; *Barbot*, 516-516.)

**Population, Customs, &c.**—The population is dense for a barbarous country, the monarch being called Ince, from the great number of subjects under his command. (*Barbot*, 320.) It is not, however, easy to assign the amount, but it may perhaps be taken at between 2,000,000 and 3,000,000. The capital city, St. Paul, or Loanda, contains 8000. (*Benedict*, 5.) The natives have few of the negro peculiarities in form or feature: they are of ordinary stature, well limbed, and, but for their colour, very like the Portuguese, by whom they are surrounded. Blue eyes and red hair are not uncommon among them. (*Pigafetta*, 6.) Society is divided into four classes, two free and two slaves; the first two consisting of nobles and husbandmen or artificers; the others of slaves, native born, and those acquired by war or foreign purchase. Marriage is an extremely simple ceremony, a mere agreement between the husband and the father of the woman. The appearance of the first tooth in children is an important epoch, the infant being then carried from house to house, and given escorted from friends and strangers. For the rest, they do not differ much from other negroes. Dancing is a favourite diversion, and a religious rite; and, like other African people, their ceremonies are defiled with blood and cruelty. Money is of several kinds: *marked cloths*, the shell of a small fish called *ambo*, a red wood brought from Malemba, and iron, which last was introduced by the Portuguese. The year is divided into 12 months, and the week into 4 days, of which the last is observed as a sabbath. (*Lebat*, I, 110, 379, &c.; *Barbot*, 518; *Merolla*, 367, &c.; *Benedict*, 30, &c.) The country is parcelled out into an immense number of little lordships, each under a magistrate called a *sova*. It would appear that the king is able to control the petty despotism of these governors; for they have neither wealth nor any other distinction, except the personal respect paid to them, which is, however, very profound, to distinguish them from any other freemen. (*Barbot*, 320.) The religion of the bulk of the people is Fetichism, differing in nothing from that on the coast of Guinea (*see ANHANTER*); but there are many Christian

## ANGORA.

families among the natives, and at one time the Jesuits had converted nearly the whole population, and established a regular form of church government. (*Pigafetta* and *Merolla*, *passim*; *Barbot*, 521; *Lebat*, II, 244, *et seq.*) But the effect of their labours has now nearly vanished, and the negroes have relapsed into the idolatrous rites of their ancestors. (*De-grandpré*, I, 47; *Benedict*, 112.) The language is less barbarous, and more uniform, on this coast than in most other parts of Africa; the whole of Congo, that is the country between the Coanza and the Zaire, speak a dialect of the same tongue (*Merolla*, *passim*; *Barbot*, 512), which, according to *De-grandpré* (I, 56), is extremely musical and flexible; not particularly sonorous, but very agreeable; with a perfect syntax, and bearing in some points a resemblance to the Latin. He imagines that this fact may prove a guide to the obscure history of these countries, may it not, however, be owing solely to the long intercourse which has existed between the natives and the Christian priests from Portugal and Italy?

**Trade, &c.**—The Portuguese established a factory on this coast in 1485 (*Merolla*, 76); and their power has been constantly extending to the present time. Two of their establishments are 700 m. inland; but it is not to be supposed that they possess a sovereignty over the whole country to this extent. Their posts, called *fairs*, or *faireria*, are little more than entrepôts for trade; though the residents exercise a political power in their immediate neighbourhood. These establishments have, it is said, excited a spirit of manufacture and commerce among the negroes; but we doubt much whether this has been the case in any considerable degree; and whatever beneficial influence they might otherwise have had, has been counterbalanced and nullified by the support given by the Portuguese authorities to the slave trade. In fact, Angola has been for a lengthened series of years the great mart whence slaves have been obtained for Brazil; and though their importation into the latter be now, in appearance at least, prohibited, it is believed that they are still conveyed in great numbers to that country. *Bowditch* gives the following account of the trade of Angola in 1803:

## Exports from Angola to Lisbon, 1803.

|                                          | Reis.     |
|------------------------------------------|-----------|
| 171 Quintals of Ivory, 1st quality . . . | 1,770,000 |
| 77 . . . . . 2d quality . . .            | 462,000   |
| 41 . . . . . 3d quality . . .            | 164,000   |

289 Quintals . . . . . 2,396,000

No account is taken of the gold, iron, or other commodities exported; but in 1804, the amount of ivory was much greater, namely, in gross,

750½ Quintals . . . . . 4,779,000 R

## Imports from Lisbon to Angola, 1803.

|                                   | Reis.       |
|-----------------------------------|-------------|
| Provisions . . . . .              | 18,689,760  |
| Woollen goods . . . . .           | 87,174,602  |
| Linens . . . . .                  | 25,474,880  |
| Portuguese manufactures . . . . . | 36,882,655  |
| Drugs . . . . .                   | 1,572,190   |
| Asiatic manufactures . . . . .    | 940,878,290 |
| Metals . . . . .                  | 23,065,115  |
| Sundries . . . . .                | 45,425,000  |

R. 480,789,012

In 1804, the gross imports amounted to 410,198,585 reis but in this there is no account of drugs or Asiatic manufactures. (*Bowditch*, 9, *et seq.*, 146-153.)

**ANGOLA**, p. L. capital of Steuben co. Ia., 174 m. N.N.E. Indianopolis, 549 W. It contains a court-house, jail, two schools, 53 scholars. Pop. 168.

**ANGORA**, or **ENGOURI**, the ancient *Ancyra*, a city all most in the centre of Natolia, near the N.E. source of the Sakarlah, or *Sangerius*, lat. 40° 29' N. long. 33° 18' E. After undergoing various revolutions, it fell under the dominion of the Romans; and being embellished and other wise favoured by Augustus, the inhabitants erected to his honour the celebrated *Monumentum Augustum*, a temple of white marble, on the walls of which an account of the principal events in the life of Augustus was inscribed. The ruins of this edifice still remain. Notwithstanding the demise of its powerful patron, Ancyra continued to flourish. It was here that St. Paul preached to the Galatians; and when the Christian religion spread itself over the world, it was advanced to the dignity of an apostolic see. It came into the possession of the Turks in 1359. The great battle between the Turkish sultan Bajazet, or Bayazid, and the famous Tartar conqueror Tamerlane, or Timur Bec, which ended in the total defeat and capture of the former, was fought in the vicinity of Ancyra in 1401. It continues to be one of the principal cities of Natolia; and is celebrated for manufactures of stuffs made of the silk-like wool of the *proe of Angora*, a variety peculiar to the country round the

## ANGOSTURA.

town. The population has been variously estimated at from 35,000 to 80,000. We incline to think that the first number is nearest the mark. (*Turnerfort, Voyages du Levant*, ii. p. 442, 464; *Kissner's Journey*, p. 63, &c.)

ANGOSTURA, a city of S. America, rep. of Venezuela, on the S. bank of the Orinoco, about 240 m. above its embouchure, and about 190 feet above the level of the sea, lat.  $6^{\circ} 8' 10''$  N., long.  $63^{\circ} 55' 20''$  W. It was founded in 1588. Owing to its situation in a fertile country, on a great navigable river, and its command of a very extensive inland navigation, Angostura is favourably situated for commerce, which it carried on to a very considerable extent previously to the revolutionary struggles. These, however, have diminished its commerce, wealth, and population. The last, which in 1807 was estimated at about 8500, does not now, perhaps, exceed 3500. It has a large hall, where meetings of Congress have been held; with a hospital and a college; and is defended by a fort on the opposite bank of the river. Though low, and subject to inundation, the climate is temperate and not unhealthy.

ANGOULEME (an. *Iculisma*), a city of France, dep. Charente, of which it is the capital, on a plateau elevated 221 feet above the river Charente, lat.  $45^{\circ} 38' 57''$  N., long.  $0^{\circ} 9' 18''$  E. Pop. 16,530. The old town, which occupies the summit of the plateau, has narrow, crooked streets, and is *triste et laide*. In its centre stands the old castle in ruins. The walls, with which the city was formerly surrounded, have been mostly demolished, and the ramparts converted into public walks. The new town, built on a declivity to the S. of the old town, has broad straight streets, good houses, and is rapidly increasing. There are also several suburbs, of which Houmeau is the most important. Its port is the entrepôt of the commerce of Angoulême: cathedral ancient, but neither large nor beautiful; and, with the exception of the fine bridge over the Charente, and an obelisk erected in honour of the present Duchesse d'Angoulême, the other public buildings deserve no particular notice. The *Place d'Armes* is a fine promenade, and, from its elevated position, commands a view of the valley of the Angouenne and the surrounding country. Angoulême is the seat of a court of assizes, and of a tribunal of original jurisdiction; and has a royal college; a society of agriculture, arts, and commerce, which publishes memoirs once a month; a public library with 16,000 volumes; a cabinet of natural history; a school of midwifery; a founding hospital, and various other hospitals; a theatre, &c. It had also a royal marine school, the buildings of which are on a large scale: this institution was, however, closed in 1830; but it is expected that it will be re-opened. Angoulême is celebrated for the extensive paper manufactures in its vicinity: it has also fabrics of serges and coarse stuffs, and earthenware; with extensive distilleries, which produce excellent brandy; tanneries, a cannon foundry, a manufactory of arms, a sugar refinery, &c. The *pêches de perdrix aux truffes d'Angoulême* are sent to all parts of Europe.

Angoulême is very ancient, being noticed by Ausonius, who flourished in the 3d century. Balzac was a native of the town and so also was the detestable regicide, Ravalliac, the assassin of Henry IV. In the vicinity are the ruins of the famous abbey *de la Couronne*, founded in 1122, long the ornament of the Angoumois. This venerable and magnificent structure, after escaping the revolutionary phrensy, was demolished in 1808. The fountain of Trouve, a few miles from Angoulême, is, next to that of Vaucluse, the most celebrated in France. (*Hugo, France Pittoresque, art. Charente, &c.*)

ANGOUMOIS, the name of a district in France previously to the revolution, nearly but not exactly coinciding with the dep. Charente. It formed, in connexion with the district of Saintonge, one of the provinces into which France was formerly divided.

ANGRA, a town and seaport of the island of Terceira, one of the Azores, being the capital of the archipelago, and the residence of the governor, at the bottom of a deep bay or creek, lat.  $36^{\circ} 38' 33''$  N., long.  $27^{\circ} 12' 33''$  W. Pop. variously estimated at from 10,000 to 15,000. It is beautifully situated on a hill, rising gradually from the sea. The streets are broad and regular, and the houses, generally of three stories, though gloomy, are well built. It is well supplied with water, but the streets, as well as the inhabitants, are notwithstanding excessively filthy. There are a great number of churches, and it formerly also had various monasteries and convents; but the latter have been dissolved, and the buildings applied to other uses. As a port, Angra has nothing to boast of: it is open to all winds from the S.E.W. by the S. to the E. The swell from the S.W. in particular, which sets round mount Brazil, on the W. side of the bay, is tremendous. In the bad weather months, large vessels anchor in the mouth of the bay, abreast of St. Antonio, in 25 and 30 fathoms, to be ready instantly to put to sea in the event of storm setting in, the coast affording no shelter. The town is defended on the W. by the citadel at the foot of mount Brazil, and on the opposite side of the bay by the

## ANNABERG, ST.

fort of St. Sebastian, the distance between them being about  $\frac{1}{2}$  m. (*Bois's Azores*, p. 210; *Purdy's Sailing Directions for the Atlantic*, p. 230.)

ANORA, a sea-port town of Brazil, prov. Rio Janeiro, bears S.W., distant 78 m. from the city of that name. Its port admits large ships; it is fortified by two redoubts, and has some commerce.

ANGUILLA, or SNAKE ISLAND, so called from its tortuous figure, an island belonging to the British in the W. Indies, being the most northerly of the Caribbee islands, and separated by a narrow channel from St. Martins: lat.  $18^{\circ} 8' 8''$  N., long.  $63^{\circ} 12' 12''$  E. It is from 25 to 30 m. in length, by about 6 m. in breadth. Pop. about 3000, of whom about 2400 are blacks. Surface flat; soil chalky, and not very productive; and there is a deficiency both of wood and water; climate healthy. By far the largest portion is uncultivated. It produces some sugar and cotton, with maize and provisions of various kinds. A salt lake in the middle of the island furnishes (or at all events did furnish) a considerable supply of salt. It has no good harbour. The town, an inconsiderable place, stands near the N.E. extremity of the island. The colonists elect their chief magistrate, subject to the approval of our governor of Antigua. (*Edwards*, ed. 1819; and *Official Returns*.)

ANGUILLA, one of the Bahama islands, about 20 m. long, and 5 broad; lat.  $23^{\circ} 36' 36''$  N., long.  $79^{\circ} 30' 30''$  W.

ANGUILLARA, a town of Austrian Italy, on the Adige, 23 m. S. Padua. Pop. 2300. This also is the name of a town of nearly equal size in the Papal states, on the S. side of the lake Bracciano, 16 m. N.N.W. Rome.

ANGUS, see FORBES.

ANHALT, a country of Germany, almost surrounded by the Prussian dominions, having Brandenburg on the N., Prussian Saxony on the E. and S., the county of Mansfeld on the S.W., and Brunswick and the Prussian circ. of Magdeburg on the N.W. Its greatest length is 60 m., and its breadth varies from 12 to 16. Principal river the Elbe, by which it is intersected. Area, 1018 sq. m. Pop. 146,933. It is mostly flat, and is very fertile and well cultivated. It is divided into the three duchies of Anhalt-Bernburg having an area of 339 sq. m., and a pop. (in 1833) of 45,135; Anhalt-Cöthen, area 318 sq. m., pop. (in 1833) 40,133; and Anhalt-Dessau, area 360 $\frac{1}{2}$  sq. m., pop. (in 1837) 60,945. The consent of the states is necessary to the imposition of any new tax. Inhab. mostly Protestants and very industrious. The entire principality furnishes 1294 men to the army of the confederation. Principal towns, Dessau, Zerbst, Cöthen, and Bernburg.

ANMOLT, a small Danish island in the Cattegat, nearly halfway between Læsø and Zealand. A light-house, having the lantern elevated 112 feet above the level of the sea, has been erected on its most easterly promontory, in lat.  $56^{\circ} 44' 30''$  N., long.  $11^{\circ} 38' 51''$  E.

ANIANE, a town of France, dep. Hérault, cap. cant. 16 m. W. by N. Montpellier. Pop. 2650.

ANIMALLY or ANIMALAYA, a town of Hindostan, prov. Colimbeotor, on the Alima, lat.  $10^{\circ} 31' 31''$  N., long.  $77^{\circ} 1' 1' 1''$  E. In 1800 it contained 400 houses.

ANJAR, a town of Hindostan, prov. Cutch, cap. district of same name, ceded in 1816 to the British, near the N.E. shore of the gulf, lat.  $23^{\circ} 3' 3' 3''$  N., long.  $70^{\circ} 11' 1' 1''$  E. It is fortified, but not strongly. In 1819 nearly half the town was destroyed by an earthquake, but only 165 persons lost their lives. The town was estimated in the following year at 10,000. (*Hamilton's E. I. Gazetteer*.)

ANJENGO, a sea-port town of S. Hindostan, prov. Travancore, 18 m. N.N.W. cape Comorin, lat.  $8^{\circ} 37' 37''$  N., long.  $76^{\circ} 53' 53''$  E. The E. I. company had a factory here from 1684 to 1813, when it was abolished. The best coir cables on the Malabar coast are made here and at Cochín; and pepper, coarse piece-goods, drugs, &c., are exported.

ANJOU, an ancient prov. and gov. of France, now distributed among the depts. of Maine et Loire, Loire Inférieure, Vendée, Indre et Loire, Sarthe, Ille et Vilaine, Mayenne, and Deux Sèvres.

ANKLAM, a town of the Prussian states, prov. Pomerania, cap. circ. on the navigable river Peene, about 7 m. from where it falls into the strait separating the isle of Usedom from the continent. Pop. 7000. It was founded in 1188; has a college and three hospitals, with manufactures of cloth, linen, &c., and carries on a considerable trade in ship-building and shipping.

ANKOBER, a town of Abyssinia, cap. prov. Efat.

ANKOL, or ANDKHO, a town of Bokhara, 75 m. W. Balkh, lat.  $36^{\circ} 48' 48''$  N., long.  $66^{\circ} 6''$  E. Mayendorff says that it has nearly 4000 houses, which would infer a pop. of at least from 25,000 to 30,000, consisting principally of Arabs. A small river flows past the town; but, as it dries in summer, the inhab. are obliged to supply themselves with water from wells. (*Peygah & Boukhara*, p. 143.)

ANNABERG (ST.), a town of Saxony, circle Erzgebirge, 8 m. S.W. Marienburg. Pop. 4500. It is well built, has

## ANNAH.

three churches, two hospitals, and a gymnasium, with manufactures of lace and ribbons. In its vicinity are mines of iron, tin, cobalt, and silver.

ANNAH, a town of Asiatic Turkey, cap. Senjak, on the Euphrates, 160 m. N.W. Bagdad, lat. 34° 10' N., long. 41° 47' E. It is finely situated on the route of the caravans that cross the desert of Mesopotamia. It was surprised in 1807 by the Wahabites, who, after committing all sorts of excesses, set it on fire. The pop. does not probably exceed from 3000 to 4000. The environs are very fertile.

ANNAMABOE, a sea-port town on the Gold coast of Africa, formerly prov. Fanti, empire of the Ashantees, lat. 5° 5' N., long. 1° 15' E., one of the principal marts for slaves. It was burned by the Ashantees in 1808. Pop. probably from 3000 to 4000.

ANNAMOOKO, one of the Friendly Islands (which see). ANNAN, a borough, sea-port, m. town, and p. of Scotland, co. Dumfries. The town is situated on the E. side of the river Annan, which is here crossed by a fine bridge of three arches erected in 1834, about 14 m. above its confluence with the Solway frith, 67 m. S. Edinburgh. Pop. 5033. It is clean, well-built, neat and thriving; has a handsome new church and spire; a good natural harbour, which has been much improved by an embankment constructed at the expense of Mr. Irving of Newton; and an academy well attended. There is here a cotton manufactory, which, in 1837, employed from 130 to 140 hands. Ship-building is also carried on to a considerable extent; but the principal trade of the town consists in the carrying of bacon and hams for the Newcastle and London markets; and in the shipping of corn, fat cattle and sheep, by steam, for Liverpool. In 1837 there belonged to the town thirty-four vessels, of the burden of 1639 tons. Annan unites with Dumfries, Kirkcubright, Lochmaben, and Sanquhar, in returning a member to the H. of C. 210 houses in 1831, 153; constituency in 1837, 179. (*Boundary Report*, p. 137; *New Statistical Ac. of Scotland*, art. *Annan*.)

ANNAH, the river on which the above town is built. It rises on the S. side of Hartfell, a mountain on the confines of the cos. Dumfries and Peebles, near Moffat, and after pursuing a S. course of about 36 m. in a direct line, unites with the Solway frith, 14 m. below Annan, to which it is navigable. It has near its mouth salmon fisheries, which let, in 1837, for about £550 a year.

ANNANDALE, the name given to the valley or low grounds traversed lengthwise by the river Annan.

ANNAPOLIS, a town of Nova Scotia, on the S. side of the river of the same name, near where it falls into its estuary or basin, on the S.W. side of the bay of Fundy, lat. 44° 47' N., long. 65° 50' W. The harbour is spacious and secure. This is the oldest European settlement in N. America, having been founded in 1604. It was called Fort Royal by the French; but, on their ceding the prov. to England in the reign of Queen Anne, it received its present name in honour of her Majesty. Notwithstanding it was the cap. of the prov. till the foundation of Halifax in 1750, and its fine harbour, it never attained to any considerable magnitude. At present it does not contain above fifty or sixty houses, shops, &c., and the fortifications and government buildings are going to ruin. (*McGregor's British America*, l. p. 360.)

ANNAFOLIS, city and port of entry, cap. of Anne Arundel co. and of the state of Maryland, is situated on the W. side of the Severn, 9 m. from its entrance into Chesapeake bay, 98 S.E. Baltimore, 40 E.N.E. W. It was established as the seat of government in Md. in 1699. Pop. 1630, 2623; 1840, 3722. It is regularly laid out with streets diverging from the state-house and the Episcopal church. The state-house is a venerable and handsome building, in which the American congress, during the revolutionary war, held some of its sessions, and in the senate chamber of which Washington resigned his commission at its close. A state library kept in it contains 10,000 vols. It contains also the county buildings and two churches, one Episcopal and one Methodist, a market house, bank, forty stores, two printing-offices, two semi-weekly newspapers, five academies, 97 students, three schools, 181 scholars, and about 300 dwellings. St. John's college, a branch of the university of Maryland, is located here. It was founded by the Roman Catholics, but became extinct, and has been resuscitated under a different direction. It has a president, five professors, or other instructors, 37 students, 190 alumni, and 4000 vols. in its libraries. The commencement is on the 29d of February. There is another branch of the university at Chester, on the eastern shore.

ANN ARBOR, p. v. cap. of Washtenaw co., Mich. 40 m. W. by S. Detroit, 526 W. It is situated on elevated ground on the W. side of Huron r. It is regularly laid out, and contains a court-house, jail, a bank, four churches, one Presbyterian, one Episcopal, one Baptist, and one Universalist, twenty-seven stores, one flouring-mill, one saw-mill, one woollen factory, one iron foundry, two printing-offices, two weekly newspapers. The University of Michigan is lo-

## ANTEQUERA.

cated here, and the academical branch has 70 students. In the t., besides the above, are two distilleries, two breweries, one flouring-mill, and four saw-mills.

ANNE ARUNDEL county, Md., situated in the central part of the state, and contains 790 sq. m. Bounded E. by Chesapeake bay, Patuxent r. bounds it on the N., and Patuxent r. on the S.W. It contained in 1840, 13,854 neat cattle, 18,189 swine, 31,741 swine, and produced 306,143 bushels of wheat, 26,179 of rye, 866,139 of oats. It had 187 stores, two fulling-mills, two woollen factories, two cotton factories with 400 spindles, four furnaces, five flouring-mills, thirty-three grist-mills sixteen saw-mills, three printing-offices, one weekly and two semi-weekly newspapers, one college, 35 students, thirteen academies, 242 students, thirty-two schools, 1018 scholars. Pop. whites, 14,630, slaves 9819, free coloured 5083; total, 29,532. Capital, Annapolis.

ANNECY, a town of the Savoyard states, cap. prov. Geneva, at the northern extremity of the lake of the same name, 39 m. S. Geneva. Pop. 5700. It is pleasantly situated among hills and mountains; and is thriving and industrious, having establishments for the spinning of cotton and silk, with manufactures of earthenware and glass, vitriol, straw hats, white iron and steel, &c. It is the seat of a bishopric, and is very ancient.

ANNET, one of the Scilly Islands, about 1 m. from that of St. Agnes.

ANNONAY, a town of France, dep. Ardèche, being, though not the cap., the principal town of the dep., at the confluence of the Cance and the Deume, 7 m. from the Rhone. Pop. 7689. It is a thriving, improving town, agreeably situated on the elevated uneven ground between the two rivers, with suburbs on the opposite banks; being well, though irregularly built. The only public building worth notice, is an obelisk in honour of the celebrated astronomer Montgolfier, a native of the place. Annonay is principally distinguished by its manufactures, particularly by that of paper, long reckoned the best in France; and hence the recommendation, so frequently seen in French catalogues, of books being printed on *papier fin d'Annonay* (See *ANNECY*.) It has also manufactures of cloth, woollen stockings, and gloves; establishments for the spinning of cotton and silk, part of the latter of a peculiarly fine quality, being employed in the manufacture of tulles and blondes; with dye-works, tanneries, &c. The town is proprietor of a large nursery; and in its vicinity is the first suspension bridge constructed in France.

ANNVILLE, t., Oneida co., N. Y., 25 m. N.W. Utica 118 m. N.W. Albany. It contains two stores, one woollen factory, one grist-mill, thirteen saw-mills, one furnace, three tanneries, twelve schools, 519 scholars. Pop. 1765.

ANNVILLE, p. l., Lebanon co., Pa., 19 m. E. Harrisburg, 139 W. Watered by Swatara cr. and its branches. It contains eleven stores, one fulling-mill, one woollen factory eight grist-mills, five saw-mills, one oil-mill, one distillery, six schools, 194 scholars. Pop. 3949.

ANOPSHERE, a town of Hindostan, prov. Agra, on the W. side of the Ganges, 68 m. E.S.E. Delhi, lat. 28° 23' N. long. 78° 8' E. It is surrounded by a strong mud wall, and is thickly inhabited. (*Hamilton's E. I. Gazetteer*.)

ANSON, county, N. C., situated in the S. part of it, state, and contains 760 sq. m. Yadkin r. bounds it on the E. and Rocky r. on the N., by branches of which it is drained. It contained in 1840, 15,461 neat cattle, 10,440 sheep, 28,492 swine, and produced 39,991 bushels of wheat, 416,102 of Indian corn, 9,078,659 pounds of cotton, and had seventeen stores, two flouring-mills, thirty grist-mills, thirteen saw-mills, twenty-one distilleries, seven academies, 11 students. Pop. whites 9633, slaves 5304, free coloured 14 total, 15,077. Capital, Wadesborough.

ANSBACH, or ANSBACH, a town of Bavaria, cap. ch. Rezat, on the Rezat, 34 m. S.W. by W. Nuremberg, lat. 49° 14' 30' N., long. 10° 30' 15' E. Pop. 16,500. It is surrounded by walls, and has four gates; is the seat of the provincial authorities and of a court of appeal. The object most deserving of attention are the castle and gardens that formerly belonged to the Margraves of Ansbach; the church of St. John, with the tombs of the princes. It has a gymnasium, a hospital, an orphan hospital, a library of 16,000 vols., with a cabinet of medals, &c.; and manufactures of woollen and cotton stuffs, earthenware, white lead, and playing cards.

ANSTRUTHER (EASTER AND WESTER), two considerable royal burghs and sea-ports of Scotland, co. Fife, on the N. shore of the Frith of Forth. Pop. of both burghs, with their parishes, in 1831, 1437; Parl. const. 1837, 63. They unite with Crail, Pittenweem, and Killybeg, in returning a m. to the H. of C.

ANTALOW, a considerable town of Abyssinia, co. prov. Enderta, 85 m. S.S.E. Axum. Pop. probably abt. 8000.

ANTEQUERA, a large town of Spain, Andalusia, 30 m. N.N.W. Malaga, lat. 37° 9' N., long. 4° 32' W. Pop. 20,114

## ANTES.

It is built partly on a hill, and partly on a plain; has an old castle built by the Moors, several churches and convents, with establishments for the spinning of silk and cotton, and fabrics of paper, morocco leather, and soap. There are in its neighbourhood quarries of marble of different colours, and plesier, a salt lake, and a mineral spring. It was taken by assault from the Moors, by Ferdinand, afterwards king of Aragon, in 1410.

ANTES, p. 1, Huntington co., Pa., 116 m. W.N.W. Harrisburg, 179 W. It contains four stores, four grist-mills, thirty-eight saw-mills, one furnace, eight schools, 560 scholars. Pop. 2154.

ANTHEME (St.), a town of France, dep. Puy de Dome, cap. cant. on the Aude, 9 m. E. Ambert. Pop. 3601.

ANTHONY (ST.), FALLS OF, in the Mississippi river, about 3000 miles above its entrance into the gulf of Mexico, in 54° 15' N. lat., 89° 40' W. long. The river is 627 yards wide above the falls, and 300 yards below. An island divides the river into two parts. The perpendicular fall is 17 feet high, with 58 feet more of a rapid below, so that the fall from some distance below appears higher than it is. When the river is high, it presents a grand appearance, and a beautiful rainbow is formed in the rising spray. The country around is highly picturesque. The falls are passed by a portage 260 rods long.

ANTHONY, (St.), a cape on the coast of S. America, Argentine republic, being the S. extremity of the estuary of the La Plata, lat. 36° 15' 19" S., long. 50° 37' W.

ANTIBES (an. *Antipolis*), a sea-port town of France, dep. Var, cap. cant. on the Mediterranean, 23 m. E.N.E. Fréjus, lat. 43° 34' 40" N., long. 7° 50' E. Pop. 5030. Being an important station on the side of Italy, Antibes is pretty strongly fortified. It is the seat of a tribunal of commerce, and of a school of navigation. The port, which is circular, of considerable size, and easy access, is formed by a mole projecting from the town, the distance from its extremity to the point on which fort Carré is built being only about 150 fathoms. In most parts the port is shallow; but within and near the mole there are from 15 to 18 feet water. The inhabitants are principally employed in the fishing and curing of sardines and anchovies.

Antibes is very ancient, having been founded by a colony from Marseilles, 340 years B.C. It was afterwards occupied by the Romans, by whom it was fortified and embellished. Having been destroyed by the Saracens towards the end of the 9th century, it continued in a comparatively neglected state, till it was again fortified by Francis I. and Henry IV. It was unsuccessfully besieged by the English and Imperialists in 1746. (*Hugo, France Pittoresque, art. Var.*)

ANTICOSTI, a large island in the mouth of the St. Lawrence, between 49° and 50° N. lat., and 61° 43' and 64° 35' W. longitude. It has an unfavourable soil, is without a single good harbour, and is uninhabited, with the exception of the attendants on the light-houses, one of which has been erected on its E. point, and another either has been or is about to be erected on its W. extremity.

ANTIGUA, an island belonging to Great Britain, in the West Indies, being one of those denominated the Windward Islands. It was called by the natives Xaymaca, but Columbus gave it the name of Santa Maria de la Antigua. It is about 25 m. N.E. Montserrat, and 40 m. N. Guadalupe. It is oval-shaped, being 20 m. in its greatest length, and contains about 168 sq. m., or nearly 70,000 acres. The pop. has decreased since 1774, when it had 2590 whites, and 37,808 slaves. In 1837 the people of colour and whites together were only about 3000; and the blacks, all of whom were enfranchised in 1824, about 33,000. It has little of the mountainous character of the neighbouring islands, the greatest elevation being only 1210 feet. On approaching it from the sea, instead of mountains clothed with rich foliage and luxuriant vegetation, a barren rugged coast, almost destitute of verdure, presents itself. A few miles, however, from the shore, the prospect is more pleasing, the country being agreeably diversified with hill and dale; and when not parched by the droughts to which it is subject, green fields of cane, clumps of feathery bamboos, flowers of dazzling brilliancy, and verdant cliffs hung with beautiful varieties of intertropical plants, enchant the voyager. The island has neither fountain nor river, and but a few scanty springs among the hills. Rain water, preserved in tanks, is subsisted, and it is found particularly light and pleasant to the palate. The soil in the high lands is a reddish clay on a substratum of marl; that in the low lands a rich dark mould on a substratum of clay. The climate is remarkable for its want of moisture, though the average fall of rain be 45 inches. The dew is scanty, and the rainy season very uncertain, but it may be said generally to extend from June to the end of the year. The alternations of temperature are very slight, the thermometer seldom ranging more than 4° in 24 hours. The deaths among the white troops for the last 30 years, according to Captain Tulloch's tables, was

## ANTIOCH.

40-6 per 1000 of mean strength. Among the black troops, 28-9. The sugar cane is the principal article of cultivation; but sufficient ground provisions are also procured in favourable seasons for the supply of the inhabitants. The crops vary considerably. In the years 1770, 1773, 1778, there was no produce of any kind, the canes and ground provisions being destroyed by drought, and the inhabitants would have perished, but for the importation of flour and corn-meal from America. The total value of imports in 1833 was £170,324 ster., the principal of which were grain, meal, and flour, cotton manufactures, linens, woollens, and fish. In 1834, the value of the imports was £178,076. There would seem to have been a very extraordinary falling off in the exports of produce from Antigua since 1834, in consequence, partly, perhaps, of deficient harvests, but more, as we apprehend, of the emancipation of the slaves. The principal imports into the United Kingdom from Antigua in the unmentioned years, have been—

| Years.               | Bar.         | Molasses.    |
|----------------------|--------------|--------------|
| 1834 — 257,177 cwts. | 71,445 gals. | 87,893 cwts. |
| 35 — 174,818 —       | 67,051 —     | 75,985 —     |
| 36 — 135,469 —       | —            | —            |
| 37 — 69,170 —        | 11,536 —     | 26,069 —     |

The shipping entered inwards in 1833, was 33,634 tons, employing 3270 men; outwards, 28,009 tons, and 2183 men. The legislature is composed of a governor, a council of 12, and an assembly of 25 members. The courts of equity and law are the same as in Great Britain. The governor for the time being acts as chancellor of the court of equity, and suitors have a right of appeal from his decrees to the king in council, on giving security for costs. The militia consists of 80 officers and 993 rank and file. There are ten public or free schools, and four private, fifteen infant, and many Sunday schools, giving instruction, in all, to nearly 1000 children. The manners, customs, and habits of the people differ in no degree from those of the other West Indian Islands. The revenue, in 1831, was £16,007, the expenditure £13,708. The island contains six towns and villages, viz., St. John's, Parham, Falmouth, Wiloughby Bay, Old Road, and James Fort. St. John's, the capital, on the N.W. side of the island, lat. 19° 23' N., long. 64° 43' W., is regularly built, partly on a high rock, connected with the mainland by a causeway, which is, however, submerged at high water. In the harbour there is sufficient depth of water for merchant vessels, and perfect security in all winds. English Harbour, on the S. side of the island, is, however, the best harbour in Antigua, and is, indeed, one of the best in the West Indies. It has water for ships of any size, and is well sheltered in all weathers. It has a dock-yard, a naval hospital, and every convenience for careening and repairing ships. (*Blunt's American Navigator*, p. 402.) Antigua is the oldest W. I. colony, after St. Kitt's and Barbadoes, in possession of the English, having been acquired in 1633. Its planters have been remarkable for their leniency to the slaves, who were finally enfranchised in 1834. The amount awarded to Antigua out of the £30,000,000 granted for the freedom of the slaves, was £485,895 7s. 0d.,—those of Antigua included. The average value of each slave was reckoned at £14 15s. 3d. (*Edward's; Parl. Papers, &c.*)

ANTILLES, see WEST INDIES.

ANTIOCH (vulg. *Antakia*) (*Antioch*), properly Antiochia, (*Antiocheia*), a famous city of Syria, and once the residence of its sovereigns, on the left bank of the Asany (*Orontes*), 30 m. above its mouth; 32 m. E. Aleppo, and 30 m. S. Iskenderoun, in lat. 36° 19' N., long. 36° 15' E. The population, which at its most flourishing epoch probably amounted to 400,000, is now reduced to from 6000 to 10,000, of whom about a tenth part may be Christians, and about the same proportion Jews.

Modern Antioch does not cover more than a sixth part of the area of the ancient city, the walls of which, though ruinous, may still be distinctly traced throughout their whole circuit. The Bab-Bouloos (Gate of St. Paul), the entrance from the E., is now  $\frac{1}{2}$  m. from the nearest houses; and, in every other direction except the W., the buildings have similarly receded from their old limits. Volney describes it as a wretched collection of huts, built of mud and straw, with narrow and miry streets, and exhibiting every appearance of misery and desolation. Kinneir, however, says that "the houses are in the Turkish fashion, small, but neatly built of hewn stone." But though this be the case with some of them, the majority are constructed of slight materials; and, unlike the houses of other Syrian or rather Eastern towns, have sloping roofs covered with thin tiles. There are ten or twelve mean and unimportant mosques, with low minarets; but in this city, so famous in the annals of Christianity, there is not at present a single Christian church! The baths and bazars are numerous, but neither exhibit anything remarkable. It has manufactures of coarse pottery, cotton stuffs, leather, &c.; but the greater part of the inhabitants are engaged in the cultivation and manufacture of silk.

## ANTIOCH.

All traces of its famous theatres, its circus, and its magnificent baths, have irretrievably perished. For about  $\frac{1}{2}$  m. on the E. of the town, a part of the ancient pavement still exists; and on the S. are the ruins of an aqueduct, which conveyed a supply of water from the foot of the Djebel Okrah (an. *Jft. Cassius*). The old walls are, however, interesting monuments. The situation of the ancient city was most delightful. It occupied the summits and slopes of two considerable hills, and the plain between them and the river. Over these hills and across this plain, the walls were built nearly in a rectangular form, inclosing a space of several m. in circumference. They are of various ages, part being, apparently, as old as the first foundation of the town, part referable to the era of Roman power, and part the work of the crusaders. They are carried over the beds of mountain torrents, and down the sides of almost perpendicular precipices, filling up the intervening gorges and ravines, so that they vary from 20 or 30 feet in height to upwards of 70. The oldest portion of the walls is also the most perfect; it stands upon a rock, and, having been originally well built, has resisted the influence of time and the shocks of earthquakes. There are two bridges, one of five arches with piers, cut out of the rock, across a ravine; and one of inferior dimensions, across the Orontes. In the sides of the mountains to the S.E. of the town are numerous excavations, apparently intended for cemeteries or catacombs, some of which are now used as places of worship by the Christian population.

The ancient Syrian name of Antioch is said to have been *Bibloth*; but being enlarged and beautified by Seleucus Nicator, he gave it, B.C. 301, after his father, the name of Antioch. It became at once the capital of the Macedonian kingdom of Syria, and continued for nearly 24 centuries to be the residence of the monarchs of the Seleucidian dynasty. About 65 years B.C., the conquest of Pompey brought Antioch, with the whole of Syria, under the control of Rome. At this era it consisted of three distinct towns, each having separate fortifications, the whole being surrounded by a common wall; hence it was sometimes called *Tetrapolis*. Under the Romans, Antioch continued to advance in importance: it was the centre of an extensive commerce, the residence of the governor of Syria, the frequent resort of the emperors, and the most celebrated town of the empire (the capital only excepted) for the amusements of the circus and the theatre. It is intimately connected with the early history of Christianity, the doctrines of which were planted in it by Paul and Barnabas; and in it, also, the term *Christian* had its origin as a distinctive appellation. (Acts, xi. 26). It has suffered severely on many occasions from earthquakes. One of the most celebrated and disastrous of these calamities occurred A.D. 115. The emperor Trajan, who had just concluded his victorious Parthian campaign, being then in the city, it was crowded with troops and strangers from all parts of the ancient world. The shocks are said to have continued for a lengthened period, and to have been most severe; the emperor himself narrowly escaped with some bruises, and many thousands of individuals were buried in the ruins of the city. (*Ancient Univer. Hist.*, xv, 133, Bro ed.) It again suffered severely from similar catastrophes in the years 340, 364, 396, 458, 526, and 598; the last destroying, it is said (but such statements are almost always much exaggerated), above 60,000 persons. Notwithstanding these repeated afflictions, and its devastation by Chosroes the Persian in 548, it revived again and again, and continued to be the "Queen of the East," and a place of great importance, till 638, when it fell under the power of the Saracens. In 1098 it was taken by the crusaders, and continued to be the capital of a Christian principality till 1269, when it was taken by the Egyptian sultan, by whom it was partially demolished. It was added to the Ottoman empire by Selim I. in 1516; but its commercial importance had already vanished; and it has continued, under the barbarous sway of the Turks, to decline till it has reached its present state of comparative insignificance.

The valley of the Orontes spreads, in the neighbourhood of Antioch, into a fertile plain, 10 m. in length, and 5 or 6 in width; the town and river, occupying the extreme edge, being close to the bounding mountains on the S.E. The soil is excellent, consisting of a rich alluvial deposit, producing figs, olives, vines, and mulberries in great abundance. The deserted space within the old walls are one continued garden; but in general the country is ill-cultivated, being abandoned to the Turks and other wandering tribes. Pliny speaks of a part of Antioch lying on the right bank of the river. (*Hist. Nat.*, v. 81.) This must have been a suburb, and probably, as in the case of Aleppo, as extensive as the town within the walls; but no vestiges of it now remain.

Modern critics and travellers differ in opinion as to the site of the grove, and village of Daphne, and temple of Apollo, in the immediate vicinity of Antioch. Gibbon has given the following description of this long-famous seat of

## ANTIPAROS.

religion and pleasure. "At the distance of 5 m. from Antioch, the Macedonian kings of Syria had consecrated to Apollo one of the most elegant places of devotion in the pagan world. A magnificent temple rose in honour of the god of light; and his colossal figure almost filled the capacious sanctuary, which was enriched with gold and gems, and adorned by the skill of the Grecian artists. The deity was represented in a bending attitude, with a golden cup in his hand, pouring out a libation on the earth, as if he supplicated the venerable mother to give to his arms the cold and beautiful Daphne; for the spot was ennobled by fiction, and the fancy of the Syrian poets had transplanted the amorous tale from the banks of the Peneus to those of the Orontes. The ancient rites of Greece were initiated by the royal colony of Antioch. A stream of prophecy, which rivalled the truth and reputation of the Delphic oracle, flowed from the Castalian fountain of Daphne. In the adjacent fields, a stadium was built by a special privilege which had been purchased from Elie: the Olympic games were celebrated at the expense of the city; and a revenue of £30,000 sterling was annually applied to the public pleasures. The perpetual resort of pilgrims and spectators incessantly formed, in the neighbourhood of the temple, the noisy and populous village of Daphne, which emulated the splendour, without acquiring the title, of a provincial city. The temple and the village were deeply bosomed in a thick grove of laurels and cypresses, which reached as far as a circumference of 10 m., and formed in the most sultry summers a cool and impenetrable shade. A thousand streams of the purest water springing from every hill, preserved the verdure of the earth and the temperature of the air; the senses were gratified with harmonious sounds and aromatic odours; and the peaceful grove was consecrated to health and joy, to luxury and love. The vigorous youth pursued, like Apollo, the object of his desire, and the blushing maid was warned by the fable of Daphne to shun the folly of unreasonable coyries. The soldiers and the philosophers wisely avoided the temptation of this sensual paradise, where pleasure, assuming the character of religion, imperceptibly dissolved the firmness of manly virtue. But the groves of Daphne continued for many ages to enjoy the veneration of natives and strangers; the privileges of the holy ground were enlarged by the munificence of succeeding emperors; and every generation added new ornaments to the splendour of the temple."—(*Calmet, Dictionnaire de la Bible*, art. *Antioche*; *Decline and Fall*, cap. 32; *Volney*, ii, 130; *Bruno*, 390-392; *Klüber*, p. 149-161; *Robinson*, ii, 273-277.)

ANTIPAROS (an. *Oliaros*), a small island of the Grecian Archipelago, group of the Cyclades, between Paros and Rhaphanto,  $\frac{1}{2}$  m. W. of the former, and 16 m. E. of the latter. It is about 7 m. in length from N. to S. by about 3 m. in breadth, its highest point being in lat.  $36^{\circ} 30' 40''$  N., long.  $25^{\circ} 3' 60''$  E. It consists of a mass of marble covered with a moderately fertile soil; and exclusive of some cotton and wine, it produces barley enough to suffice for its inhab. consisting of some 60 or 70 families who live in a miserable village about 1 m. from the shore, and are partially employed in fishing. Though hardly worthy of notice in other respects, this island is famous for an immense subterranean cavern or grotto. Its entrance is on the side of a hill under a low arch. The passage thence to the cavern is long, narrow, and in parts precipitous. "The mode of descent is by ropes, which are either held by the natives, or joined to a cable fastened at the entrance round a staircase pillar. In this manner we reached the specious chambers of a truly enchanted grotto. The roof, the floor, the sides of a whole series of magnificent caverns are entirely invested with a dazzling incrustation, as white as snow. Columns, some of which were 25 ft. in length, pended in fine icicle forms above our heads; fortunately, some of them are so far above the reach of the numerous travellers who during many ages have visited this place, that no one has been able to injure or remove them. Others extend from the roof to the floor, with diameters equal to the mast of a first-rate ship of the line. The last chamber into which we descended surprised us more by the grandeur of its exhibition than any other. Probably there are other chambers still unexplored." (*Clarke's Travels*, vi, p. 125, 8vo ed.)

The era of the discovery of this cavern in modern times is not ascertained; but it was first made fully known by the visit paid to it by M. Nointel, ambassador from France to the Porte, who descended into it with a cortège of no fewer than 500 individuals, at Christmas, 1673. On this occasion it was brilliantly illuminated. His excellency and suite remained in it for three entire days, and celebrated high mass at midnight on Christmas in this most magnificent of subterranean temples. It was also visited by the learned and excellent traveller, M. Tournefort, who supposed that he saw in it conclusive proofs of his singular theory as to the vegetation of stones. (*Tournefort, Voyage du Levant*, i, p. 185-195, 4to ed.) It has since been repeatedly visited by other travellers; and it is said that the smoke from the ne-

## ANTWERP.

record of the manor of Moylenny—within which the town is, and at which the seneschal, appointed by the Marquis of Donegal, presides—are also held here; the latter court decides pleas of debt to the amount of £30. Part of the market-house is used as a bridewell. Close to the town is the residence of Viscount Ferrard, and about 4 m. distant is a perfect pillar-gower, 95 ft. high, with a conical roof. The manufactures are those of linen, cotton, and hosiery. There are several bleach-works in the neighbourhood, and two paper-mills, one of which first introduced into Ireland the process of making paper in webs like cloth, instead of separate sheets. There are also several flour and meal mills, and a brewery: 8445 bushels of malt were manufactured here in 1836. Most of the grain is sent to Belfast, its conveyance being facilitated by the contiguity of lough Neagh, where a small quay has been erected at the mouth of the Six-mile-water. Markets are held on Tuesdays for grain, and on Thursdays for general purposes; and fairs on Jan. 1, May 13, Aug. 1, and Nov. 12. No tolls are now levied. A branch of the Ulster bank was opened in 1836. The post-office revenue increased from £348 in 1830, to £432 in 1836. Two caravans and three cars convey passengers between Antrim and Belfast three times a week. The average number carried is fifteen each trip. (Stat. Survey; Railway Report.)

ANTRIM, p. t. Hillsborough co., N.H., 38 m. W. by S. Concord, 480 W. Bounded E. by Contocook river, by branches of which it is drained. Gregg's pond covers 300 acres, and is 80 ft. deep. It has two stores, one fulling-mill, four grist-mills, seven saw-mills, twelve schools, 421 scholars. Pop. 1925.

ANTRIM, L. Franklin co., Pa., 11 m. S. Chambersburg. Watered by Conococheague creek and its tributaries. It contains Greencastle borough, and has five churches, seven stores, one woollen-factory, two flouring-mills, nine grist-mills, eight saw-mills, thirteen schools, 493 scholars. Pop. 4061, of whom 931 are in the borough.

ANTRIM, L. Sheawasee co., Mich. Pop. 117.

ANTRIM, L. Crawford co., O. Pop. 261.

ANTWERP (Ger. *Antwerpen*, Fr. *Anvers*), a marit. city of Belgium, cap. prov. and arrond. of same name, on the N. bank of the Scheldt, 36 m. N. Brussels, 33 m. E. Ghent; lat.  $51^{\circ} 13' 16''$  N., long.  $4^{\circ} 24' 10''$  E. It is in the shape of a bow, the arch being formed by the walls and the chord by the river, and is well fortified. A strong pentagonal citadel, built by the Duke of Alva, in 1567, and improved by the French, stands on the south side of the town, which is farther defended by various forts on both sides the river. Though much declined from its former prosperity, Antwerp is a well-built, fine old city, and is in various respects highly interesting. The principal street, Place de Meer, rivals any in Europe. It is about the width of Portland-place, but the variety and richness of the architecture render it far more magnificent. The older and narrower streets, bordered by lofty houses with their gables to the street, are singularly picturesque. Altogether, it is supposed to contain about 10,000 houses, mostly built of stone, and had in 1835 a pop. of 75,362. The great boast of Antwerp is its cathedral, a superb Gothic structure, begun early in the 15th and not finished till the 16th century. Its spire, of the most beautiful and delicate workmanship, is said by Schreiber and others to be 466 ft. high; but, according to a statement in the Penny Cyclopaedia this is 100 ft. too much, the height being there affirmed to be only 366 ft. The interior corresponds in grandeur with the exterior, and it contains two famous pictures of Rubens; one of which, the Descent from the Cross, is generally regarded as his *chef-d'œuvre*. Of the other churches, that of St. James, which contains the tomb of Rubens, St. Andrew, and St. Paul, are the most celebrated. All of them are adorned with fine paintings. The Bourse, or exchange, is one of the finest buildings of its class in Europe: it is said to have served as a model for the London exchange, burnt down in 1837. The *Hôtel de Ville*, a marble structure, rebuilt in 1581 after being destroyed by fire, is a magnificent fabric. The convent of the Recolets has been converted into a museum, in which is a superb collection of paintings, including many that were formerly scattered among the different churches and convents. It comprises some of the choicest specimens of the masters of the Flemish school; as Rubens, Van Dyke, Jordaens, Van Veen, Martin de Vos, &c. Antwerp has a theatre; an academy of painting (St. Luke's), which originated in the 16th century; a royal academy of the fine arts, established in 1817; an academy of sciences: an Athenaeum, or college: Latin, medical, and naval schools; a gallery of sculpture; a public library with 15,000 vols.; a botanical garden; with various learned societies, and many good private collections of works of art. Its charitable institutions include several hospitals, asylums, and workhouses. It is the seat of the courts of assize for the province; of a tribunal of original jurisdiction, a commercial tribunal, &c. The people have every appearance of being in comfortable circumstan-

## ANTWERP.

des, and are quiet and orderly. The upper classes speak French, and the lower Flemish.

The manufactures are very various, and are of considerable importance and value. They comprise fabrics of silk and cotton stockings, thread and tape, linen, calico printing, &c. Embroidery, bleaching, and ship-building are extensively carried on. The business of sugar-refining employed, in 1834, from 500 to 600 individuals, and consumed about 6,000,000 kilogs. of raw sugar. The lapidaries of Antwerp are very skillful in the cutting of diamonds and other precious stones. Of fifty-four mills for various purposes, within the city in 1834, only one was wrought by steam, two by wind, and one by water, the rest being moved by horses! In this respect there is certainly much room for improvement.

The depth of water in the river opposite to the city is from 32 to 40 ft. at ebb tide, with a rise at springs of from 12 to 14 ft.; and as this depth is increased towards the sea, Antwerp is a peculiarly eligible situation for the formation of dock-yards and the building of large ships. Its capability in this respect did not escape the observation of Napoleon, who endeavoured to raise it to the first rank as a naval arsenal. His plans in furtherance of this object were judiciously devised on a very grand scale, and were zealously prosecuted. Two large basins, capable of admitting ships of the line, were excavated on the N. side of the town; one comprising an area of 17, and the other of 7 Eng. acres. Attached to these was an extensive dock-yard, with careening and repairing docks, store-houses, &c., all planned and executed in the best and most approved manner, and at an immense expense. On the downfall of Napoleon, the dock-yard with its fortifications, &c., was completely destroyed; and it was even debated whether the two great basins should share the same fate! Luckily, however, they were preserved; and, being converted into commercial docks, are of the most signal service to the trade and navigation of the city. The fleet and naval stores in the arsenal, when it surrendered to the allied forces in 1814, were divided; two thirds being assigned to France, and one third to the king of the Netherlands.

Her fine river, and the numerous canals with which it is united, give Antwerp great advantages as a commercial emporium; and during the early part of the 16th century she was one of the first trading cities of Europe. Owing, however, to the ascendancy and jealousy of the Dutch, and the supineness of her rulers, her foreign trade was nearly annihilated during the 17th and 18th centuries. But the navigation of the Scheldt, which had been formally closed by the treaty of Westphalia, was re-opened on the occupation of Belgium by the French, and since the peace of 1815 the trade of the town has rapidly increased; and the probability seems to be, looking at the natural advantages of her situation, that it will go on increasing. The greater part by far of the foreign trade of Belgium centres here. The imports consist principally of coffee (16,000 tons), sugar (18,000 tons), cotton, tobacco, and all sorts of colonial produce; with cotton stuffs, wine, hardware, ashes, coal, hides, pepper, indigo and other dye-stuffs, &c. The timber used in ship-building is mostly brought by water from the interior. The exports consist chiefly of corn, linseed, flax, bark, and madder, linen, lace, carpets, tallow, &c.

The increase in the trade of Antwerp is evinced by the fact, that while only 681 ships arrived at the port in 1834, and 800 in 1835, there arrived, in 1836, 1945 ships of the burden of 176,079 tons, and in 1837, 1436 ships of the burden of 225,030 tons. In 1836, fifty-nine ships belonged to the port of the burden of 8754 tons. In 1837 six new vessels were launched.

The railway from Brussels to Antwerp, 28½ m. in length, was opened throughout the whole distance in 1836. It has been signally successful, and will, no doubt, be of great advantage to both cities.

Antwerp has produced many distinguished men, being the birth-place of the painters Teniers, Van Dyke, Jordaens, and Crayer; the geographer Ortelius, the admirable engraver Edelinck, &c.\*

Antwerp is very ancient. Ludovico Guicciardini, in his *Descrizioni di Paesi Bassi*, describes it in 1560 as a city of vast wealth and the most extensive commerce; adding, that it was no uncommon thing for 500 ships to enter and leave its port in a single day! And making every allowance for the exaggeration obvious in this statement, there is no doubt that it then enjoyed a more extensive foreign trade than any other city in the N. of Europe. But this prosperity was destined to be of short duration. In 1576 it was sacked and partly burned by the Spaniards. In 1585, it was invested by the famous Alexander Farnese, prince of Parma, who took it after a lengthened and memorable siege. After its cap-

## APENNINES.

ture, the greater part of its merchants and principal people emigrated to Amsterdam and other towns in the United Provinces, carrying with them their capital, skill, and connections. The ruin of its trade dates from this epoch, and was consummated by the Dutch obtaining the command of the river, and by the stipulation in the treaty of Westphalia, by which, as already seen, it was regularly closed. In 1794 it fell into the hands of the French, who made it the capital of the department of Deux Netbes, and held it till 1814. On the revolt of the Belgian provinces in 1830, the Dutch garrison continued to hold the citadel for the king of the Netherlands; and the latter having refused to make it be evacuated, agreeably to the determination of the great powers, a French army of 65,000 men, under Marshal Gerard, entered Belgium in November, 1832, to compel its evacuation. The details of the siege are well known. The trenches were opened on the 28th November; and after an obstinate, but not a skilful or energetic defence, the citadel surrendered on the 24th of December. (*Vendemiaire, Dict. Géog. de la Prov. d'Auvergne*, p. 4-30; *Barrow's Family Tour in S. Holland*, &c., p. 11-41; *Murray's Handbook*; and *Private Information*.)

ANWEILER, a town of Bavaria, circ. of the Rhine, on the Queich, 7 m. W. Landau. Pop. 9000. It has tanneries, and distilleries of Kirschwasser. Its castle, now in ruins, built by the emperor Frédéric, was long the dépôt of the jewels of the crown.

ANZIN, a village of France, dep. du Nord, in the immediate vicinity of Valenciennes. Pop. 4182. This is the seat of the richest coal mines in France. They have been wrought since 1734, and some of the pits are as much as 1500 feet in depth. The mines of Anzin, Vieux Condé, Furnes, &c., are said to employ in all above 4000 work-people, and to furnish annually nearly 3,000,000 hectolitres of coal. The cost of its production is estimated at 65 cent. the hectolitre; and it is stated that a company at Anzin, for working the mines, clears annually nearly 3,000,000 fr. profit, in consequence of the increased production and price of coal, caused by the high duties on foreign coal. (*Hugo, France Pittoresque*, art. Nord.)

AOSTA, a town of the Sardinian states, cap. prov. same name, at the confluence of the Buthera with the Dora, at the opening of the two valleys of the Great and Little St. Bernard, 49 m. N.N.W. Turin. Pop. 7000. It has straight, broad streets; and many of the houses having gardens attached to them, it covers a large extent of ground. It is the seat of a council of justice, and of a bishopric; but is principally distinguished by its ruins of edifices constructed by the Romans, among which are a triumphal arch, a superb gate with three arches, the remains of an amphitheatre, &c. It received different names from the Romans, being sometimes called *Civitas Augusti*, *Augusta Prætoria Julia*, and *Augusta Salassiorum*; the latter from its having been the capital of the Salassi, subdued by Terentius Varro.

APENNINES, the name given to the mountain system which traverses the whole length of Italy.

*Unhæc medium qua colles Apenninus  
Ergit Italiam, nullæque vertice lævi  
Alis intus, propiusque aciem Olympi.  
Mons inter geminas medius ac porrigit undas,  
Infans superque mare; collibus coarctat,  
Hinc Tyrrhenus vado frangens impetu Picus,  
Hinc Delmaticæ glaucæ Nectæus Aëon.*

Lucan., lib. 1.

At its W. extremity this range is so closely connected with the Alps, that it may be considered as an extensive off-set of that great system. It is difficult to determine where the Alps terminate and the Apennines begin: some think that the road over the Col di Tende (7040 E. long.) forms the boundary; others assign for it that road which begins on the N. at Alessandria, runs in the valley of the Bormida to Acqui, Signo, &c., and terminates on the coast at Savona, rising at its highest point to 4460 ft. above the sea; others think that the sea Alps extend to the road which leads from Novi on the N. over the pass of the Bocchetta (3550 ft.) to Genoa on the coast.

The Northern Apennines extend from the pass of the Bocchetta E., with a slight declination to the S. through three degrees of longitude (90° and 120°) to Monte Falterona, lying E. of Florence.

The Central Apennines extend from Monte Falterona S.E., with some bends to either side, as far as Monte Vellano, or nearly two degrees of latitude (44° and 49°).

The Southern Apennines, beginning at Monte Velino, run E.S.E. between 43° and 41° N. lat. South of the last-mentioned parallel, between the towns of Conza, Acerenza, and Verosa, and at the sources of the Bradano, they divide into two branches; of which the E., extending first E. and then S.E., terminates at Capo de Leuca, opposite Corfu. The W. range runs between 41° and 39° N. lat., nearly S.S.W., and between 30° and 36° S.W., and terminates with the Capo dell' Armi on the S. extremity of the straits of Messina.

\* It is stated in various publications that Rubens was a native of Antwerp; but in point of fact he was born at Cologne, on the 25th June, 1577, and was ten years old when, on the death of his father, his mother, a native of Antwerp, carried him to that city. (*Biographie Universelle*, art. Rubens.)

## APENNINES.

The Northern Apennines, which, near the pass of the Bocchetta, are of moderate height and breadth, occupy further E. a greater space and rise to a higher elevation. The highest summits are between  $10^{\circ}$  and  $11^{\circ}$  E. long., where Monte Pellegrino rises to 5161 ft., and Monte Cimone to 6075 ft. Their northern declivity towards the plain of the Po is gradual and gentle; but towards the S. they lower with an abrupt and steep descent. On the S. they send off some lateral ranges, among which that which is called the Alpi Apenni is the most remarkable, and highest. It leaves the main range W. of Monte Pellegrino, and is separated from it by a considerable depression. It extends southward, and terminates at a short distance from the sea, near the towns of Massa and Carrara. It forms a mass of finely-crystallized limestone nearly thirty miles long, and scarcely ever at a less elevation than 4000 feet above the sea, rising often much higher, as in the Panni della Croce, at the S. extremity, 6102 ft., the Pizzo d'Uccello, at the N.W. end, 6147 feet, and Monte Suro, near Carrara, 5540 ft. On the slope of the last-mentioned mountain the quarries are worked, from which nearly for 3000 years, the finest marble has been extracted.

Besides the road over the Bocchetta, the N. Apennines are traversed by three roads; one begins at Parma, runs over the plain to Fornovo, and then in the valley of the Taro to the upper part of the range, which it crosses by the pass of Cento Croci; it afterward descends to Pontremoli, and then, mostly in the valley of the Magra, to the gulf of Spezia. Farther E. is the road between Modena and Pistoia; it runs through Favallo, Fieve Pelago, on the west of Monte Cimone, and traverses the range by the pass of Fimballo. The third road unites Bologna with Florence; it runs from Bologna over the plain of Lombardy to Lojano, crosses the range by the pass of Pietra Mala, at an elevation of 3984 feet, and descends into the valley of the Sieve, whence it passes over a lateral ridge of moderate elevation to Fiesole and Florence.

The Central Apennines may be divided into two parts. Between Monte Falterona (S. of  $44^{\circ}$ ) and Monte Sibilla (S. of  $43^{\circ}$ ) their general direction is S.E., and though their upper declivity is very steep, they do not seem to rise to a great elevation, one of the highest summits, Cima de Vernina, hardly exceeding 4000 feet. Between Monte Sibilla and Monte Velino (N. of  $40^{\circ}$  lat.) the Apennines attain their greatest elevation. Monte Sibilla rises to 7212 ft., and Monte Velino to 8183 ft. Nearly at equal distance from either, and near the source of the Velino, two lateral ranges branch off, which are overtopped by high summits; on that which runs to the S.E., towards the Adriatic sea, is the Gran Sasso d'Italia, whose summit, the Monte Corno, attains 9531 ft. above the sea, and is the highest in the range. On the W. lateral range is the Terminello Grande, 7024 ft. above the sea. Numerous are the lateral ridges which branch off from the central Apennines. Those running towards the Adriatic sea form nearly right angles with the principal range, preserve for some distance a considerable elevation, and lower afterward rapidly but gradually. They terminate with hills, at no great distance from the shore. The lateral ridges, which traverse the much more extensive country between the Apennines and the Mediterranean, run mostly parallel to the principal range, so that nearly all the rivers of this region run in valleys extending S.E. or N.W., and form, as it were, terraces of different elevation, by which the country gradually lowers towards the sea. In these lateral ridges some summits attain a considerable elevation, as Monte Amiata, W. of Radicofani (S. of  $43^{\circ}$  N. lat.), which rises to 5794 ft.

Two roads traverse the N. portion of the central Apennines. The northern begins on the side of the Adriatic at Fossombrone, on the Metauro; runs S. to Cagli, and passes over the range between this place and Sigillo, whence it continues to Nocera and Foligno, and hence by Spoleto, Terni, and Narni, to Rome. The S. road begins at Ancona, runs S. to Loreto, and hence W. to Tolentino and Belforte; between the last-mentioned place and Foligno, it passes the range at some distance N. of Monte Sibilla. Only one road traverses the southern higher part of the central Apennines. It begins on the N. at Terni, on the Nera, a tributary of the Tiber, passes hence to Rieti and Civita Ducale, on the Velino, whence it traverses the range by a long mountain-pass, which terminates near Aquila, on the Aterno, and thence the road continues to Sulmona.

The undivided portion of the S. Apennines resembles, in part, the central Apennines: its offshoots towards the Adriatic run off at nearly right angles; but on the W. it has a lateral ridge, which runs parallel to it for a distance of more than 50 miles; and between it and the principal range extends a longitudinal valley, drained by the Volturno, and its tributary, the Calore; after these rivers have united, they break through the lateral range, and enter into the plain of Terra di Lavoro. The principal range contains some high summits, as Monte Meta, 7364 ft., Monte Miletto, 6720 ft. above

the sea. The highest part, however, seems to be the Matero, an enormous mass of chalk rocks, 40 m. in circ., situated at the sources of the Biferno, nearly in  $41^{\circ}40'$  N. lat. On some of its summits snow is stated to be found the whole year.

Near the sources of the river Calore a lateral branch runs off nearly due W., which terminates with a high ridge on the peninsula S. of the gulf of Naples. It contains the Monte S. Angelo di Castelmare, which rises to the height of 4988 feet. The W. extremity of this ridge is the Punta della Campanella, opposite the rocky island of Capri. Monte Gargano, a promontory projecting into the Adriatic, is commonly considered as the E. extremity of another lateral ridge of the Apennines, but it is quite unconnected with that range, being separated from its nearest offset by a low plain, many miles in breadth.

This range is traversed by two roads: one runs from the town of Naples to Capua and Praenestum, and passes over the lateral ridge enclosing the valley of the Volturno to Venusia and Isernia. Between Isernia and Castel di Sangro it crosses the principal range of the Apennines, and from the last-mentioned place it continues to Sulmona and Chieti. The second road strikes off E. from Naples, and passes over the first range by the pass of Monte Virgine; it then descends into the valley of the river Calore, in which it traverses the towns of Avellino and Ariano. E. of the last-mentioned town is the principal range of the Apennines, over which the road passes to Ponte di Bovino, and then enters the great plain of Puglia (il Tavolieri della Puglia), and continues to Foggia, Bari, &c.

The most easterly ridge, arising from the bifurcation of the Apennines, preserves a considerable elevation as far as the town of Altamura; but E. of that it is continued only by a series of hills, called *Le Murge*, which extend through the whole of the peninsula lying between the Adriatic and the gulf of Taranto. They are interrupted in several places, and terminate at Capo di Leuca.

The other chain runs directly S., and approaches by degrees the shores of the Mediterranean sea: on the E. side of the gulf of Policastro it comes close to it, and continues to run along the sea as far as the gulf of S. Eufemia, where it suddenly turns to the E., but soon again to the S., in which direction it skirts the eastern shores of Calabria, between the gulf of Squillace and Capo Spartivento. In this chain are some elevated summits. Monte Pollino (near  $40^{\circ}$  N. lat.) rises to 7067 ft. above the sea, and Monte Alito, the highest summit of the great mountain mass, with which the Apennines terminate on the straits of Messina, is 4390 ft. above the sea.

**Geology.**—The N. parts of the Apennines are, in general, composed of sandstone and chalk. The former is known in Toscana by the name of *macigno*, or *pietra sarena*, and several high mountains are composed of it: others consist of chalk, and others of *macigno* and chalk together. In the S. ranges the chalk formation predominates, especially on the W. side; on the E. declivity sandstone occurs in few places. A great portion of the hilly districts, which extend to the W. of the range, and intersect the plains along the Mediterranean, is composed of lava and other volcanic productions.

This region extends from Monte Vesuvius on the S., to the river Ombrone, in Tuscany, on the N. Near this river is Monte Amiata and Monte Radicofani (3000 ft. high), both volcanic mountains. A volcanic country encloses the lakes of Bolsena and Bracciano, and the rocky masses near Viterbo are also of volcanic origin. S. of the Tiber other volcanic rocks of considerable extent and elevation form the mountains near Albano: here Monte Cavo rises to 3110 ft. above the sea. The country round Rome is overpread with volcanic matter; and the Seven Hills themselves are partly composed of it. A third volcanic region occurs N. of Capua, near Tiano, where several heights rise to a considerable elevation, especially Monte St. Croce. Mount Vesuvius and the volcanic country round the town of Naples, constitute the most southerly region of the volcanic tract which skirts the W. side of the Apennines. On the E. side of the Apennines, only a single extinct volcano has been found; it is Monte Vulture, near Melfi, not far from the place where the bifurcation of the range takes place.

The lower declivities of the principal range, and a great part of the lateral ranges, where they do not rise above an elevation of 3000 ft., are commonly clothed with woods, especially evergreen oak and chestnut. The upper parts of the principal range have, in general, an arid soil, or are formed of bare rocks, of fantastic forms, and destitute of vegetation, except a few stunted bushes. The whole range is poor in metals, none of them occurring, except iron ore in a few places, and of bad quality. But in many places excellent marble is met with, and in a few it is worked.

The higher parts of the Apennines begin to be covered with snow in October, and they are not entirely free from it before June. It is deserving of remark, that the quantity of rain falling in the countries E. of the range is much less than that with which those on the W. are favoured. In the

## APENRADE.

plain of Puglia the rain amounts to about 19 inches annually, while in that of Terra di Lavoro it is 27 inches.

The countries lying W. of the range are subject to frequent earthquakes, and even some parts of the range itself are visited by them. An earthquake in the country lying about mount Matese occurred in 1805, by which 3574 persons lost their lives, and 1513 were wounded.

APENRADE, a sea port town of Denmark, at the bottom of a bay of the same name, on the E. coast of Sleswick, opposite to the N. end of the island of Alsens, lat. 55° 2' 57" N., long. 9° 36' 38" E. Pop. 3800. It is the cap. of a bailiwick. Its port is shallow, and not very safe; but it has, notwithstanding, a considerable trade in the export of agricultural produce, with distilleries, breweries, tanneries, &c.

APOLDA, a town of Saxony, circle of Weimar-Jena, 9½ m. N.E. Weimar. Pop. 3300. It has a castle, a college, with a bell-foundry, fabrics of cloth and cassimere, and distilleries. Its fairs, four annually, are well attended.

APPALACHICOLA, river and bay, Ga. and Fl. The river is formed by the junction of Chattahoochee and Flint rivers, whence it flows S. into Appalachiola bay, which opens into the gulf of Mexico. The river is navigable for small vessels 70 m. to the junction, and the Chattahoochee, for boats, 400 m. farther.

APPALACHICOLA, p. v., port of entry, and capital of Franklin co., Flor., 135 m. S.W. Tallahassee, 976 W. Situated on a bluff on a peninsula at the mouth of Appalachiola river. It is regularly laid out, and has an Episcopal church, two banks, seven blocks of brick stores and warehouses, and a weekly newspaper. It has considerable trade in cotton. Twenty steam-boats, besides other craft, navigate the river. It is the seat of an admiralty jurisdiction. The tonnage in 1840 was 4054. It has a good harbour, which is visited by many large vessels.

APPELDOORN, a town of the Netherlands, prov. Guelderland, 17 m. N. Arnheim. Pop. 3000.

APPENZELL (CANTON op), a canton in the N.E. part of Switzerland, the 13th in the Confederation. It is completely inclosed within the territory of St. Gall, and is shaped somewhat like a ham, the knuckle end stretching N.E. ward; area, 133 sq. m. (7.9 Germ.). Pop. 49,576; being next to that of Geneva the most thickly peopled of the cantons. Its surface consists chiefly of mountain ranges; those of the S. belonging to the higher Alps; the principal of which, the Hoch Sentis, is 8109 ft. high, but having its summit covered with perpetual snow: most of the others belong to the Lower or Fore-Alps (see SWITZERLAND), which enclose numerous small valleys. It is watered by several rivulets, the chief of which is the Sitter, running through its centre; there are also several small mountain lakes. The prevailing geological formations are calcareous; but pudding-stone and sandy or clay soils are likewise found. Climate cold and variable, but not unhealthy. The mineral riches of the canton consist of peat and coal: salt, chalybeate, and sulphurous springs are met with, some of which, as those of Weissbad near Appenzell, and Waldstatt near Herisan, are used as baths. Its forests, mostly of pine and fir, originally extended over the whole surrounding country; but their extent has been greatly diminished with the increase of population and cultivation; and wild animals, game, fish, &c., have become proportionally rare. Before the Reformation, the whole canton was under one government; but at that epoch, part of the inhab. having embraced the Protestant faith, while the other part continued Catholics, violent disputes were kindled between them, which, after much contest, were at length settled by a singular compromise. By an agreement in 1597, the canton was divided into two portions—*Rhodes Interior* and *Rhodes Exterior*. It was stipulated that the former should be appropriated to the Catholics and the latter to the Protestants. Accordingly, the two parties separated, and formed two independent democratical republics, having each a distinct system of government, police, and finance. Exterior or Outer Rhodes comprises about two thirds of the whole canton (its N. and W. parts), and has 40,080 inhab., engaged chiefly in manufactures; Inner Rhodes has 9700 inhab., principally agriculturists. Both republics have but one vote in the Swiss diet, and send their deputy by turns. Except in a few districts at the N.E. extremity, Appenzell produces neither corn nor wine; but the mountains abound with rich pastures, and cattle-breeding forms the chief occupation of the Inner Rhodes. 15,000 cows and oxen, 600 sheep, and 3000 goats are fed there annually, it being a practice to purchase them when lean, and sell them again when fattened: cheese, beer, and a liqueur made from a fine kind of black cherry, are the other products of the agricultural districts. The manufactures of the Outer Rhodes are cotton and linen goods, and embroidery: there are about 10,000 looms, by means of which are woven an average of the same number of pieces of cloth 16 Fr. ells in length. Machinery has not been introduced: weavers work from thirteen to fourteen hours a day. They are dispersed over the country, and combine

## APPLETON.

with their business as manufacturers of small farmers being, in each case, assisted by their families.

The houses are distinguished by neatness, convenience, and cleanliness; and being surrounded with gardens and hedges, and thickly scattered over the country, give it somewhat of an English aspect. Weavers generally earn from two to five florins (3s. 8d. to 9s. 2d.) per week.

Outer Rhodes has communal and lesser councils, and a grand council, composed of the principal magistrates of each commune, which assembles twice a year, and exercises the executive power. The grand council proposes the laws, and submits them for approval to the *landsgemeinde*, or general assembly of all the males of the republic above sixteen years of age, who meet armed on the last Sunday in April, in the open air, and either sanction, or put their veto on the laws proposed. Bankrupts, paupers, &c., are precluded from voting; and penalties are imposed on others who do not attend. The government of the Inner Rhodes is similar, except that the clergy take more part in it, and that none under eighteen years of age have the right of voting in the general assembly. Public schools are universally established, in which, after the rudiments of education, arithmetic, drawing, and singing are taught. Music is very generally cultivated. Savings' banks and poor-houses are established in every parish, and there are numerous orphan asylums and other charitable institutions. Appenzell furnishes 973 men to the federal army, and contributes 9298 Swiss francs a year to the funds of the union: the expenses of the canton are very trifling, as the services of the magistrates, &c., are gratuitous. The tax on salt is the only indirect one; the poor are not taxed at all. The Appenzellers of the Outer Rhodes are of German, those of the Inner Rhodes chiefly of more southern lineage; all, however, are lively, intelligent, and exhibit much mechanical ingenuity, and, with few exceptions, are said to be moral, well-behaved, prudent, and simple in their mode of life.

In the 7th or 8th century, the Frankish kings bestowed this country on the abbots of St. Gall, and it remained subject to them until 1401, when the inhabitants revolted, and with the assistance of their neighbours of Glarus and Schwytz, achieved their liberty, defeating the Austrians and the forces of the abbot in several engagements. In 1513 it was admitted into the confederation, with the history of which it is subsequently connected. (*Coez's Switzerland*, Letter 4; *Picot, Statistiques de la Suisse*, 1830; *Helvetic Almanac*; *Bourring's Report*, &c., p. 21-27.)

APPENZELL, a town of Switzerland, cant. Appenzell, cap. Inner Rhodes, and seat of its executive council, in a pleasant valley on the left bank of the Sitter, 9 m. S. St. Gall. Pop. 1400. It is dirty and ill-built; has a Gothic church, built in 1069, which contains various banners taken in former wars by the Appenzellers; two convents; a council-house; and two bridges over the Sitter. The annual general assembly of the republic is held here. About 2½ m. S. are the baths of Weissbad.

APPIN, an extensive district of Scotland, co. Argyle, which see.

APPLE CREEK, p. t., Greene co., Ill., 37 m. W. by S. Springfield, 609 W. It contains one school, 30 scholars. Pop. 1566.

APPLE CREEK, p. t., Cape Girardeau co., Mo., 212 m. S.E. Jefferson City, 650 W. It has one school, 22 scholars. Pop. 1393.

APPLEBY, a borough, m. town, and par. of England, co. Westmoreland, of which it is the cap., 250 m. N.N.W. London, 28 m. S.S.E. Carlisle. Pop. of town, 537, of par. 1439. It stands principally on the left bank of the river, on the slope of a hill, and consists chiefly of one broad street, having the castle at the upper end, and the parish of Thaneet at the lower. The former, the property of the earls of Thanet, is very ancient, part being either of Saxon or early Norman architecture; but it was mostly rebuilt in 1668. The church was rebuilt in 1655, by Lady Pembroke, a great benefactress of the town, from whom the castle descended to the Thanet family, and has a fine monument to her ladyship. There is a good market-house, erected in 1811; and a town-hall and jail on the right bank of the river, which is here crossed by an old stone bridge. Appleby has a grammar school, founded in the reign of Elizabeth, open to all children belonging to the town on payment of a fee of ten shillings a year, and having attached to it five scholarships at Queen's college, Oxford, and a right to participate in as many exhibitions in the same college. It has also an almshouse, founded by Lady Pembroke, for thirteen poor widows. Previously to the passing of the Reform Act, when it was disfranchised, Appleby returned two m. to the H. of C.; but they were in reality the nominees of the Thanet and Lonsdale families. The town is without manufactures, but has a good market.

APPLE RIVER, p. t., Jo Daviess co., Ill., 215 m. N. by W. Springfield, 867 W. Pop. 530.

APPLETON, t., Waldo co., Me., 30 m. S.W. Belfast, 35 E.

## APPLING.

**St. S. Augusta.** It contains five schools, 391 scholars. Pop. 361.

**APPLING, Co., Ga.,** situated in the S. part of the state, and contains 1000 sq. m. Bounded N. by Altamaha river. It contained in 1840, 13,398 head cattle; 9563 swine; and produced 9287 bushels of wheat; 24,945 of Indian corn; 5150 pounds of cotton. It had four stores, seven grist-mills, seven saw-mills, one oil-mill, two schools, 53 scholars. Pop. whites, 1753, slaves, 398, free coloured, 15; total, 2023.

**APPLINGTON, v. v.,** capital of Columbia co., Ga., 111 S.E. Milledgeville, 397 W. It contains a court-house, jail, an academy, one Baptist and one Methodist church, three stores and twenty dwellings.

**APFOMATTOX, river, Va.,** after a course of 130 m., enters James river at City Point. It is navigable for vessels of 100 tons, to the falls at Petersburg. Around these falls is a canal; and for 80 m. above them it is boatable.

**APPOQUINIMINK, humd.,** Newcastle co., Del. It has nine stores, three grist-mills, one saw-mill, two schools, 61 scholars. Pop. 2675.

**APRICENA, a town of Naples, prov. Capitanata, 7 m. N. N.E. St. Severo. Pop. 3008.**

**APT (an. *Apia Julia*),** a town of France, dep. Vaucluse, cap. arrond., on the Cavaion, 30 m. S.E. E. Avignon, lat. 43° 52' 30" N., long. 5° 23' 52" E. Pop. 5598. It is situated in a spacious valley, surrounded by hills, covered with vines and olives. The walls, originally constructed by the Romans, and repaired by the comtes de Provence, still partially exist. The older streets are narrow, crooked, and the houses mean; but the more modern streets are broad and straight, and the houses comparatively good. Principal public building, cathedral, of great antiquity, and remarkable for its subterranean chapel, &c. A bridge over the Cavaion, of a single arch, is said to be *dominée par sa hardiesse*. There are establishments for the spinning of cotton and silk, with fabrics of cloth, hosiery, cotton-stuff, hats, and earthenware; the latter, and the *confitures* made here, being highly esteemed. Several remains of Roman works are found in the town and its vicinity. (*Hug. art. France, &c.*)

**APULIA, PUGLIA, or APUGLIA,** a portion of S. Italy, lying between 39° 45' and 41° 46' N. lat., and 14° 57' and 16° 34' E. long., comprising the S.E. provinces of the K. of Naples; viz., Capitanata, Bari, and Otranto; having N.W. the prov. Basso, N.E. the Adriatic, S.E. the Ionian sea, S. W. and W. the gulf of Taranto and the prov. of Basilicata and Principato Ultra. Area, 8068 sq. m. Pop. (1833), 1,079,706. It has, at its S. extremity, the sub-peninsula of Otranto, which forms the heel of the fancied Italian boot; and on its N.E. shore the promontory of Gargano. Although it has 440 m. of coast, it is singularly deficient in bays and harbours, and the shores are low; forming in both respects a great contrast to the S.W. shores of Naples.

Puglia presents also a striking contrast to Calabria, and the S.W. prov. of Naples, in being almost wholly a plain country, and indeed containing by far the most considerable extent of level lands of any tract of the same size S. of the Po. It is divided into *Puglia plana* and *Puglia montana*; the latter is composed of the Apennine chain, 155 m. in length, which, emerging from Basilicata, runs through the Terra di Bari and Otranto to the extremity of the latter, and of the Garganese, and other branches chiefly in the N. and W. of Capitanata. The mountains of Bari and Otranto are much less elevated than the Apennines in any other region. The plains in the N. are pretty well watered, while those of the central and S. parts are remarkably destitute of water, forming another contrast to the sub-peninsula of Calabria on the opposite side of the gulf of Taranto. Chief rivers, Candelaro, with its tributary streams, Radiconia, Trilico, Salento, and Colone; and the Cervaro, both of which run into the Laguna Pantano Salvo; the Fortore, Carpella, and Ofanto, which discharge themselves into the Adriatic, all in the province of Capitanata; the latter river is the only one not dried up during summer. On its banks near Canne, was fought the famous battle of Canne (see CANNE). Thence to C. St. Maria di Leuca, a tract 180 m. in length, there are only a few insignificant streams. There are no lakes, but several lagoons of some size, along the shore round and near M. Gargano, as those of Lesina (14 m. long, and 3 m. broad), Varno, Pantano Salvo, and Belpi; and a few smaller ones near Taranto.

Apulia is divided into the following provinces:  
**Capitanata.** Area, 3714 sq. m. Pop. 396,703. Ch. towns, Foggia, 20,687 inh., Manfredonia, M. St. Angelo, Termoli, Vieste, Ascoli.

**Terra di Bari.** Area, 1719 sq. m. Pop. 486,706. Ch. towns, Bari, 18,937 inh., Barletta, 17,606 inh., Monopoli, 15,525 inh., Trani, 13,787, Bitonto.

**Terra d'Otranto.** Area, 9086 sq. m. Pop. 397,905. Ch. towns, Lecce, 14,061 inh., Taranto, 14,111 inh., Gallipoli, Brindisi, Otranto.

**Aspect and Agriculture.**—Much of the land is uncultivated and abandoned to wandering herds of oxen and buff-

## AQUAPIM.

loos: in other parts, a good deal of corn of different kinds is grown; but maize does not generally flourish, owing to the dryness of the soil. Corn and wool are the chief products of Capitanata, which also produces plenty of wine and oil. In the neighbourhood of Lucera (says Craven, 1831), of 37,000 varas of land (the *varna* = 3 acres), 1880 were sown with corn; 3000 with barley; 2500 with oats; 800 with beans; 5500 fallow; 700 covered with olives, vines, and fruit-gardens; the rest in pasture. In this prov. lands are let in large tracts, and a *cassale* or large house established upon each farm, in which the *agente* and labourers reside. There are also extensive *tenetiers* or pasture lands belonging to the crown, capable of feeding as many as 1,900,000 sheep. The centre of Capitanata has a sandy soil, and consists chiefly of pasture. From Foggia to Manfredonia, this tract abounds with thistles, asphodels, wild artichokes, and giant-funnel, of the stalks of which latter chair-bottoms and bee-hives are made. On the banks of the Cervaro, the mountains are clothed with fine woods, and thickets of flowering shrubs; near Bovino the plain is wooded with low stunted oaks; a forest of oak, manna and other ash, pitch-pine, chestnut, and evergreens (but none of them large), adorns M. Gargano; the country is well-cultivated at its foot. Capitanata produces excellent vegetables, wine, and fruit of all sorts, liquorice and tobacco. A great deal of wine is produced in the Terra di Bari; the vines are cut low, but not staked as in France; it is fertile in corn, oil, saffron, almonds, tobacco, mulberry-trees, liquorice, and capers, generally without manure, though in some parts the soil is but indifferent. Its sheep (all of a dark colour) furnish the best wool in Apulia; goats and swine are kept in large numbers. This prov. yields also, annually, 1,600,000 *mezzie* of salt, and 12,000 cwts of nitre. The T. d'Otranto "would be one of the richest provinces in Italy, were it not for its wretched administration." (*Rampoldi*.) Its tobacco is as good as that of Seville, but only a given quantity is allowed to be cultivated. It yields wine, olives, cotton (good and abundant), wheat sufficient for the inhab.; the arable lands are well cultivated, but there are no artificial pastures, and much of the land lies waste. The chief natural disadvantage it labours under, is the want of water, and the rain that falls is therefore carefully preserved in subterranean cisterns.

The hilly parts of Apulia feed many flocks, and produce an abundance of corn, oil, cotton, and flax; which latter is exported to Venice, Germany, and Switzerland. The shore is generally sandy, uncultivated, and covered with bushes, wild prunes, myrtles, erics, &c., that serve as food for oases and buffaloes. The whole country, in Bari and Otranto, abounds with aromatic plants; and both the wines and flesh of some of the animals, as the buffaloes, have an aromatic flavour. Puglia is famous for its deer and other game; the sportsmen run down hares with grayhounds, and pursue the wild-boar with lurchers and mastiffs, riding armed with a lance and brace of pistols. The shores about Taranto furnish large quantities of shell-fish. The viper, asp, a species of large black snake, the tarantula, &c., infect this part of Italy.

The dyeing of wool is an important branch of industry at Taranto; the internal commerce of Apulia, of which Foggia is the head-quarter, consists chiefly in the sale of wool, cheese (from sheep's milk), and corn.

The country is quite healthy, the people industrious, peaceable, and handsome. Many of them in various districts are Greeks or Albanians; these being, in the Terra d'Otranto, 1 of the whole; they preserve their original customs, dress, and religion, and occupy themselves in cotton-weaving. Brigandage is prevalent about Bovino, and on the borders of Basso, but not in other parts.

This territory was originally called Daunia, Iapygia, Peucecia, and Messapia, and formed part of Magna Græcia. Having fallen under the Roman dominion, Augustus made it the third prov. of Italy, under the name of Apulia. After the fall of the empire in the W., it was occupied successively by Odoacer, Theodoric, and the Greek emperors, till, in the 8th century, it was wrested from the latter by the Arabs; and from them in turn by the Normans, in the 11th century; Robert Guiscard styling himself first Count or Duke of Apulia. It continued in the possession of his successors till the death of Manfred, at the battle of Benevento, in 1268, when it fell under the dominion of Charles of Anjou, as well as the rest of the Neapolitan territory. Its subsequent history belongs to that of Naples. (*Rampoldi, *Corografia dell'Italia*; Swinburne's *Travels in the Two Sicilies*; Craven, *Tour in the S. Prov. of Naples*; *Weimar Almanach*, 1838.)*

**APURE, a river of S. America, Colombia,** one of the principal tributaries of the Orinoco, which see.

**AQUAMABOE, a territory of W. Africa,** part of the state of Dahomey, which see.

**AQUAPIM, a territory of W. Africa,** part of the empire of Ashantee, which see.

## AQUILA.

**AQUILA**, a city of the Neapolitan states, cap. prov. Abruzzo Ultra, on a hill at the foot of which flows the Aterno, lat. 42° 37' N., long. 13° 28' E. Pop. (1839), 9194: viz., 4511 males, 4683 females.\* It is surrounded by walls, and ranks as a fortified place of the 4th class; is pretty well built; has a cathedral, and various churches, convents, and hospitals; is the seat of a bishopric, of a civil and criminal court, a chamber of finances, &c. A royal college, established at Sulmona in 1807, was transferred thither in 1816: it was soon after raised to the rank of a lyceum, differing little from a university, and is attended by about 400 pupils. There is also a secondary school, established in 1768, and various other seminaries. A handsome new theatre, built on the model of that of Vicenza, was opened in 1833. Excellent water, conveyed from the Monte San Giuliano, about 3 miles distant, by an aqueduct, constructed at a great expense, during the flourishing period of the city, is liberally distributed to some fine public fountains, as well as private houses. The town has manufactures of linen and wax; and a considerable trade in Saffron raised in its neighbourhood.

Aquila was founded in 1340; and rose in no long time to be one of the richest, most populous, and powerful cities in the kingdom. But the combined influence of misgovernment, pestilence, war, and earthquakes, from the latter of which it suffered severely in 1703 and 1706, have reduced it to its present state of decadence. Latterly, however, it has been improving. (*Det Re Descriptione delle Due Sicilie*, ii., p. 115-300.)

**AQUILEIA**, a small town of Austrian Italy, near the bottom of the Adriatic, 18 m. S.E.W. Gorizia, lat. 45° 45' 32" N., long. 13° 25' E. Pop. circa 1500. It is surrounded by a wall and a fosse, and is connected by a canal with the port of Grado, the residence of a few fishermen. This is all that now remains of one of the principal cities of ancient Italy—its chief bulwark on its N.E. frontier, and the great emporium of its trade with the nations of Illyria and Pannonia! Augustus assigned to it the ninth place among the great cities of the empire:

Nona inter civitates, Aquileia dicenda, urbes,  
Italia ad Illyricos objecta colossas moestas,  
Mansibiles at porta coelestria.

Cluvius Ulter, 7.

Aquileia withstood a siege by Maximian; and in 432 it opposed a vigorous and gallant resistance to Attila; but that ferocious barbarian having carried it by assault, razed it to the ground, the destruction being so complete, that the succeeding generation could scarcely discover its site! The unhealthiness of its situation has caused the miscarriage of the attempts that have been made for its restoration. In 1751, two archbishops were formed out of the patriarchate of Aquileia. (*Cramer's Ancient Italy*, i., p. 129; Gibbon, cap. 35.)

**ARABIA**, an extensive peninsula, comprising the S.W. portion of the Asiatic continent, situated between the rest of Asia and Africa, and between 19° 22' and 33° 45' N. lat., and 39° 50' and 59° 42' E. long. It is bounded on the S. and E. by that part of the Indian ocean called the Arabian sea; on the N.E. by the gulfs of Oman and Persia; and on the W. the Arabic gulf, or Red sea, forms its boundary from the straits of Bab-el-Mandeb to the isthmus of Suez. The N. limit is less clearly defined; the desert in which Arabia terminates in this direction being continuous with that of Syria, and no well-defined line of demarcation existing between them. The most natural boundary on this side appears to be a line drawn from the head of the Persian gulf to the most westerly point of that of Suez, coinciding very nearly with the 30th parallel of N. lat.; but it is usual to include in this country a considerable part of Irak Arabi, and the desert plains S. and E. of Syria and Palestine; and under this view, the N. boundary follows very nearly the course of the Euphrates. The countries contiguous to Arabia are, on the N. the Asiatic provinces of the Turkish empire; on the W. Egypt and Abyssinia; on the S. Adel, the most easterly portion of Africa; and on the N.E. Persia. On the E., except along the Persian gulf, the nearest land is Hindostan. Its greatest length from Suez to cape Ras-al-Hind is 1600 m., and its greatest width from the straits of Bab-el-Mandeb to the town of Kefmah, on the Euphrates, 1400 m. Its area, measured on D'Anville's map, is about 1,100,000 sq. m. (Compare D'Anville, *Carte d'Asie*, with *Trevels of Ali Bey*, ii., p. 9; *Map of the Coast of Arabia*, same work, ii., p. 37.)

*Divisions, Ancient and Modern.*—From the earliest period of authentic history, Arabia has been the connecting link between the E. and the W. world. It was the mart whence the Phœnicians drew the supplies of gold and silver, gems

## ARABIA.

and pearls, spices and perfumes, with which they furnished the countries of Europe. And even before this more extensive intercourse existed—before Phœnicia was a nation, or her "trafficers princes," the Arabian caravan was seen upon the Nile, and on the borders of Palestine, laden with the most rare and precious products. (Genesis, ch. xliiii.) That these were only partially, if at all, native products of Arabia, is sufficiently proved; but the W. nations, who received them from Arabia, looked at first no farther for their origin. Exaggerated notions were formed of the beauty of a land whence such precious luxuries were procured, and the term *Eudæmon*, *Felix*, or the Happy, became connected with its name. But when, in the course of time, the Greeks first, and then the Romans, came to this fancied paradise, they found the soil, wherever they essayed to enter the country, a burning and/or an unfruitful rock. The possibility of an erroneous theory was, however, seldom admitted by ancient inquirers. Arabia was still believed to be the Happy or Fortunata, but its bilateral regions were supposed to be separated from the less favoured portions of the earth by an absolutely sterile zone or belt. All the country E. of Egypt had, indeed, been known, time immemorial, by the common name *Arabia*; and this designation being still retained, the inapplicable terms upon the N. and W. received the distinctive epithets of *Ægyptus*, *Deserta*, or the Desert. (*Herodotus*, *Thalia*, § 107-113; *Diodorus Siculus*, lib. ii., p. 150-167; lib. iii., p. 211-216; *Strabo*, lib. xvi., p. 767-781; *Pliny*, *Nat. Hist.*, lib. v., § 11.)

Ptolemy subsequently added a third division to Arabia, including the country between the Red and Dead seas, and between Palestine and the Euphrates: in other words, he gave to his Arabia the N. limit which, since his time, it has generally been considered as retaining. To this new district he gave the name of *Arabia Petrea*, from *Hyra*, a town on the lesser Jordan, south of the Dead sea, and the capital of the Nabatheans. (See *FERRAS*.) This division of the country by the Greco-Roman geographers was universally adopted, not only by their contemporaries, but by all the western nations in the middle ages. On the revival of learning, the great work of Ptolemy was taken as the text-book of geography, and his arrangements were universally adopted. Even Gibbon was deceived by them. "It is singular enough," he remarks, "that a country whose language and inhabitants have ever been the same, should scarcely retain a vestige of its old geography." (*Decl. and Fall*, v., chap. 50.) But he forgot that this "old geography" was the invention of foreign nations, possessing neither political power nor influence over the wandering Arab tribes, in almost total ignorance of the settled portion of the Arab people, and, consequently, without the means of making their divisions known among the natives, still less of causing them to be adopted. The fact remarked by Gibbon of the identity of the people and language in ancient and modern times, leads, indeed, irresistibly to the conclusion that an "old geography," of which the natives retain neither vestige nor recollection, never had an existence among them, and that the ancient *Arabic* divisions of this country are as identical as the people and the language with those existing in the present day. These native divisions are the following:

1. *Bar-el-tour-Sinai* (the Desert of mount Sinai), nearly identical with the *Arabia Petrea* of Ptolemy. It comprises the small peninsula between the gulfs of Suez and Akabah, and the country northward as far as the Dead sea. This is the region so celebrated in Sacred History as the scene of the wanderings of the Jewish people; but, though it may be gathered from the Mosiac account that it was then the residence of several warlike nations, it is, at present, nearly uninhabited. (*Niebuhr*, par. ii., p. 345.)

2. *El-Hedjaz*, or the Land of Pilgrimage, occupies a considerable portion of the coast of the Red sea. Its boundaries are E. *Nedjed*, W. the Red sea, S. *Yemen*, and N. *Bar-el-tour-Sinai* and *Nedjed*. This district acknowledges a sort of doubtful authority in the grand Signior as protector of the holy cities (Mecca and Medina); but those cities, and the whole southern part of Hedjaz, called *Balad-el-Haram* (Holy or Forbidden land) were, till within these few years, under the government of the sheriff of Mecca. The sheriff's power has, however, of late been much shaken; first by the Wahabees, a fanatical sect of Nedjed, and more recently by Mehemet Ali, Pacha of Egypt. (*Niebuhr*, par. ii., p. 308; *Ali Bey*, ii., p. 36, et seq.; *Burckhardt's Travels in Arabia*, passim.)

3. *Nedjed* constitutes the central part of the peninsula. It is the largest, but the least known, of all the divisions. It is bounded N. by the Syrian desert, E. by *Lacka*, S. by *Yemen*, and W. by *Hedjaz*. (*Niebuhr*, par. ii., p. 306; *Burckhardt*, vol. ii., p. 306, et seq.)

4. *El-Hassa-Lacka*, otherwise *Lacka*, *Hedjaz*, or *Bahrein*, lies upon the Persian gulf. Its boundaries are, towards the N. the country of *Irak Arabi*, W. *Nedjed*, S. *Oman*, and E. the Persian gulf. (*Niebuhr*, par. ii., p. 293.)

5. *Oman* is bounded N. by the Persian gulf and *Lacka*,

\* The population is generally set down in late works at between 12,000 and 14,000. This, however, is an error; and no doubt refers not to the town but to the *circondario* (arrondissement), which contains a considerable extent of country, and some small towns. Its population in 1836 was 14,400.

## ARABIA.

R. by the Indian ocean, W. and S. by vast sandy deserts (parts of *Nedjed* and *Hadræmut*), in the midst of which it seems to rise like a little knot of mountains out of an extensive sea. (*Niebuhr*, par. ii., p. 255.)

6. *Hadræmut* forms the S.E. division of Arabia, and is bounded N. and N.E. by the deserts of *Nedjed* and *Oman*, S. and S.E. by the Indian ocean, and W. by *Yemen*. (*Niebuhr*, par. ii., p. 245.)

7. *Yemen*, the southern part of the peninsula, has the Red sea on its W. side, the straits of Bab-el-Mandeb and the Indian ocean on the S., *Hadræmut* on the E., and *Nedjed* and *Hedjaz* N. (*Niebuhr*, par. ii., p. 160.)

*Yemen* and *Hadræmut* point out the situation, if not the extent, of the *Arabia Felix* of Strabo and Ptolemy. The inhabitants regard themselves as the chief of all the Arabian people, calling their country *Bellad-el-Uim* or *Bellad-el-Din*, "The birthplace of the sciences and of religion." (*Niebuhr*, par. ii., p. 247.) But the *Arabia Felix* of Greek geography seems to have extended much farther N., comprising the whole of *Hedjaz* and *Oman*, together with the greater part of *Lachas*, and a very considerable portion of *Nedjed*. (*Strabo*, lib. xvi., cap. 3, p. 765; *Ptolemy*, lib. vi., cap. 7, p. 112.) The *Arabia Deserta* included the N. parts of *Nedjed* and *Lachas*. In Ptolemy's map this district is separated from the former by an imaginary range of mountains, running from the Persian gulf to another range, equally imaginary, supposed to form the boundary between *Arabia Felix* and *Arabia Petraea*. The position of this last-mentioned province has been previously pointed out.

**Physical Features of the Country, Mountains, and Plains.**—The name (*Nedjed*) of the central and largest division of Arabia, signifies high or elevated ground; and the whole peninsula, as far as at present explored, consists of an elevated table-land, with a general inclination towards the N. and E.; and surrounded by a belt of low land, varying in width from one or two days' journey, to a single mile or less. (*Niebuhr*, par. ii., p. 160, 206, &c.; *Burchhardt*, ii., p. 307, of seq.) This belt is called *Gassr* or *Tehama*, Arabic terms for a plain country; and the W. part of *Yemen*, on the Red sea, has received the latter name as a distinctive appellation. A range of mountains, a continuation of the Syrian Lebanon, runs S. from the borders of the Dead sea to *Yemen*; and the face of which is much more steep and precipitous towards the W. than the E.; so that the great plain which commences immediately to the E. of these mountains is very considerably raised above the level of the sea. (*Burchhardt*, ii., p. 165.) The hills of *Oman* seem to form the E. shoulder of this table-land, and the plains of *Lachas* the termination of its inclination towards the Persian gulf. (*Niebuhr*, ii., p. 255, 262.) This high plain is diversified with several considerable elevations, which cross its surface in every direction, shooting off like branches or spurs from the principal chain. *Niebuhr* expressly states (ii., p. 206,) that the portion of this plain, more particularly known by the name of *Nedjed*, is mountainous; and *Burchhardt*, in describing *Deraiyeh*, the capital of *Nedjed-el-Arad*, says, that it is situated in a valley, the outlets of which are so narrow that only one camel can pass at a time. (*Travels*, ii., p. 399.) The main chain, supporting this table-land on the W., increases in elevation as it extends towards the E.; and, although it has not been explored in the S.E. part of the peninsula, there can be little doubt that the same chain, after following the direction of the Red sea to *Yemen* and *Hadræmut*, is continued in a line, parallel to the Indian ocean, as far as *Oman*. *Lord Valentia* describes that part of the E. coast of Arabia, which he saw in his voyage from India to the Red sea, as a sandy beach with a chain of mountains in the distance (*Voyages and Travels*, ii., p. 19); and *Niebuhr* has no doubt that the hills of *Oman* form the N. termination of this chain (par. ii., p. 255.) The elevations of the land are rather in masses than in peaks, and the few great eminences of the latter kind noticed by travellers, are referred to in terms which seem to imply that they are regarded as singularities. Thus, we are told that mount *Shahab* is seen, at a distance of two days' journey, rising like a tower in the midst of the plain, and that it forms a land-mark for the pilgrims travelling from *Barnacusa* to *Mecca*; but the notice which this mountain has attracted from all travellers along the Hadj road, leads to the inference that such land-marks are rare. (*Zack's Correspondence*, No. 18, p. 389.) Mounts *Horeb* and *Sinal* are, out of all comparison, the most celebrated in the world: they are connected with some of the most important events in sacred history; and are regarded with feelings of religious awe by Mohammedans as well as by Jews and Christians. The *Sinal* group is the last considerable elevation towards the N.W. of the mountains which support the table-land of the interior. This group fills the peninsula between the gulfs of *Suez* and *Akaba*. Mount *Ararat*, an eminence extremely sacred in Mohammedan estimation, at a short distance from *Mecca*, rises from the plain country of the table-land to an elevation of 150 or 200 feet. It forms the centre of a natural collierte, being situated in a plain about three quarters of a

league in diameter, and surrounded by barren mountains. The composition of the Arabian mountains, towards the N. and W., is limestone rock, with granite towards the summit; but in the higher parts of the country the bare granite rises uncovered from its very base. (See *Burchhardt*, *Ali Bey*, and *Niebuhr*, *passim*.)

The *Gassr* or *Tehama*, from its regular inclination towards the sea, and the nature of its soil—sand with saline incrustations (*Niebuhr*, par. ii., p. 161; *Lord Valentia*, vol. ii., p. 359)—seems to have been under water at a comparatively recent period. At *Mocha* the soil for 28 feet in depth is wholly composed of marine productions; and at *Okella*, close to the straits of *Bab-el-Mandeb*, where anciently there was a harbour in which a fleet could lie, there is not, at present, much more than a foot of water. (*Lord Valentia*, vol. ii., p. 361.) The town of *Musa*, formerly on the coast, is now several miles inland. This fact was remarked even in *Pliny's* time. "Nowhere," says he, "has the earth gained more, nor in so short a time, from the water." (*Nat. Hist.*, lib. vi., § 97.)

**Rivers and Lakes.**—There are no rivers, in the strict acceptance of the term, in Arabia. The most important streams noted on D'Anville's map are the *Astan* and the *Falg*, both falling into the Persian gulf; the *Masora* and the *Folm* emptying themselves into the Indian ocean; a nameless stream, falling into the same ocean on the confines of *Yemen* and *Hadræmut*; and the *Meldam* and *Zebid* in the S. part of *Yemen*. But these and every other stream of running water known to exist in this country, have more or less the character of occasional torrents. *Niebuhr* remarks it as a singularity, that the *Masora* and another small stream in *Oman* continued to run throughout the year; and he states, that in the *Tehama* of *Yemen* there are no rivers that retain their water during the entire summer. (*Des de l'Ar.*, par. ii., p. 255, 161, &c.) The few perennial streams are all reduced to insignificance during the dry season; but, under the influence of the periodical rains, these and the others often swell to an immense size, and sometimes make new channels for themselves, changing, in this way, the appearance of the coast, and leading to contradictory statements as to the number and embouchures of the different streams. (*Valentia*, ii., p. 360.)

The arid sands of the *Tehama*, unfavourable to the formation of rivers, are, of course, equally hostile to the accumulation of water in lakes. In fact, the dryness of the Arabian soil is proverbial; but the interior is only very partially known; and in the table-land of *Nedjed* lakes are supposed to exist, on the authority of *Strabo*, who affirms that he saw them (lib. xvi., p. 774); and also on that of eastern geographers, cited by *Malte-Brun* (*Géographie Universelle*, viii., p. 346.)

**Climate.**—The tropic of Cancer divides Arabia into two not very unequal parts. It lies, therefore, partly in the torrid, and partly in the S. part of the N. temperate zone; but so many modifying circumstances exert an influence over its climate, that the mere latitude of its several parts is, perhaps, the least important element in determining the temperature, humidity, and salubrity of its atmosphere. In general, the climate is very similar to that of N. Africa. Lying under the tropic, it has, of course, its succession of dry and rainy seasons; and on the mountains of *Yemen* the showers regularly fall from the middle of June till the end of September. During the early part of the season the rains are most abundant, and at this time the sky is sometimes, but very rarely, covered by clouds for 24 hours together. During the dry season a cloud is scarcely ever seen. In *Oman* the rainy season begins in November, and continues till the middle of February. In the plain country on the coast, and in the *Tehama* of *Yemen* (though so close to the mountainous regions of regular showers), a whole year frequently passes without a drop of rain. (*Niebuhr*, par. i., p. 34, of seq.) In this respect is found striking physical resemblances between Africa and Arabia. In the latter, as in the former, the parched plains are denied the refreshment of falling showers, and owe what share of fertility they possess to the inundations consequent upon the saturation of the mountains.

The temperature of Arabia, like that of other countries, differs widely, according to the elevation of the surface, the nature of the soil, and the neighbourhood of the ocean. In general, the mountains of the S. *Yemen* and *Hadræmut* are the most habitable, and even the coolest parts of the peninsula; but the heat of the *Tehama* is excessive; and great extremes of temperature are experienced within very short distances. At *Mocha*, on the Red sea, the thermometer rises in summer to 90° Fahr.; while at *Saana*, in the mountains, it never exceeds 85°, and in this district freezing winter nights are not unfrequent. The inhabitants of *Yemen* live, consequently, under several different climates, and very different species of animals and vegetables flourish within its limits. (*Niebuhr*, par. i., p. 4.) From the borders of *Hedjaz* to the banks of the *Euphrates* the country is a vast plain,

## ARABIA.

without the slightest elevation, and wholly destitute of rivers or permanent springs. The soil is one mass of moving sand, without the slightest trace of town or village; and the dreary monotony of the scene is broken only by the appearance of a few thorny shrubs, which, taking vigorous root in the sand, supply the patient camel with the only food which he can find in these deserts. (*Joseph et Milly, in Zach's Correspondence*, No. 18.) This country, with the desert of Syria, seems to have formed the *Arabia Deserta* of Strabo and Ptolemy.

Another plain, of the same kind, and most probably even more extensive, called the *Desert of Akhaz*, lies between Yemen and Hadramaut, on the S. and W., and between Nedjed and Oman, on the N. and E. (*Niebuhr*, par. ii., p. 245-255.) These vast sandy deserts increase very greatly the heat of the atmosphere in their neighbourhood. The wind blowing over them, about the summer solstice, becomes so dry that paper and parchment exposed to its influence scorch and crack, as though placed in the mouth of an oven; and life, both animal and vegetable, perishes in the noxious blast. (*Ah Bey*, vol. ii., p. 46.) This is the wind known, in different and often very distant countries, by the names of the Simoom, Samiel, Sirocco, and Sorana; and which is always generated in every tropical country having extensive sandy deserts. Its grand seat is the vast desert of Sahara, in Africa; and next to it, perhaps, the deserts now mentioned. It comes from a different quarter in different parts of the peninsula, according to their position with respect to these deserts. Thus, at Mecca, the Simoom comes from the E.; in the neighbourhood of the Persian gulf and the Euphrates, from the W.; in Yemen and Hadramaut, from the N. and N.E. The chain of hills seems to shelter the Tehama of the Hedjaz from the influence of the Simoom from the Arabian desert, as the hottest wind, known in this district comes from the African deserts across the Red sea, and is, consequently, very considerably cooled and mitigated in its violence.

It is only, however, during the intense summer heats that the Simoom is dreaded; and such is the general purity of the atmosphere, owing to the few exhalations from the dry soil, that both man and beast in Arabia are aware of the approach of the poisonous blast, from the sulphurous odour by which it is preceded. It is said, also, that the point of the heavens from which the Simoom is approaching is always marked by a peculiar colouring, easily distinguishable by an Arab eye. Thus forewarned, the Arab throws himself upon the ground, and the beasts hold down their heads; for it is found that this terrific blast has little or no power near the earth, perhaps because, blowing in a horizontal direction, it is broken by the inequalities of the ground, and also, perhaps, because the few slight exhalations forced from the arid soil by the extreme heat, have power to counteract its virulence. Those who are rash enough to face it are suddenly suffocated; and in the deserts, where the Simoom blows long and strongly, whole caravans have been buried beneath the burning sands, which then rise in waves as high and strong as those of a stormy ocean. (*Niebuhr*, par. i., p. 7, 8.)

**Natural Productions.**—The differences of soil and climate occasion much variety in the species and amount of the natural products of Arabia. Nothing can, perhaps, be more strongly contrasted than the vivid descriptions of the country by ancient and oriental writers, and the cold realities exhibited to the traveller or voyager who approaches its confines. Even on nearing the southern shore, the Arabia Felix, or terrestrial paradise of the ancients, the eye looks in vain for the beauty; nor is the smell gratified by the "Sabeian odours" which have been so vividly, but erroneously described. A wide, sandy beach, bounded in the distance by a range of mountains, dreary and unproductive, without a patch of verdure to relieve the eye, or a running stream to slake the thirst, or break the dull monotony of the view, constitutes the southern coast of Yemen. (*Valentia*, ii., p. 12.)

The fertile spots, however, like the oases of the African deserts, are so luxuriant and beautiful, as in some measure to warrant the hyperbolic praises bestowed on the peninsula. In consequence, too, of the various circumstances of elevation, aspect, temperature, and moisture, there is no country whose productions are more numerous and varied.

The sandy plains of the centre produce the same plants as N. Africa—the mesembryanthemum, aloe, euphorbium, stapelia, and salsaia; plants which answer a few purposes in these wastes, by alleviating the thirst of the camel, during the painful journeys of the caravans.

The sea-coast, consisting for the most part of arid sands, produces, in general, the same plants as the central deserts; but wherever the Tehama is watered by rivulets descending from the mountains, or wherever the soil is subjected to occasional inundations, a very different scene is presented. Under these circumstances, a vegetation, luxuriant and diversified, is produced, the effect of which is the more stri-

king, from the desolation with which it is surrounded. The valleys, too, in the mountains, exposed to the influence of the regular rains, and consequently abounding in rivulets, are the seats of an abundant vegetation. In such districts, the tamarind, cotton-tree, sugar-cane, banana, nutmeg, betel, and every variety of melons and pumpkins are indigenous; at all events they have grown there from the remotest antiquity (*Strabo*, lib. xvi., cap. 3, p. 704, et seq.; *Pliny*, *Nat. Hist.*, lib. xii., cap. 8, p. 362; *Id.*, lib. xii., cap. 10, p. 363; *Id.*, lib. xix., cap. 1, p. 4), and continue to flourish in greater luxuriance than in any other part of the world, except in the similar soil and under the similar climate of N. Africa. Arabia produces several kinds of hard wood, of which the agallochum seems to be the same with the sandal wood of the East India islands; and it may be regarded as the native home of the date tree, the cocoa, and the fan-leaved palm. Of other trees, there are the fig, orange, plantain, almond, apricot, acacia vera (producing the gum Arabic), quince, and vine. Among shrubs, the sensitive-plat, castor-oil plant, and senna (both used in medicine); the globe amaranth, white lily, and pancreatium (all distinguished for their fragrance); the aloe, styrax, and sesamum are very abundant. But, notwithstanding this variety of wood, although there are some groves or thickets on the mountain side, Arabia possesses no forest, properly so called. The reason of this is obvious: the fertile, irrigated spots, small in extent, and scattered here and there, are surrounded by the sandy plain or granite rock, and, consequently, the formation of extensive woods becomes a matter of impossibility. (*Niebuhr*, par. i., p. 127-133.)

Of Arab trees, the most worthy of notice are the coffee tree, and the tree producing the balm of Mecca, called by the natives, *Ab Scam* (that is, the *odoriferous tree*). Both are natives of Yemen, the coffee plantations being found chiefly on the W. slopes of the mountains, in that division of the peninsula. It is said that the Arabs have always prohibited the exportation of the coffee plant; but it is a well-known fact that it was first introduced into the W. Indies from Arabia. The coffee of Yemen still, however, preserves its superiority, and fetches the highest price in the European markets. The balm of Mecca is the most fragrant and valuable of all the gum resins, but it is never met with pure out of Arabia, and there scarcely beyond the confines of Yemen. The merchants of Mocha convey it in great quantities to Medina, whence it is never exported for the purposes of external commerce till it has been considerably adulterated. (*Niebuhr*, par. i., p. 127.)

Among the natural productions is the singular substance called *Mesna*, produced from a little thorny bush, which seems to be abundant in all the deserts and their neighbourhood, and exactly answers the description in *Exodus* xvi. and Numbers xi.

Wherever water is found, or can be procured, the labour of the Arabian agriculturist is well repaid. Matze, wheat, dhourrah, barley, and millet cover the mountain sides of Yemen and other fertile parts. Indigo, tobacco, *Uars*, a plant yielding a yellow dye; *Fuar*, an herb which produces a red colour; together with many species of garden fruits and vegetables, are cultivated; but, in order to insure success in the cultivation beyond the districts watered by the scanty rivulets and torrents, much labour is required. It is true that the agricultural implements are of a very simple and primitive construction, but it is not in the use of these that the great labour of Arabian agriculture exists. Channels and dikes have to be constructed to conduct the water to spots where none flows naturally, and to retain it there that it may fertilize them. Great reservoirs are formed, in which the abundant rains of the wet season are collected for future use. The coffee grounds and gardens on the mountain sides are supported by *walls*, to make their surface horizontal, and so prevent the escape of the moisture. Wells are dug at immense depths; and, in short, since it is upon the amount of irrigation that the productiveness of the soil depends, it is to the collection and just distribution of water that the cares of the cultivator are principally directed; and the nature of the Arabian climate and hydrography renders these cares in the highest degree laborious. (*Niebuhr*, par. i., p. 134-142.)

The fame of Arabia as the land of incense and perfumes is of very old date. But it was long since suspected, and is now well known, that the frankincense, myrra, and similar products with which it supplied the ancient world, were not all of its own growth, but were principally brought to its ports from Africa and various E. countries. (*Niebuhr*, par. i., p. 136; *Valentia*, ii., p. 12.)

The camel is to the Arabian what the reindeer is to the Laplander. It has been justly called the "Ship of the Desert;" and without it the Arab could never cross the seas of sand that fence his country. There are two species of this useful animal; that used in Arabia and N. Africa has only one hump, while that found in Persia and Bokhara has two. The latter is frequently called the Bactrian camel,

## ARABIA.

and the Arabian species is sometimes called dromedary. This last name is, however, improperly applied, the Greek term *Spasas* (swift) being, most probably, unknown to the Arabians, while by the Greeks themselves it was applied to only one variety of Arabian camel, distinguished by its greater speed from those best adapted to carrying burdens. (*Diodorus Siculus*, lib. iii., p. 125.) Arabia is generally regarded as the native country of the horse; and there are, perhaps, no breeds to be compared with those trained by the Bedouins of the desert. The horses are of two kinds: the one called *Kadeschi*, that is, of an unknown race, are used for the purposes of labour, reside in the towns, and are not more esteemed than the horses of Europe. But the true Arab steed, the horse of the desert, is said to be descended from the breed of Solomon: this kind is called *Kochlani*, or horses of an ascertained race; and it is pretended that their genealogy has been preserved in the country for 3000 years. (*Niebuhr*, par. i., p. 142-144.) Horses are, however, by no means so numerous as has been supposed. In the settled districts the most common beasts of burden are oxen and camels (*Niebuhr*, *passim*); and among the Bedouins the mare is rather a mark of distinction than a substantive part of her master's wealth. In many tribes (and those among the richest) not more than one mare to six or seven tents can be found: in some of the W. districts there are many encampments without a single horse or mare among them; and when, in 1815, the S. tribes united against *Mehomet Ali*, out of an army of 25,000 men not more than 500 horsemen could be mustered. The Arab tribes richest in horses live without the limits of the peninsula, in the fertile plains of Mesopotamia, and in the plain country of Syria. *Burckhardt* thinks that the number of horses in Arabia does not exceed 50,000. (*Notes on Bedouins*, p. 46, 115, et seq., 246-248.)

The great cause of this scarcity is undoubtedly the difficulty of providing food for the animal, especially in the S. districts; but another cause, depending probably upon the first, is, that the Arabs almost uniformly ride their mares, and sell the horses to the town's-people. The horses that they reserve are merely for the purpose of breeding, and a gelding is rarely, if ever, seen in the desert. Although the Bedouins parts readily with the horses of his famous *Kochlani* breed, he rarely disposes of the mares until they become old, or are from some accident unfit for war; and even then he contracts with the buyer to receive the first filly foaled of any mare that he may sell, or to receive back the mare, the buyer retaining the filly. Sometimes the first two, three, or even four fillies are thus reserved to the seller; and this, in Arab phraseology, is called selling a half, a third, or a fourth of the mare's belly. It is very rarely, indeed, that a Bedouin will part with a *Kochlani* mare except under such reservation of right in her future offspring. (*Burckhardt's Notes on the Bedouins*, p. 117, 118, &c.) An Arab will sometimes take his mare a journey of several days, in order that she may breed by some celebrated horse; but, in general, the Bedouins are by no means so particular in this respect as Europeans, and consider the good qualities of the colt to depend rather upon the dam than the sire. They never, however, willingly mix the *Kochlani* with the *Kadeschi* breed; and if such mixture take place by accident, the colt is reckoned of the inferior race. In the towns, *Kadeschi* mares are coupled with *Kochlani* horses, but in this case, also, the offspring is accounted *Kadeschi*. (*Niebuhr*, par. i., p. 144.)

*Kochlani* horses are mostly small, seldom above 14 hands high, of a delicate but extremely graceful form, and have all some characteristic beauty which distinguishes their breed from every other. This breed is subdivided into almost innumerable families; for every mare distinguished for speed or beauty may give rise to a new breed called after her. They all, however, belong to five great divisions, named after the favourite mares of Mohammed, *Tascep*, *Manakeje*, *Kohypt*, *Taklawye*, and *Dryffe*.

The colt, when foaled, is not suffered to fall to the ground, but is received into the arms of attendants, and attended for a while as though it were a human infant. Witnesses are assembled, before whom the genealogy of the colt is drawn out, and suspended to the animal's neck.

A colt is not mounted till it is two years old, but from this time the saddle is rarely off its back; it becomes the intimate companion of its master, sharing all his comforts (such as they are), and also all his privations. Pasture in the rainy season—barley and wheat when the plains are scorched by the tropical sun—date-paste and dried clover when grain is scarce—form the variable diet of the Arab horse, in different districts and seasons. As long, too, as its master's camels can supply milk, it receives its share, and the Bedouin most commonly gives the fragments of his own meal to the mare on which he rides. It is, moreover, a common practice, more especially in Nedjed, to give horses flesh, both raw and cooked, particularly before the commencement of a fatiguing journey. Like their masters, the

Arab horses live all the year in the open air. With little grooming and attention to their health, they are seldom ill. Being constantly in the society of their masters, they become gentle, docile, and intelligent in a high degree; they are ridden without bits—generally, too, without stirrups; and instances of vice or ill-temper are almost unknown among them. (*Niebuhr*, par. i., p. 141-143; *Burckhardt, Notes on Bedouins*, p. 115-123, 246-256.)

The other domestic animals are oxen, generally of a humped kind, like those of Syria; sheep, one variety of which have extremely thick and broad tails; goats and asses, of which last there are two varieties—one not differing from those of Europe, the other large, courageous, and more desirable for a journey than even the horse. From these asses a breed of very valuable mules is procured. The buffalo, though common in Egypt, Syria, and on the banks of the Euphrates and Tigris, that is, all round the confines of Arabia, is not found within its limits; at least Niebuhr did not meet with it, and no other writer mentions the animal, except in one or two instances, when the humped Syrian ox seems to have been mistaken for the buffalo. The latter requires a moist pasture and a plentiful supply of water. Hence it is found on the banks of the Nile and the Orontes, though in the close neighbourhood of parched deserts; but the want of water in Arabia clearly renders that country unfit for its location.

Among the wild animals are the jackal, hyena, several kinds of asses, the jerboa, wolf, fox, boar, and panther. Besides these, there are several kinds of antelopes; the goat runs wild among the mountains, and wild oxen and asses are to be met with in the plains. Domestic poultry is very plentiful in all the fertile districts, and the plains are filled with partridges, the woods with guinea fowl, and the mountain sides with pheasants. But the most celebrated bird is one of the thrush kind, called by the natives *Samsarag*, which comes in flocks every year from Persia, and commits great devastation among the flights of locusts. For this important service it is held in a degree of respect, amounting almost to adoration. The ostrich wanders in the sandy deserts, and is called by the Arabs *Thar-odjamel*, that is, camel bird. It is certainly a remarkable circumstance, that in a country lying on both sides the tropic, there should be no great abundance of insects; yet this appears to be the case. Ali Bey, speaking of Hedjaz, says, "There are few flies, and no gnats or other insects." (*Travels*, ii., p. 45, 118.) The locust is, however, one of the scourges of Arabia, though even this pest seems to be less destructive here than in the neighbouring countries of Syria and Persia. The sculent locust is sold in the markets, and is esteemed a great delicacy. (*Bochart, Hierozoicon*, par. i., lib. iv., cap. 6, p. 44.) These destructive ravagers come to Arabia from different quarters: a S.W. wind brings them from the Libyan desert to the shores of Yemen and Hedjaz; a N.W. wind hurst them upon Oman and Laches, from Persia and Mesopotamia; and a wind from the N.E. frequently overwhelms Nedjed with this plague from Syria. They seem, however, to be confined to their several localities, perhaps from inability to pass the interior deserts; for the W. flight, as it may be called, or that from the African shores, never passes the mountains of Yemen, and commonly retraces its route on the day following its first appearance. No part of the year seems to be peculiarly exposed to or exempted from this plague. Niebuhr noticed locust flights in the months of January, May, June, July, November, and December. In one of these, the Red sea, between Mocha and the opposite coast of Africa, was covered with their dead bodies.

Of the reptile tribes, land and sea turtles are very numerous; there are also several species of serpents, one of which, very small, and covered with white blotches, is extremely venomous, its bite being instantly mortal. The gharil, a large lizard, is said by Bochart, on the authority of Karwiny and Abdollatif, two native writers, to be equal in size and strength to the crocodile. (*Hierozoicon*, par. i., lib. iv., cap. 3, p. 1070.) All the coasts abound in fish; reefs of coral and madrepore extend along the shores of the Red sea, and the pearl oyster is abundant in the Persian gulf. (*Niebuhr*, par. i., p. 149-159.)

*Minerals* are scarce; but this may proceed from a want of industry or skill in working mines. The mountains, of an old formation, are precisely those in which the precious metals are found, and the unanimous voice of antiquity proclaims this country as the land of gold and gems, as well as of incense and perfumes. Niebuhr affirms, however, that no gold is found, and that only a small portion of silver is found mixed with lead in the mountains of Oman. There are some iron mines in the N. of Yemen, but the metal they yield is brittle and of little worth; and with regard to gems, it is now well known that the agate called *Mocha-stones*, and the Arabian *cornellans* come from India; and there is nothing to contradict the presumption that the other gems for which Arabia was formerly distinguished, were derived

from the same source. The opal, however, is found in Yemen, and an inferior emerald. The other minerals are basalt, blue alabaster, several kinds of spar and selenite. (Niebuhr, par. i., p. 123-125.)

*Population, Manners, and Customs of Arabia.*—The native Arab has always been an object of interest and curiosity to the rest of the world. Descended from the same stock with the Jews, he has preserved his race almost unaltered, and traces up his genealogy to Abraham through Ishmael, with the same pride as his conspecific looks up to the same patriarch through his lawful but younger offspring Isaac. Through all the centuries which have passed over his head, he has preserved the character given to his infant ancestor in the wilderness. The desert has continued his home; he has been a man of war from his youth—"his hand against every man, and every man's hand against his."

The descendants of Ishmael were by no means, however, the first inhabitants of Arabia; and through the various eastern traditions on the subject are too numerous and too involved to be here stated. It seems pretty certain that the Arabs of the towns and those of the desert owed their origin to different ancestors—that the settled population on the coasts are descended from a more ancient, if not an aboriginal race, while the wild horseman and shepherd of the waste is the descendant of the discarded son of Abraham. Between these a marked and striking difference has existed throughout the historic period; and not only is this the case, but each class seems to have retained pretty nearly the same distinguishing features which marked it in the earliest times. The caravans from Mecca and Senna still convey the produce of the South to Turkey, Egypt, Syria, and Persia (Niebuhr, par. i., p. 130), as they did 3,000 years ago (Pliny, *Nat. Hist.*, lib. vi., cap. 38), though the Arab merchant be not so important a character in this commercial age, as when it could be said of him that, "he must, of necessity, be exceeding rich; for with him the Roman and the Parthian leave large sums of gold and silver for the products of his woods and seas, which he sells to them without buying anything in return." (Pliny, lib. vi., § 38.) The Bedouins, too, or *Bedawis*, are described by Pliny as living in the *black hair-cloth* tents, under which they shelter themselves at present; and he expresses his astonishment at the fact, that, being so numerous a race, the half of them, at least, should live by plunder. (*Nat. Hist.* lib. vi., § 38.)

Though the younger race, the Bedouins account themselves the more noble; and the Arab is prouder of his rank than the native of any other country in the world. They have no titles of nobility, excepting such as refer to religious or political offices. The Bedouin has no idea of rank depending upon letters patent of a caliph or sultan; all men descended from the same ancestor are, in his estimation, equal in rank; and hence the preservation of their genealogies is a matter of extreme care. Among their great houses, those descended from the Prophet hold the first rank; then those whose ancestors diverged the latest from the common stock; the lowest place being seemingly assigned to those who trace their genealogy to Aar, the second son of Adnam, thus diverging from the Prophet's stock in the first accredited generation. (Sale, *Introd. Koran*, p. 9; Niebuhr, par. i., p. 9, 10.)

According to Niebuhr, the Bedouins are now the only true Arabs; the inhabitants of the cities and coasts being, in consequence of their commerce, so mixed with strangers, that they have lost much of their ancient manners and customs; whereas the Bedouins (*les vrais Arabes*) have always looked more to their liberties than their ease or riches, and continue to live in separate tribes under tents, preserving in the present day the same manners and customs which distinguished their forefathers in the most remote times. (Par. ii., p. 327.) Niebuhr enumerates above a hundred Bedouin tribes, each under its own particular sheikh or sheriff; these are not, however, all found within the limits of the peninsula, but extend over Syria, the plain country between the Euphrates and the Tigris, and even from the left bank of the latter river into Persia. There are, however, two classes of Bedouins; the *Ahl-el-Absar* (true, noble Arabs), who live entirely by pasturage and plunder, and those tribes who, finding any portion of the country fitted for agriculture, bestow their labour on the ground, an occupation which the true Bedouin considers far beneath him. This second class of Arabs is called *Medan*, and it seems to hold an intermediate place between the Noble-Shepherd (*Ahl-el-Absar*) and the peasant of other countries. Mr. Buckingham, who remarks this distinction in their occupations, does not, however, use the terms *Ahl-el-Absar* and *Medan* to distinguish them, but calls the first race *Khayli*, and the other *Fakihien*. (Travels, p. 87.)

The Bedouin tribes who inhabit the open country between the Euphrates and Tigris extend as far north as Orfa and Diarbeckr. They are under the nominal sovereignty of the

Turkish pachas of Bagdad, Mossoul, and Orfa; their sheikhs frequently receive the *Taj*, or horse's tail, from the grand signor; but it appears that the bestowal and the acceptance of this mark of dignity is almost the only assertion on the one hand, or acknowledgment on the other, of supremacy or subordination that is ever attempted or conceded, except in occasional instances, when direct force has deposed a sheikh, and appointed another in his place, without in the slightest degree changing the relative position of the tribe and its so-called sovereign pacha.

The Bedouins of the Syrian coast are rather more closely connected with the pachas of Syria, inasmuch as the necessity of protecting the trade between Aleppo and Damascus on the W., and Bagdad and Basra on the E., has caused the employment of the various Arab tribes as a kind of irregular soldiery, and the bestowal of the rank of *emir* on the reigning sheikh of the most powerful tribe for the time being. This emir sheikh (in consideration of his rank) is obliged to conduct the caravans in safety through the desert, and to hold in check any or all of the other tribes. "We may readily judge," says Niebuhr (*Des. de l'Ar.*, par. ii., p. 329), "that this is not done for nothing." In fact it happens, as it not unfrequently does, that the pacha is unable to fulfil his engagements with the sheikh, he is compelled to cede to him such towns and villages as border on his encampment, and thus to make him, in effect, the master of the settled as well as of the open country. The tribe of Anasse is the most considerable of all the Syrian Arabs. It has frequently been at war with the pachas of Damascus; and at such times the departure of the caravans from that city for Bagdad has been delayed, and the reason openly assigned that the Arabs of Syria were discontented with the pacha.

The Bedouins within the peninsula do not acknowledge a sovereignty of any kind, except in their native chiefs. They are very numerous in Nedjed, and are scattered among the settled population in all the other provinces. The most powerful tribe of any in Arabia is, perhaps, that of Beni-Khaled; it inhabits that part of the desert which borders on the Persian gulf, and has under its dominion not only many smaller tribes, but also most of the towns and villages of Lachas. The reigning sheikh passes a portion of each year in these towns, but by far the greater part is spent in the open country under tents.

The form of government among the Bedouins is strictly patriarchal, and their manner of living is that of the pastoral ages recorded in the Bible. The head of a tribe receives a submission from his subjects, similar to that which a father receives from his family; and in the East that submission is unbounded. There is, however, a check upon the abuse of power in the sovereign sheikh, which, though indirect, is by no means weak. Since every tribe consists of many branches, the various heads of these sub-tribes, as they may be called, form a powerful restraint upon the chief; and should he become unpopular, though direct opposition to his will is never attempted, the discontented branch not unfrequently leaves his encampment, and either forms itself into a new tribe, or, if not powerful enough for that, joins itself to the tents of some other powerful sheikh. Instances have been known in which a Bedouin chief has been entirely deserted, and thus the names of several tribes have vanished. As, however, the pride of tribe is strong in every Arab breast, this expedient is only resorted to in the last extreme; but the assumption of supremacy by some subordinate branch is frequent enough to render the continuance of the sovereignty of the tribe of Montefidaj in the same family since the days of Mohammed, a remarkable circumstance. The preservation of their herds being the first care of the Bedouins, a wandering life seems awarded to them by nature; the search for proper pasturage leads from place to place in their extensive country, according as the desert has become temporarily fruitful under the influence of the tropical rains, or has been burned up by the continued action of a tropical sun. Accustomed to live in a clear air, their sight and smell become extremely fine, inasmuch that, on arriving at a spot which affords nourishment, however scanty, to plants or herbage, they can at once determine at what depth water is to be found, and, consequently, whether it be worth the labour of digging for. Accustomed to privations, the Bedouin is temperate from habit as well as from disposition, and can almost emulate the endurance of his camels, which, in the burning desert, live five days without drink.

Robbery is an honourable occupation among these wanderers, but the Arab boasts of being the most refined and civilized of thieves. His robberies are never attended with violence, except in the case of violent opposition; and, as he considers his country as sacred ground, he regards the plunder of the pilgrim caravan as the mere levying of tribute, or payment for permission to pass through it. If the right to this tribute be recognised, and the permission to pass through the country purchased, the bargain is never violated on the

## ARABIA.

part of the Bedouin: strict faith being one of the best points of his character, as his deadly spirit of revenge is, perhaps, the worst. This spirit is very easily excited; and, once aroused, descends frequently from generation to generation; the duty of pursuing the quarrels of his father being regarded as a sacred part of the Arab's inheritance. According to the Koran (chap. ii., p. 90), whoever sheds blood owes blood to the family of the slain; but the same law allows, and even recommends, a commutation, by way of fine. If this be not accepted, retaliation is *allowed* to the injured family; but as this usually exceeds the offence, new cause of hatred and revenge is given, till a single (perhaps accidental) murder *pays blood*, in Arab phraseology, between whole families forever. But the irascibility of the Arab requires no such serious offence as the death of a relative to rouse it into action. A slighting expression, or an insulting sarcasm, is sometimes sufficient to put blood between two families. "Your turban is filthy," is frequently answered by a deathblow; and instances are on record where, for an offence as slight, the offender has been pursued for years, and fastest, perhaps in old age, at last for the insult offered by him in his youth. Niebuhr reports, that a noble Arab being asked, scoldingly, if he were the father of the handsome wife of a person named, construed the question into a sneer upon his daughter's virtue. Being unmoved at the moment, the offender escaped; and the father spent years in vainly pursuing him, during which, however, he killed both the paragon, and many relations of the offender, his slaves, his cattle, and reduced him to the verge of beggary. The offence was at last commuted by an enormous fine. (*Niebuhr*, par. i., p. 27, 28; *Burckhardt*, *Not. on Bed.*, 64-68, 177, 184, 286.)

A relief to this dark shade in the Arab's character is found in his hospitality. In many of the towns where the population is most unimproved, houses of entertainment are kept at the public expense, or at that of some rich individual, where the traveller is fed and sheltered without charge. But in the desert hospitality is a part of the Bedouin's nature; and though the influence of foreign manners has, upon the Hadj roads, considerably dimmed the lustre of this virtue, yet even there a helpless, solitary traveller is sure of finding relief, though the assembled Hadjles should crave in vain for assistance or mercy. In districts off the Hadj roads, that is, over much the greater portion of the desert, the Bedouin considers his property less as his own than as that of the casual stranger he may meet; he is however hungry, he shares his last morsel with the wayfarer; and sacrifices which he would not make for himself or his family, are made unhesitatingly for the wants of his guest. The inhabitants of the towns have fewer points of interest than the Bedouins. Niebuhr (par. ii., p. 287) says they have lost much of their distinctive character; and other travellers speak of them as having superseded the virtues of civilized society to those of a savage state. "Superstitious, yet irreligious; performing all the *rites* of their faith, yet living in the practice of every vice, natural and unnatural. Hypocrites by profession, preferring a lie to the truth; even when not urged by motives of interest, deceit forms a part of their education from youth. Their governments are systems of extortion and tyranny; their traders are fraudulent, corrupt, and dishonest overreachers; the individuals of their communities are sunk into the lowest state of ignorance and debauchery." Such is the character given of the town Arabs by Lord Valentia (ii., 354, 355), and a similar picture is unwillingly exhibited by Niebuhr (par. ii., p. 180-190). All *Rey*, *Burckhardt*, and *Buckingham*, *passim*.

In prosperous times, the right of entertaining a guest is frequently disputed; and should a stranger reach the encampment unobserved, it is reckoned an affront if he pass the first tent on his right hand and enter another.

In many tribes the women are permitted to drink coffee with strangers; and in some, towards the E., the wife entertains a guest in the absence of her husband, and does the honours of the tent. To tell an Arab that he neglects his guest is the greatest insult that can be offered. (*Niebuhr*, par. i., p. 41-43; *Burckhardt*'s *Not. on Bed.*, p. 100-102, 120-126.)

The superiority of the Bedouins appears to be admitted by the town residents; for the descendants of Mohammed resident at Mecca send their male children, eight days after birth, to the tents of the neighbouring Bedouins, where they remain till they are 8 or 10, and frequently 14 or 15 years old. All sheriffs (descendants of the Prophet), from the sovereign downwards, have been thus bred; and, as they usually take wives from the tents where they have been educated, they preserve the race and many of the customs of the Bedouins, in the midst of the mixed population by which they are surrounded. This custom is very ancient among the pure Arabs. Mohammed himself was educated in the Bedouin tribe of Beni Saad. (*Burckhardt*'s *Travels*, vol. ii., p. 424-426.)

The Arabs are of a middle height, generally extremely

thin, and, when either very young or far advanced in life, of a highly prepossessing appearance. The mild but expressive countenance of an Arab boy, and his dark, sparkling eye, are spoken of in terms of admiration by all travellers. As he reaches manhood, however, a very disadvantageous change takes place; his meagre figure becomes still more attenuated, and seems as though it were parched and shrivelled up. The very splendour of the eye, buried between high cheek bones, apparently destitute of every covering except the tightened skin, is then rather a deformity. But in old age the Arab is truly venerable. The fine dark eye contrasts admirably with the long, white beard; and the emaciation, which in middle life seems to intimate premature decay, assimilates well with the closing scenes of existence. There are exceptions, however, to this general description. The Aeneze Bedouins are generally short, well formed, and by no means so thin as the majority of their countrymen. The lower orders in Mecca are generally stout. The Arab women are stouter than the men, and larger limbed. The complexion of the Bedouins is tawny, but this is evidently the effect of their exposed life; an effect which the same exposure would produce upon the most N. people. At the time of birth the infant is fair, even of a livid whiteness; and Burckhardt, who, as a physician, saw the naked arms of a sheikh's lady, states that her skin was as fair as that of any European. Lord Valentia makes the same remark regarding the wives and daughters of an Arab of Djidda (iii., 308). In the towns, the Arabs may be described as fair, especially in the mountain districts. But this remark must be understood as limited to those of pure descent; on the coasts, and in the towns of Mecca, Medina, &c., the prevailing colour is a sickly, yellowish brown, lighter or darker, according to the origin of the mother, who is in many, perhaps in most, cases an Abyssinian slave. (*Niebuhr*, par. i., p. 41; *Ali Bey*, vol. ii., p. 103, 106; *Burckhardt*, i., p. 323; ii., p. 240; *Notes on Bedouins*, p. 22; *Valentia*, ii., p. 351.)

The Arabs, like other Eastern people, wear long dresses. A cotton shirt, over which the more wealthy wear a *kumbar*, or long gown of silk or cotton stuff, and the poorer classes a woollen mantle, is the usual costume. The mantle is of various kinds; one, very thin, light, and white, is called *mesameey*; a coarser and heavier kind, worn over the former, is called *abba*. In some cases, however, this last is a very splendid garment. It is usually striped white and brown; but the rich Arab frequently clothes himself in a black *abba*, interwoven with gold, in preference to the *kumbar* or Turkish gown. The *abba* is not used in the W. districts, Yemen and Hedjaz. In the towns, large cotton drawers are worn by the men; but these rarely form a part of the Bedouin's dress, among whom any covering for the feet or legs is almost unknown. Though they walk and ride barefoot, they greatly value yellow boots and red shoes; but more as articles of ornament than use. A very rude kind of sandal is worn by the lower orders in the settled parts of the country, and the more wealthy inhabitants of the same districts use a slipper of yellow or red leather, sometimes very elaborately worked, brought from Egypt or Turkey. The head-dress is a turban, varying in form, size, and material, according to the taste or wealth of the wearer. Among those who would pass for men of superior learning and attainments the turban is ridiculously large. The wealthy classes wear shawls, wrought with gold and silver, on their heads; and certain colours are restricted to certain families, as green to the descendants of Mohammed, black to the houses of Abbas, &c.

The women's dress is a gown or shift of most simple dimensions, which in the tents, and among the middle and poorer classes in the towns, is of cotton; but the more wealthy of the townswomen use silk. Over this is worn a robe of Indian cotton; and this, with a handkerchief on the head, and sometimes very full trousers, completes the ordinary in-door dress of an Arab female. The women enjoy more liberty in Arabia than in any other Mohammedan country, but still the veil is indispensable in the streets. A cloak or scarf of blue and white striped linen is worn with much grace, the arrangement and placing of which is an important part of the tactics of Arab coquetry.

Rings, principally of silver, are worn in the ears and noses of the women; and tattooing of the face, arms, breast, and ankles is very common with both sexes; as is also painting, not to assist but to disguise nature, the face and hands being frequently daubed over with black, blue, and yellow, the first colour being esteemed a beauty on the *eyelids*, the last on the *teeth*. (*Niebuhr*, par. i., p. 54-61; *Burckhardt*'s *Travels*, vol. i., p. 334-340; *Notes on Bedouins*, p. 26-29, 131-133; *Ali Bey*, vol. ii., p. 105, 106.)

The Arabs are proverbially abstemious. Even the wealthy classes drink little else than water, and live principally (next to dates) upon a coarse bread made of dhourra, steeped in camel's milk, and saturated with butter.

There is no want of animal food, but very little is consumed

## ARABIA.

med. The butchers in the towns on the Red sea are foreigners, and depend entirely on the influx of strangers. Among the Bedouins, if a man of rank arrive at an encampment, a kid or lamb is killed, and, being boiled, is served up in a paste made of dried wheat, camel's milk, butter, and the fat of the animal. Sometimes, but very rarely, a camel is killed, and on such occasions the whole tribe meet together at the repast. In the S. districts, the Bedouins occasionally eat horse flesh. This is not, however, a matter of choice. It sometimes occurs, especially in the interior of the desert, or in times of scarcity, that not a single measure of corn can be found among a whole tribe. It is only under such circumstances of necessity that the Bedouin has recourse to a diet of milk and flesh alone; and there are many tribes (especially in the N., and near the larger towns) who, like the settled population, scarcely know the taste of animal food. Besides the *syceh*, the dish already described, rice, boiled with camel's milk, is a common article of food, as also *dourrah* bread, butter, and dates, blended together into a paste; there are also many preparations of various vegetables, among which the *kewmages*, or desert-plant, of the truffe kind, is a great favourite with the Bedouins; but wherever dates grow or can be procured, that fruit constitutes the chief diet of both tent and town.

The date-palm flourishes where most other vegetation withers, and is peculiarly abundant in the sands of Arabia. The fruit continues in season about two months, or from the end of June to the end of August; and during this period the new fruit forms a part, in some cases the whole, of the daily food of the Arabs. When the dates are fully ripe, they are gathered, and pressed into a hard, solid paste or cake. This paste, which is called *adjoue*, is in lumps of about 5 cwt. each. The *adjoue* forms a part of the daily food of all people for the remainder of the year, and thus the date-palm is to Arabia what the bread corns are to European nations. *Adjoue* is an article both of export and import, considerable quantities being taken to Hindostan, while the kind most esteemed in the Hedjaz is imported from the Persian gulf.

Arab cookery is extremely *frugal*, more so than even the Italian; but no oil is used for culinary purposes, except in frying fish. Butter is their universal sauce, and of it the consumption is immense; their vegetable dishes all float in butter; with it they work their *adjoue* into a proper consistency; dried corn, or bread crumbs, boiled in butter, is a common breakfast with all classes, and in the desert the *kewmages* are prepared for use in the same manner. In short, butter may be said to be to the Arab what the potato is to the Irishman: it forms an indispensable part of his diet; and, besides the various forms in which it is taken with other articles, it is a common practice with both Bedouins and townspeople to drink a coffee-cup full of butter every morning; the former, and the lower orders of the latter, adding another half cup, which—to the disgust of strangers—they *snuff* up their nostrils! Arab butter is made from the milk of sheep and goats, that of camel's is not being used for that purpose. The home supply is not nearly sufficient for the consumption, and butter consequently forms an important article of importation. It is brought from the opposite coast of Africa, chiefly from Souakin, Massouah, and upper Egypt. Salads are unknown. Coffee is used to a great extent, though scarcely so much as might be expected; and tobacco is smoked universally by young and old.

The Arabs feed sitting, or, rather, reclining on the ground; they use neither knife nor fork, but divide and take up the food with their fingers. This practice, notwithstanding what has been said in its extenuation (see *Niebuhr*, par. I., p. 47), is very disgusting to a European. The hands are carefully washed *before* eating, but (among the Bedouins, at least) rarely after. The common hour of breakfast is ten in the morning; of dinner, sunset: and at these two, which are the only meals, they eat heartily. The women feed apart from the men; and, in the desert, their repast consists of the remains of that of the men. (*Niebuhr*, par. I., p. 45-52; *Burckhardt's Notes on Bedouins*, p. 32-36, 135-138; *Travels*, I., p. 47-56; *Lord Valentia*, II., p. 351.) The Arabs are healthy, and instances of longevity are more frequent among them than most E. nations. The diseases to which they are most subject are, an induration and obstruction of the stomach—said to be caused by the camel's milk which they drink—and leprosy. Like the Jews, they regard the latter as a visitation from heaven; and believe that, once confirmed in a family, it can never be eradicated: it is considered as disgraceful in the highest degree, and the unfortunate leper is completely shut out from society. The other diseases to which the Arabs are chiefly exposed are, the small-pox, fevers, ophthalmia, and worms. The method of treatment is, in all cases, extremely simple: but few internal medicines are administered, and those chiefly aperient simples. In slight cases of disorder, or, as a prevention, they rub the body with oil (sometimes of a very offensive kind) or butter. In severe cases they tear the parts affected with

red-hot iron; and Niebuhr, who saw this severe remedy applied to a boy who complained of the cholera, remarks that "if he did not complain again of his first suffering, it probably was because the remedy was so much more painful." Disorders of the teeth are very rare, and among the Bedouins unknown. The women suffer little in childbirth; and such is the general health of the people, that the profession of medicine is unprofitable, and at a low ebb. Some surgeons can set a limb, but these are principally Jews. Chronic disorders are but little known; and acute diseases either yield to the rough treatment, before described, or carry off the patient. As the Bedouin, from his mode of life, is more exposed to casualties than the townsman, instances of long life are less frequent in the desert than in the settled districts. (*Niebuhr*, par. I., p. 114-123; *Burckhardt's Notes on Bed.*, p. 53-56; *Valentia*, II., 350.) All household duties and menial offices devolve upon the women. This arrangement falls heavier on the Bedouin females than on those of the town, the latter having merely to attend their husbands within doors; and where slaves are kept, this is little more than superintendence. But the Bedouin women perform all the laborious out-door occupations, fetching water from the wells, driving the flocks to the pasture, and bringing them back to the tents at night; while the men, during their stay in the encampment, spend their entire time in utter idleness, or, at best, in playing at a sort of draughts. This indolence within doors is a part of the Arab character. A merchant or shopkeeper in the towns, returning from his daily avocations, undresses himself, changes his shirt, and, with no other covering, sits for hours upon his carpet, in the projection of his latticed window. The women, according to Ali Bey, are also frequently seen at the front windows, unveiled, and sometimes entirely undressed (*Travels*, vol. II., p. 105); but the usual apartments of the females are in the back part of the house.

The parental character is highly respected; though the Arab children, both in the towns and in the desert, have more freedom than in any other E. country. The Bedouin child runs naked, in the open country, round his father's tent; and at Mecca, Djidda, and other towns, the children, even of the better classes, are allowed to play in the streets, as soon as they can walk, nearly in the same primitive state. But, within doors, the strictest decorum is observed, a boy never presuming to eat in his father's presence, unless expressly invited. It would seem, however, that this is little better than mere ceremony; for, when emancipated from his father's authority, the young Arab pays him little deference, and instances are not uncommon where the old man, having fallen into poverty, is left by his, perhaps wealthy, son to struggle with distress, or to seek for assistance at the hands of strangers. An old Bedouin is sometimes supported by the charity of the whole tribe; and the daily quarrels between the father and his adult sons form one of the most revolting features in the Bedouin character. On the other hand, however, it should be stated that the Arab, young or old, invariably treats his mother with the most respectful attention. The fact is the more remarkable as contrasted with the little estimation in which the female parent is held in other E. countries; and as combined with the fact that, in Arabia, the facility of divorce (see *Law*, &c.) tends naturally to loosen every tie that connects families. (*Niebuhr*, par. I., p. 44, 45; *Burckhardt's Travels*, I., p. 340; *Notes on Bed.*, p. 65, 66, 190-203.) The Arab has a grave deportment, but a lively imagination: he is a stranger to gaiety, in the European sense of the word, but the alien reserve of most other E. nations is equally unknown: he delights in public meetings—especially on occasions of weddings, births, and the like; his language is animated and picturesque; he is instinctively a poet and orator, and is extravagantly fond of music. In a word, the demeanour of the Arab may be characterized as a serious cheerfulness, equally removed from boisterous mirth on the one hand, and dull apathy on the other. One of the chief amusements is listening to the recitations or songs of poets, by profession, who travel from town to town, or from encampment to encampment, after the fashion of the bards and minstrels of Gothic Europe, accompanying their verses, usually in praise of some native hero, with the *nehaba*, a kind of guitar. Niebuhr affirms (*Voyage en Arabie*, II., p. 134), that it is reckoned scandalous in people of credit to practise music; and Burckhardt (*Notes on Bedouins*, p. 145) states that, in most districts, slaves only perform before company. This contempt for instrumental music does not, however, extend to vocal performances: songs, or chanted poems, form the great delight of the Arabs. Love odes, closely resembling the similar productions of the Troubadours and Provençals of the middle ages, are in every mouth. Dancing is reckoned disgraceful in a man, but a woman pliques herself upon nothing more than skill in that art. Their ordinary amusements, beyond those now mentioned, are of a sedentary and indolent kind. The military, indeed, and the young Bedouins, practise the Djeddah, and other warlike sports; but unless particularly excited, the

## ARABIA.

Arab, both of the town and desert, employs his leisure in smoking, or in playing games of chance—of which chess, draughts, and cards are the principal. The cards in use are similar to those of the Chinese, which are much more numerous than those of Europe; and the games, also, are more intricate and involved. The Mohammedan law prohibits playing for money, but this prohibition is not always attended to. (*Nisabur, Voyage en Arabie*, tom. I., p. 141-153; *Burckhardt, Notes on Bed.*, p. 303; *Travels*, I., 377; *Lord Valentia*, vol. II., p. 308.) All public occasions are festivals to the Arabs. The poorest will make his marriage a gala day; but the greatest family festival is that of the circumcision of an infant: on such occasions the greatest efforts are made to give a handsome entertainment. In the desert it is usually so arranged that all who have families perform the ceremony on the same day, which is consequently one of great festivity. The religious festivals and the saints' days—which are very numerous—are also days of sport and rejoicing. On such occasions, the town Arabs affect great splendour in appearance, and a person would rather be thought a thief than allow one of his equals to exceed him in merriness. The Bedouin, also, on such occasions, loads his wife with gold and silk, but seems little careful as to what appearance he may make. All Bey affirms that the people of Mecca are the dullest and most melancholy he ever saw; that their marriages and births are unaccompanied by rejoicings, and that the arrival of the Hadj is the only thing that rouses them from their lethargy; and that it is rather an incentive to avarice than pleasure. (*Ali Bey*, II., p. 102, 111; *Burckhardt*, I., p. 338; *Notes on Bed.*, p. 50, 51, 147, 148.) Mohammed found the slave-trade so firmly established in Arabia, that he made no effort to abolish it; and throughout the peninsula there are a great number of black slaves, Africans, or the descendants of Africans, or mixed races, besides a great number of free blacks, the offspring of emancipated negroes. The great slave dealers are the Yemen and Muscat merchants, who annually import fresh supplies from the coast of Africa. In the towns, especially those of the Hedjaz, every man, almost, keeps an Abyssinian mistress, whom it is reckoned shameful to sell; and whom, if she bears him a child, he generally marries. This accounts for the swarthy complexion of the people of Hedjaz. The male slaves and the females, not Abyssinian, are usually employed in domestic duties. The Bedouins never cohabit with their female slaves; but after a few years service they give them their freedom, and marry them to some of their own complexion. The offspring of these marriages are free, so that a vast number of these black naturalized Arabs are spread over the country. The emancipated slave possesses all the rights of a free Arab, but no Bedouin, male or female, will intermarry with the race, so that they remain a distinct people, discriminated by their colour from all around them. They have, however, lost much of the negro appearance, especially the woolly hair and thick lip, but the form of the head still bears witness to their origin. Greek and Syrian slaves are found commonly enough in the bazars; but they are not regularly supplied. A native Arab is by birth a freeman; and though, in most cases, the condition of the mother fixes that of her offspring, there is no difference between a man's children by his Arab wives and those by his Abyssinian slave. Instances of harsh and cruel masters occur (*Ali Bey*, II., p. 103), but, generally, slaves are considered as part of the owner's family: the younger ones are instructed with their owner's children, from whom, indeed, they are distinguished only by a very slight difference of treatment, and the performance of some menial offices. They are protected by legal provisions; and upon a just ground of complaint against his master, the Cadi will order a slave to be sold. Servility is no bar to official dignities; indeed, the dolas, or governors of towns, are not unfrequently selected from slaves, for the express reason that they belong to that class; being supposed to be more strictly bound to their masters' interest than free Arabs of noble blood. (*Burckhardt*, I., p. 243, 243; *Notes on Bed.*, 103, 104; *Ali Bey*, II., p. 45, 103; *Nisabur, Des. de l'Ar.*, par. I., p. 91; *Lord Valentia*, vol. II., p. 398, 399.)

Arabia, if united under one, or even a few governments, would possess many of the elements of political power. The nature of its soil and climate has always proved a formidable obstruction to foreign invaders, while the conquests of the immediate successors of Mohammed bear witness to the effect that the combined operation of its military energies is capable of producing. Split as the country is into some hundreds of petty sovereignties, this effect is little likely to be repeated. Though every Bedouin is by birth a soldier, dreams of conquest, beyond the plunder of a camp or caravan, rarely disturb his imagination; and though the princes of the settled districts surround themselves with regular troops, they employ them rather to avert internal treachery than to make any attempt at foreign aggrandizement. Still, however, the military power of the Arabs is considerable. In 1815, the princes opposed Mehemet Ali with an army of 35,000

men; and in 1863, the Wahabee chief marched against the same potentate at the head of 45,000 (*Burckhardt's Notes*, p. 248; *Ali Bey, Travels*, vol. II., p. 115); and though unable to prevent the establishment of the Egyptian power in the Hedjaz, they delayed it for some years, during which they more than once defeated the troops of the Pacha, and failed at last, more, as it would appear, from want of concert in their operations than from want of force. It should be remarked, too, that Mehemet Ali seems fully satisfied with the possession of the sea ports of the Hedjaz, and the holy cities. During twenty-four years he has made no attempt to extend his conquests, but has sought to conciliate his neighbours and his new subjects, by enacting laws equally favourable to both. The sultan sheriff of the Hedjaz, previously to the Egyptian conquest, maintained a guard of 1000 men at Djidda, and probably 3000 or 4000 more in the other towns of the Hedjaz; this army is still maintained. The imam of Yemen has an army of 4000 or 5000 men, and the imam of Muscat one of about 1000. The smaller settled states have also their military forces, but no return of their amounts can be obtained. As before observed, every Bedouin is bred a soldier; but a very great difference exists between his sense of duty to his sheikh when called upon to attend him in a predatory expedition, and when called out for the purposes of national warfare—such, for instance, as a contest between two hostile and powerful tribes. On the latter occasions, the hostile sheikhs have sometimes marched each at the head of 5000 men, while in the desultory plundering expeditions fifty or sixty men frequently compose the whole force. There is a great difference, too, in the conduct of the Bedouins in these cases. Those who have encountered him in his robber character, stigmatize him as cowardly; and it appears that if he fail to effect his purpose by surprise, he generally declines attacking even a far inferior force; but in his open contests with the foes of his tribe, no soldier is braver; though, even here, warfare is carried on at a less cost of human life than in most other countries. (*Burckhardt's Notes on Bed.*, p. 76-84, 165-177.)

The Bedouin attends his chief much in the fashion that the feudal vassal attended his liege lord during the middle ages in Europe. He arms, equips, and clothes himself; and trusts for pay to his share of booty. The Wahabee chief, who is essentially a Bedouin, has, indeed, kept on foot a large body of mercenary troops; but this system is in its infancy in the desert, and it is doubtful whether it will survive the present generation. The Wahabee power, since 1815, has evidently been on the decline. In the settled states, on the contrary, the soldiers are all mercenaries, their pay being, in general, 24 dollars per month, in addition to food, arms, and clothing. This accounts for the different appearance made by an army of Bedouins, and one belonging to the states of Yemen, Muscat, Hedjaz, &c. The former present a motley appearance as to arms and equipment; the latter have the same arms and uniform. The Bedouins use long lances, sabres, and short crooked knives; and shorter lances for the footmen. Clubs are very common, where lances (which are never of home manufacture) cannot be procured; and the Bedouins have several kinds, some wholly of wood, some laden with iron, and others wholly composed of the latter material. Matchlocks are in great request, but not very plentiful; though, when possessed of one, the Bedouin is an almost unerring marksman. He has not yet learned to use the musket, and if he get one, he converts it into a match-lock. The pistol is a favourite weapon.

The soldiers of the settled states are armed with matchlocks, and the long crooked knife, called *jambes*. The horsemen carry the long lance, but the shorter one is almost unknown out of the desert. The Arabs have no skill in working heavy artillery; cannon are never used in the field, and the few pieces mounted in the citadels are served by Turks.

A shield, 18 in. in diameter, covered with ox or hippopotamus hide, is a very common piece of defensive armour; in addition to which, coats of mail are worn whenever they can be procured. An iron cap, without a feather, iron gloves, and sometimes greaves for the legs, complete the costume of the mailed Arab. This mode of equipment is, however, chiefly confined to the Bedouins. Of all the arms in use, only the *jambes*, the clubs, and the target, are of home manufacture; the lances come from Syria and Persia, the sabres *professedly* from Damascus, the matchlock from Egypt, Turkey, and Europe, and the coats of mail, principally, from Syria.

It is a common practice for all Arabs, except merchants and learned professors, to go armed. The *jambes* is the usual weapon. (*Nisabur*, par. II., p. 184-190; *Burckhardt's Notes*, 30-32, 124, 135, 248; *Travels*, vol. I., p. 338, 339; *Ali Bey*, II., p. 100-115; *Lord Valentia*, II., p. 348; III., p. 330.)

**Agriculture.**—The nature of the soil restricts the pursuits of the agriculturist to particular localities, and his return varies materially in different parts of the peninsula. In

## ARABIA.

Oman, the better sort of wheat, even when the season has been peculiarly rainy, will not return more than 10 for one; nor the dhourrah (a coarse kind of barley) more than 19 for one; while in the most fertile parts of Yemen, wheat is said to yield sometimes as much as 50 times the seed, and the return for the dhourrah, it is affirmed, amounts to 150, 200, and sometimes even 400 for one. But statements like these, being liable to extreme exaggeration, must be received with considerable skepticism; though, as the dhourrah yields, in this district, two and even three crops in the year, the accounts of its extreme productiveness are not so very extravagant as, at first sight, they seem to be. (*Niebuhr, Des. de l'Ar., par. i., 135.*)

The Tahoma of Yemen, whenever its arid soil is naturally, or can be artificially irrigated, is plentifully sown with dhourrah. The plough is dragged in every direction over the field, till the earth is well broken and completely mixed. The sower follows the plough, and casts the seed into the furrow, as it is formed, the return of the plough covering the grain. In about eight weeks the dhourrah is fit for the reaper; but as the farmer wishes the corn to be extremely ripe and dry before it is gathered, it remains standing a week or two longer, and then is pulled up by the roots. As, by this process, a considerable quantity of the dry seed is shed, the plough is again passed over the ground, and, in about ten weeks, a second crop is produced, which, being gathered in the same way as the first, is, as before stated, not unfrequently followed by a third.

The plough is of the rudest description, and even this cannot be used on the mountain side; the latter being tilled by means of an iron hoe, or, rather, pickaxe. These, with tools of primitive construction for cutting channels in the fields and gardens, and for forming banks or dikes to preserve the water, complete the scanty list of agricultural implements. When the corn is to be thrashed, the Arabs place it in two rows, ear to ear: a large stone is then drawn over it by two oxen, so that the grain is rather crushed than beaten out of the husks. A water-mill would be an anomaly in a country where there are hardly any streams; but, with the exception of one or two, lately introduced into the Hedjaz by the Egyptians, there are no wind-mills in Arabia. The corn, when ready to be ground, is placed between two stones, of which the uppermost, if small, is turned by the hand; if large, it is worked by an ox or ass. (*Niebuhr, par. ii., p. 188.*)

But, notwithstanding this rude state of agriculture, such is the fertility of the S. parts of Arabia, that they not only supply corn for their own consumption, but for that of the greater part of the other districts, and of the wandering tribes of the desert. The Hedjaz is, however, almost wholly dependant on supplies from Egypt. (*Ld. Valentia, iii., 265, et seq.; Ali Bey, ii., 46, 101, &c.; Nieb., par. ii., 303-307.*)

With the exception of the Median tribes, none of the Bedouins meddle with tillage; while the business of the dairy and pasturage are almost equally unknown among the settled population. The Bedouin depends upon the Arab of the towns and villages for his corn and clothing; the latter upon the former for his cattle and part of his butter. In the division of rural labour, the pastoral portion thus falls to the Bedouin. He is a shepherd, though a warlike one; and now, as in the days of Abraham, he counts his wealth, not by his silver or gold (though of them he is by no means negligent), but by the number of his flocks and herds, and especially his camels. The same number of these animals, which would in one part of the desert constitute their proprietor a rich man, in another would mark him as comparatively poor. The tribes of poor Bedouins are those who inhabit the mountainous country, where the camels find little food, and are not very prolific. Among these, the possessor of ten camels is reckoned wealthy, while in the plains of Nedjed, some sheikhs have as many as 300, and no one with less than 30 or 40 is reckoned in easy circumstances. In the fertile parts of Nedjed, are some of the best pastures in the world, and the camels bred there are preferred by the towns Arabs. These plains also produce the finest horses, and with them the town population is supplied. The wealth of the Bedouin depends, however, upon many contingencies: not only is he liable to be stripped by some more powerful tribe, but disease among his herds, or profuse hospitality, frequently reduce him to poverty. His finest pastures, also, sometimes fail, depending as they do upon the rainy season, and being unprovided with independent means of irrigation. Should the rain fail, herbage also fails, and the Bedouin never looks for more than three or four successive years of plenty, and considers himself fortunate if he pass ten without encountering absolute famine. (*Burckhardt, Notes on the Bedouins and Wahabys, p. 29-43, 138-141; Travels, vol. ii., p. 400-402.*)

**Manufactures.**—These are at a lower ebb in Arabia than in perhaps any other semi-civilized country. Among the Bedouins, two or three blacksmiths, and a few saddlers, are the only artists: they are not members of the tribe for which they labour, but natives of the neighbouring towns and vil-

lages. The Bedouins regard them as an inferior race, and would feel degraded were any individual of their tribe to give his daughter in marriage to one of them. It is curious, however, that while they thus regard the service of their horses (their greatest pride) as a menial occupation, they should themselves unscrupulously perform other works, which appear to us quite of as low a character. The businesses of dyeing and tanning are performed wholly by the men. The Bedouin women weave the coverings of tents and the bags for holding provisions, of the hair of goats and camels, but the manufacture of tent-covers is confined to the mountainous regions, where goats abound, their hair being exclusively used for that purpose. (*Pliny, Nat. Hist., lib. vi., cap. 38, p. 162.*) The Arab loom is a very primitive machine. Spinning is performed by the men, being the only domestic occupation which they do not spurn. (*Burckhardt's Notes on Bed., p. 37-39, 138.*)

These are all the arts or manufactures practised among the Bedouins; and the standard seems scarcely higher in the towns. It is true that gold and silver ornaments are manufactured in Yemen; but by Jews and Banian Indians. Even the money which is coined in that district (and there is none coined in any other), is the work of the former; and the only watch-maker who ever settled in the country, was a Turk. Of machinery, there is next to none. Some rude sorts of arms are made in Yemen, as the crooked knife, *jambes*, and a very inferior matchlock. There are also, in Yemen, several looms for the manufacture of coarse linen; and this, like the hair and wool-weaving among the Bedouins, forms by far the most important of all their industrial occupations. Some woollen cloths are also woven; but this manufacture is much less extensive than the former. There is, or was, a glass-house at Mocha. (*Niebuhr, par. ii., p. 188-190.*) In Djidda, out of 234 shops, Burckhardt enumerates only twelve in which anything is made: the others are all places of sale, and chiefly for articles of food or luxury. The twelve manufactures are, four tailors, five sandal-makers (all Egyptians), two turners, and one watch-maker, who, like his fellow craftsmen, formerly residing in Yemen, is a Turk. These, with a few blacksmiths, silversmiths, and carpenters (mostly Egyptians), constitute all the artisans of Djidda. (*Burckhardt's Travels, vol. i., p. 47-54.*) In the holiest of the holy cities, Mecca, not a man can be found capable of forging a lock or key. The slippers and sandals in common use, are brought from Egypt and Constantinople; and the only attempts at manufactures are confined to the construction of rude matchlocks, *jambes*, and lance-heads, together with vessels of copper and tin, in which the pilgrims carry away the water of the holy well, *zemzem*. (*Burckhardt's Travels, i., 343; Ali Bey, ii., 98, 100.*) In Oman, the only manufactures are sashes and turbans of silk or cotton, the *abbe*, or Arab cloak of wool or camel's hair, a coarse kind of cotton canvas, arms of a very rude description, earthen jars, called *murtaban*, and gunpowder. (*Fraser's Journey into Khorasan, p. 18.*)

At Suva, Hodeida, Mocha, and Muscat, some of the vessels are constructed in which the Arabs carry on their coasting and Indian trade. Till within these few years, ship-building was carried on at Djidda also (*Ali Bey, ii., 45*); but though it be still a very important shipping-station, no vessels of any kind are now built at it, and it is with difficulty that means are found of even repairing a ship or boat. (*Burckhardt's Travels, i., 43.*) The want of wood, in Arabia, lays the shipwright under peculiar disadvantages. The timber used in Suva is felled in the woods of Asia Minor, conveyed up the Nile to Cairo, and thence, overland, to its place of destination. When ships were built at Djidda, the timber came by the same route; and it may be presumed that its further transit, by the Red sea, from Suva rendered it too costly. In Mocha and Hodeida a part of the timber is procured from the mountain-sides of Yemen, but the greater portion is imported from the coast of Africa. (*Burckhardt's Travels, i., 42-40.*)

The ships of the Arabs, excepting those of Muscat, which are of a very superior description, are extremely rude and simple. Those called dows are the largest, and are the only ones that perform the voyage to India. (*Burckhardt's Travels, i., 43.*)

The unskillfulness of the Arab seamen, with the clumsy nature of their dows, render shipwrecks of very frequent occurrence. All Bey was wrecked on his voyage from Suva to Djidda, and again on his return from Djidda to Suva (*Travels, ii., 34, 164*); and he affirms, that not a year passes without several vessels being totally lost, and many more, more or less injured; so that ships are always being built or repaired, without increasing the actual number employed in the coasting trade. (*ii., 45.*) That number is, however, considerable: the ships belonging to Djidda only amount to 250; and it is estimated that about as many belong respectively to Suva, Hodeida, and Mocha. (*Burck. Trav., i., 42; Ali Bey, ii., 45.*) Many of these ships are purchased at Bombay and Muscat; the vessels of the latter being very superior to

## ARABIA.

of the Red sea, and their navigators much before the sailors of Yemen in energy and skill. (See MUSCAT.)

The best houses of the Arabs are built of stone, or, if upon the coast, of madrepora and coral. This latter material is of such a nature that it rapidly decomposes when exposed to the weather. In other parts they use a sun-burnt brick with little or no lime, so that constant care is necessary to prevent the introduction of moisture, the tropical rains bringing with them sure destruction to the neglected buildings of an Arab town, quickly reducing them to a heap of rubbish; and as the wooden materials very soon vanish in a country where wood is extremely scarce, the very ruins of many cities, formerly celebrated for their magnificence and grandeur, may now be sought for in vain. Even in towns that are populous, and stirring with activity, many houses are falling rapidly to decay; and while no part is old, many parts are dilapidated and ruinous: yet an Arab town, on the first approach to it, appears handsome and picturesque; the houses, like those all over the East, are flat-roofed, and among them rise, here and there, the dome-covered tombs, called *kubes*, which, with the tapering minarets of the mosques, give to the whole outline an air of variety and elegance. Every good house exhibits a series of gaudy lattices to its windows; and many of them are ornamented with fanciful designs in white stucco. Most of the gateways have pointed arches; and the general character of the ornamental architecture is not very dissimilar to the Gothic. The mosques are square buildings, or rather parallelograms, without much external beauty, except their tall and slender minarets, which always appear light and graceful; but their interior frequently displays much skillful workmanship. The great mosque at Mecca contains more than 500 columns and pilasters of very great beauty. The houses of the poorer classes are of the most wretched description. Huts composed of wicker work or date-tree leaves, covered on the inside with mats, and, sometimes, on the outside with a little clay; huddled together, and hardly sufficient to afford a shelter from the weather. These circumstances, with the filth collected in the unpaved streets, and never removed, impress the mind of a European with a sense of utter desolation and misery.

No remains of the fine Sarcenic architecture of the middle ages are found in Arabia; singular as it may appear, that a people who have left the traces of their skill in this art in every land, from Mesopotamia to Spain, should possess no trace of it in their native country. The perishable nature of building materials in Arabia may account for this fact; for even the holy mosque at Mecca has undergone so many repairs that it may be regarded as a modern structure; but it is much more probable that, while the Arab conquerors caught the love of arts and sciences from the enervated, but refined, nations subdued by them in their headlong career of conquest, those arts and sciences did not find their way into the peninsula; and that architecture, like the rest, never flourished within its limits.

The Arabs use no levels in their buildings, consequently their floors are very uneven; and, notwithstanding the heat of their climate, they have a very bad, or, rather, no idea of ventilation. The large ventilators, placed on the house-tops in Egypt, and which diffuse a current of air through all the lower apartments, are totally unknown. In many places the windows are composed of transparent stone, built into the walls, and, consequently, incapable of opening. (*Burckhardt's Travels*, i. 17-23, 153-155, 185-243; ii. 150, 330, &c.; *Ali Bey*, ii. 20, 42, 94-104, 161-174; *Lord Valentia*, ii. 345-348; *Fraser*, 7, 8.)

*Commerce*.—Owing to the situation of Arabia, nearly surrounded by the sea, and occupying, as it were, a central position between Europe, Asia, and Africa, it has always enjoyed a considerable trade, which, in later ages, has been materially promoted by the resort of pilgrims to the holy cities. The hadjja, indeed, are expressly authorized by the prophet to combine commercial pursuits with the performance of a religious duty (*Koran*, chap. ii, *Sale*); and a great amount of business is, consequently, transacted at Mecca, during the period that the pilgrims remain in that city. With the exception of coffee, and a few other articles of inferior importance, Arabia has but little native produce to export. Its trade, therefore, is, and always has been, principally one of transit. Great quantities of commodities are annually brought in Djidda, Mecca, Muscat, and its other entrepôts, from Turkey, &c., partly by caravans, but principally by ships: such parts of these as are not wanted for home consumption, being distributed among the pilgrims and merchants, are by them conveyed away by sea or land, as the case may be. The great centres of Arabian trade are Djidda, Mecca, and Muscat. The first is the port of Mecca, and also the principal channel through which the regular trade between the Hedjaz and Egypt is carried on; the former being principally dependent upon the latter for its supplies of corn. Since the zeal for pilgrimage has begun to abate in the Mohammedan world, the trade of Arabia has

considerably decreased; but it is still carried on to a greater extent than would readily be supposed, considering the limited amount of its population and productions. Mecca is the principal seat of the coffee trade, though Lohela has of late years made some powerful attempts at rivalry; and Muscat has recently risen to very considerable eminence as a sea-port and seat of the carrying trade, particularly with India and the countries round the Persian gulf. (*Burckhardt's Travels*, i. 30-31; *Ali Bey*, ii. 101-107; *Fraser*, 16; *Lord Valentia*, ii. 370; *Niebuhr*, par. ii, p. 193. See also, *DJIDDA*, *MECCA*, *MUSCAT*, &c.)

*Laws, Crimes, and Punishments*.—The laws of Arabia are those of a primitive people under a patriarchal government. The civil laws, founded upon the *Koran*, are administered by cadis, distinguished by their experience in the customs of the nation, but in whom a knowledge of the arts of reading and writing is not always indispensable. It should be observed, however, that the Arab judges are of two kinds; the *Cadi-el-ferias* (judge of customary laws), and the *Cadi-el-sherpes* (judge of written law), the latter being more common in what are called the Turkish towns (that is, in towns governed by Turkish law), than in those where the unmixed customs of Arabia exist. Written pleadings are not, however, unknown, even in pure Arab towns; but precedents (in some cases, perhaps, reduced to a rude form of codification) seem to form the principal, if not the only guide, to an Arab judge's decision. The sovereign, whether he be monarch of a state, or sheikh of a Bedouin tribe, is only president of the tribunal of justice; he cannot decide a case, either civil or criminal; every one must be referred to the proper tribunal; and the sovereign possesses no power of reversing its decision. But this protection from despotic power is, in the towns, merely apparent; for, as the sovereign names the cadis and dismisses them at pleasure, they regard themselves simply as his officers, and never dream of pronouncing a sentence of which he disapproves. Among the Bedouins, however, the office of cadi is elective, and the sheikh has no influence in the appointment. (*Niebuhr*, par. ii, p. 180, &c.; *Burckhardt's Notes on Bed.*, p. 68, &c.)

Capital punishments are very rare; being inflicted only for blasphemy, and conjugal infidelity in woman. The blasphemer is hanged; the unchaste wife, if her guilt be unequivocally proved, has her throat cut; and, by an unheard-of refinement of atrocity, her father or brother is compelled to be her executioner. This detestable barbarity is, however, rarely perpetrated; for the marriage tie being, on the part of the husband, of very easy dissolution, he generally prefers sending his offending spouse back to her family, merely assigning as a reason that she does not suit him. (*Niebuhr*, par. i, p. 21; *Burckhardt's Notes on Bed.*, p. 63.) Corporal punishments are almost unknown. The immemorial usage is to award a pecuniary fine, whatever may be the nature of the crime. Every offence has its ascertained mulct, even to murder; but, in this case, the friends of the deceased are not compelled to take the compensation, being, by the law of *Thar*, or blood revenge, allowed to take the life of the homicide, or that of any of his relations within the fourth degree. If, however, the fine be accepted, the *Koran* expressly provides for the safety of the murderer. (*Koran*, chap. ii, p. 21; *Niebuhr*, par. i, p. 29-31; *Burckhardt's Notes on Bed.*, p. 84-86.) Insulting expressions, acts of violence, however slight, and the infliction of wounds, have each their respective tariff of fines; and it sometimes happens that, in the course of a quarrel, mutual offences having been committed, the cadi's sentence is a curious specimen of striking a balance. *Burckhardt* (*Notes on Bed.*, p. 71) affords an instance of this. "Bokhyt called Djolan a dog. Djolan returned the insult by a blow upon Bokhyt's arm; then Bokhyt cut Djolan's shoulder with a knife. Bokhyt owes to Djolan, therefore,

|                                  |           |
|----------------------------------|-----------|
| For the insulting expression     | 1 sheep.  |
| For wounding him in the shoulder | 3 camels. |
| Djolan owes to Bokhyt,           |           |
| For the blow upon the arm        | 1 camel.  |

Remain due to Djolan, 3 camels and 1 sheep."

The killing of a watch-dog is paid for by placing in the earth a stick as long as the dog, from tail to snout, and this stick the offender is obliged to cover with wheat, as a satisfaction to the owner.

The decisions of the cadis are generally founded upon the amount of testimony before them; but, if there be no witnesses, the defendant is called upon to exonerate himself by oath. The judicial oaths vary in sanctity and solemnity; and if the accused swear, by the one proposed, to his innocence, he is considered as acquitted. An ordeal, not very dissimilar to that formerly prevailing in Europe, exists in Arabia. It consists of heating an iron spoon red-hot, and calling on the accused party to lick it. If he escape without injury, he is accounted innocent; if otherwise, guilty. *Burckhardt* is orthodox enough to declare, that persons have been known to lick the *beakaa* (red-hot spoon) twenty times, with perfect impunity! (*Niebuhr*, par. ii, p. 66.)

## ARABIA.

Though robbers be accounted anything but infamous, those detected in the fact are very severely punished. In this case, the robber is kept in close confinement (among the Bedouins, in a hole dug in the earth), and very scantily fed, till he fix the terms of ransom with his captor, or till he contrive to make his escape. This is a strictly legal method of proceeding; the right of detention being lodged, by custom, in the person of the captor; and even the mode of treatment is so well ascertained, that it is scarcely ever departed from.

Among the Bedouins, the customs of *Wasy* and *Dakheil* have all the force of law in other countries; by the first, an Arab family binds itself to be the protector of another, and this obligation, once undertaken, descends through all the generations of both. There is no Arab, from the lowest to the highest, but has his *wasy*, or guardian; and the duty of protection inferred from this character, is among the most sacred recognised in Arabia.

By the law of *dakheil*, a person in actual danger, who can touch another, or even anything with which that other is in contact, or can hit him by spitting or throwing a stone at him, at the same time exclaiming, *Ana dakheilak*, "I am thy protected," acquires a right to the protection which he seeks, and which is always accorded to the fullest extent. Even a detected thief, if he can touch any one in his captor's tent (except the captor himself), becomes safe; for which reason he is bound hand and foot, and beaten, till he agrees to renounce the *dakheil* for that day. It is for this reason, too, that he is subsequently buried alive, as *k wore*; for should he become the *dakheil* of any one, his right to freedom is immediately allowed, and he is treated, in every respect, like a newly-arrived guest in the tent of his late enemy. There is only one offender to whom the privilege of *dakheil* is refused, namely, the thief released upon the responsibility of some third party. If he should, when at liberty, refuse to satisfy his bail. Under such circumstances, he is proclaimed *traitor*, and loses all the privileges in question; in fact, becomes outlawed. The *dakheil* does not apply to a homicide under the *thar*. (*Burckhardt's Notes on Bed.*, p. 74, 75, 80-100, 182.)

Though polygamy be allowed by the Mohammedan law, in practice it is by no means general. Few men, of moderate fortunes, have more than one wife; and many, even of the highest rank, similarly confine themselves.—(*Niebuhr*, par. I., p. 65; *Burckhardt's Notes on Bed.*, p. 61.) On the other hand, the nature of the marriage ceremony, and the facility of divorce, renders changes of wives of very common occurrence. In the towns, an agreement before the *cad*—in the desert, the slaughter of a lamb in the tent of the bride's father, completes the contract, which is broken quite as readily as it is formed. The husband having said, before witnesses, *ent talek* (thou art divorced), and sent the woman back to her family, both parties are considered free; the husband from the maintenance of his wife, the wife to form a new connexion. In these cases, the woman's portion is returned; and, among the Bedouins, the husband adds to it a she-camel. The custom of divorce is, however, much more prevalent in the tents than in the towns. In the latter, it is always considered indecorous, and implying dishonour in the woman; but in the desert a wife may have been divorced three or four times, and yet be free from any stain or imputation on her character. Polygamy, however, is much more common in the towns than among the Bedouins.

If a man leave a widow, his brother generally offers to marry her; but this is entirely a law of custom, and not binding on either party. A man has, however, an exclusive right to the hand of his cousin; and, although he cannot be compelled to marry her, his renunciation of his right is necessary to enable her to marry another. Marriages are consummated at a very early age; it being reckoned creditable in a man, and almost infamous in a woman, to lead a life of celibacy. (*Burckhardt's Notes on Bed.*, p. 61-66; *Niebuhr*, par. I., p. 63-67.)

A curious custom, connected with the laws of marriage and divorce, prevails in the Hedjaz. No unmarried woman is, by the Mohammedan law, allowed to visit the holy temple; but as many rich old widows, or women whose husbands have died on the road, arrive with every hadj: a number of men are established at Djidda, and other frontier towns of the *Beled-el-Harem*, whose business it is to facilitate the progress of these widowed females through the sacred territory. The *mulabih* (as one of these men is called) marries the lady legally before the *cad*, accompanies her to Mecca, Arrafat, and all the sacred places; and, on the termination of the pilgrimage, pronounces the *ent talek*, or sentence of divorce. Should he, however, refuse to do this, the law cannot compel him; but he would be prevented from any longer exercising his calling, which, though not very creditable, is so lucrative, that only two instances are recorded of such temporary marriages having become permanent. (*Burckhardt's Travels*, I., 339.)

The law of inheritance is very simple as regards property.

The effects of a deceased father are shared among his children, the portion of a male being double that of a female. The succession to power is clearly ascertained. If a sheikh or sovereign die, his successor is usually taken from among his sons; but it does not seem that any one has a well established right in preference to the others. In Yemen, it would appear that the *Iman* is succeeded by his eldest living son, even to the exclusion of the children of an elder one deceased. (*Niebuhr*, par. II., p. 179; *Burckhardt's Notes on Bed.*, p. 66, 75; *Lord Valentia*, vol. II., p. 260.)

*Religion*.—Antecedent to the earliest records, the city of Mecca had been sacred ground; and its holy temple, the *kaaba*, identified in the minds of the Arabs with every sacred feeling. The legends with respect to it, to which it is unnecessary more particularly to allude, show that the religion of the early Arabs was, to a considerable extent, mixed up with that of the Hebrews. They acknowledged one supreme God, regarding, however, the sun, moon, planets, and stars as inferior and subordinate intelligences. This religion has been called *SANANISM*, either from *SAN*, a supposed son of Seth, or, as is more probable, from the word *SAN*, signifying the Host of Heaven. The supreme God was called *Allah Tuah* (Most High God), the subordinate deities, *Al-Sakhat* (the Powers). It was these titles (one particular, the other general) that led Herodotus to affirm that the Arabians worshipped only two gods, namely, *Uol-tal* and *Alilat*; the former of whom he identifies with the Bacchus (*Asperus*) of the Greeks, the latter with Urania, the muse of astronomy. (*Herodotus*, *Thalia*, § 8: *Al-Firuzi*, *Shahrestan al-ahis in Peccoko*, p. 110, 138, 143, 294; *D'Herbelot*, p. 725, 736, &c.) The Arabian religion can scarcely be deemed irrational, when professed by a rude people, inhabiting an open country, under a clear sky; who must have connected the changes of the seasons, and the returns of the periodic rains and droughts, that rendered their plains alternately fertile and sterile, with the revolutions of the heavenly bodies. But the Arabs also worshipped angels (*Koran*, chap. III. and IX.); and their images, which last they believed to be inspired by the supreme Divinity with life and intelligence. This sort of idolatry having been once introduced, gradually spread; and in the sixth century, and long before, the number of these deities was very great, each tribe having chosen one to be its peculiar intercessor with the Supreme Being; and 300 were enshrined in the *kaaba*, as tutelary guardians of the days of the Arab year. (*Al-Jauhar*, *Shahrestan al-ahis in Peccoko*, 20, et seq.; *Sala*, *Intro. Koran*, 14-23; *Burckhardt's Travels*, I., p. 290, &c.)

The Arabs seem, indeed, to have admitted, without hesitation, all deities; and thus, in the sixth century, a figure of the Virgin Mary, with the infant Jesus, was sculptured on one of the principal pillars of the *kaaba* as an object of adoration. (*El Irraky*, quoted by *Burckhardt*, *Travels*, I., p. 300.) It is most probable that this indiscriminate adoption of the objects of veneration of all sects, was intended to render the sacred city sacred to all men, and thus to increase the resort of pilgrims.

After the destruction of Jerusalem, by Titus, A.D. 70, many Jews fled into Arabia. These exiles made many proselytes among the natives, whole tribes embracing the Hebrew faith; so that, in a century or two, the Jewish Arabs became a very powerful section of the whole people. A similar cause, the persecution early in the third century of the Christian era, drove many Christians to Arabia, whose zeal, unchecked by former sufferings, led them to preach their doctrines in their new homes, and that with such success that in a short time they had made a very great progress in the country.

The faith of the Persian Magi, or the religion of Zoroaster, had, at a very early period, found its way into the peninsula; had been embraced with avidity by many tribes; and thus, in the middle of the sixth century, the population of Arabia was divided, perhaps not very unequally, into Sabians, Jews, Christians, and Magians. (*Shahrestan al-ahis in Peccoko*, 140, et seq.; *Sala*, *Intro. Koran*, 21-24.)

Such was the state of religion in Arabia at the birth of Mohammed; an epoch which may be regarded as the commencement of one of the most extraordinary revolutions that history has to record. It occurred at Mecca, in the month of May, A.D. 571 (*Dr. Prichard*, *Hist. Arab.*, 6), or 570 (*Abul-Fida*, *Vit. Moh.*, 40). This founder of a new religion, and of a political power, which, even in his lifetime, extended over his native country, and which, under his successors, threatened to embrace the empire of the world, traced his genealogy in a direct line through eleven descents from Koreish, the founder of the powerful tribe that bore his name. Koreish again was affirmed to be the tenth in direct descent from Adnan; and Adnan the third, seventh, or eighth (which is doubtful) from Ishmael, the son of Abraham. (*Abul-Fida*, *Vit. Moh.*, cap. II., p. 6, 7.)

The future Prophet sprung, therefore, from the noblest tribe of the Ishmaelitic Arabs, and his grandfather was, at

## ARABIA.

the time of his birth, sovereign of Mecca, and guardian of the Kaaba; consequently, from the sacredness of his territory, and the holiness of his office, a prince of great power and influence. (*Abul-Fida*, cap. vi., p. 13; *Al-Fihrist*, at *al-Is* in *Pococke*, p. 81; *Recherches Chron. et Hist. Ar.*, par. 1., cap. III., p. 130, et seq.)

Yes, notwithstanding his high connexions, Mohammed's early life was passed in comparative poverty. His father, a younger son of the sovereign of Mecca, dying before Mohammed was two years old, the latter, and his mother, were left with no other provision than five camels and a female slave. To his grandfather, Abdul-Muttalib, in the first instance, and subsequently to his uncle, Abu-Taleb, the future Prophet was, therefore, indebted for his infant protection; and this guardianship was exercised with the greatest kindness, the uncle especially (for Abdul-Muttalib died when Mohammed was only eight years old), continuing the firm friend of his ward, throughout his life, and protecting him in the dangers and difficulties which beset his first attempts to disseminate his doctrines. Under the auspices of his uncle, Mohammed began life as a merchant, accompanying a trading caravan to Syria, in his thirteenth year. Subsequently, and at a very early age, Abu-Taleb recommended him as a factor to Khadija, a rich widow, to whom his skill in commerce, or his other accomplishments, so far endeared him, that, in a short time, he exchanged the name of servant for that of husband; raising himself by this alliance to an equality with the richest, if not the most powerful men of Mecca. At the time of his marriage he was twenty-five and his wife forty years of age. (*Abul-Fida*, caps. iv. and v., p. 10 and 12.) It would be useless now to attempt to discover the proximate cause that led Mohammed to attack a system of idolatry, of which his own family were at the head. It was not, however, as some have surmised, a sudden outbreak of enthusiasm; for, after his marriage, he continued to live in all the privacy compatible with the station of a rich and highly-connected individual for thirteen years. At the termination of this period, he withdrew from society, retired to a cave in the neighbourhood of Mecca, where, for two years, he gave out that he was in daily communication with the Divinity. At the end of this time, being then forty years of age, he assumed the character of a prophet, sent by the Almighty to establish a new religion; and, if we may take his own words, to restore the ancient one, professed by Adam, Noah, Abraham, the Prophets, and Jesus Christ; by destroying the gross idolatries of his countrymen, and wounding out the corrupt and superstitious by which, as he alleged, the Jews and Christians had defamed the beautiful simplicity of the true faith. (*Abul-Fida*, cap. vi., p. 14-17; *Abul-Fihrist*, p. 102; *El-Macn*, Hist. Ser., lib. I., cap. 13, &c.)

His first convert was his wife Khadija, of whose merits, in this and other instances, he always entertained the highest sense, uniformly speaking of her with an affection bordering upon reverence; and placing her, after her death, among the only perfect women the world had ever seen. The other three converts, Miriam, the sister of Moses and Aaron, the Virgin Mary and his own daughter Fatima. (*Abul-Fida*, caps. vii. and viii., p. 16, 17.) The progress of the new sect was at first very slow. It is usually stated, that nine converts only were made in the first three years; but this is scarcely consistent with the fact that, in the fourth, Mohammed felt himself strong enough to abandon his private preaching, and to proclaim his doctrines publicly. (*Abul-Fida*, cap. vii., p. 19; *Koran*, cap. xxvi. and xxvii.; *Abul-Fihrist*, p. 102, &c.)

Nothing can well exceed the simplicity of the Mohammedan doctrines, as delivered by the founder and his immediate successors; and as they are embodied in the 114 chapters of the Koran: The unity of God; the divine mission of Mohammed; the stated observance of prayer; the giving of alms; the observance of an annual fast; and the pilgrimage to Mecca; comprise, under five heads, the principal points, whether doctrinal or practical, which were to be enforced. The resurrection of the body was proclaimed, and a future state, in which men will receive the reward of their good actions and obedience to the law of the Prophet, or be subjected to a purifying punishment for their evil deeds and infidelity. The first admission of all believers to a state of bliss, is an article of Mohammedan faith. (*Koran*, panim, especially chapters II., III., iv., v., and xli.; *Adelard's Koran*, Theol., p. 20, &c.) The supposed divine legation of Mohammed is the principal novelty introduced. The stated prayers were only adaptations of customs already existing among the Sabians, Jews, Christians, and Magians; the annual fast was a very ancient practice among the old Arabs; and the only change effected by Mohammed in its observance, was, by prohibiting the intercalation of a month in the lunar year, to make the sacred season fixed instead of ambulatory. (*Koran*, chap. ix.) The pilgrimage to Mecca was, as has been shown, a practice followed from the very earliest times; and the rewards and punishments

in another life were adopted, but with much adulteration, from the Christian doctrines. The grossly sensual character of Mohammed's paradise, is, in fact, the great blemish in his religious system; and has had a most debasing and degrading influence over the countries where it has acquired an ascendancy.

The new religion being in most parts little more than an adaptation of various parts of the religions previously existing in Arabia, was well fitted to attract all by the respect it professed for the peculiar tenets of each, excepting the idolatrous worship of the Sabians. Accordingly, Mohammed was heard with patience by the people of Mecca, till he denounced the idols of the Kaaba. This, however, roused so strong a feeling against him, that his ruin was prevented, and his life preserved, only by the firm friendship of his uncle, Abu-Taleb, who, although unconvinced by the preaching of his nephew, protected him against his enemies. In the sixth year of his mission, the persecutions to which he was exposed became so severe, that many of his followers sought, by his permission, refuge in other lands, chiefly in Abyssinia; where they became the first instruments for planting the new faith in Africa. This event is called by Eastern writers, *the flight of HAJRA* or flight. (*Abul-Fida*, caps. ix., x., xi., p. 21-37; *El-Macn*, *Al-Fihrist* at *al-Is* in *Pococke*, p. 177, et seq.)

The protection of Abu-Taleb, though it preserved Mohammed from personal danger, could not prevent a very strong manifestation of hostility, in which Abu-Taleb himself and all his family were sharers. The other Koreishites bound themselves to hold no communion with the family of Hashem, the great grandfather of Mohammed; and to give the greater force to their act, it was reduced to writing, and laid up in the Kaaba. At the end of three years, however, Mohammed, having, no doubt, previously concerted his measures, proclaimed, that God had sent a worm to eat out every word in the parchment except his own holy name; and the writing being, on inspection, found to be destroyed, the league was put an end to; and Mohammed's reputation considerably increased. In the same year, being the tenth of his mission, Abu-Taleb and Khadija died; and their deaths were by far the greatest blow which Mohammed experienced during his career. In the Musliman calendar, this year is commemorated as the *year of mourning*. (*Abul-Fida*, caps. x., xiv., p. 36-39; *El-Macn*, lib. I., cap. 1., p. 4.) The death of Abu-Taleb removed the only check to the virulent enmity of the Koreishites; and a stranger having succeeded to the sovereignty of Mecca, after a troubled residence of three years—marked, however, by the accession of many proselytes—Mohammed, on the invitation of a deputation from Medina, fled to that city; and instantly, as if by magic, the proscribed and condemned exile became powerful, and as it soon appeared, an all but invincible monarch. The flight from Mecca to Medina, the second *Hajra*, or *Hajra*, *excellence*, is the epoch from which the Muslims date their era. It occurred in the fifty-third year of Mohammed's age, and thirteenth of his mission; and coincides with the 10th July, A.D. 622. (*Abul-Fida*, cap. xii., xlii., p. 40-50; *El-Macn*, lib. I., cap. 1., p. 4; *D'Herbelot*, p. 444, 445.) Down to this point, Mohammed had propagated his religion by means of persuasion only: throughout eighty-five chapters of the Koran, published at Mecca, there is nothing said of a compulsory power being given to the Prophet: on the contrary, he exhorts his disciples to bear with patience the evils inflicted by unbelievers, declaring he has no authority to compel any one to embrace his religion. (*See*, in particular, chapters vii. to xlii.; xvi. to xxii., &c.) But his doctrines breathe a very different spirit after his establishment in regal and sacerdotal power at Medina. The eighteen chapters of the Koran, published at that city, declare that since man had perversely rejected the missions of Abraham, Moses, the Prophets, Christ, and even the mild pleadings of Mohammed himself, God had now commanded him to extirpate idolatry from the earth, and to bring all mankind into subjection to his will. (*See*, in particular, chapters iii., iv., v., viii., ix., &c.) The sword, however, was first drawn against Mohammed, and not by him. Abu-Sophian, the new sovereign of Mecca, led an army, of 900 or 1000 men, against the supposititious Prophet, who, with a force of only 319 enthusiasts, met his enemies in the valley of Bedier, near Medina, and gained a complete victory, with the loss of only forty men; who were immediately canonized, as the first martyrs in the cause of God and his Prophet. (*Abul-Fida*, cap. xvii., p. 56-60; *El-Macn*, lib. I., cap. 1., p. 5.)

From this time the progress of Mohammed was, if not a continued triumph—for he sustained some defeats—an example of the most rapid success upon record. During the next six years he fought twenty-seven battles, exclusive of those fought by his generals, in which he was not personally present; and, at the end of that period, he entered Mecca in triumph, on the 90th Ramadan, in the 8th *Hajra*, or De-

ember 31, A.D. 629. The conquest of Mecca may be regarded as the final establishment of Mohammedanism in Arabia. The few contests that followed were merely the last struggles of an expiring opposition; and were mostly terminated by Mohammed's generals, while the Prophet himself was employed in destroying the idols in and round the Kaaba, and in sending embassies, inviting the Arabs to embrace his faith, which invitations were now attended with complete success. The following year, the 9th Hégira, is called, by Eastern writers, the year of embassies: missions from all parts of Arabia poured in, bringing the adhesion of the various tribes to the now triumphant faith; and the victorious founder of the new religion made a solemn pilgrimage to the temple of the Kaaba, to return thanks to Heaven for his success, and the final overthrow of idolatry.—(*Abul-Feda*, caps. xviii.-ix., p. 61-132; *El-Macini*, lib. i., p. 5-10.)

All Arabia was now united in one faith; but Mohammed did not live long to enjoy his triumph. Some years previously, or in the 7th Hégira, A.D. 628, he was poisoned by a Jewess of Chabir, who, on his entering that town in triumph, offered him some eggs, previously drugged, professedly to test the reality of his divine knowledge. (*Abul-Feda*, cap. xiv., p. 92.) Henceforward his strength declined; but his death was caused by a fever,\* which having, at intervals, deprived him of his reason, terminated his existence in the space of fourteen days, on the 12th of the 1st month, Rebi'ah, in the 11th Hégira (6th June, 632), in his 63d, or according to some authorities, 65th year. He was buried at Medina; and the Mohammedan doctors differ as to which is the most sacred—Mecca, which gave birth to their Apostle, or Medina, which received him in his flight, and contains his mortal remains. (*El-Macini*, lib. i., p. 10; *Abul-Feda*, caps. lxi.-xiv., p. 133-143; *Ockley's Hist. Sar.*, i. 1.)

During Khadija's life, Mohammed abstained entirely from the right of polygamy; after her death he took nine wives, alleging, of course, that a special revelation authorised him in exceeding the number four, to which his law restricted his followers! By Khadija, he had four sons and as many daughters; and by an Egyptian concubine he had a fifth son; all his other wives being barren. His five sons died in infancy, and of his daughters, Fatima only, who was married to her cousin Ali, survived her father. From Ali and Fatima a numerous and illustrious progeny descended, the ancestors of the numerous existing Sheriffs, or *Sons of the Prophet*. (*Abul-Feda*, caps. lxvii., lxviii., p. 146-151.)

Mohammed died in the midst of preparations to carry his spiritual faith and temporal power into other countries. His death scarcely, however, suspended the completion of his great designs: a momentary state of confusion was followed by the election of Abu-Becre, father-in-law of Mohammed, to the office of supreme head of the Mussulman religion and power, under the title of "Khalif," or "Successor of the Prophet." Under his reign, and that of his two successors, the Arab arms were carried triumphantly into all the neighbouring countries; and, by the 30th year of the Hégira, or within less than ten years from the death of Mohammed, the conquest of Syria, Persia, and Egypt, was completed. In the 13th year of the Hégira, Damascus was taken; in the 16th, Jerusalem; in the 17th Antioch; in the 19th, Ispahan; and in the 20th, Alexandria. (*El-Macini*, lib. i., cap. ii., p. 16-38; *Abul-Pharagius*, p. 108-117; *Ockley*, i., p. 1-391.)

The khalifate continued elective for four successive elections; the last, who held the power by public suffrage, being Ali, the cousin and son-in-law of Mohammed. This first BELIEVER had been thus long passed by in consequence of his refusing to hold as sacred anything not contained in the Koran, or the immediate traditions of the prophet. (*Abul-Pharagius*, p. 115.) From this circumstance arose the division of the Mohammedans into two great sects, the *SONNITES* and the *SCHITTES*. The latter, the disciples of Ali, whom they denominate the *viceroy of God*, receiving only those doctrines which he admitted to be sacred; while their adversaries (the orthodox Mussulmans) hold, at least in equal reverence, the 7975 *Sonnas*, or oral laws, which, within the first 900 years of Mohammedanism, had grown into respect and veneration. (*D'Herbelot*, *art. Bokhari, Hadith, and Sonnah*, p. 908, 418, and 807.)

All fell by the hand of an assassin, after a troubled reign of five years; and Moawijah, son of Abu-Sophian, the greatest enemy of Mohammed, usurped the throne; and, what is more remarkable, had the power or art to make the khalifate hereditary in his own family. His descendants are called the Ommyyade race of khalifs, from Ommyyah, the grandfather of Abu-Sophian; and they possessed the regal and sacerdotal power through fourteen generations, and for

nearly 100 years. (*El-Macini*, lib. i., caps. v. and vi., p. 39-49; *Abul-Pharagius*, p. 117-133; *Ockley*, ii., p. 1-108.)

Under the sway of this family the whole of Africa was subdued; and so far colonised by tribes of Bedouins that it has ever since remained, in language, manners, and religion, essentially an Arab country. The Oxus (Jihon) was very early crossed; the shepherd tribes of Turke and Tartar brought under the triumphant faith of the Arabian prophet; and, within eighty years from Mohammed's death, the sceptre of his representative extended over all the countries between the Indus and the Atlantic, and (eastward of the Mediterranean) from the Indian ocean to the steppes of Central Asia. (*El-Macini*, lib. i., caps. vii.-xii., p. 49-77; *Abul-Pharagius*, p. 133-195.)

Spain was the last and most remote of the conquests of the khalifs. It was subdued in the beginning of the 8th century; Roderic, the Gothic king, being defeated and slain in the battle of Xeres, July 18, A.D. 711. Subsequently to this, though the Arabs were for a short time masters of the S. of France, they made no further impression on Europe; and, in the year 732, they were completely defeated by Charles Martel, and driven beyond the Pyrenees, which barrier they never recrossed. (*Abul-Casin*, vol. i., chap. iv.-ix., p. 28-111; *Roderic Ximenes*, *Hist. Ar.*, caps. xiv.-xv., p. 10-13.)

The Ommyyade khalifs were, in the 133d Hégira (A.D. 750), superseded by the descendants of Abbas, one of the uncles of Mohammed. The Ommyyade dynasty had never received the cheerful submission of the prophet's family; and, after a lengthened struggle, the last Ommyyade khalif was completely defeated in Mesopotamia, and again in Egypt, where he was slain. *Abul-Abas-Saffi*, and the princes, his descendants, are known in history as the Abbasside khalifs. (*El-Macini*, lib. i., cap. xxi.; lib. ii., cap. i., p. 95-100; *Abul-Pharagius*, p. 137, 138.)

The seat of government had, in the meanwhile, been removed from Medina to Damascus, and from the latter to Bagdad. It was in this new seat of empire that the Arab claim to literary and scientific eminence was first raised. It was here that the splendid courts of Haroun al-Raschid, and his sons, Al-Mansour and Motassem, were held. It was here that, under their patronage, the Greek sages and philosophers were translated, that the native Arab genius raised its head, and carried the sciences, physical and metaphysical, together with the useful arts, to a point of grandeur unknown in former times. The names alone of the Saracen philosophers, mathematicians, astronomers, physicians, botanists, chemists, and architects, who illustrated this period of Arab history, would fill a volume. Of chemistry they may be called the *inventors*; and although, in astronomy, they did not presume to depart from the Ptolemaean hypothesis, they carried out the views of the Alexandrian philosopher, and attained results marvellous for their accuracy, when the erroneous nature of the data on which they were founded is considered. To the astronomical tables of Bagdad, Cordova, and Samarcand, subsequent observers owe a large debt of gratitude; and many of the common terms in modern astronomy, and most of the names applied to the fixed stars, attest the source whence Europe drew the elements of astronomical science. The Arabs, if they did not invent, at least were the great improvers of algebra\* (the name sufficiently attests its origin), which placed in the hands of the analyst an instrument of vast and apparently unlimited power. Perhaps, however, the most important invention we owe to the Arabs is that of the arithmetical characters, now in common use, which banished at once and forever the cumbersome and unwieldy notation of the Romans. In medicine, the Arabs were pre-eminently great; and the magnificent remains of their public and private buildings, in Syria, Egypt, and Spain, evince their skill in architecture. The Arab court of Bagdad was, in fact, the centre of the knowledge and refinement of the period in which it existed; and, by a singular contrast, that period corresponded with the darkest and most degraded portion of European history. (*Abul-Pharagius*, p. 150, et seq.; *D'Herbelot*, p. 430, 545, &c.)

The khalifate shared the fate of all gigantic empires, especially of such as rise suddenly to immense power. It fell by its own unwieldiness. Spain first, and then Egypt and Africa, effected their independence. The wild Turk and Tartar tribes, among whom the Mohammedan faith had been imperfectly introduced, became dangerous neighbours to their nominal sovereigns; and, in their decreasing power, the khalifs had recourse to the desperate expedient of forming from these wild warriors a body of mercenary troops to guard their frontiers, and protect their persons. The result

\* The epilepsy, or falling sickness, to which he is said to have been subject, is nowhere so much as hinted at by the native writers. It is strongly implied on by *Priscutus* (*Life of Abd.*, p. 30, and by *Henricus* (*Hist. Gr.*, lib. i., cap. 6); but their authorities are wholly Latin; namely, Ximenes, *Thomassin*, *Scaliger*, &c.

\* This science was, certainly, originally discovered by Diophanes of Alexandria, but its power, as an instrument of analysis, by descent and unknown, till developed by the ingenuity of the Arab mathematicians. The first systematic work on this subject came from the court of the Khalif Al-Mansour, and from the pen of the Arab, Mohammed-Ben-Musa. (*Abul-Pharagius*, p. 185-186.)

## ARABIA.

was identical with that which attended a similar experiment among the Romans. In a few generations the servants became the masters; and though, as in the parallel case of Rome, the destruction of this overgrown empire occupied some centuries, yet piece by piece it crumbled away, till, in the 656th Hégira (A.D. 1258), a Tartar army, having captured Bagdad, put an end to the nominal existence of the khalifate, all real power having, long before, passed into the hands of the Turkish sultans of Asia-Minor. (*Abul-Feda, Annales Muslemici*, l. p. 173-250, 309, 405; iii., 295-383, 633; iv., 37, 315, 555; v., 181-243; *Abul-Pharagius*, 130-174, 198-200, 318; *Ed-Mocin*, lib. ii., xlii., xxxi., 97-163; lib. iii., xlii., 214, et seq.)

The foreign conquests of the Arabs made no change in the political state of the peninsula. The heads of tribes still governed their subjects, as they had governed them from time immemorial; acknowledging, in the distant khalif, no more than a general head of the Arab people, and the sacred chief of the prophet's faith. As the downfall of the khalifate was unattended by any shock to Mohammedanism, merely transferring the office of "Commander of the Faithful" from the khalif of Bagdad to the Turkish sultan, it may be easily imagined that the Arabs had little difficulty in changing the objects of their veneration. Their holy cities were visited as before, and by larger caravans, as their faith was more diffused. Though they sent forth a host of conquerors, who subdued more countries in a shorter time than almost any by whom they had been preceded, their country escaped the fate of most victorious nations—that of being conquered in turn. Two revolutions only are recorded as having shaken Arabia since the era of Mohammed; and both of them, like his, were of native growth, and of a religious character.

A tribe of fanatics, under the influence of a leader named Esmath, attempted, in the 907th Hégira (A.D. 900), to effect a change in the ceremonial part of Mohammed's institutions, by rescinding the prohibition of wine, and preventing the pilgrimages to the holy cities: slaughter and desolation marked the progress of the sect for more than sixty years; but, finally, it vanished, leaving no record of its existence, but the memory of its cruelties and enormities. (*Abul-Feda, An. Mus.*, ii., 367 et seq.; *D'Hervé*, p. 254.)

The other revolution had its rise in the beginning of the last century. Addul-Wahab, a native of Nedjed, proclaimed himself a prophet sent from God, to reform the abuses which, in the lapse of years, had crept into the pure doctrines of Mohammed. The Koran, in the creed of Wahab, is the only rule of life, and the Mussulman traditions are entirely rejected. God is to be worshipped in the strictest unity, and every species of adoration paid to Mohammed, or any other created being, is denounced as idolatrous. Simplicity, or, rather, asceticism, seems to be the distinguishing characteristic of the new sect: they acknowledge no saints; they bury their dead without pomp or ceremony; their clothes and houses are as plain as possible; their mosques have no ornaments whatever; and they interdict the use of coffee, tobacco, and opium.

The Wahabee doctrine, so called from its founder, found a protector in Ebn Saoud, a Bedouin sheikh of Nedjed. The preacher was proclaimed supreme spiritual head, the soldier, prince, and general of the new worship; extermination was threatened to all opposers, and, for awhile, the progress of the Wahabees was a continued triumph. Mecca was subdued in 1803, Medina in 1804; and it seemed as though a repetition of Mohammed's victorious career was about to be enacted by the sons of the first establisher and supporter of the new sect. But in 1813 Mehemet Ali drove them from the western coast, and restored the holy cities to the nominal protection of the Porte. Since that time, the progress of the Wahabees appears to be at a stand; and though they are still strong in Nedjed, there is reason to believe that their power is on the decline, and that their numbers are decreasing. (*Niebuhr*, par. ii., p. 298-302; *Histoire de Wahabie*, par M. A. L. Paris, 1810, passim; *Burckhardt's Notes on Bedouins and Wah.*, passim.)

**Schools and Education.**—The learning which gave celebrity in the court of Bagdad in the middle ages does not appear ever to have been naturalized in Arabia. Before the era of Mohammed, ignorance (that is, ignorance of written learning) was so far from being accounted disgraceful, that we learn from the Koran (chap. xix.) that Mohammed, though of the royal house of Hedjaz, could neither read nor write; and in the present day, judges are frequently illiterate. (*Burckhardt's Notes on Bed.*, 68.) It cannot, therefore, be supposed that education in Arabia is either very good or widely diffused. According to Niebuhr (*Des de l'Arab.*, par. i., p. 91) "the Arab princes by no means encourage science; and throughout the East, you meet few who merit the title of learned."

Public provision is, however, made for the education of youth; and a teacher for the children and young slaves is no uncommon part of the domestic establishment of distin-

guished families; so that, in the cities, the greater part of the population can read and write—attainments which are also found commonly enough among the sheikhs of tribes in the neighbourhood of the settled districts.

To almost every mosque there is (or was) attached a school, where the poorer children may be taught gratuitously; besides which, there are in every great town more or fewer private establishments where the children of the middle classes are received. The education is of a limited kind, comprising little more than reading, writing, the simple rules of arithmetic, and the doctrines of the Mohammedan religion. School-houses, like the shops, are open to the street, so that the whole process of education is conducted in public; and, to prevent the distraction incident to such a situation, the readers and repeaters speak in the highest possible key, and accompany their delivery with violent gesticulations.

Besides these, there are in many of the greater towns schools of a higher character; colleges, in fact, in which the higher sciences—mathematics, astronomy, astrology, and medicine are taught. In the Imamut of Yemen (which is but a small part of the district so called) there are two of these colleges. One of the chief studies in them is the ancient Arabic, now a dead language; for their learned men are expected to understand clearly, not only the Koran in its original tongue, but also all the ancient commentators, of whom the number is very considerable. Candidates for offices, civil or ecclesiastical, are said to undergo a very rigorous public examination as to their literary and scientific attainments; but this is mere pretence, the most illiterate persons being frequently appointed to the highest posts, while the best instructed get a precarious living as scribes, teachers, and public reciters or poets. Hence the wish to acquire a high degree of scholastic knowledge is very weak in the majority of Arabs; and the profession of teacher is far from respectable or lucrative. In many of the towns, the public schools are falling to decay; and those qualified to conduct them prefer wandering over the country like the bards and troubadours of the middle ages, as poets and orators; in which characters, as the reciters or singers of the glories of the nation, they are welcomed and rewarded alike by the sheikhs and sheikhs. There is no public provision whatever for female education; and, among the Bedouins, whole tribes can neither read nor write. A very great obstacle to the advancement of education in Arabia is the prejudice of the natives against printing. From the nature of the Arabic characters, interlacing each other, and frequently placed vertically, they appear handsomer, when well written, than when printed. There was, not a few years ago, and perhaps there is not at present, a single printing-press in the country. (*Niebuhr*, par. i., p. 91-96; par. ii., p. 189; *Ali Bey*, ii., 100; *Burckhardt's Notes on Bed.*, 42, et seq.)

**Political Divisions.—Sources of Revenue.**—Without reckoning the Bedouin tribes, the number of which can hardly be ascertained, the settled parts of Arabia are divided into a great many independent governments: hence states, also, not unfrequently spring up. The political divisions of this country are therefore very uncertain, but at present they may be regarded as consisting of—1st. Fourteen or fifteen states, upon the S.E.W. coasts; 2d. A much greater number upon the shores of the Persian gulf; 3d. The half-settled Bedouin tribes on the N. part of that gulf; 4th. The dominions of the Wahabee chief, Abdallah, in Nedjed; 5th. The Hedjaz and Bahr-el-Tour-Sinal, on the W. and N.W. of all these. The last are the only parts that own a foreign master. The descendants of Mohammed continued to reign in the Hedjaz from this time down to a late epoch; acknowledging, however, the supremacy, first, of the court of Bagdad, and afterward of the Turkish sultan, as head of the Mohammedan faith; ministers of the paramount power residing at the sanctuary in the holy cities. While the Turkish government retained its strength, this connexion was acknowledged and respected in the Hedjaz; but in the latter part of last century, the sheikhs renounced their nominal allegiance, attacked the Turkish pashas, and finally expelled them. Scarcely, however, was this effected, when the Wahabees subdued the whole of the Holy Land, and held it till 1813-14; when Mehemet Ali, pasha of Egypt, nominally restored the holy cities to the protection of the Porte, but virtually made himself master of the Hedjaz; which he has since retained, and governed at discretion. The desert of Sinal has always belonged, more or less, to Egypt. (*Burckhardt's Travels*, passim; *Notes on Wahabees*, 331-430; *Lord Valentia*, iii., 325-337.)

Taxes in the settled portions of Arabia are pretty uniform. A tenth of the productions of the land is paid to the sovereign, and this not unfrequently in kind. (*Fraser*, p. 13.) In Yemen, however, this tax appears to be compounded for by the payment of a fixed sum annually (*Niebuhr*, par. ii., p. 183); and with regard to the town population, this method must necessarily be general. The tithes upon land is the

## ARABIA.

only legal fixed impost which the subjects of the native Arab princes are called upon to pay. But a far more productive source of revenue is found in the customs and duties upon merchandise. The iman of Muscat lays 1 per cent. upon all goods passing up the Persian gulf in Arab bottoms; and this small duty is so productive that it yields from 110,000 to 150,000 dollars annually. (Fraser, p. 16.) In Yemen, the iman levies 3 per cent. upon the coffee carried from his dominions beyond the straits of Bab-el-Mandeb, and 7 per cent. upon all that is sent up the Red sea; and the sultan sheriff of Mecca—or, rather, his present master, Mehemet Ali—takes 6 per cent. more in the port of Djidda. (Lord Valentia, ii., 303, 309.) The large quantities of goods that are constantly passing from India, Abyssinia, Egypt, Syria, &c., to all the trading towns of Arabia, have also their stated rates of duties; and the income derived from them is so great, that Mehemet Ali cheaply purchased his popularity in his new dominions by foregoing the settled tribute which had formerly been paid in them. One of his first acts was a declaration, that the inhabitants of the Hedjaz should be wholly free from taxes. (Burckhardt's Notes on Bed., p. 306.) The city of Medina was said to be impost free, even before this period. (Ali Bey, ii., 137.)

Certain articles of commerce are monopolies in the hands of the governments; as salt in the Hedjaz, and the same article and sulphur in Oman. (Burckhardt's Travels, i., p. 65; Fraser, 16.) Besides which, the sovereign is frequently possessed of large landed property in private right, which he lets out precisely like any other landlord; and in certain cases, as in those of the imams of Muscat and Yemen, he is also the most considerable merchant in his own dominions. (Niebuhr, par. ii., p. 183-184; Fraser, 16.)

These are all legitimate sources of revenue; but the evil in this and all other Mohammedan countries is, that the governments, being despotic, practise and tolerate all sorts of extortion. Before the conquest of the Hedjaz by the Egyptians, it was customary for the sultan sheriff of Mecca to fill the prisons with persons upon charges of disaffection to his person, that they might purchase their lives and liberties by large fines. (Burckhardt's Travels, i., p. 416.) In Yemen the dolas receive the taxes and customs of the towns, pay the troops, the judges, and other public functionaries, and transmit the balance to Sanaa, the seat of government. In this arrangement, the iman squeezes all he can from the dola; and the latter, whose nominal income is very trifling, resorts to any means, however infamous, of realizing a large income for himself. The chief sufferers in these transactions are the Indian and other foreign merchants. When Lord Valentia was at Mocha, the dola used to confine the Banians and Jews in a close room, and fumigate them with sulphur till they purchased their release at the price he chose to stipulate! (Niebuhr, par. ii., p. 183; Lord Valentia, ii., p. 353.) The collection of the customs, too, is attended with considerable fraud; and it is in the power of the officer to favour his friends, and oppress strangers, without incurring any responsibility. These abuses have, however, been considerably modified in the Hedjaz since the establishment of the Egyptian power. (Lord Valentia, iii., p. 235; Burckhardt's Travels, i., p. 98, 417.)

The Bedouins pay no taxes, except the tribute exacted by the Wahabee chief. The sheikhs derive no income from their tribes: their only source of revenue, beyond their private property, consists of the tribute collected from the villages in their neighbourhood, and from the caravans that cross the desert. Formerly, the Bedouins in the neighbourhood of Mecca paid a nominal impost to the sultan sheriff, but this was given up by Mehemet Ali. The Bedouin sheikhs have, however, few or none of those expenses to sustain which fall upon the sovereigns of the settled districts. The tribes are the sheikh's soldiers, and receive no pay; and the emoluments of the kadis depend upon the cases brought before them; being paid, according to the value of the property in dispute, by the party in whose favour they decide. (Niebuhr, par. ii., p. 327-333; Burckhardt's Notes on Bedouins and Wahabees, p. 67-69, 306.)

The tribute exacted by the Wahabee chief, wherever his power extends, consists of the *alms*; the giving of which is a fundamental law of the Mohammedan religion, but the payment of which had been always left to every man's conscience, till the Wahabee chiefs compelled their subjects and tributaries to deliver them for distribution into their hands. The Mohammedan law had minutely fixed the proportion of these alms to the property of the donor, and to that law the Wahabees have rigorously adhered. For five camels they exact one sheep for tribute; 900 camels pay four camels of four years old; and between these extremes the rates vary in every possible variety. For herds no tribute is exacted under 30 heads, for which a calf of two years is paid; 129 heads pay four oxen and three cows. For sheep, one is claimed for all numbers between 40 and 120; three for all between 120 and 400; for 400, four are taken, and after this, one sheep for every hundred in the flock.

For all horses above five, a sequa per head is paid, or 2½ per cent. on the value of the beast. For money, all sums above 500 dirhems (about £130) in silver, or 30 miscalas (about £160) in gold, pay 2½ per cent. (Burckhardt's Notes on Bed., p. 305; D'Osson, *Tableau Général de l'Empire Ottoman*, ii., 413-418.) The Wahabee chiefs divided this tribute into two parts; appropriating that derived from the Bedouins to their own use, and that from the towns to the public service. They have also introduced some changes in the collection of the tribute of produce, which have materially relieved the cultivator. Where water was abundant, they continued to draw the tenth; but where it is deficient, they have reduced the tax to a twentieth part. Merchants in the Wahabee country pay 2½ per cent. upon their property yearly, stating its amount upon oath. (Burckhardt's Notes on Bed., p. 306.)

Arabia has been supposed to contain from 12,000,000 to 14,000,000 inhab., though this is probably beyond the mark. The nomadic habits of the greater part of its population, and the number of petty states into which the settled pop. is divided, and the little that is known with respect to most of them, renders it impossible to assign either their limits or their population. According to Balbi, the imams of Yemen, or Yemen Proper, and the imams of Muscat, on the coast of Omar, have respectively,

*Imam of Yemen.*  
Superficial extent, 58,000 sq. m.  
Pop. 2,500,000.  
Revenue, 125,000,000. starl.  
Army, 5000 men.

*Imam of Muscat.*  
Superficial extent, 55,000 sq. m.  
Pop. 1,800,000.  
Revenue, 105,000,000. starl.  
Army, 1000 men.  
Navy, 1 ship, 3 frigates, 20 inferior vessels.

Density of pop., 47 per sq. m.

Density of pop., 31 per sq. m.

The Hedjaz has been very well surveyed, especially by Ali Bey and Burckhardt, but its varying population, owing to the influx and efflux of pilgrims, together with the crowd of traders who are constantly passing between its shores and distant countries, renders it difficult, if not impossible, to assign its real numbers with any tolerable accuracy. Probably, however, it is more densely peopled than either Yemen or Muscat.

The states of Yemen, as enumerated by Niebuhr, are the following:

- |                     |                    |
|---------------------|--------------------|
| 1. Yemen Proper.    | 8. Sahan.          |
| 2. Aden.            | 9. Nedjiren.       |
| 3. Kankeban.        | 10. Kachran.       |
| 4. Haschid-u-Bekel. | 11. Dejof.         |
| 5. Abu-Arish.       | 12. South Khanlan. |
| 6. Beled-el-Kobell. | 13. Nohm.          |
| 7. North Khanlan.   | 14. Jaffa.         |

There are, also, a great many little states upon the Persian gulf; and Hadramaut consists of insignificant sovereignties, mostly of not greater extent than a mile or two round the town where the chief resides. (Niebuhr, par. ii., p. 160-165, 267-292, &c.)

ARABKIR, a town of Asiatic Turkey, pachalik of Sivas, cap. sanjak, 7 m. N. Euphrates, and 80 m. N.N.E. Malatia, lat. 39° 5' N., long. 39° E. It is said to be well built.

ARACAN, a country of Asia, called by the natives *Rak-haing*, extending along the W. coast of the great E. peninsula of S. Asia, acquired from the Birmees, by the British, in 1824. It lies between 15° 53' (cape Negrais) and 21° 30' N. lat., and 92° 20' and 94° 14' E. long.; having N. the river Nauf, which separates it from Chittagong, E. the Yeoman-dong mountains, dividing it from the Birmees dominions, and W. the Indian ocean; the two latter boundaries meeting at an acute angle at cape Negrais, its S. extremity: length N. to S., about 500 m.; breadth, at its N. end, 90 m.; but thence southward continually decreasing; area, 16,250 sq. geog. m. (Pemberton); pop. said to be about 230,000 only, whereas, in 1795, it was estimated, but probably much beyond the mark, at 2,600,000. (Pemberton's Report on the E. Frontier of British India, 8vo, Calcutta, 1835, p. 83, 84; Captain Laws, in the *Geographical Journal*, i., 175.)

The Yeoman-dong, or Anoo-pectoo-moo mountains are a branch from those that bound S. the vale of Assam; and form the E. boundary of both Aracan and Chittagong. Their heights vary from 9000 to 9000 feet: Table mountain, in 21° N. lat., and 93° E. long., is 8340 feet above the level of the sea. Near lat. 20° they take a sudden turn E. far about a degree; but in general their direction is N. to S.; they are covered with forests, and have numerous passes, the chief being those of Khyounzab and Gos in the Birmees, and Tongo, Talak, and Aeng, in the British dominions. They are, in almost every case, mere narrow footpaths. (Ritter, *Ersk.* vol. i., p. 308; Pemberton, p. 99.)

The country, generally, is diversified with hill and vale; but on the N. border and the sea shore there are low and marshy tracts. The rivers run mostly in a S.W. direction, and are frequently navigable for trading vessels of some magnitude; the largest is the Aracan (properly Kuladyne), which rises in the Birmees dominions, near 23° N. lat., and

## ARACAN.

discharges itself in 30° 15' by several mouths; on one of its minor branches is situated the town of Aracan, accessible to vessels of 350 tons burden. The other principal streams are the Naaf, Aeng, Mion, and Sandoway rivers, all in some degree navigable. (*Hamilton's Descr. of Hindoostan*, vol. iv, p. 891; *Pemberton*, p. 7, 8.)

The coast, in the central part of Aracan especially, contains many good harbours, is much indented by creeks, and studded with islands and rocks, which render the mouth of the Aracan river somewhat dangerous to approach in the S. W. monsoon: during the rest of the year, however, the water is smooth, and there are good anchorages all along the coast, in from 6 to 30 fathoms, with a muddy bottom. (*Geogr. Journal*, i, 175; *Hamilton*, p. 890, 901.)

The principal islands are Cheduba, Ramree, and Akyah, between the rivers Kulsadyne and Mion. They are usually separated from the main land by narrow channels, and partake of the same natural aspect. (*Ritter, Erdk.*, vol. iv, p. 368.)

The climate is decidedly unhealthy, except in a few spots, as Kyook-Phyoo, on the N. side of Ramree, and especially hostile to Europeans, who are attacked by intermittent fevers, and other effects of malaria. During the Birmanese war the troops died in great numbers from these causes. The country is inundated by heavy rains during the S.W. monsoon, which begins in May and ends in October. In 1833, from June to October, 196 inches of rain had fallen; during the other portion of the year it is often enveloped in heavy fogs; and violent showers sometimes occur in December, February, and April. In 1833, the maximum height of the thermometer in July was 80° Fahr., in August 94°; the minimum in both months 77°. (*Ritter, Erdk.*, p. 317; *Geogr. Journal*, i, 175.)

The abundance of forests which cover the mountains have hitherto been insurmountable obstacles towards any knowledge of their geology. The primitive rocks that have been seen are mostly slate. The lower hills consist chiefly of sandstone, with a stiff clay occasionally intermixed; on every part of the coast coral and shell-fossils are abundant. A low alluvial soil extends over the whole of the country from the foot of the mountains to the sea.

Little systematic information has been collected as to the products of the country. Salt is largely produced in the creeks, &c.; its export has lately increased very rapidly, and is now (1837) estimated at about 250,000 maunds. Gold and silver are said to be met with; jungles of mangrove crowd the banks of the rivers; firs are common N. of the Aracan river; teak, bamboo, *red jural*, too, &c., are found in the forests, and since the British occupation have been used for ship-building; the sugar-cane, cocoa, palm, indigo, cotton, rice, red pepper, cucumber, melon, plantain, mango, jacko, orange, and other fruits are indigenous; elephants, cattle, birds of many kinds, fish, silkworms, and bees are found in great plenty. (*Hamilton's Descr.*, vol. ii, p. 800; *Ritter, Erdk.*, p. 319; *Pemberton*, p. 14.)

About 11,677 doona, each don 635 acres, or 115 sq. m., are cultivated with rice; miscellaneous culture occupies about 8 sq. m. more; there being thus not 1-133d part of the whole country brought into tillage: the lands round Aracan are the best. Next to rice, indigo and cotton are the chief objects of culture; the chief farmers are Mussulmans, the Mugh tribes subsisting generally by hunting and fishing. The houses are bamboo huts, raised on posts four feet from the ground, to preserve them during the inundations, built often in thick jungles, or along the sides of rivers, and surrounded by small patches of indigo, cotton, tobacco, and fruit; even in the principal towns the houses are not of a more substantial material. Since the British occupation, articles of civilized life have been largely introduced into the markets; the imports consist of Indian and European goods, and betel nut; the exports, of rice, paddy, wood, salt, oil, buffalo hides and horns, elephants' teeth, sugar, cotton, tobacco, silk, wax, &c. The exports from Akyah, the chief port, during seven months of the year 1833, were of the value of 93,800 rupees: the chief trade is with Bengal and Chittagong. The public revenue, which has been progressively improving since the British occupation, amounted in 1836-37 to 525,000 rupees; but is as yet hardly sufficient to pay the government expenses. British Aracan extends as far S. as 17° 52' N. lat., and is governed by three civil functionaries, one placed over each of the three provinces of Akyah, Ramree, and Sandoway; and all under the superintendence of the British governor at Chittagong. The troops employed by the government are only eight companies of sepoys; viz., two at Akyah, two at Sandoway, and the other four at Kyook-Phyoo, the chief military station, and where also a part of the flotilla used in the late war is laid up. The inhab. are 1-10th Birmanese, 3-10th Mohammedans and Indians, and the remainder *Yekins* or *Kikins*, as they call themselves, the Mughs of the Europeans. The latter are of middle height, with a broad face, high and prominent cheek bones, the nose flat, and the eyes like those of the

## ARAD.

Chinese: they are cunning, and addicted to stealing but not to falsehood. Their language and religion resemble those of the Birmanese; the latter, however (that of Buddh), they do not adhere to very strictly, since they do not abstain from animal food; Guadma is a celebrated idol among them, and they take as their vulgar era the period at which he introduced Buddhism into Aracan; the present year, 1838, is with them 1900. There are two or three priests in every village, who occupy themselves chiefly in the tuition of the children in schools, which are voluntarily supported and open to all. The Aracanese are by no means uneducated; almost all of them can read and write; the latter they practise with a chalk pencil on a paper made from the bark of a tree: their records are kept on palm-leaf, lacquered in Japan or red upon a gilt ground. The people are fond of finery; the dress of the women is a red binder wrapped closely round them, over this a robe reaching to the knees, and the petticoat fastened loosely on one side all down, so that in walking, the whole of one limb is exposed. Women are not kept secluded, but enjoy as much liberty as the other sex. Slavery in all its forms is tolerated. Marriages are arranged by the parents of the parties; solemnized by feasts, and ratified by the married couple eating out of one dish. If they separate at a future time at the wish of the husband, he must take upon himself all his wife's debts; if such a determination originate with the latter, she takes them upon herself, but can demand 25 rupees from her husband. If a man be in want of money, he may pawn his wife; but if she become pregnant in consequence, he can claim her again, and the contract to pay becomes null and void. The dead are either buried or burned.

This country has been very greatly improved since it came into the possession of the British, previously to which it was in the worst possible state. The bands of robbers by which it was infested have been extirpated; and the habits of the bulk of the people materially improved. With one exception, there was no instance of dacoity (robbery) in the principal district of the prov. of Akyah during the two years ending with 1837. (*Moulmein Chronicle*.) The introduction of tranquillity and commerce has awakened a spirit of industry, and rendered the people cultivators, salt-manufacturers, and traders. Akyah is daily becoming of more and more importance. (*Palen's Hist. and Statist. Sketch, Asiatic Researches*, vol. xvi.; *Pemberton*; *Ritter*, vol. iv, p. 325; *Lowe, in the Royal Geogr. Journal*, i, 177.)

Before 1783, Aracan was independent, though often ravaged by the Moghuls and Peguans: in that year it was conquered by the Birmanese, and governed by their viceroys, whose oppressions depopulated the country, causing many of the inhabitants to fly to Chittagong and Tipperah, where they settled; and others to become jungle-robbers. A revolt broke out in 1811, and the violation of the British frontier by the Birmanese, both then and subsequently, was the cause of the Birmanese war of 1824; which ended in the cession of Aracan to the British.

ARACAN, a town and cap. of the above prov., on an inferior branch of the Kulsadyne river, which is here crossed by several lofty wooden bridges, 50 m. N.E. Akyah, lat. 30° 44' N., long. 93° 96' E. Pop. (1835) from 8000 to 10,000. It forms an irregular square, walled on all sides except the N.E., where it touches a shallow lake. As a fortress, however, it is worthless, being commanded by various hills in the neighbourhood. S. of the principal street, which runs E. and W., are the ruins of an ancient palace and fort, the latter surrounded by a triple enclosure of stone patched up with brick. There are many pagodas, both in the town and on the heights around it. Next to Akyah it has the best market in the prov. for British manufactures and the silks of Pegu, and its river is navigable for boats at high tide; but its consequence has been gradually diminishing since Akyah began to rise into importance. Aracan was taken in 1783 by the Birmanese, who captured much booty, including a large brazen image of Guadma, held in the highest veneration, and other idols. (*Pemberton's Report*, &c., p. 80; *Hamilton's Hindostan*, vol. ii, p. 804.)

ARAD, a town of the Austrian empire, on both sides of the Maros; that part which is on the N. bank, or Old Arad, being in Hungary, and the other, or New Arad, in the Banat, 37 m. N. Temeswar, lat. 46° 9' 58" N., long. 21° 18' 3" E. Pop. of both parts near 18,000.

New Arad is strongly fortified; and Old Arad is the residence of a Greek bishop. The most opulent inhabitants are the Jews, who are also very numerous. "They are greatly favoured, being allowed exclusive monopolies of tobacco, corn, and other commodities." (*Walsch*.) The town is the entrepôt of the products of a large tract of country, which are here embarked on the Maros, and sent by the river to the Danube, and thence to Germany, Hungary, the Black sea, &c. On a weekly market day, Dr. Walsh found the streets choked up with cars and carts, of which he was assured there were no fewer than 7000 in the town: filled with produce, principally for shipment. On inquiry, he

## ARAFAT, MOUNT.

found the prices of different articles to be, wheat 8s. a quarter; wine 2½d. a bottle; delicious Hungarian wine at the tavern, 10d. per do.; beef, 1½d. per lb.; mutton, 1½d. do., &c. (*Walsh's Journey from Constantinople to England*, p. 216).

**ARAFAT (MOUNT)**, a hill of Arabia, 15 m. S.E. of Mecca, consisting of a granite rock about 150 feet high, a principal object of the Mohammedan pilgrimages to that city.

**ARAGON**, one of the ancient divisions of Spain, formerly a separate kingdom, comprising the provinces of Zaragoza, Huesca, and Teruel, lying between 40° and 42° 35' N. lat., and 40° E. and 5° 7' W. long., having N. the Pyrenees, which divide it from France; E. Catalonia; S. Valencia; and W. Navarre and Castile; length, N. to S., 215 m.; breadth, 65 to 135 m.; area, 14,693 sq. m.; pop. (1833) 734,685. It is a basin every where surrounded, except on the E., by mountain ranges; on the N. offsets from the Pyrenees extend into the prov. as far S. as lat. 42° 10', inclosing many picturesque and fertile valleys; the Sierra Mocosayo Cuenca, Moaña and Albarracín separates it from Castile, and those of Morella from Valencia. Another distinct chain runs parallel to the latter through the S. part of Aragon, from N.W. to S.E.: between the Sierra and this chain is the valley of the Xiloca; and between this latter chain and the Pyrenees is the extensive plain intersected by the Ebro. This, which is not only the largest of the Aragonese rivers, but the largest river which has its embouchure on the E. coast of Spain, runs through the prov. in a S. easterly direction, dividing it into two nearly equal parts. Exclusive of the Ebro, there are a great number of other rivers, mostly its affluents, having their sources in the mountain ranges that bound on either side the central plain: as the Gállego, Cinca, and Segre, from the N., the Xiloca, Guera, Agües, St. Martin, Gualdoulpe, and Alguas, from the S.: the Tagus and the Guadalquivir have, also, their origin in this region. Salt is every where abundant, and gold, silver, copper, iron, lead, nitre, alum, &c., are met with, but the mines are mostly neglected. The mine of rock salt at Remolinos, near Alagon, is, however, extensively wrought, furnishing supplies not only for the prov., but also for Catalonia and other parts of the kingdom. Climate temperate and warm in the valleys and plains, but on the Pyrenees the snow is often found five or six feet deep in June, and violent storms occur in winter. The country is, however, universally healthy. The soil of the plains is, in general, fertile, and well adapted to the growth of most products of temperate climates. Though agriculture be very defective, more corn and wine are produced than are required for home-consumption; and there are also large supplies of fine fruits, with legumes, flax, hemp, oil, saffron, liquorice, madder, espargo, barilla, &c. Previously to the late war with France, the stock of sheep in the prov. was supposed to exceed 2,000,000; and though it must have been much reduced during that contest, there was, according to Miñano, previously to the present civil war, an annual export of 250,000 arrobas of wool. Horned cattle are scarce. Wolves and bears are met with in the mountainous districts; game is plentiful, and the rivers abound with excellent fish, especially eels and trout. The manufactures are confined to common woollen and other cloths, cordage, and hempen articles, gunpowder, with soap, vinegar, brandy, paper, hair, earthen-ware, and leather. The manufacture of silk in the capital and other towns has greatly diminished. Aragon is divided into 13 districts or governorates: its chief cities are Zaragoza, Huesca, Calatayud, and Teruel. The first is an archbishopric; there are six bishoprics and two universities. Several roads cross the prov., passing to all the great towns; and the imperial canal, from Tudela to Zaragoza, 10 ft. in depth and 70 ft. wide, commenced in 1589 by Charles V. and completed to its present extent in 1673, serves the double purpose of promoting trade and navigation. The Aragonese are strong, and well built; not so active as the Catalonians, but industrious, brave, and honest. They are intelligent, and desirous of knowledge, but proud, sullen, and extremely opposed to foreign interference with their government. The original harsh Aragonese dialect has now become intermixed with the Castilian. The male peasantry wear a waistcoat and a round jacket over it, drawn together by a thong, and a large round hat, or sometimes two, to work in during the heats of summer. The dress of the women is odd and grotesque; it consists partly of two woollen corsets, and three or four thick petticoats one over another, the whole weighing a quarter of a cwt. Under the Romans Aragon was included in Celtiberia; in A.D. 470 it was overrun by the Goths, and in 714 by the Moors. After the expulsion of the latter, it was governed by its own kings till the marriage of Ferdinand with Isabella of Castile in the 14th century.

The gov. of Aragon, previously to the junction of its crown with that of Castile, and for some time afterward, though monarchical in form, was in principle essentially republi-  
can. The kings, who were long elective, retained

## ARAGONA.

little more than the shadow of power; it being really vested in the cortes or parliament. This supreme assembly was composed of four different *arres* or members; the nobility of the first rank, the equestrian order or second rank, the representatives of cities and towns, and the ecclesiastics. No law could pass without the assent of every *ar*; and without permission of the cortes, no tax could be imposed, no war declared, no peace concluded, nor money coined or altered. The power of reviewing the proceedings of the inferior courts, the privilege of inspecting every department of administration, and the right of redressing all grievances, belonged to the cortes; to which, however, those aggrieved did not address themselves in the humble tone of supplicants, but demanded an interference as due to them as freemen. This sovereign court was held during several centuries every year; but from the beginning of the 14th century was convoked only once in two years; the session continued forty days, and the king could neither prorogue nor dissolve the assembly, after it had met, without its own consent.

Not satisfied with having erected such formidable barriers against the encroachments of the royal prerogative, the Aragonese, by an institution peculiar to themselves, elected a *justiza*, or supreme judge, as the protector of the people and the controller of the prince. The person of the *justiza* was sacred, and his power and jurisdiction almost unbonded; he was the supreme interpreter of the laws, and not only inferior judges, but the kings themselves were bound to consult him in every difficult case, and to receive his responses with implicit deference. An appeal lay to him from the royal as well as the baronial judges, and even when no appeal was made, he could interpose by his own authority, prohibit the ordinary judge from proceeding, take immediate cognizance of the cause himself, and remove the party accused to the prison of the *mesnoscarras*, to which no person had access but by his permission. His power was exerted with no less vigour and effect in superintending the administration of government, than in regulating the court of justice. It was the prerogative of the *justiza* to inspect the conduct of the king. He reviewed all the royal proclamations and patents, and declared whether they were assailable to law, and ought to be carried into execution. He, by his sole authority, could exclude any of the king's ministers from the conduct of affairs, and call them to answer for their mal-administration. He himself was accountable to the cortes only for the manner in which he discharged the duties of his high office, and performed the functions of the greatest importance that could be committed to a subject. The Aragonese were so solicitous that their monarchs should know and feel their dependance on their subjects, that even in swearing allegiance to their sovereign, the *justiza* thus addressed him in their name, "We, who are each of us as good, and who are altogether more powerful than you, promise obedience to your government, if you maintain our rights and liberties, but not otherwise." Conformably to this oath, it was expressly declared in their constitution, that if the king should violate his compact with them, it was lawful for the Aragonese to disclaim him, and elect another sovereign, even though a heathen, in his room.

Aragon, while a separate kingdom, was the most powerful of the peninsular states. It comprised, exclusive of Aragoa Proper, Navarre, Catalonia, Valencia, the Balearic Isles, and Sardinia. The marriage of Ferdinand with the heiress of Castile, the conquest of Granada by their united forces, with the possessions they inherited or acquired in other parts of Europe and in the New World, by giving the sovereigns extrinsic, and, as it were, foreign resources, rendered them in a great measure independent of the supplies voted by the cortes at the same time that it enabled them gradually to subvert their authority. The establishment of the Inquisition was also a great blow to the liberal institutions of Aragon and other parts of the peninsula, which were finally suppressed during the reign of the bloody and tyrannical Philip II. (*Miñano, Antillon, Schetz, Allg. Erdk.* xviii., 314-317; *Robertson, Hist. Charles V.*, Introd., sect. iii.)

**ARAGONA**, a town of Sicily, Val di Girgenti, 7 m. N. Girgenti, on a hill. Pop. 5850. It is ill built and dirty, but is worthy of notice for its castle (containing a fine gallery of pictures), its antiquities, and for having in its vicinity the mud volcano of Maccaluba. This consists of numerous small hillocks, with craters on a kind of truncated cone of argillaceous barren soil, ½ m. in circuit, elevated about 900 feet above the surrounding arid plain. These craters are continually in action, making a hollow, rumbling noise, and throwing up a fine, cold mud, mixed with water, a little petroleum and salt, and occasionally bubbles of air with a sulphurous taint. Sometimes reports like the discharge of artillery are heard, and slight local earthquakes, till an eruption takes place by the ejection of mud and stones to the height of from 30 to 60 feet, the ordinary height of the spouts being only from a few inches to 2 or 3 feet. (For a

## ARACHIS, EL.

farther account of this singular phenomenon, see *Seyth's Sicily*, p. 313.

ARACHIS (EL.), see LARACHE.

ARAL (SEA OF), an inland sea or lake of Asia, in independent Tartary, between  $49^{\circ}$  and  $46^{\circ} 15'$  N. lat., and  $56^{\circ}$  and  $61^{\circ} 15'$  E. long., being about 300 m. in length from S.W. to N.E., and from about 100 to nearly 250 m. in breadth; so that, with the exception of the Caspian, it is by far the most extensive inland sea of the Old World. It has a great number of islands, particularly towards the S., and is generally so shallow, that it can be safely navigated only by flat-bottomed boats. Its waters are salt, and its coasts generally low and sandy, the country around consisting mostly of vast arid steppes. It is well supplied with fish, of which sturgeons are the most valuable; seals are also met with. The sea of Aral receives, besides smaller streams, the waters of two great rivers, the Sir or Sihoun (the *Jaxartes* of the ancients), and the Amoo or Jihoun (the *Oxus* of the ancients). But, notwithstanding it has no outlet, the prevalent opinion is, that the supply of water brought to it, and also to the Caspian sea, is unequal to what is carried off by evaporation, and that their level and surface are being gradually diminished. The extraordinary difference between the level of the Caspian and the sea of Aral, and the level of the Black sea (see CASPIAN SEA), as well as the nature of the soil in their vicinity, the traditional and historical statements with respect to their boundaries, and the opinions of the most eminent naturalists, all lead to the belief that they once extended over a much larger tract of country, and most probably made part of one great inland sea. (For further details, see CASPIAN SEA.)

ARAMON, a town of France, dep. Gard, cap. cant. on the Rhone, 16 m. E. Nîmes. Pop. 2509.

ARANDA DE DUERO, a town of Spain, on the Duero, 49 m. S. Burgos. Pop. 3500.

ARANJUEZ, (*Jara Juezo*). A town of Spain, new Castile, in a fertile and well-watered valley on the left bank of the Tagus, immediately above where it is joined by the Xarama, 98 m. S.E. Madrid, and 93 m. E.N.E. Toledo. Lat.  $40^{\circ} 1' N.$ , long.  $3^{\circ} 37' W.$  Pop. 4500, unless the court be there, when it used to amount to 8000 or 10,000. It derives its entire celebrity from its royal palace, commenced by Philip II., and enlarged and embellished by several of his successors, particularly Charles IV., who added the fine gardens and groves along the banks of the Tagus, and a small but elegant pleasure house, the *Casa del Labrador*. The palace is a handsome square building, with a fine marble staircase, containing many fine sculptures, and (as well as the church and monasteries of the town) paintings of the Spanish and Italian masters, especially of Raphael Mengs. The town is built after the Dutch model; having broad and well-paved streets, houses uniform and painted, fine promenades, a square adorned with many handsome edifices, &c. The court used to occupy this palace from Easter till the end of June; but in July and August the situation is accounted unhealthy.

These statements apply, however, rather to the former than the present state of Aranjuez. The palace and gardens suffered severely during the late war with France. In 1808, the park and pleasure grounds were split into patches, and applied to agricultural purposes.

Another eye has seen the golden ear  
Indrown the slope, and nod on the parterre,  
Deep harvests bury all that pride had planned,  
And laughing Ceres resumes the land.

At first the cultivators obtained very large returns, and the population of the town and its vicinity rapidly augmented. But this extraordinary productiveness, the result of the improved state of the lands, speedily disappeared under the scourge of continual cropping; and it is doubtful whether they yield more at this moment than they did previously to their being broken up. (*Mémoires, Schütz, &c.*)

ARARAT (Turkish *Aghar Dagh*, Armenian *Macis*), a famous mountain of Armenia, on the confines of the Russian, Turkish, and Persian empires, its principal summit being about 35 m. S. Erivan, lat.  $39^{\circ} 30' N.$ , long.  $44^{\circ} 25' E.$  Its base E. and N.E. is washed by the Araxes, from the low plain of which it rises most majestically to an immense height. It forms the termination in this direction of a range of mountains connected with the Caucasian chain; but these, though elevated, seem, in comparison with Ararat, so low, as to strengthen the impression of sublimity and greatness made by contemplating it singly from the plains to the E. It consists of two enormous conical masses, one much higher than the other, but the lowest ascending far within the line of perpetual congelation. Repeated efforts had been made at different times to reach its summit, but this Herculean task was not effected till 1830, when Professor Parrot, of Dorpat, accomplished, by dint of extraordinary perseverance and energy, what had previously been reckoned all but impossible. He determined the altitude of the highest peak to be 16,900 French, or 17,930 Eng. feet above

## ARAUCAANIA.

the level of the sea, being about 4760 feet higher than Mont Blanc. The summit is described as a circular plain of limited dimensions, united by a gentle descent to the less elevated peak towards the E. The whole of the upper region of the mountain, from the height of 12,750 feet, is covered with perpetual snow and ice; and not unfrequently avalanches precipitate themselves down its sides with tremendous noise and fury.

On one of the sides of the principal cone is a chasm or cleft of prodigious depth, having much the appearance of the crater of a volcano. Tournesfort says, that its precipices are blackened as if by smoke, but that nothing issues from it except torrents of muddy water; but the mountain presents many appearances of volcanic action, and Dr. Reibogge affirms that he has seen fire and smoke issue from this chasm for three days together.

Ararat is not only an object of superior interest from its mass and height, but still more from the associations with which it is connected. It is believed to be the Ararat of Scripture, on whose summit the ark rested. (Genesis, viii., 4.) And certainly it would be difficult anywhere to find a mountain that seems better entitled to the honour of serving as a stepping-stone "à Nos peurs descendre du ciel on terre avec la route de toutes les créatures." (Tournesfort, *Voyage du Levant*, ii., p. 360, &c.; *Missionary Researches in Armenia*, p. 267, and *Introd.*; *Kinnear's Persian Empire*, p. 396.)

ARAS (an. *Araxe*), a river of Asia, which has its source in the mountain land of Armenia, 98 m. S. Erzerum. It flows E. past the N. base of mount Ararat, then S.E. to Curdasi, and N.E. to Djir, where it falls into the Kur, 50 m. in a direct line from the embouchure of the latter in the Caspian sea. Its entire course may be estimated at 480 m. Notwithstanding its rapid current, it is in many places fordable.

ARAUCAANIA. The territory known under this name is situated to the S. of Chili, and comprises the country lying between  $37^{\circ}$  and  $30^{\circ} 50'$  S. lat., and  $70^{\circ}$  and  $75^{\circ} 50'$  W. long. On the N. it is bounded by the river Bioleio, which divides it from Chili; on the S. by the Valdivia or Calacalla; on the E. by the Andes; and on the W. by the Pacific ocean.

The Araucanians divide their country into four *Batalnaps* or tetrarchies, viz.:

1. Languenmapu, i. e., the maritime country.
2. Lelpunmapu, i. e., the plain country.
3. Inapirmapu, i. e., the country at the foot of the Andes.
4. Premapu, i. e., the Andes country.

Each tetrarchy is governed by a Toqui or tetrarch, and is subdivided into nine *Allaregues* or provinces, at the head of each of which is an Apo-Ulmen. Each prov. is again subdivided into nine *Regues* or districts, several presided over by an Ulmen. This division existed before the arrival of the Spaniards, and is supposed to be of great antiquity.

The dignity of Apo-Ulmen and Ulmen are hereditary in the male line. In case, however, of failure, a successor is chosen by the people, and their choice is afterward confirmed by the Toqui or generalissimo. The succession is thenceforward perpetuated in the family of the individual newly chosen. The ensign of an Apo-Ulmen is a staff, with a silver globe at one end, and a silver ring in the centre. That of an Ulmen resembles the foregoing, with the exception only of the ring, which is peculiar to the former. The ensign of the Toqui's authority is a battle-axe.

The form of government comprises a mixture of democracy and aristocracy.

The natives proper of Araucania belong to the race of the Mouteches, and the name of Araucanians has been given them by the Spaniards. Their range of information is extremely limited, and though Spanish writers affirm that they have some notion of geometry, and are sufficiently acquainted with astronomy to distinguish the stars by particular names, the credibility of their account is much to be questioned.

The industry of the country is confined to a little agriculture. The Araucanians cultivate a few fruits, and make a kind of cider. Their principal wealth consists of their flocks and herds, and they possess a great number of horses of the Spanish breed, as well as oxen, guanacos, and vicuñas. The oxen and guanacos yield them a plentiful subsistence, and the wool of the vicuñas supplies them with various articles of clothing.

The Araucanians have a sort of criminal code, and the crimes which seem to be regarded as the most heinous by them are murder, adultery, robbery, and witchcraft. The latter is visited with immediate death. (*Wimmer's *arucanos Gens de l'Amérique*, vol. iv., p. 312; Wien, 1833.*) Their religion consists in the belief of the existence of a Supreme Being, besides that of many lesser deities, and also in the immortality of the soul. (*Stein's *Handbuch der Geographie*, vol. iii., p. 739; Leipzig, 1834.*) The Araucanians maintain no standing force, but every male is armed to the teeth

## ARAURE.

arms, and being naturally a warlike people, it needs no compulsion to rally them in defence of their country. None of the aboriginal race of S. America have resisted with so much obstinacy and such determined bravery all the attempts of Europeans to reduce them to a state of subjection, and to the present time their efforts have been successful, and they remain independent. They are extremely proud of having maintained their independence, and call themselves the unconquered people. They have derived from the Spaniards the knowledge and the use of cavalry in battle, and their skill in this mode of warfare is scarcely to be surpassed.

The Araucanians inter their dead in square pits, with the body in a sitting posture, placing at the side of the deceased his arms and drinking-cup if a male, and her domestic implements if a female. In the grave they also place the skeleton of a horse, interred in honour of the deceased. (*Tableaux civils et moraux des Araucans; Annales des Voyages*, vol. xvi., p. 100.)

The clothing of the men consists of trousers reaching to the ankle of woollen stuff, and a smock of the same materials, usually white, over which is thrown a piece of cloth 2 yards wide, and 2½ long, with a hole in the centre for the purpose of admitting the head. This garment is styled a Poncho. Their hats are of a conical shape. The dress worn by the women is a long white tunic, and a black upper garment fastened round the hips with a girdle, together with a small mantle called an Ichilla. The favourite colour is blue, having a greenish hue. The latter wear no head-dress, and go bare-footed. They are fond of displaying a quantity of rings upon their fingers, and ornament their arms and necks with strings of beads. Every woman is obliged to present her husband annually with a Poncho of her own making, and daily with a dish cooked by herself. (*Wimmer*, vol. iv., p. 313.) Both the men and women are exceedingly hardy, and capable of enduring great fatigue. The children go naked till their tenth or eleventh year.

A tribe called Cunchi, inhabits the country between Valdivia and the gulf of Guayaquil; and another, known by the name of the Hinilichi, that between the archipelago of Chonos and the gulf of Pennas.

The reader who may desire more extensive information upon the subject of the Araucanians, is referred to *Poeppig's Reise nach Chili und auf die Amazonasströme*, 2 vols., 4to, Leipzig, 1835-6. This intelligent traveller, who resided in these latitudes from 1827 to 1832 in pursuit of scientific knowledge, gives the most recent, and perhaps the only authentic account of this people, and his book is replete with information. The glowing pictures of the civilization of the Araucanians, drawn by Molina in his *Compendio de la Historia de Chili*, &c., and by other Spanish writers, who have hitherto been looked up to as authorities upon this subject, are clearly proved by Dr. Poeppig to be much exaggerated. The warlike deeds of the Araucanians have been made the subject of a poem by the celebrated Erilla, the prince of Spanish epic poets. Although many of the descriptions contained in the Araucana may be considered as overcharged, they are, nevertheless, the result of the author's own observation, as he was an active party in the wars carried on between the Spaniards and this people.

ARAURE, a town of S. America, rep. Venezuela, dep. Orinoco, on the Acarigua, 65 m. N.E. Truxillo.

ARBE, or ARBA, a small island in the gulf of Quarnero in the Adriatic, separated by the narrow channel of Morlacca from the coast of Croatia. Pop. 4100. It produces corn, figs, and excellent wine; and has salt lakes. Its capital, of the same name, is situated on a bay on its S. coast.

ARBELA, or ARBIL, a town of Turkey in Asia, pachalik Bagdad, between the greater and lesser Zab, on the high road from Bagdad to Mosul, lat. 36° 11' N., long. 44° E. This was formerly a large city, the cap. of the prov. of Adiabene, and is renowned in history for the final and decisive victory obtained in its vicinity, anno 331 B.C., by Alexander the Great over Darius, which was speedily followed by the death of the latter, and the total subversion of the Persian empire. But, under its present barbarian masters, Arbela has sadly declined from its former greatness, and is now an inconsiderable mud town, with about 3000 inhabitants. Part of it is built on an artificial mound, 150 feet in height, formerly surmounted by a castle. (*Niebuhr's Voyage in Arabia*, ii., p. 278; *Kinnaird's Persia*, p. 300; *Rich's Travels*, ii., p. 16.)

ARBOGA, an inland town of Sweden, prefect. Westoras, on the navigable river Utvison, which falls into the lake Mälar, near the point where the former is joined by the canal of Arboga, proceeding from lake Helmar, 160 m. W. Stockholm. Pop. 1500. It is the entrepôt for the iron, copper, &c., of the surrounding country, has a considerable transit trade, and has been the seat of several diets.

ARBOIS, a town of France, dep. Jura, cap. cant., on the Cusance, half-way between Salins and Poligny. Pop. 7131. It is a handsome, well-built town, situated in a valley sur-

## ARCHANGEL.

rounded by hills and vineyards, which produce excellent white wines. It has a royal college and a tribunal of original jurisdiction, with fabrics of earthenware, rape seed, oil, and paper; tanneries, and flattening-mills. Pichegru was a native of this town; and after the Restoration of 1815, a bronze statue was erected to him in one of its squares. We have not learned whether it still exists.

ARCADIA, the classical name of central Peloponnesus, now an incl. monarchy of mod. Greece, Morea, of which it occupies the high table-land, between lat. 37° 15' and near 38° N., long. 21° 44' to 29° 35' E., having N. Achaia, E. Argolis, W. Elis, and S. Messenia and Laconia: length and breadth about 40 m. each. Area, 1000 sq. m. Pop. doubtful. It is intersected by hill-ridges in various directions, and on the N. a lofty mountain range renders its access difficult. It contains several plains of tolerable extent, as that of Tripolizza, 25 m. long, and from 1 to 8 m. broad, with those of Londari, Mantinea, Tegea, &c. Its chief streams are the Rouda (*Alpheus*), the largest river of the Morea, and its tributaries, the Dogana, Ladon, &c.: its lakes are insignificant in size, but the Stympthalus, of classic fame, is among them. Arcadia has many geographical features in common with Boeotia: it is copiously watered, but its valleys are often quite encased by hills, and having no good outlet, the waters are but partly carried off by subterraneous channels, leaving stagnant marshes, which deteriorate the air. Arcadia, from its elevation, is much colder than the rest of the Morea; its climate is even rigorous. Much of it is uncultivated or given up to pasture, cattle-feeding being by far the most important rural occupation, the Arcadian shepherds roving about with their flocks, in families of 12 or 15 persons, living in tents, and changing their locality as fresh pastures are required. Some of the plains contain many vineyards; that of Horeia was said by Pliny and others to produce a wine that made "men mad, and women fruitful": a sweetish red wine is still made at that place, with more flavour and body than almost any other in the Morea. The Arcadians are strong and laborious, but all the operations of agriculture devolve upon the women: the men devote themselves to tending cattle, or performing necessary journeys on business. The decline of the culture and population of Arcadia dates from a very remote period. Strabo refers it, or at least the conversion of the corn lands into pasture, to the era of the foundation of Megalopolis, to settle in which city many of the smaller towns and villages were abandoned. Forests, however, have not apparently much increased; and that of Pelagus, in the plain of Pallantium (Tripolizza), has wholly disappeared. Arcadia presents, in many places, most beautiful scenery; as, for instance, the valley of Megalopolis. (See *Leake, Morea*.) The plane, fir, chestnut, oak, ilex, wild-pear, lentisk, &c., are the most common trees; deer and game are plentiful; wild boars, wolves, bears, &c., common only in the N. Arcadia, is divided into four eparchies—Tripolizza, Londari, Karienna, and Andruzzena, are its chief towns. It contains the remains of the cities of Phigaleia, Megalopolis, Pallantium, &c., besides many other interesting ruins. (*Leake, Travels in Morea*, 1830.)

ARCADIA, t. Wayne co., N. Y., 5 m. W. Lyons, 190 W.N.W. Albany. The village is situated on the Erie canal, and contains one Baptist church, two stores, besides several groceries, 100 dwellings, and about 500 inhabitants. The town contains fourteen stores, one flouring-mill, one grist-mill, fourteen saw mills, one printing-office, one weekly newspaper, two academies, 46 students, twenty-two schools, 646 scholars. Pop. 4980.

ARC-EN-BARROIS, a town of France, depart. Haute Marne, cap. cant. on the Aujon, 13 m. S.W. Chaumont. Pop. 1536.

ARCHANGEL, or ARKHANGHELSK, a government of Russia in Europe, occupying the whole country from the Oural mountains on the E. to the grand duchy of Finland on the W., and from the frontiers of Volhoda and Olonetz on the S. to the Arctic ocean and the White sea on the N. It includes, also, Novn Zembla, and some other large islands in the Arctic sea. The estimates of the area differ considerably, but it is believed, exclusive of the islands, to exceed 250,000 sq. m., or more than double the size of Great Britain and Ireland! But the largest portion by far of this vast territory is condemned to perpetual sterility. The part of it within the Arctic circle consists principally of an almost boundless expanse of sandy and mossy plains, having ice, even in the middle of summer, always a little below the surface. The country on this side the Arctic circle consists, also, of immense plains, partly occupied with forests that cover more than half the entire extent of the prov.: partly, but in a very inferior degree, by low pasture grounds; and partly with lakes, morasses, &c. Principal towns, Archangel, Ouega, Dwina, Mezen, and Petchora. Pop. not ascertained exactly, but does not certainly exceed from 250,000 to 250,000. Owing to the severity and variability of the climate, corn crops cannot be depended upon; and,

## ARCHANGEL.

In consequence, even in the southern district, where the land is most fertile, they are but little attended to; though considerable quantities of hemp and flax are raised. The principal wealth of the government consists in its immense and apparently inexhaustible forests; but fishing and hunting are the chief employments. The rein-deer is the domestic animal of the Lapianders and Samoyedes, the former occupying the N.W. and the latter the N.E. parts of the government. Among the tribes now mentioned, dried fish occupies the place of bread; and in the more S. districts, the inner barks of trees, and certain species of moss, are intermixed with meal, or substituted for it in the making of bread. Horses and cattle diminutive, and but little attention is paid to their treatment. The district of Kholmogor, on the Dwina, a little below Archangel, where the pasture is exceedingly good, must, however, be excepted from this remark. A breed of Dutch cattle, imported into this district by Catherine II., and distributed among the inhabitants, still preserves its superiority; and the calves of these cattle, being well fed, furnish the delicate white veal so much esteemed at Petersburg. (*Travels in the Russian Empire*, iii. p. 89.) Ship and boat building, and the preparation of pitch and tar, are carried on to a considerable extent. A good deal of coarse linen is made by the peasantry of Archangel, and of the contiguous districts; and they also manufacture a good deal of cordage and immense quantities of mats, with leather, tallow, turpentine, potash, &c. The population, though originally Finnish, is now essentially Russian. The Samoyedes, who are almost at the bottom of the scale of civilization, though spread over an immense surface, do not exceed 6000 or 7000 individuals. They are exempted from the Obrook and from compulsory military service, paying only the *issaak* or tribute imposed on Asiatics. The Laplanders, who are a little more advanced, do not amount to 2000 individuals. They are subject to the capitation tax.

ARCHANGEL, the cap. of the above government, is at the principal city and port of trade in the N. of Russia, on the right bank of the Dwina, about 34 m. above where it falls into the White sea, lat.  $64^{\circ} 33' 8''$  N., long.  $40^{\circ} 33'$  E. Pop. in 1830, including that of the small dependant village of Solombolok, 24,730. It is almost entirely built of wood, and has been materially improved since the fire of 1793. The principal building is the Gostinoy dwor, or bazar, for the exhibition and sale of merchandise, and its protection against fire. It is of stone, and of great extent. The marine hospital also deserves to be noticed. Archangel is the residence of a general and civil governor, and of an archbishop. There is an ecclesiastical seminary with nine professors, a gymnasium, a school of commerce and navigation, and some other educational establishments. Notwithstanding its high N. latitude, and the lengthened period during which it is annually inaccessible, it has a pretty extensive commerce. It owes this to its situation on the Dwina, one of the most important rivers of Russia, and which has been united by canals with the Volga on the one hand, and the Neva on the other. The greater part of the articles of export are brought by this channel, mostly from a considerable distance, some even from Siberia. The principal are corn, flax, and hemp, timber, iron, linseed; vast quantities of mats, potash, tallow, tar, pitch, train-oil, canvass and coarse linen, furs, cordage, &c. The exports vary materially in different years, principally according to the demand for corn in this and other foreign countries. In 1831 their total value was 14,750,756 roubles; whereas in 1834, when little corn was exported, they only amounted to 8,464,696 roubles. The value of the imports, which consist principally of colonial produce, spices, salt, woollens, cottons, hardware, &c., is always much less than that of the exports. In 1831, it amounted to 1,555,872 roubles; and in 1834, to only 659,555 do. The exports being bulky articles, employ a great number of ships, varying from 300 to 500. The harbour is at the island of Solombolok, about 1 m. below the town; and the ships are principally loaded direct from the prams, rafts, &c. that bring the produce down the river. There is a bar at the mouth of the river with from 12 to 14 fathoms water; and vessels drawing more than this must, of course, partly load and unload by means of lighters in the roads. There is a government dock-yard, with slips for building ships, about 12 m. below the town, where also are situated warehouses belonging to merchants of the city. A fishing company was established here in 1803. Exclusive of the ship and boat building, and the manufacture of cordage and canvass referred to in the preceding article, there is here a sugar refinery, several breweries, &c.

The entrance to the Dwina, where Archangel was soon after built, was discovered by the famous Richard Chancellor, the companion of Sir Hugh Willoughby in his voyage of discovery, in 1554; and from that period down to the foundation of Petersburg, it was the only port in the empire accessible to foreigners. (*Schmitzer, La Russie*, &c. p. 620; *Odley's European Commerce*, p. 94; *Russian Official Accounts*, &c.)

## ARCHIPELAGO, EASTERN.

ARCHER, p. t., Harrison co., O. 122 m. E. by N. Columbus, 293 W. It has five schools, 230 scholars. Pop. 1019.

ARCHIDONA, a town of Spain, 34 m. N. Malaga. Pop. 5000.

ARCHIPELAGO, a term applied to such tracts of sea as are interspersed with numerous and contiguous islands; but it is especially applied to the islands in the *Ægean sea*, or that part of the Mediterranean lying between Asia Minor and Greece.

ARCHIPELAGO (EASTERN). This, the most extensive archipelago with which we are acquainted, comprises a vast number of islands, some of which, as Borneo, Java, Sumatra, Celebes, &c., are of very large dimensions. It lies within the tropics between  $95^{\circ}$  and  $135^{\circ}$  E. long., and  $11^{\circ}$  S. and  $10^{\circ}$  N. lat., having N.W. and N. the Chinese sea; N.E. and E. the Pacific; and S. and S.W. the Indian ocean. It is divided by Mr. Crawford into the following five divisions, each distinguished by peculiarities of situation, climate, and products.

1st Div. From long.  $95^{\circ}$  to  $116^{\circ}$ , including Samatra, Java, Bali, Lombok, Madura, Bangka, Billiton, the Malay peninsula and the W. and larger portion of Borneo. The soil of this division is good, and suited to the production of most kinds of vegetable food. Rice is the chief subsistence of the inhabitants, who are the most civilised of the archipelago.

2d Div. From long.  $116^{\circ}$  to  $134^{\circ}$ , includes Celebes, Sumatra, Flores, Sandal-wood, Timor, and the E. part of Borneo to  $30^{\circ}$  N. lat. The soil is inferior to the former; rice is not so abundantly produced, and sago partly supplies its place.

3d Div. From long.  $134^{\circ}$  to  $130^{\circ}$ ; lat.  $10^{\circ}$  S. to  $9^{\circ}$  N. includes Ceram, Boero, Gilolo, Timor-lant, the Aroos I. and Papua. The climate differs from that of most of the other divisions: the E. monsoon is rainy and boisterous, the W. dry and temperate; the plants and animals of the 1st and 2d divisions disappear, and others take their place, peculiar to this region of the world, as the clove, nutmeg, &c. Very little rice is grown; sago forms the chief food; the natives are greatly inferior to those of all the other divisions in civilization.

4th Div. From long.  $116^{\circ}$  to  $138^{\circ}$ , and lat.  $4^{\circ}$  to  $10^{\circ}$  N. includes Mindanao, the Sooolo I., Palawan, and the N.E. part of Borneo. Products of all the former divisions are found here; but the clove and nutmeg are very inferior. Rice is consumed, but sago is the principal article of food; the natives are above those of the 3d division in civilization.

5th Div. From  $100^{\circ}$  to  $190^{\circ}$  N. lat. includes the remainder of the Philippines, and is the only portion within the limits of the hurricanes. The soil is fertile in rice, tobacco, and the sugar-cane, but not in the pepper of the 1st, nor the fine species of the 3d divisions. The manners, institutions, and language of the inhabitants differ from those of all the other divisions.

The E. archipelago is mountainous, and its principal mountains, which are often isolated, have all a volcanic character. It is very generally covered with deep forests of stupendous trees. The number of grassy plains is very small, and there are no arid sandy deserts. It is distinguished from all other clusters of islands by its periodical winds, and peculiar natural products, one of which, sago, "is such as men nowhere else subsist upon" as a chief article of food. Gold is found in almost every part, but especially in Borneo and Sumatra, the total yearly produce being estimated at 555,000 oz. Silver is believed to be native, it is very plentiful in Bangka; and there are also iron and copper; diamonds are found in Borneo; sulphur pretty generally, and salt from springs, especially in Java. Palms, bamboo, and rattans are universal; the most remarkable of these trees is the sago palm (*Metroylen sago*), one of the smallest of its tribe, seldom reaching to more than 30 feet in height, and growing only where the E. is the boisterous monsoon, a region extending W. to Celebes and Borneo, N. to Mindanao, S. to Timor, and E. to Papua: Ceram is its chief seat, and there large forests of it are found. The edible farina is the central pith, which varies considerably in different trees, as to the time required for its attaining proper maturity. At the age of perhaps 15 years the tree is cut down, and may yield 500 or 600 lbs. pith, but the average is about 300 lbs.; this is ground into powder, clarified, and made into cakes, kept dry for use: it is eaten by the natives in the form of pottage. Sago grows well only in marshy places: "a good sago-plantation or forest is a bog knee-deep." A farina of an inferior kind is supplied by the *gumuti* (*Borassus gomutus*), another palm peculiar to this part of the world, which grows in the E. island in the valleys of hilly tracts, and yields also toddy, and a fibrous epidemics used in the cordage of the native shipping. Teak is abundant in Java, and the banana grows commonly in the greatest perfection; the orange and lemon tribe, shaddock, pomegranate, pine-apple, guava, tamarind, jack-fruit, mango, &c., are plentiful; and several fine fruits, as the *clampusdak*, *mangosteen*, and *durian*, are confined to the archipelago.

## ARCHEPELAGO, EASTERN.

go. The latter is esteemed by the natives before all other fruits: it is as large as a pumpkin, its seeds being enveloped in a rich white pulp, the edible portion; and, although repulsive at first by a strong smell, a taste for it once acquired, is lasting. The copal tree is found in Palawan, and others yielding resins are plentiful: the palma christi, cocon-nut, and semum yield oil, as well as a large and handsome tree called *Kasari*, peculiar to the E. islands; benzoin, catechu, camphor, oilibannum, are the gums naturally produced, and the *pterocarpus*, yielding dragon's-blood, grows in Sumatra and Borneo. Ebony, toon, madal-wood, in Timor and the adjacent islands, sapin-wood, lignum-aloes, &c. are found; and indigo, annatto, safflower, and turmeric in nearly all the islands. The clove and nutmeg flourish in Amboyna and the Moluccas, black pepper in Sumatra, and ginger and cassia pretty generally; cubebs, cajuput (*melaleuca cajuputi*), and saesfras, in various parts, areca in all, as well as the ashler or poison tree: the *elektik*, wrongly called *ape*, is confined to Java. The sugar-cane, cotton, tobacco, capsicums, onions, cucumbers, and the sweet potato in the W. are common articles of culture: many kinds of pulses are grown as articles of food; millet is but seldom cultivated, but maize, which is next in importance here to rice, flourishes everywhere. The natives generally are very fond of flowers; those of the archipelago are mostly yellow or red; blue is rare among them; lotuses and other aquatic plants are profusely numerous. European flowers and other vegetables transplanted thither, in general soon lose their perfume and excellence; and the same is the case with those from America, which, like the pine-apple, &c., are treated with indifference by the natives. The buffalo and ox, being both of remarkably large and fine breeds, are used in agriculture; elephants are found in the Malay peninsula and Sumatra only.

The argus pheasant and bird of paradise are the most remarkable birds: the latter is exceedingly abundant in Papua, the Arcos, and other E. id. The edible birds'-nests, so much valued by the Chinese, are built in caves, most commonly on the sea-shore, by a species of swallow (*Hirundo ascutella*). Tortoises are numerous in the E.: the shores, especially in the W., profusely abound with fine fish, as the pomfret, calcap, sole, &c.; the whale fishery of the S. seas is reputed worth upward of £1,000,000 per ann.; sharks, whose fins are important articles of export to China, pearl oysters, cowries or gigantic cockles, are common; and the *Helethuria*, or sea slug, is fished for on coral reefs from one end of the archipelago to the other. The lac insect exists in most of the forests, especially in Sumatra and the Malay peninsula; and bees are very numerous in the E., but they have never been domesticated.

**Native Tribes.**—The inhab. are of two distinct races, differing widely in conformation; one having a fair or brown complexion, while the other is black. The former inhabit chiefly the W., the latter the whole of the archip., but become more prevalent as we go farther eastward. The fair or brown tribes are short, squat, and robust, 5 ft. 2 in. being the greatest height commonly of the men, and 4 ft. 11 in. of the women. Their lower limbs are large and heavy, but not ill-formed, the bosoms of the women rather small than large in proportion to their size, and the arms and limbs of both sexes are round and fleshy, rather than muscular. Face round, mouth wide, teeth remarkably fine, chin square, angles of lower jaw very prominent, cheek-bones high (cheeks therefore hollow); nose not very prominent, but never flat; eyes small and black; hair on the head long, lank, harsh, and generally black; elsewhere very scanty. This race is superior in appearance to the other, but less good-looking than most Asiatic nations. The black or Papuan race is a kind of dwarf African negro, never more than 5 ft. in height; spare and puny, with a projecting belly and buttocks, which are much lower than the African's; complexion sooty, nose and under-lip projecting very much from the face; hair woolly, in small tufts, and each hair with a spiral twist. For undressed people, the inhabitants of the archip. are strong and athletic, though not agile, nor, like some Asiatic nations, fond of practising and exhibiting feats to show the flexibility of their bodies. They have a singular strength of constitution and ability to recover speedily from bodily accidents and resist inflammatory disorders: childbirth is a function very easily performed among them. Their most prevalent diseases are remittent and intermittent fevers, worms, smallpox, and other cutaneous disorders; and as medicine is in a very low state, many perish miserably. Although so unclean as to wear what clothes they have till they drop from them, and otherwise very dirty in their homes and habits, they are temperate and abstemious, and not devoted to intoxicating liquors, although they universally use betel, areca, and tobacco, and would consume much opium were the price not so high. They are good-tempered, brave, humane, hospitable, and neither bigoted nor perfidious, but very revengeful; and under certain circumstances, such as great oppression, they have a peculiar

custom of *running-a-suck*, in which an individual, careless of his own life, rushes forward with a drawn *Aris* or dagger, striking at everything and every one he meets. They are capable of attachment, gratitude, and fidelity, have great parental and filial affection, love for their country, and a regard for truth. The faculties of their mind are generally feeble; they are slow of comprehension, credulous, and impetuous; their judgment narrow, and their reason, memory, and imagination alike weak; they are, however, good imitators, and have an aptitude for music: in their manners they are grave, courteous, and reserved; they consider it most respectful to sit, cover the head, and turn the back to their superiors. The more savage tribes go quite naked, with the exception of a small piece of cloth worn round the loins. In the Philippines the dress is nearly the same for both sexes, and between the flowing dress of the Asiatics, and the close one of Europe, consisting of two coverings: excepting the Mohammedans, all wear the head uncovered. Their teeth are usually filed and blackened: the women's ornaments are chiefly of gold: pearls are never worn. All the men are armed with the *Aris*, or dagger, which, with the spear, is the favourite weapon; the others are the club, sling, sword, and bow and arrows; the latter are often poisoned with *ancker*, which is, however, by no means a powerful drug. They are not expert in the use of fire-arms. The materials of their dwellings are commonly bamboo, ratan, palm-leaf, and wild grass, the two latter of which are used for roofing: houses in the neighbourhood of the seas are mounted on posts 15 to 30 ft. high, and superior residences are enclosed within temporary palings. They consist of but one floor, and their furniture is rude and scanty; the beds are rough mats, or often mere benches, on which a person lies down with his day-dress wrapt around him. Knives and forks are unknown, and porcelain dishes are a luxury: meals are taken sitting on the ground; the food is served up in trays of wood or metal, and grasped by hand-fuls by each as he wants it. The Polynesian language, which, in various dialects, is spoken over nearly the whole of the archip., and extends as well to Madagascar, and to the farthest of Cook's discoveries toward the E., is in every respect different from all others, and probably derived from an ancient nation originally settled in Java, where it is spoken in its greatest purity. Next to the dialect of Java, those of the Malay penins., Bugis and Macassar, are the most civilized; Sanskrit is introduced into the more improved islands of the W. division; Arabic has also been introduced by the Mohammedans. There is, in parts, also a small admixture of Chinese and Persian, Portuguese and Dutch.

By far the greater portion of the land is yet uncultivated; and of that which is, the chief part is no better than a meadow for half the year. There is a wide difference in the industry of the natives: some are roaming about their forests, but the greater number have actually made "a respectable progress in social order, tamed the useful animals, applied themselves successfully to agriculture, to fisheries, to navigation, and even to mining." The negro race are fond of hunting; all are devoted to games of hazard, and in Java, cock-fighting is a favourite amusement. They are fond of dancing; their dances being grave, stately, and slow: their music is not destitute of melody. Polygamy and concubinage are common among the higher ranks in the more civilized states. Chastity is variously appreciated; but women are never immured, and are even eligible to govern in elective monarchies as Celebes. Slavery exists everywhere except in Java. The inhab. of the archip. are clothed in cotton, mostly woven by themselves: silk they never wear generally, nor was the silk-worm ever cultivated by them; their loom they have derived from the Hindos. They know how to work many of the most useful metals, as iron, tin, and gold. Some of their musical instruments are made of a kind of bell-metal, which they cast themselves; and they sometimes use a metallic coinage. Iron, however, is but little used for tools and implements of agriculture: their cutlery is wretched, from a want of knowledge how to temper it; and they are unable to make a lock for a musket. They carve *Aris* handles, and make betel-boxes in a very superior manner, and build vessels even to 40 or 50 tons burden; but their smaller ones are better, safer, and swifter. They manufacture *be-salawag*, a kind of fish-sauce, both for home consumption and exportation: salt they obtain by the usual means of evaporation, and saltpetre by boiling the salt of caves which bats and birds frequent. The manufacture of glass is unknown; but they attempt that of gunpowder; the great request, however, in which they hold that of Europe, proves the inferiority of their own. In war, the flower of their land-forces always consists of infantry; but their naval strength is the more formidable: their warfare has always been confined to predatory descents on adjacent islands. Every description of government is to be met with in this archip., from unlimited freedom in a savage state, to absolute despotism in the most civilized; in no one is there an hereditary nobility, and the

## ARCIS-SUR-AUBE.

civil and religious authority are in every case kept distinct. The public revenues are usually derived from the three sources of taxes on land, a poll-tax, and taxes on articles consumed or imported; in Java there is a tax on fisheries. Farming the revenues is a common practice, and it is common in many states for the prince or chief to reward his officers by assigning to them, instead of paying them directly, a certain extent of land, or the amount of the value of the labour of a certain number of cultivators. The prevailing religion is Mohammedan, which was introduced into the archipelago in the 13th, and continued to spread till the end of the 16th century. Christianity prevails only in the Philippines and the Spice Is. The Mohammedan laws are those chiefly in force in the civilised parts, and are closely adhered to sometimes; but the task of avenging of private injuries mostly passes into private hands. The *lex talionis* is very popular, though almost all punishments may be compounded or alleviated by paying the party injured, his friends, or the executioner, a ransom by the *bris* is the most usual mode of capital punishment.

Trade in the archipelago is considered a most honourable employment, and even foreign persons are engaged in it. Java, Sumatra, and Celebes are the chief seats of trade: from the latter 40 vessels go annually to the N. coast of Australia, and many others to the rest of the archipelago, to collect articles for the Chinese trade, the most considerable of all, yet not of 180 years' standing. The exports to China are pepper, cloves, maca, and nutmegs, scented woods, ebony, ivory, horns, hides, tortoise-shell, sharks' fins, edible birds'-nests, gold-dust, benzoin, camphor, betel, wax, wool, tripping, European woollens and cottons. The trade with India is believed by Mr. Crawford to have commenced at the beginning of the second century of the Christian era, and is now very extensive, the value of the imports from the archipelago into Calcutta only, in 1837-38, having amounted to £252,780: these imports consist principally of pepper, tin, betel-nut, fine woods, gold and silver, wax, spices, &c. The exports to Europe and America have very greatly increased within these few years; principally in consequence of the wonderfully extended growth of sugar, coffee, indigo, &c. in Java (which see). But, exclusive of these great staples, Java sends rice to the other islands to the Cape of Good Hope, and even to Europe: sugar is sent to Europe, China, and Bengal; cotton is produced principally in the great south chain of the first and second divisions, but little, however, is sent beyond the archipelago. The chief imports are black tea, coarse porcelain, wrought iron, cottons and silks, brass and tinnedware, glass, paper, books, shoes, fans, umbrellas, paint, and toys from China; salt, tobacco, blue cotton cloths and chintzes, from India. Chintzes dyed red, green, and other bright colours, and especially in patterns of running flowers, are peculiarly acceptable to the natives. Manchester and Glasgow cottons, handsome handkerchiefs, cotton velvets and woollens, English saddlery and iron, fire-arms and ammunition, glass and plated ware, raw and wrought silks, and opium, are also in great request. These nations are ignorant of arithmetic, and, excepting in Java, 1000 is the highest number they have any term to express. Interest on money lent is very high; bills of exchange are unknown; and women are almost solely the merchants, brokers, and money-changers. (For other particulars see *Articles on the several Islands*, and the learned and excellent *History of the Indian Archipelago*, by John Crawford, Esq., F.R.S., 3 vols. 8vo. passim.)

**ARCIS-SUR-AUBE**, a town of France, dep. Aube, cap. arrond., on the river of that name, at the point where it begins to become navigable, and where it is crossed by the high road from Troyes to Rheims. Pop. 9739. There are no buildings worth notice. It has manufactures of woollen stockings and caps, an establishment for spinning cotton, *sericeries*, &c., and is the entrepôt of the iron of the valley of the Aube, and of the wire and wood-work of the Vosges. This town suffered severely during the campaign of 1814. Napoleon, who displayed equal skill and courage, repulsed at this point, with a very inferior force, one of the principal divisions of the allied army.

**ARCO**, or **ARCOH**, a town of the Tyrol, with a castle, on the Sarca, 7 m. W. Roveredo. Pop. 3009.

**ARCOLE**, a village of Austrian Italy, on the Alpina, 15 m. E.S.E. Verona. A series of sanguinary engagements took place here on the 15th, 16th, and 17th of November, 1796, between the Austrians and the French under Napoleon, when the former were ultimately defeated.

**ARCO DE LA FRONTERA**, a town of Spain, Andalusia, on the Guadalquivir, 30 m. E.N.E. Cadix. Pop. 10,000. It is situated on an elevated rock, and is of difficult access. Streets unpaved, and ill adapted for foot passengers. It has two parish churches, and some convents for both sexes. The great altar of the church of Santa Maria is much adorned. The country in the vicinity is mountainous, intersected by valleys, and very fertile.

## ARDECHE.

**ARROOT**, a marit. district of Hindostan, prov. Carnatic, presid. Madras, divided into two sub-districts or collectorates, comprising the whole country from Coleroon river on the S. to the frontier of the Nellore district on the N. and E. of Cuddapah, Mysore, and Salem, with the exception of the Chingleput district lying round Madras. The districts are divided by the Palaur river. That to the N. comprises an area of 8300 sq. m., and a pop. of 506,831; and that to the S. an area of 4500 sq. m., and a pop. of 550,230. Near the sea the country is low and well cultivated; but farther inland it is hilly, with extensive tracts of jungle. Agriculture is the great business of the natives; and this depends very much on irrigation, to assist in which many very large tanks, artificial channels, and dams have been constructed. The country is held under the ryotwar system (see *INDIA*). The revenue of the N. division amounted in 1835-36 to £287,718, and that of the S. division to £340,967. The trade in piece goods has been well-nigh annihilated by the introduction of the cheaper cottons of Great Britain; but cotton stuffs still continue to be manufactured at Pulkat and Irryrun, and there is an extensive iron foundry at Porto Novo. (*Madras Almanac for 1838*, part II., p. 17, &c.)

**ARROOT**, a city of Hindostan, the Mohammedan cap. of the Carnatic, on the S. side of the Palaur, 68 m. W.S.W. Madras, lat. 19° 54' N., long. 79° 33' E. It is well built, is enclosed by walls, and contains the ruins of the palace of the nabobs of Arroot. The population consists principally of Mohammedans who speak the Decanny dialect, which we call Hindostani. It has a handsome Mohammedan mosque, with some other Mohammedan religious edifices. The citadel, formerly of large extent and considerable strength, is now quite in ruins, its principal defences having been blown up; but the rampart next the river, as it protects the town from inundation, is kept in good repair. Arroot very ancient, and has undergone many vicissitudes. It came definitively into our possession in 1801. (*Hamilton's E. I. Gazetteer*.)

**ARDAGH**, an insignificant village of Ireland, co. Longford. The church is very ancient; and it was the see of a bishopric, united in 1685 to the bishopric of Kilmore, but separated from the latter in 1741, when it was united to the archbishopric of Tuam.

**ARDEBYL**, a town of Persia, prov. Asorbijan, 36 m. W. from the Caspian sea, between which there is a chain of pretty high mountains, near the edge of an extensive and elevated plain, lat. 39° 15' N., long. 49° 23' E. Pop. said by Mr. Fraser to amount to 500 or 600 families, or from 3000 to 3600 individuals. Houses mean and small, built of mud or sun-burnt bricks, with flat roofs like those of the poorest villages. It is surrounded by a ruinous mud wall; but the fort is a regular square, with bastions, a ditch, glacis, and drawbridge in the European style. The place is remarkable for its containing the tombs of Shakh Suffa, the founder of the Suffia dynasty of Persia, princes and of a religious sect, and of some of his descendants. It is a good deal resorted to by pilgrims, but is now falling into decay. A fine library formerly belonged to Ardebil; but it was carried to Petersburg on the town being taken by the Russians, by whom, however, it was restored to the Persians. (*Fraser's Travels on the Shores of the Caspian Sea*, p. 298; *Journal of the Geographical Society*, III. p. 37.)

**ARDECHE**, a dep. of France, lying lengthwise along the W. side of the Rhone, by which it is separated from the Drome, having S. the Gard, W. the Lozere and Haute Loire, and N. the Loire. Area, 536,000 hect. Pop. 363,752. With the exception of a narrow border along the Rhone, most part of the surface is occupied by hills and mountains belonging to the chain of the Cevennes; mount Mosen, on its W. frontier, the highest in the dep., rises to the height of 1774 toises (5770 feet) above the level of the sea. Several of the smaller hills are of volcanic origin. The cultivable soil is estimated at about 190,000; meadows, 44,000; vineyards, 37,000; forests, 98,000; mountains, heaths, &c., 148,000; and *cultures diverses* 63,000 hect. Besides the Rhone, the dep. is watered by the Ardèche, whence it derives its name, the Erioux, Doux, &c.; and it has to boast of the source of the Loire, which rises about 18 m. W. Privas. There are mines of coal, iron, lead, antimony, &c. The produce of corn is insufficient for the consumption of the inhabitants, the deficiency being supplied by potatoes and chestnuts, of which last the forests produce immense quantities. Valleys cultivated with the plough; hills generally with the spade. The inhabitants are exceedingly industrious, as is evinced by their careful system of irrigation, and by the terraces formed on the sides of the hills planted with vines. The culture of the latter is an object of great attention; and the wines of Limoux, St. Joseph, Cornas, St. Peray, &c., particularly the last-mentioned, are highly esteemed in foreign countries, as well as in France. The raising of the silk-worm and the production of silk is also a most important object in the economy of the dep. The culture of the olive has been abandoned, and the only oil used is now procured

## ARDEE.

from walnuts. Butter and cheese yield considerable returns; great numbers of fat hogs are exported; and the sheep, which are numerous, furnish annually about 410,000 kilogs. wool. Manufacturing industry is promoted with much spirit and success. The dep., which from 1820 to 1812 produced at an average 732,000 kilogs. a year of cocoons, worth 2,196,000 fr., produced, in 1839, 319,600 kilogs. raw silk, worth about 16,000,000 fr., and had at the same time 236 establishments for spinning, organizing, &c.; this silk, by which its value was raised to 33,944,250 fr., and since then there has been a considerable increase. The paper produced at Annonay and other places ranks among the very best in Europe. The manufacture is not, however, very extensive, employing only about 400 work-people, and furnishing 313,500 reams a year. Latterly, the tanning of leather, particularly of goat-skins for gloves, has become a considerable business. There are also fabrics of coarse cloth, linen, and straw hats; establishments for spinning cotton, with iron-works, &c. The dep. returns four members to the Ch. Dep. Const. In 1837, 1837. Total public revenue in 1831: very near 5,000,000 fr. Principal towns, Privas the cap., Annonay, Aubenas, &c.

ARDEE, an inland town of Ireland, co. Louth, prov. Leinster, on the Dee, whence its ancient name of Athderce, "Town on the Dee," 36 m. N.W. Dublin. A strong castle, now fitted up as a courthouse, built here by one of the early English settlers, long rendered it a place of much importance; but it was, notwithstanding, burned by Edward Bruce during his invasion of Ireland, in 1315, and again by O'Neill, during the war in the reign of Elizabeth. In 1641, it was the head-quarter of Sir Phelim O'Neill. Afterward it fell into the hands of Cromwell, and was one of the stations of the army of James II. while retreating before that of William III. previously to the battle of the Boyne. Pop. in 1691, 3568; in 1831, 3975, being about 3/4 of that of the entire parish, which in 1834 contained 6151 inhab., of whom 458 were of the Episcopal church, 45 Protestant disp., and 5648 Roman Catholics. The town, which stands in a fertile district, consists of main street, having several lanes branching from it; the dwellings, with the exception of some good houses, are mostly miserable cabins. The church, built in the early part of the 13th century, and originally forming part of an Augustine monastery, is a plain structure in good repair; the Roman Catholic chapel is a new and spacious edifice. There are schools for both sexes, under the endowment of Erasmus Smith; a savings' bank, and a dispensary. In the centre of the town is another ancient castle, now fitted up as a dwelling-house, and near the entrance is a large artificial mound, called the Castle Guard. It was incorporated towards the close of the reign of Edward III., and received additional privileges from subsequent monarchs. Its ruling charter is that of 11th Anne, under which it consists of a portreeve, 32 burgesses, and an unlimited number of freemen; the municipal government being vested in the portreeve, six burgesses, and six freemen, who hold office for life. The corporation returned two m. to the Irish parl., and continues to enjoy a revenue of about £135 per annum. The local courts have fallen into disuse; general sessions of the peace are held in January and June, and petty sessions every Wednesday: part of the ancient castle is used as a bridewell. The manufacture of malt is carried on to a considerable extent, 64,483 bushels having paid duty in 1836: there are also flour and meal mills; turf is brought from a bog, about two miles distant by the river Dee, which is here navigable for boats. A market-place for corn was built in 1710, and shambles in 1756, in which a well-stocked market is held every Tuesday. Fairs, principally for live-stock, are held in a large, enclosed area provided by the corporation, on 1st March, 10th April, 6th June, 8th July, 30th August, 23d October, and 17th December; that of October is principally for sheep. The right of tolls, which was for some time matter of dispute and turbulence, has been decided in favour of the corporation. The post-office revenue amounted in 1830 to £217, and in 1836 to £246; a daily mail car from Drogheda to Louth passes through Ardee, carrying at an average two passengers each trip. (Railroad Report, Priv. Infer.)

ARDELAN, a prov. of Persia, forming the E. division of Kurdistan. It extends 900 m. in length, from the stream Sharook to the Turkish district of Bohau, and is nearly 160 m. in breadth. From the Sharook to Senna, cap. prov., in lat. 35° 19' N., long. 40° E., the surface presents successive clusters of hills, heaped, as it were, on each other, on extensive table lands, covered with huts and the flocks of tribes passing the summer months here, and migrating in winter towards Bagdad. The soil is good, and will yield abundance of wheat and barley; but the Kurds, who prefer a pastoral life, content themselves with raising only what is absolutely necessary for their subsistence. Tobacco is cultivated in small quantities; and the extensive forests of oak on the mountains W. of Senna afford abundance of timber and gall-nuts. The former is floated down the Zab

## ARDGLASS.

in rafts into the Tigris, and the latter exported to India. Various tribes inhabit Ardeian, which are represented as robust, brave, temperate, and living to a great age; but they are averse from settled habits; war and rapine are their delight; and they scarce consider murder and parricide as crimes! They have a language of their own, and are proud of their descent, which they trace back to the most distant epochs. Some of their chiefs have great power. (Kinnear's Persia, p. 142.)

ARDENNES, a dep. in the N. of France, having N. Belgium, E. dep. Meuse, & dep. Marne, and W. dep. Aisne. Area, 517,385 act. Pop. 304,861. It derives its name from the old forest of Ardenness, which occupies its N. division. It is divided into two portions by a mountainous ridge, a ramification of the chain of the Vosges, by which it is traversed from S.E. to N.W. Principal rivers Meuse and Aisne, connected by means of the canal of the Ardennes and the Bar. Soil of very different degrees of fertility. The N. is interspersed with mountains or high hills covered with forests and heaths, and some plains in the S.W. district are naked, arid, and barren. But it has some large and fruitful valleys, particularly that of the Aisne, one of the best countries in France. The extent of its principal divisions is set down as follows in the official tables, viz., cultivable lands, 214,000; meadows, 48,000; forests, 95,000; and heaths, &c., 11,000 hect. Agriculture has recently made much progress, and more corn is now produced than is sufficient for the consumption of the inhabitants. The crop of 1831 was estimated at about 570,000 hect., while that of 1839 was estimated at 918,000. Some inferior wine is made in the S. districts. There are large herds of cattle and flocks of sheep, there being among the latter, which are celebrated for their mutton, several of the long-wooled and merino breeds. Average annual produce of wool, 560,000 kilogs. This dep. is distinguished by its mines and manufactures. Among the former are those of iron, lead, calamine, &c., with quarries of slate and marble, the former the most important of the kind in the N. of France; coal is also found, but it is not worked, at least to any considerable extent. The annual produce of iron is estimated at above 500,000 kilogs. bar, and above 700,000 kilogs. cast. Charleville produces annually about 2,000,000 kilogs. nails: the copper works furnish above 180,000 kilogs. sheet copper, with above 110,000 kilogs. brass-wire for pian. clock-work, &c., and copper for caldrons and boilers. Above 6000 individuals are employed in the arrondissement of Mézières in the nail trade, and 800 in the manufacture of ironmongery goods. Immense quantities of slates are quarried at Fumay, Fepin, St. Barnabé, &c. Fabrics of superior earthenware, glass, white lead, tanneries, &c., are met with at Montherme and other places. There are also numerous establishments for the spinning of wool; and various branches of the woollen manufacture are extensively carried on at Sedan, Bethel, &c. The great manufactory of fire-arms on account of government, carried on at Charleville, has been transferred to Feltri and Chateaufort. Besides furnishing timber and other products for exportation to the contiguous depas, and Belgium, the forests are the great source of the productiveness of the mines, timber being the fuel used in the iron and copper works. The dep. returns four m. to the Ch. of Dep. Const. In 1837, 1839. Public revenue in 1831, 8,075,980 fr. Principal towns, Mézières, Sedan, Charleville, Bethel, Givet, &c. (Hogg, France Pittoresque, art. Ardennes; and Official Tables.)

ARDES, a town of France, dep. Puy-de-Dôme, cap. cant., on a small river that falls into the Allier, 10 m. S.W., Is-sire. Pop. 1830.

ARDGLASS, a marit. town of Ireland, co. Down, prov. Ulster, on the sea-coast, a little to the N. of St. John's point, between Dundrum bay and the entrance of Strangford lough, 68 m. N.N.E. Dublin. It was formerly of such commercial importance that a mercantile company from London settled here in the reign of Hen. IV., and in that of Hen. VI. its trade exceeded that of any port to the N. of Drogheda. It was also a place of considerable strength, as appears from the gallant stand made in it by Simon Jordan, at the close of the reign of Elizabeth, who maintained it successfully during a siege of three years against the earl of Tyrone; but subsequently, in consequence of its exclusive commercial privileges having been purchased up by the Crown, and transferred to Newry and Belfast, its trade declined, inasmuch that it has been for many years merely a fishing station and watering-place, and the port for embarkation to a few passengers to the Isle of Man. Pop. in 1834, 1628, of whom 681 were of the E. church, 99 Prot. dis., and 938 R. Cath. It stands on the side of an elevated tract of land overlooking the sea, between two remarkable hills. The late proprietor expended a considerable sum on buildings suited to make it a fashionable bathing-place. It now consists of a long, semi-circular street, with lanes branching from it; a range, called the Crescent, overlooking the bay, and several detached residences. The pa. church and R. Cath. chapel are next

## ARDJA.

buildings. Schools, on the foundation of Erasmus Smith, educate ninety boys and eighty girls; there are also several private schools, in which about 100 pupils are instructed. The castle, now the occasional residence of the proprietor, consists of a range of very ancient buildings, supposed to have been stores for merchandise, converted into a castellated mansion of three stories. A manorial court holds pleas to the amount of £100. The harbour has also been much improved. It consists of an inner cove, capable of admitting vessels of 100 tons, but nearly dry at low water, and of a large outer harbour, which, having been still further enlarged by a pier, extending 300 feet into deep water, admits vessels of 500 tons at any time of tide; it has a lighthouse at its extremity. A constabulary force and coast-guard are maintained here. There are no manufactures: its trade is confined to that of grain, of which considerable quantities are shipped. Its low state in these respects is indicated by its post-office revenue, which, in 1830, was but £30, and in 1836 was not returned. In its commercial arrangements it is considered as a creek or dependency of Killough, with which port its custom duties are consolidated. (See KILLOUGH.) The fishery is the almost exclusive occupation of the working classes; that of herrings being most followed. During the season, which continues from the beginning of June to the close of August, vessels assemble here, not only from the fishing ports on the E. coast of Ireland, but from the Isle of Man and Cornwall. In 1834 about 300 vessels were collected, of which a third were Manx, a third English from Penzance in Cornwall, and the remainder Irish. Besides herrings, most kinds of round and flat fish are abundant; but they are not so much sought for. The fishermen, as a body, are orderly, well conducted, willing to work, and not more addicted to the use of ardent spirits than most others of the same grade. When disabled by age or accident, they are principally supported by their children and friends. It is observed, that though the takes of fish are frequently very large, the quantity brought in for sale never exceeds the demand. (*Fishery Report; Priv. Inf.*)

ARDJA, a town of Turkey in Asia, on the left bank of the Euphrates, 45 m. N.W. Basrah.

ARDNAMURCHAN POINT, a promontory on the W. coast of Scotland, Argyshire, being the most westerly point in the mainland of Great Britain, lat. 56° 45' N., long. 6° 8' 30" W.

ARDNAREE, a marit. town of Ireland, co. Sligo, prov. Connaught, 160½ m. W.N.W. Dublin, on the Moy, a bridge over which river connects it with the town of Ballina. It being, therefore, in reality a suburb of the latter, the particulars relative to it will be found under BALLINA.

ARDOCH, a village of Scotland, co. Perth, par. Muthil, 8 m. N. Dumbane, remarkable for having in its vicinity one of the best preserved Roman stations or forts in the empire. It is an oblong, 420 feet by 375 within the lines. On the W. side it is defended by the steep banks of the river Knial, on the S. by a deep morass and two ditches, and on the other sides, where it is most exposed, by no fewer than five parallel ditches and six ramparts. On the S. side the ditches have been partially destroyed in the process of cultivation, and the W. side has been injured by carrying (unnecessarily) the military road from Stirling through Crieff to the Highlands through part of the works; but it is now luckily inclosed and protected from further degradation. The pretorium, which is well preserved, is a square, 60 feet in the side, but it is not exactly in the centre of the station. Near this strong fort are three camps of different magnitudes, one 2800 by 1850 feet, estimated to accommodate 25,000 men; another, 1910 by 1340 feet, accommodating 19,000 men; and the third and smallest, 1060 by 900 feet, accommodating 4000 men. Nothing certain is known as to the period when, or the general by whom, this station and camps were constructed; but they are generally supposed to have been the work of Agricola. A little to the W. of Ardoch a cairn formerly existed, 129 feet in height; but it is now nearly demolished, the stones having been carried away to build houses and fences. (*Roy's Military Antiquities; New Statistical Account of Scotland, art. Muthil.*)

ARDOYE, a town of Belgium, 14 m. S.S.W. Bruges. Pop. 5500.

ARURA, or AYEM, a country of Africa, formerly independent, but now a prov. of Dahomey. Arura is also the name of the capital of the above country, about 40 m. inland.

ARDRES, a small but well-fortified town of France, dep. Pas de Calais, cap. cant., 9 m. S.E. Calais. Pop. 2150. In the vicinity of this town in June, 1590, was held the famous meeting between Francis I. king of France, and Henry VIII. king of England. The pomp and magnificence displayed on both sides, during eighteen days that the meeting lasted, acquired for the place of rendezvous the name of the *Camp du drey d'or*. The interview had no very important political result.

AREDOSSAN, a parish and sea-port town of Scotland, co. Ayr, the town being 24 m. W.S.W. Glasgow, 20 m. S.

## AREQUIPA.

Greenock, and about 1 m. N.W. Salicots. Pop. of parish in 1831, 3597; of Ardrossan, at present, (1838) from 1000 to 1100. The town was founded by the late Earl of Eglintoun. His lordship's intention was to make a harbour here that should be accessible at all times of the tide; and as a project was, at the same time, set on foot for bringing a canal from Glasgow to Ardrossan, it was supposed that the latter would become the port of the former, and that the circuitous navigation of the Clyde would be avoided. In furtherance of this design, Lord Eglintoun expended vast sums on the harbour and town. The harbour is partly formed by a small islet, called Home Isle, which shelters it on the N.W., and by a lengthened circular pier, and a breakwater. Within the extremity of the latter, there are 26 feet water at spring ebbes, shoaling gradually to 15 feet, where the pier commences. The wet docks which it was intended to construct have not been proceeded with. The town is laid out on a regular and magnificent plan; there is a splendid establishment of baths; and latterly, the place has been a good deal resorted to by visitors in the bathing season. The projected canal from Glasgow to Ardrossan not having been excavated farther than the village of Johnstone in Renfrewshire, an act was obtained, in 1827, for constructing a railway from Johnstone to Ardrossan; but hitherto it has been only completed as far as Kilwinning. There can, however, be little doubt that a railway will, at no distant period, be carried from Glasgow to Ardrossan; and when this is done, the latter will become the point whence the steam packets will sail for Liverpool and Belfast. The shipping of coal from Ardrossan has lately increased rapidly. During the year 1838 there entered the port 1963 vessels, of the burden of 108,549 tons. (*New Statistical Ac. of Scotland, art. Ardrossan; Priv. Information.*)

AREBO, or ARBON, a town of Benin, on the river For-mosa, 60 m. from its mouth. Lat. 5° 58' N., long. 5° 8' E.

ARECIFE, a sea-port town, cap. island of Launcrota, one of the Canaries, on its E. coast, lat. 28° 56' N., long. 13° 38' W. Pop. 2500. The harbour, which though small is secure, is formed by several rocky islets. It has two entrances, the N. having a depth of 12, and the E. of 174 feet at low water, with a 9 feet rise of tide. Both entrances are defended by bomb-proof forts. The inhab. are mostly engaged in the fishery on the opposite coast of Africa. (*Journal Geog. Society, vi. p. 387.*)

ARENAC, co. Mich., situated on the N.W. side of Saginaw bay, and contains about 400 sq. m. Watered by Rifle river and other streams flowing into Saginaw bay. It is unorganized.

ARENDAL, a sea-port town of Norway, on the Arendal, 75 m. N.E. Christiansand, lat. 59° 27' N., long. 8° 50' 25" E. Pop. 1800. It is mostly built on piles, and small vessels reach almost all parts of the town by means of the canals by which it is intersected. The harbour is protected by the opposite island of Tromoc. There are iron mines and forges in the vicinity; and a good deal of trade is carried on in iron and timber.

ARENDOUK, a village of Belgium, prov. Antwerp, 5½ m. E. by S. Turnhout. Pop. 2500. It has manufactures of stockings and linens, and distilleries.

ARENIS DE MAR, a town of Spain, Catalonia, 26 m. N.E. Barcelona, near the sea. Pop. 5000. It is neat and clean, has a fine parish church and a convent, fabrics of silk and cotton stockings, a school of pilotage, a yard for the building of small vessels, and anchor-forges. The women employ themselves in making lace.

ARENSBURG, a sea-port town of European Russia, gov. Livonia, capital of the island of Oesel, in the Baltic, at the mouth of the gulf of Riga, being situated on the S. side of the island, lat. 56° 15' N., long. 25° 17' 45" E. Pop. 1800. It has a castle, a Russian and a Lutheran church, a public school, and a hospital. The water in the harbour being shallow, vessels are obliged to anchor in the roads at a considerable distance from town. The articles of export consist of corn, timber, butter, cheese, tallow, hides, and seal oil. (See OESSEL.)

AREQUIPA, a city of S. America, rep. Peru, cap. prov. same name, in the valley of Quilca, on the Chile, at the foot of M. Onate, 7700 feet above the level of the sea, 30 m. E. from the Pacific ocean, and 900 m. S.S.W. Cuzco, lat. 16° 30' S., long. 73° 11' W. It was founded by order of Pizarro, in 1538. The houses, though low, on account of the prevalence of earthquakes, are strongly built; and the cathedral, a bronze fountain in the great square, and the bridge over the Chile, deserve notice. It has four convents, a college, a workhouse, &c.; and it has, or had, flourishing manufactures of gold and silver cloths, woollens, and cottons. Its environs, notwithstanding their elevation, are very fruitful; and by means of its port Mollendo, and of the road passing through it from Lima to the S., it is the seat of a pretty extensive commerce. It is very subject to earthquakes, from several of which it has sustained great injury. The accounts of its pop. differ very widely; but it may perhaps be estimated at about 35,000.

## ARETHUSA.

**ARETHUSA**, a famous fountain of Sicily, which rises close to the sea, in the city of Syracuse. Cicero says of it, *In hac tunica (Ortygia) extrema est fons aqua dulcis, cui nomen Aretusae est, incredibili magnitudine, plenioris piscium; qui factus totus operitur, nisi munitione ac mole lapidum a mari disjunctus esset.* (*In Verr.*, lib. iv., § 53.) Poetry and fable have combined to give an enduring celebrity to this fountain. It was supposed that the river Alpheus, which flows past Olympia in Greece, and falls into the Sicilian sea, did not terminate its course there; but that it continued to flow in a subterranean channel, preserving the purity of its waters, till they again reappeared in the fountain Aretusae; and in proof of this it was affirmed that things cast into the Alpheus were after a while thrown up by the fountain: Virgil alludes to this circumstance when he says,

*Sic tibi, cum ductus subter labere Sicanos,  
Dors amara suum non intermiscuit undam.*

*Eclog.* v., line 4, 5.

and it is referred to by Pliny (*Hist. Nat.*, lib. ii., § 3), Seneca (*Quest. N.*, lib. iii., § 36), and other ancient authors. The poetical account of the fountain may be seen in *Ovid's Met.*, lib. v., line 573.

This celebrated spring is now sadly changed. The sea has made its way, probably by the agency of the earthquakes so frequent here, into the fountain; so that, instead of being sweet, the water, which also is greatly diminished in quantity, in consequence of a large portion rising in the sea, is brackish and unfit for any purpose but that of washing. Its fish have disappeared with the sacred groves and temples that adorned its banks; and this glory of ancient Syracuse is now degraded into a sort of public washing tub for the poorer classes of the modern city. (*Swinburne's Two Sicilies*, ii., p. 338, 4th edit.; *Hughes's Travels*, i., p. 41, 8vo edit.)

**AREVALO**, a town of Spain, Old Castile, prov. Areia, on the Adaja, 29 m. N.N.E. Avila. Pop. 4500. Besides churches, it has two hospitals and two corn markets.

**AREZZO** (an. *Arretium*) a city of Tuscany, in the rich plain of Chiana (which sec), 31 m. E. by N. Siena, lat. 43° 18' 53" N., long. 119° 0' 39" E. Pop. 10,000. It is surrounded by walls, has a citadel, but is neither well built nor well laid out. It is the seat of a bishop, and has a Gothic cathedral. Its finest building, *le Logge*, containing the custom-house and theatre, in the principal square, has a magnificent portico, 400 feet in length. It has also numerous churches, convents, and four hospitals. There are manufactures of woollen stuffs and pins. Petrarch was born here, on the 30th July, 1304; and this also is the native country of Vannari, Bacchi, and of Leonardo Bruin, called Aretin, Redi, &c.

Arezzo is very ancient, having been one of the principal states of Etruria. After it became subject to the Romans, it was reckoned a post of great importance as a defence against the incursions of the Cispaline Gauls. It was famous for its terra-cotta vases, ranked by Pliny with those of Samos and Saguntum. (*Hist. Nat.*, lib. xxv., § 12.) The remains of the ruins of an amphitheatre are still visible. It was taken by assault by the French on the 19th of October, 1800.

**ARGANIL**, a town of Portugal, prov. Beira, 21 m. E. Coimbra. Pop. 1700.

**ARGELET**, a town of France, dep. Pyrénées-Orientales, 14 m. S.E. Perpignan, near the sea. Pop. 1907.

**ARGENTAN**, a town of France dep. Orne, cap. arrond., on the river of that name, 23 m. N. by W. Alençon. Pop. 5773. It is agreeably situated on a hill in the middle of a large and fertile plain. The walls by which it was formerly surrounded have been demolished, and its ramparts converted into agreeable promenades. It is pretty well built, has a tribunal of original jurisdiction, with manufactures of linen, lace (called *point d'Alençon*), tanneries, bleaching-grounds, &c.

**ARGENTAT** or **ARGENTAC**, a town of France, dep. Corrèze, cap. cant. on the Dordogne. Pop. 3038. There are mines of coal and lead in the environs.

**ARGENTEUIL**, a town of France, dep. Seine et Oise, cap. cant., on the Seine, 13 m. N.W. Paris. Pop. 4536. Heloise was educated in a nunnery in this town; and it was to the same place that she retired, in 1130, after the marriage of Abélard, before she became abbess of Paraclet. There is here a hospital, established by St. Vincent de Paul.

**ARGENTIERE**, a town of France, dep. Ardèche, on the Ligne, 30 m. S.W. Privas. Pop. 3000. It derives its name from mines of silver, wrought here in the 13th century. It is situated on a rock in a deep valley, has narrow, crooked streets, and is ill built and filthy. It has flatures and fabrics of silk.

**ARGENTINE**, L. Genesee co., Mich. Pop. 177.

**ARGENTON SUR-CREUSE**, a town of France, dep. Indre, cap. cant., on the Creuse, 16 m. S.E.E. Châteauroux. Pop. 4319. This town is divided into two parts by the

## ARGYLE.

Creuse. The higher and more ancient part contained a vast Gothic castle, dismantled by Louis XIV., and of which there are now hardly any remains. The bleaching grounds for woollens at this place have been long celebrated. Argenton was called *Argenteomagus* by the Romans; and medals, and other remains of that illustrious people, are still found in the town and its vicinity.

**ARGENTRE**, a village of France, dep. Ille et Vilaine, cap. cant., 5 m. S.E.E. Vitre. Pop. 3000.

**ARGENTRE-SOUL-LAVAL**, a village of France, dep. Mayenne, cap. cant., 6 m. E. Laval. Pop. 1702. It has valuable marble quarries.

**ARGOS**, a city of Greece in the Morea, in antiquity the cap. of Argolis, the kingdom of Agamemnon, and one of the most ancient and celebrated of the Grecian cities. It is situated about 2 m. from the bottom of the gulf of Argos (*Argolicus Sinus*), and about 44 m. N.W. Napoli di Romania, lat. 37° 40' N., long. 23° 44' E. Some fragments of its Cyclopean walls, and vestiges of the theatre, are the only remains of the ancient city that can be identified below the acropolis. The latter stood upon a pointed rock of considerable elevation; and great natural strength, which is now surmounted by a castle, built on the foundations of the ancient citadel. The town suffered much during the revolutionary struggle between the Greeks and Turks, but it is said to have since rapidly risen from its ruins; the buildings, however, are mean and poor. Pop. probably 3000.

**ARGOSTOLI**, a sea port town, cap. island of Cephalonia, on the E. side of the gulf of the same name, lat. 39° 10' 40' N., long. 20° 39' 15' E. Pop. from 4000 to 5000. Situation low and unhealthy, and the houses mostly mean and poor; but both the appearance and police of the town, particularly the latter have been much improved since it came under the protection of the English. The gulf of Argostoli is about 8 m. in depth by about 1½ or 2 m. in width, and has in most parts good anchorage.

**ARGUIN**, a very small island, in the gulf of the same name, on the W. coast of Africa, about 54 m. S.E. from cape Blanco. It is abundantly supplied with fresh water, and is supposed, apparently on good grounds, by D'Anville, Bougainville, Rennell, &c. to be identical with the island of Cerne, where Hanno settled a colony during his famous voyage of discovery. In modern times it has been successively possessed by the Portuguese, Dutch and French; but has been abandoned for more than half a century. The dangerous bank or shoal of Arguin extends S.E. a considerable distance from cape Blanco. It has been the scene of numerous shipwrecks, among others of that of the French frigate in Méduse.

**ARGUNSKOI**, a town and fortress of Siberia, on the Argun, 162 m. from its mouth.

**ARGYLE**, or **ARGYLL**, a marit. co. of Scotland, consisting partly of mainland and partly of islands, of which the principal are Islay, Mull, and Jura, having N. Inverness-shire, E. Perth and Dumbarton shires, S. the Irish sea and the Firth of Clyde, and W. the Atlantic. Its shores are extremely irregular, consisting of lengthened promontories and deep bays and inlets. The total area is estimated at 2,054,400 acres, of which 1,446,400 are mainland, and 608,000 islands. The rivers are unimportant; but the freshwater lakes in the mainland and islands are supposed to cover 51,840 acres. Owing to its deep bays and gulfs, the sea coast of the mainland is estimated at about 600 m. A large portion of the surface consists of heathy moors, morasses, rocks, and wild rugged mountains. Ben Cruchan, the most elevated of the latter, rises 3670 feet above the level of the sea. Woods and plantations cover from 35,000 to 45,000 acres. Lead, copper, and iron are met with, and coal is wrought near Campbellton. Good marble is found in the island of Tiree, and several other places; and the slate quarries of Easdale and Balachulish supply a large portion of the demand for Scotland. Climate mild but wet, variable, and boisterous. The entire extent of the arable land is not supposed to exceed 170,000 acres, so that grazing constitutes the main business of the farmer. Argyle is celebrated for the excellence of its native breed of black cattle; they are small, hardy, easily fed, and, when fattened in the rich pastures of the Lowlands of Scotland or England, afford the very best beef that is brought to table. The stock is estimated from 65,000 to 70,000, furnishing a large annual supply for exportation. Sheep farming is not carried on so extensively as in some other Highland counties; but lately it has been a good deal extended, and the breeds of sheep much improved. Property in a few hands. Farms of all sizes, extending from a few acres to many square miles. In various districts the practice of holding land in partnership, or what is called *run-rig*, is still kept up. Under this system a number of persons take a farm in common, each being bound for the rent. They then divide the arable land into small contiguous portions, or ridges, as equally as quantity and quality taken together—as is possible; the space falling to each tenant being determined by lot, sometimes

## ARGYRO CASTRO.

for the whole year, and sometimes only for a single season! Ploughing and most other sorts of labour are performed in common; and if, as is usually the case, any hill pasture be attached to the low ground, it is let in common. In some of the low Highland districts occupied in this way, the land falling to the share of an individual does not exceed from 3 to 7 acres, and that, perhaps, is divided into some dozen or twenty patches. It is needless to enlarge on the pernicious influence of this mode of holding land. Where it prevails it is obvious there can be nothing like industry, nor anything deserving the name of agriculture. We are, therefore, glad to have to say that, though still much too prevalent, it is rapidly declining both in this and other Highland counties, partly in consequence of the extension of the sheep farming system, and partly from many landlords having set themselves against it, and divided the lands held in common into separate possessions. Farm buildings very various: those on the largest and best farms good and substantial; but, in general, the houses of the smaller class of occupiers, and of the cottiers, are miserable hovels, sometimes without either windows or chimneys. Improved cottages are, however, begun to be introduced, and it is to be hoped that they may be universally diffused. Principal corn crops, oats and barley, especially the first. Potatoes are very extensively cultivated, and form an important part of the food of the inhabitants. Average rent of land, including islands, in 1816, 1s. 11d. an acre. Kelp is made along the shores, both of the mainland and islands; but the business has lately fallen very much off. This, also, is the case with the herring fishery, which used formerly to be prosecuted to a much greater extent than at present, in both Fyne and other arms of the adjacent sea.

Argyle is popularly divided into the seven districts of Argyle, Cowal, Kintyre, Lorn, Appin, Islay, and Mull, and contains 50 parishes. Principal towns, Campbellton, Inverary, and Oban. It had, in 1841, 23,193 inhabited houses, 10,353 families, and 192,923 inhab., having increased from 71,959 in 1801. It sends one m. to the H. C. for the co. and Campbellton and Inverary join with Ayr and Irvine in returning a m. Parl. constituency in 1837, 1532. Valued next £149,596 Scotch; annual value of real property in 1815, £227,452.

ARZEL, P. L. Washington co., N. Y., 36 m. N. Albany, 416 W. It has three churches, ten stores, two grist-mills, five saw-mills, seventeen schools, 363 scholars. Pop. 3111.

ARZYS L. Penobscot co., Me., 80 m. N.E. Augusta. It contains two grist-mills, forty-two saw-mills, eight schools, 904 scholars. Pop. 527.

ARGYRO CASTRO, a town of Turkey in Europe, in Albania, the principal place in the extensive and well-cultivated valley of Deropult, near the river Drino, on the lower declivity of the mountains on the W. side of the valley, at a short distance from the site of the old Roman town of *Hadrianopolis* or *Justinianopolis*, 45 m. N.W. Yannina. It has an imposing and peculiar aspect, being built on three separate ridges, divided from each other by deep chasms or ravines. The houses, which are mostly good, are not contiguous, but stand in various positions. "Some are placed on commanding eminences, others beneath projecting crags, and many on the ridges of precipices; but the greater part upon the flat surface of the rock, between its deep ravines: the whole appearance is singularly striking, and its fine effect augmented, not only by the minarets of its mosques, but by the grand castle or fortress, upon a much larger scale than any ever before constructed in this country." (*Hughes*, II., 300, 8vo ed.) Poesqueville estimated the population, previously to the capture of the town by Ali Pacha, at 2000 families, making probably from 12,000 to 13,000 inhab. (*Voyage dans la Grèce*, I., 223.) Mr. Hughes, who visited the town soon after its capture in 1813, states that it was supposed to contain about 15,000 inhab., which corresponds pretty closely with Poesqueville's estimate. It is probable that the pop. has not differed materially in the interval. According to Urquhart (*Spirit of the East*, II., 324), Argyro Castro contains 2000 Albanian and 800 Greek families.\* It has a good bazaar, which used to be well supplied with articles of commerce. Previously to its subjugation by Ali Pacha, it was a place of considerable industry, had a pretty extensive internal trade, and enjoyed a considerable degree of independence.

ARIANO, a town of Naples, prov. Principato Ultra, on a steep hill, in one of the passes of the Apennines, 17 m. E. Benevento, on the high road from Naples to Foggia and Manfredonia. Pop. circa 8000. It is the residence of a bishop, and has a fine cathedral, with numerous churches, convents, and *monte-de-piété*; a seminary, a hospital, and a manufacture of earthenware. It suffered much from earthquakes in 1456 and 1728, and seems lately to have been declining.

## ARKANSAS.

ARICA, a sea-port town of S. America, on the Pacific ocean, at the mouth of a small and well-watered valley, 210 m. N. W. Potosi, lat. 18° 28' 40" S., long. 70° 13' 30" W. It naturally belongs to Bolivia or Upper Peru; but it belonged in 1826, and probably still belongs, with a narrow strip of land extending as far S. as the Pavilion de Pica, to Peru. It was nearly destroyed by an earthquake in 1605; and has been ever since in a comparatively poor state. But it is the natural outlet of one of the principal mining districts of S. America, and of a large extent of country; and now that the disqualifications under which it laboured, during the Spanish régime, are removed, it will, no doubt, become a port of very considerable importance. It is a better landing place than the contiguous ports of Ilo, Mollendo, and Guila; and it is much better situated for commerce than Lamar, that has hitherto been the principal port of Bolivia. But notwithstanding its superiority to most other ports on this part of the American coast, it is, owing to the heavy surf, at all times difficult to effect a landing, and sometimes quite impossible, unless in the *balsas* of the natives. These are a sort of floats made of inflated seal-skins; and so dexterous are the natives in their management, that there is not the least risk of being upset, or even wetted with the surf. On these original and apparently frail rafts, all merchandise is landed at Arica; and the specie, and other articles of export, are conveyed to the vessels in the bay, unless the sea be unusually calm, and the surf run very low. (*Stroenzen's S. America*, III., 322, &c.)

ARIENZO, a town of Naples, prov. Terra di Lavoro, 8 m. N. Nola, and 18 m. W. by N. Naples. Pop. 11,000. It is situated on Mount Tifal, on the high road from Naples to Benevento, and has seven parish churches, a hospital, and a *mont-de-piété*.

ARIETTA, L. Hamilton co., N. Y., 73 m. N.W. Albany. It has a great extent, with a few inhabitants in its S. part. It has two stores, one grist-mill, nine saw-mills. Pop. 209.

ARIGNA, a place in the N. of the co. Roscommon, Ireland, on the W. side of Lough Allen, at which are coal and iron mines that have been worked at different times with various success; but generally with great loss to the parties carrying them on. The coal is of an inferior quality. The proceedings of a company formed in London, in 1844, for working the Arigna mines, were of so singular, or rather so disgraceful a character, as to give rise to an inquiry before a committee of the House of Commons. Full details as to these mines may be found in *Wald's Survey of Roscommon*.

ARINTHOD, a town of France, dep. Jura, cap. cant., 21 m. S. Lons-le-Saulnier. Pop. 1618.

ARISPE, a town of Mexico, in the Intendency of Sonora, near the source of the river Yaquina. Pop. 7800.

ARKANSAS, one of the Western United States, is bounded N. by Missouri; E. by the Mississippi river, separating it from Tennessee and Mississippi; S. by Louisiana, and W. by the Indian territory. It is between 33° and 36° 30' N. lat. and between 89° 30' and 94° 30' W. long., and between 19° 30' and 17° 30' W. long. from Washington. It is 240 miles long, and 238 wide, containing 54,500 square miles, or 34,800,000 acres. The population in 1830 was 30,388; in 1840, 97,574, of which 19,933 were slaves. Of the free population 49,911 were white males; 34,963 white females; 248 coloured males; 217 coloured females. Employed in agriculture, 95,353; in commerce, 215; in manufactures and trades, 1173; navigating the ocean, 3; do. rivers and canals, &c., 30; the learned professions, 301. It contained in 1840, 40 counties, which, with their population, were as follows:

| Counties.              | Total Pop. | Counties.             | Total Pop. |
|------------------------|------------|-----------------------|------------|
| Arkansas . . . . .     | 1,245      | Madison . . . . .     | 2,775      |
| Baxter . . . . .       | 9,823      | Marion . . . . .      | 1,638      |

|                        |            | Total . . . . .       | 97,574     |

The capital is Little Rock, situated on the S. side of Arkansas r., 300 m. from its entrance into the Mississippi. The other principal towns or villages are Columbia and Helena,

\* *Edinb. adv.* (3d ed., p. 264) that it contains from 4000 to 8000 inhab. I

## ARKANSAS.

on the Mississippi r., Batesville, on White r., Van Buren, on Arkansas r., Fayetteville, in the N.W. part of the state, and Fulton, on Red r.

The eastern part of the state, for the distance of 100 m. from the Mississippi, is low and wet, covered extensively with swamps and marshes, and much of it is subject to be overflowed at certain seasons. Near the St. Francis hills, and at Point Chicot, the eastern front along the Mississippi, is above the overflow. In the middle, the country is uneven and broken, and in the W. it is hilly and mountainous. There are some extensive prairies and some heavily timbered land. On the margins of the rivers the soil is generally fertile, but back of this it is poor. In many parts there is a deficiency of water. The Ozark mountains, rising sometimes to the height of from 1000 to 3000 feet, cross its N.W. part.

A range of hills, called the Black mountains, runs between the Arkansas and White rivers, extending W. from near White river to the western border of the state. A little S.W. of the centre of the state are boiling springs, the temperature of which sometimes rises nearly to the boiling point, though subject to much variation. Near these springs are ridges of hills, which rise into elevated peaks, deserving the name of mountains. Wild animals, as the deer, elk, bear and wolf, and wild fowls, as the wild geese, turkey and quail, are found in abundance. Its mineral productions are extensive, consisting of iron ore, gypsum, coal, and salt. The country is well adapted to the raising of cattle. There were in 1840, 51,479 horses and mules, 138,736 neat cattle, 62,151 sheep, 393,058 swine. Indian corn and cotton are the principal productions, with considerable wheat, &c. It produced in 1840, 105,878 bushels of wheat, 4,846,638 of Indian corn, 189,553 of oats, 953,608 of potatoes, 6,098,649 pounds of cotton, and 148,430 of tobacco. It had 90 houses engaged in foreign trade, with a capital of \$91,000; 263 retail stores, with a capital of \$1,578,719. Its household or family manufactures amounted to \$468,750. There were two cotton manufacturing with 90 spindles, fifty-three distilleries, one powder-mill, ten flouring mills, 993 grist-mills, eighty-eight saw-mills, one oil-mill, and nine printing-offices, issuing three semi-weekly and six weekly newspapers. Total capital employed in manufactures \$654,467. There is no college in this state. There were eight academies with 300 students; 113 schools with 9514 scholars.

In the eastern part, particularly on the borders of the rivers, the climate is generally moist and unhealthy; but in the middle and western part it is salubrious. Its rivers afford great facilities for commerce. The Mississippi runs on its E. border for the distance of nearly 400 miles. The Arkansas r., which gives name to the state, flows through it in a south-eastwardly direction, is a broad and deep stream, and is navigable for steam-boats 300 m. to Little Rock, and, in the spring-floods, 350 miles farther to Port Gibson, beyond the W. border of the state. White r. rises in the Black mountains, runs through a fertile and healthy country, abounding with springs and streams of pure water, and affords many mill-seats. It flows into the Arkansas r., and is uncommonly circuitous in its course. The St. Francis river rises in Missouri, and flows S. nearly parallel to the Mississippi, which it at length enters. It is boatable for 300 miles. The Wichita waters its southern, and the Red r., a majestic stream, its S.W. part.

The principal religious denominations are Methodists and Baptists: there are also Presbyterians, Episcopalians and Roman Catholics.

At the commencement of 1840, there was one bank with three branches, a capital of \$1,501,898, and a circulation of \$301,310. The state debt amounts to \$3,175,000, invested in three banks.

The constitution of the state was formed in 1836. The governor is chosen by the people for four years, but cannot hold the office more than eight years in twelve. The members of the senate are chosen by the people for four years, and the representatives for two years. The elections are wise votes. The senate can never consist of less than 17, nor more than 33 members; and the house of representatives of less than 54, nor more than 100 members. The judges of the supreme court are appointed for eight years, and of the circuit court for four years, and are all chosen by the legislature. The judges of the county courts are chosen by the justices of the peace. The legislature meets once in two years at Little Rock. Every white male citizen of the United States, and who has resided in the state for six months, possesses the rights of suffrage. No lotteries can be established, or lottery tickets sold. The legislature may establish one bank with branches, and one banking institution to promote the interests of agriculture. It cannot emancipate slaves, without the consent of their owners. Slaves have the right of trial by jury, and suffer the same degree of punishment for a crime as white persons, and no other. Courts of justice are obliged to assign counsel to the slaves for their defence.

Arkansas was a part of the Louisiana purchase. It was

## ARKLOW.

made a separate territory in 1819, and was admitted to the Union in 1836.

ARKANSAS RIVER, Ark., the next largest tributary of the Mississippi after the Missouri, rises in the Rocky mountains, in about 43° N. lat., near the sources of Louisiana, a branch of the Columbia, and the Del Norte. It forms a part of the boundary between the United States and Mexico, in the upper part of its course. Its whole length, including its curves, is over 9000 m. to its extreme source. In the summer, it pours a broad deep stream from the mountains upon the arid plains through which it passes, which so absorb its waters, that in the dry season it can be passed, many hundred miles below the mountains, without reaching as high as the knees. The Great Canadian fork enters it on the S. side, and is its largest tributary. It is so impregnated with salt in some parts as to be unfit for drink. During the periodical swell it is navigable nearly to the Rocky mountains, and at other times for 600 m. above its entrance into the Mississippi. The navigation is unobstructed by rocks, shoals or rapids. The soil on its borders in some of the lower parts is fertile; in the upper parts it is sterile. For 30 or 40 m. from its mouth, which is 300 yds wide, it passes through an inundated forest.

ARKANSAS, county, Ark. Situated in the E. part of the state, and contains 1080 sq. m. Watered by Arkansas river, which passes through its S.W. part, and by White r., which runs on its E. border, and receives bayou Agnew. Bayou Meter flows through its W. part, and enters the Arkansas. The surface is generally level; with some elevations in the W. part. There were in 1840, 6351 neat cattle, and 6810 swine, and it produced 70,834 bushels of Indian corn, 3164 of potatoes, 351,404 pounds of cotton, 1433 of tobacco. It had five stores, five grist-mills, one saw-mill, one school, 94 scholars. Pop. whites 980, slaves 361, free coloured 5; total 1346. Capital, Arkansas.

ARKANSAS POST, p. v. capital of Arkansas co. Ark., 117 m. S.E. Little Rock, 1067 W. Situated on the N. bank of Arkansas r., on a high bluff, with flats in the vicinity, inundated at times by White r. It is 50 m. from the Mississippi by the course of the river, and contains a court-house, jail, a printing-office, forty or fifty dwellings, and about 300 inhabitants.

ARKIKO, a sea-port of Abyssinia, at the bottom of the bay of Measauah; being, according to Lord Valentia, a mere collection of miserable huts. Lat. 15° 32' N. long. 39° 45' E.

ARKLOW, a marit. town, E. coast of Ireland, co. Wicklow, prov. Leinster, on the Ovoca, at its mouth, 39 m. S. by E. Dublin. It was taken possession of, and a castle erected by the first English settlers. In 1849 it was taken by Cromwell, and dismantled. A severe conflict took place here in 1798, between the royal forces and the insurgents; in which the latter were defeated with much slaughter, and their leader killed. Pop. in 1831, 3808; in 1831, 4363; being two thirds of the parish, which in 1834 had a pop. of 6594; of whom 9037 were of the E. Church, and 4357 R. Cath.

The town, placed on the declivity of a hill on the S. side of the Ovoca, which is crossed at a short distance below by a bridge of 19 arches, is divided into the Upper Town, consisting chiefly of a main street, formed of well-built houses, and of the Lower Town, called also the Fishery, from being chiefly inhabited by fishermen. The church, a handsome building in the English style, was erected in 1822. The R. Cath. chapel is also an elegant modern structure. The Methodists have a small place of worship. A male school is supported on the foundation of Erasmus Smith; two female schools by private contributions, and some others in the same manner; in which, and in private seminaries, about 550 children receive instruction. A fever hospital, with an dispensary, is in the immediate vicinity of the town. A small infantry barrack stands on the site of the ancient castle, and a coast-guard station is in the neighbourhood. Petty sessions are held every Thursday. The town is a constabulary station. The inhab. derive their support chiefly from the fisheries. There used to be an abundant summer fishery for herring and hake; but the former have deserted the coast for some years, and the winter fishery is also declining. The oyster fishery continues to be a great and constant source of employment to the fishermen, who attribute the comforts they enjoy to its continuance. The oysters are carried in boats to Beaumaris, in Anglesey, where they are laid on banks; and raised, when required, for the Liverpool market. These people build their cottages on the sandy beach; few have any kind of garden. Their exertions are much impeded by the defects of the harbour, which has a bar at its mouth, with seldom more than five feet water even at high spring tides. The boats when returning home are obliged to lie off the bar and watch the opportunity of crossing it on the rise of the wave, and few boats come in without striking. The fishermen keep up a light, at their own expense, during the season, to point out the bar. The vessels and men engaged in the fishery in 1836 were,

## ARKWRIGHT.

|                    | No. | Tonnage. | Men. |
|--------------------|-----|----------|------|
| Decked vessels     | 38  | 1174     | 156  |
| Half-decked, ditto | 90  | 790      | 540  |
| Open sail-boats    | 10  | ..       | 50   |
| Row-boats          | 5   | ..       | 90   |
| Total              | 144 | 1894     | 786  |

Malt-dry is carried on to a small extent, the quantity paying duty in 1836 being 9081 bushels. The commerce of the town, owing to the very defective state of the harbour, and the want of any kind of quay or landing pier, is very limited. The principal exports and imports for 1836, were as follows:

| Exports.                | Imports.               |
|-------------------------|------------------------|
| Corn - 548 tons.        | Coals - 4186 tons.     |
| Copper ore - 8180 cwts. | Oatmeal - 1020 cwts.   |
| Herrings - 100 barrels. | Salt - 2160 bush.      |
| Beer - 1200 gallons.    | Groceries £1063 value. |

The estimated value of which, besides a few other minor articles, was: Exports, £2677; Imports, £2763.

The markets are held on Thursdays; the fairs on the 11th of January, 29th of March, 19th of April, 14th of May, 29th of June, 9th of August, 23rd of September, and 15th of November. The post-office revenue for 1830 was £302; and for 1836, £232. The mail-coach road from Dublin to Wexford passes through Arklow; and a car, conveying on an average three passengers each trip, plies between it and Dublin, six times a week. (*Fishery Report; Rail-road Report; and Price. Infer.*)

ARKWRIGHT, p. l. Chautauque co. N.Y., 398 m. W. by S. Albany; 350 W. It contains four saw-mills, seven schools, 260 scholars. Pop. 1418.

ARLANC, a town of France, dep. Pay de Dome, cap. cant., on the Dolore, 10 m. S. Ambert. Pop. 4198. It manufactures ribands, and articles of *menue-mecerie*.

ARLES (an. *Arelas* or *Arelate*), a city of France, dep. Bouches du Rhone, cap. arrond., on the left bank of the Rhone, at the point where the river divides into two branches to inclose its delta, or the island of Camargue, 46 m. W.N.W. Marseilles, lat. 43° 40' 31" N., long. 4° 37' 47" E. Pop. cant. (the largest in France), 90,048; town, 13,342. Its situation, though pleasing, is, owing to the adjacent marshes, not very healthy; and its streets being narrow and dirty, and its houses mostly old and mean, it is indebted for its celebrity principally to the historical associations connected with its name and its monuments. It was an important town on the invasion of Gaul by Caesar, who calls it *Arelate*. It subsequently became a Roman colony; and was long a large, rich, and populous city. Its amphitheatre, (which does not, however, appear ever to have been quite finished) is a noble monument, capable, according to Martiniere, of accommodating 30,000 spectators: it is of an oval form, 1284 feet in circumference, three stories high, occupying the highest place in the city, and is older, larger, and more magnificent than that of Nismes, but not so well preserved. The obelisk of Arles consists of a single block of granite about 54 feet in height; though, unlike other monuments of the same kind, it is without hieroglyphics, it is all but certain that it has been brought from Egypt; but there are no authentic accounts with respect to it, except that, after being long buried in the ground, it was erected on the pedestal, 50 feet in height, on which it stands, in 1678. A beautiful statue of Venus, now in the museum of Paris, was discovered here in 1651; and, exclusive of the above, the ruins of an aqueduct, of two temples, of a triumphal arch, an extensive cemetery, and numerous fragments of granite and marble columns, evince the former grandeur and importance of the city. It has a cathedral and numerous churches; and has been the seat of several ecclesiastical councils. The town-hall, built by Mansard, is a handsome edifice; and it has a school of navigation, a college, a museum of antiquities, a small public library, a theatre, &c. Silk, soap, glass bottles, &c., are manufactured; and the saunages of Arles are in the highest esteem. To obviate the difficulties in the navigation of the Rhone and Durance, a navigable canal has been made from the city to the sea at Port Bouc, about 12 m. E. of the E. embouchure of the Rhone, and from the city to the Durance opposite to Cadenet. It is also connected with the canal of Beaucaire, and consequently with that of Languedoc; so that it has become the centre of a considerable and growing trade.

After being pillaged, A.D. 970, Arles was repaired and embellished by Constantine, whose son, Constantine II., was born in it. It declined under the Merovingian kings. In 855 it became the capital of a kingdom of the same name, united in 933 to that of Burgundy. It was sacked by the Saracens in 730. In the 12th century it constituted a republic; and in 1251 it submitted to Charles of Anjou. (*Martiniere, Grand Dictionnaire*, t. l., p. 413-417; *Hugo, Bouches du Rhone*, &c.)

ARLESHEIM, a village of Switzerland, cant. Bale, 4 m. S.E. Bale. It has baths and a fine botanical garden.

## ARMAGH.

ARLES-SUB-TECH, a town of France, dep. Pyrenees Orientales, cap. cant., 6 m. W.S.W. Ceret. Pop. 2223. It has hot mineral springs.

ARLEUX, a town of France, dep. du Nord, cap. cant., on the Sautet, 6 m. S. Donay. Pop. 1755.

ARLINGTON, p. l. Bennington co., Vt. Watered by Green river and branches of the Battenkill, the latter of which affords good water power. A good white marble is found. Chartered in 1781. It contains two churches, three stores, one woollen-factory, one grist-mill, six saw-mills, nine schools, 325 scholars. Pop. 1038.

ARLON (an. *Orelasum*), a town of the Low countries, duch. of Luxembourg, cap. cant., on a hill in the middle of forests, 16 m. W.N.W. Luxembourg. Pop. 3653. It has iron works, and some manufactures of linen and woollen stuffs, and earthenware. Arlon is very ancient, and was formerly fortified, and of much greater importance than at present. It was nearly burned down in 1765.

ARMA (SANTIAGO DE), a town of S. America, New Granada, on the Arma, an affluent of the Cauca, 240 m. N. by E. Popayan.

ARMACAO, a small town of Brazil, on the island of St. Catherine, that was, and perhaps is, a considerable fishing station. Lat. 37° 30' S., long. 49° 40' W.

ARMAGH, an inland co., Ireland, prov. Ulster, having N. lough Neagh, W. Tyrone and Moaghagh, S. Louth, and Down. It is about 31 m. in length from N. to S., and 20 m. across where broadest, containing 398,163 imp. acres, of which 43,478 are unimproved mountain and bog, and 18,394 water, being part of lough Neagh. Surface partly rugged and mountainous, but generally flat. Soil pretty fertile. Property to a great extent in the hands of the church, colleges, and corporations; but some noblemen and gentlemen have good estates. Minor estates numerous, and the tenures by which they are held such as to reduce them into the minutest portions. Farms very small, from two and five to twenty-five acres; those of the latter size and up to forty being deemed large. Of 1500 tenants on Lord Gosford's estate, in the barony of Fews, there are not more than sixty or seventy who occupy so much as twenty acres. This is the estate on which Mr. Blacker has introduced his system of stall feeding into the smallest farms; but though a vast improvement on the old scouring plan, it is quite visionary to suppose that there can be anything like a really good or profitable system of cultivation on such patches. Potatoes, oats, and flax are the principal crops; but a considerable quantity of good wheat is raised. There are some dairies which produce butter; and cattle of an inferior breed are reared in the mountains. Average rent of land 17s. an acre. Linen manufacture widely diffused. Cottages preferable to those in most Irish counties, with the exception of Down and Antrim. The rivers Bann and Newry being joined by the Newry canal, there is a navigable communication between the sea at Carrlingford Bay and lough Neagh. Armagh contains five baronies and twenty parishes. Principal town, Armagh. Pop. in 1821, 197,427; in 1831, 220,651. It returns three m. to the H. of C.; viz., two for the co. and one for the city of Armagh. Parl. constituency of co. 1836-7, 4041.

ARMAGH, a city of Ireland, prov. Ulster, cap. of the above co., on the Callan, an affluent of the Blackwater, 70 m. N. by W. Dublin, lat. 54° 21' N., long. 6° 37' W. It is said to have been founded by St. Patrick, A.D. 450, who is reported to have made it the seat of a college, which became so celebrated as to be speedily attended by above 1000 students! Afterward it suffered greatly from the devastations of the Danes, who were ultimately driven out in 1004. It was sacked by Edward Bruce in 1315; and again by Sir Phelim O'Neill, in 1641; and in 1688 was pillaged by the troops under William III. Since the Revolution it has gradually increased in extent and prosperity, particularly in consequence of having been made the residence of Primate Boulton; and, subsequently, of his various successors in the see; each of whom has contributed to its improvement by liberal donations or bequests. It was originally called *Drum-sailagh* and *Ardsailagh*, "the hill," or "height of sal-lows." Its modern name, Armagh, "the field on a hill," is obviously derived from its situation on a rising ground of considerable elevation. The population in 1821, was 8493; and in 1831, 9470. In 1834 the total number of inhab. was 10,764; of whom 3586 were of the E. Church, 1532 Prot. dis., and 5646 R. Catholics. The number of houses in 1831 was 1372, giving an average of 6-902 inhab. to a house.

It is well built, chiefly of a hard reddish marble, raised in the vicinity. The streets, which are well constructed, flagged, and macadamised, diverge from the cathedral down the sides of the hill on which it is built. A plentiful supply of water is conveyed through them, in pipes, from a reservoir at some distance, and they are kept perfectly clean, and are well lighted with gas. A library, containing upwards of 20,000 volumes, was built and endowed by Primate Robinson, the great benefactor of the town, as was also an ob-

## ARMAGH.

servatory, to which a fine astronomical apparatus has been supplied by him and some of his successors, particularly the present primate, Lord John Beresford. Robinson endeavoured to restore the city to its ancient rank, as the seat of a university, but this he was unable to effect. The Townline buildings consist of a suite of apartments for assembly rooms, and occasionally for dramatic entertainments; part of them is occupied by a news-room and a savings' bank. An enclosed space, called the Mall, adjoining the town, and neatly laid out and planted, affords the citizens a convenient place of recreation in fine weather. The primate's demesne also, near the town, is open for respectable people to walk in; and two of the resident gentlemen have imitated this example by throwing open their pleasure-grounds. The archbishop's mansion is plain in style, but elegant in its architectural proportions, and near it is a private chapel. Barracks in the vicinity afford accommodation for 800 men.

Armagh derives its corporate privileges from a charter of James I., in 1613, confirmed by William III. The ruling body consists of a sovereign, twelve burgesses, and an unlimited number of freemen, chosen by the former classes; but at the alteration of the franchises by the Reform Act there were but two freemen. It returned two m. to the Irish parl., but only sends one m. to the imp. parl. The elections are the burgesses and freemen residing within 7 m., and the £10 householders, their number in 1837 being 454. The Reform Act has also laid down a new boundary for electoral purposes, which comprises only 377 acres, whereas the former municipal boundary included 1147 acres. A seneschal's court is held for the archbishop's manor, for pleas of £10 and under, but its jurisdiction does not pervade the whole place, part of the city being in the adjoining manor of Mountmorris. The assizes and general sessions of the peace are held twice a year; a court for insolvent debtors three times a year; and a court of petty sessions every Saturday. The sessions-house is a handsome modern building. The co. jail, at one end of the mall, is a plain substantial building, not sufficiently large for the proper accommodation of the numbers confined in it: it has a treadmill. The commitments for a series of years have been as follows:

|          |          |          |
|----------|----------|----------|
| 1824—334 | 1829—400 | 1834—350 |
| 1825—334 | 1830—301 | 1835—369 |
| 1826—348 | 1831—403 | 1836—563 |
| 1827—578 | 1832—363 | 1837—258 |
| 1828—549 | 1833—404 |          |

The sentences of those committed in the last-named year, were—death, none; transportation—for life, 3; for 14 years, none; for seven years, 17; imprisonment—for three or two years, none; for one year, 13; for six months, 128; fine, 11; acquitted, or discharged for want of prosecution, 86.

The city is the seat of the archdiocese of Armagh, and the residence of the archbishop, styled Primate of all Ireland. His right to this title was long contested by the archbishop of Dublin. The controversy commenced in 1182, and was not terminated until 1634, when the right of precedence, and the style of primate of all Ireland, was confirmed to Armagh, and the inferior style of primate of Ireland given to Dublin. The ecclesiastical province comprises the ten dioceses of Armagh, Clogher, Meath, Down, Connor, Derry, Raphoe, Kilmore, Dromore, and Ardagh; but under the provisions of the late act for regulating the sees of Ireland, the prov. of Tuam is to be consolidated with it on the demise of the existing interests, and to be held by six prelates, according to the following arrangements: 1, Armagh and Clogher; 2, Tuam, Ardagh, Kihala, and Achoury; 3, Derry and Raphoe; 4, Down and Connor; 5, Kilmore and Elphin; 6, Meath. The diocese of Armagh is divided into the upper or English part, which includes the cos. of Louth and Meath, and the lower or Irish part, containing Armagh, Tyrone, and part of Londonderry. It extends over 100,563 acres, of which 87,999 are profitable; the annual income, by rents and renewal-fines, is stated to be £17,670, which, on the demise of the present archbishop, is to be reduced to £16,000. The cathedral, a large ancient building, after suffering often by fire and violence, is at present undergoing very extensive repairs. It contains several fine monuments: that of Brian Boru, interred in it after the battle of Clontarf, cannot now be traced. A chapel of ease, near the mall, is consecrated to St. Mark. In the R. Catholic arrangements, the parish is one of those belonging to the archbishop, who resides and has his cathedral in Drogheda. The parish chapel, which is remarkable for its triple roof, is too small for the congregation. There are places of worship for Presbyterians, Seceders, Independents, and two for Methodists.

Armagh has one of the free grammar schools so liberally endowed by James I. It is a large building, in an enclosed area, with accommodations for 100 resident pupils. The present primate maintains a separate school, for the general education of the boys of the choir. There is a charter school for boys and girls, under the endowment of Mr. Dreilincourt; a Lancasterian, a national, and a Sunday school,

## ARMENIA.

besides several private establishments; affording together instruction to about 650 pupils in the endowed, and 800 in the unendowed schools.

The county infirmary is in the town, the fever hospital and lunatic asylum in its vicinity: the latter, which receives patients from Armagh, Monaghan, Fermanagh, and Cavan, is in an enclosed area of thirteen acres, used for the exercise and horticultural employment of the inmates. The building is intended for 122 cases, and there were 116 patients in it at the close of 1837, who were maintained at the annual charge of £2188, being an average of £18 10s. each. The other charitable institutions are, a mendicity asylum, the paupers of which are employed in cleaning the streets; and two loan funds. A bequest for the foundation of a blind asylum has not yet been brought into action.

Though little or no manufacture be carried on in the town, Armagh is the centre of a large inland trade, chiefly in grain, linen, and yarn. The linen-hall, a large and well-arranged building, is open for sales on Tuesdays, chiefly for brown linens, the weekly average of which is 8000 webs, estimated at £13,000. The weekly sales of yarn, at the yarn-market, average £3500. There are, in or near the town, two distilleries, a brewery, and several tanneries and flour-mills. Markets are held on Tuesdays for linen, yarn, flax, flax-seed, and provisions; on Saturdays, for grain and provisions; and on the first Saturday in every month for cattle. A market-house, with extensive ranges of buildings for the exposure of goods, has lately been erected. The tolls, having been bought up by the inhab., are regulated by a committee; the profits, after clearing off the principal advanced, amounting to £1700, together with the interest accruing thereon, are to be expended in the improvement of the town. Fairs are held on the Tuesday after Michaelmas, and in the week before Christmas. The bank of Ireland and the Provincial bank have branches here. The chief vents for the goods sold in the fairs and markets, are by the Blackwater, which passes within 4 m. of the town, through lough Neagh to Belfast, by the Lagan canal, and so Newry by the Newry navigation. The canal now in process of construction between loughs Neagh and Erne, passes within one mile of the city.

The amount of excise duties collected in the Armagh district during the undernamed years, were as follows:

| £           | £           |
|-------------|-------------|
| 1828—84,077 | 1832—68,730 |
| 1829—78,157 | 1833—72,137 |
| 1830—78,777 | 1834—78,506 |
| 1831—66,516 | 1835—68,076 |

The general appearance of Armagh is pleasing. Its situation, on the declivity of a high hill, gives it an imposing aspect, and tends considerably to its cleanliness and salubrity. The houses are substantially built; the number of thatched cottages in its suburbs very inconsiderable. The residence of the primate, and of several of the dignified clergy, together with the immediate vicinity of a number of resident noblemen and gentry, induces an expenditure highly beneficial to all classes, which is still further increased by the circulation of money by the markets. The habits of the higher classes are social and refined. The working classes suffer little from poverty or want of employment: their dress, both men and women, is substantial; their habitations comfortable, their food above the quality common throughout the country; the fuel, coal, is brought from Great Britain by the canals, or from the collieries in Tyrone: peat is also much used. (*Priv. Information.*)

ARMAGH, t., Millin co., Pa., 12 m. N.E. Lewistown. Drained by the Great and Little Keshicquillas creeks, and contains four stores, one woollen factory, four grist-mills, ten saw-mills, one distillery, seven schools, 250 scholars. Pop. 1465.

ARMAGH, p. b., Wheatfield t., Indiana co., Pa., 158 m. W. by N. Harrisburg, 201 W. It contains three stores, one school, 32 scholars. Pop. 152.

ARMEGON, a sea-port town of Hindostan, on the coast of the Carnatic, 66 m. N. Madras, lat. 14° N., long. 80° 11' E. An English factory was established here in 1685.

ARMENIA, an extensive country of W. Asia, consisting principally of the table land lying between the Kur on the N. and the Kurdistan mountains on the S., having the Euphrates from the ridge of mount Taurus to Erzinga on the W., and approaching to near the Caspian sea on the E. But the limits of Armenia differed widely at different periods, and were at no time exactly defined. The flat parts of the country are, probably, not less than, from 5000 to 6000 feet above the level of the sea, and it is intersected by several lofty mountain chains, the summits of some of which—as that of Ararat (see ARARAT)—succeed within the line of perpetual congelation. Armenia gives birth to some large and celebrated rivers, as the Euphrates and Tigris, flowing S. to the Persian gulf; the Cyrus or Kur, and its important tributary, the Araxes or Aras, flowing E. to the Caspian sea; and the Akampsis or Choras, flowing N. to the Black sea.

## ARMENIA.

It has three great lakes; those of Van, Shaboe or Urmiah, and Goukcha or Sevan. The circumference of the first is estimated at 240 m.; it has several islands; and its waters, though brackish, are drunk by cattle. The other two lakes are also very extensive. The water of that of Urmiah is excessively salt, and so buoyant that one can with difficulty stand where it is 3 feet deep. The soil and products are very various; but in general the former is abundantly fertile, especially in the few spots where it is irrigated. In the higher parts all sorts of corn may be advantageously cultivated; and the valleys produce excellent cotton, tobacco, grapes, &c. The ploughs are all drawn by oxen or buffaloes; no fewer than eight or ten of the former being frequently attached to one. The only minerals raised in modern times are copper, iron, and rock salt; but in antiquity the precious metals ranked among its products. Owing to the great elevation of the country, the climate is in most parts rather severe; but though the winters last long, the summer heats are sufficient to bring all the fruits of the earth to perfection. The country is in many parts desert, and is everywhere very thinly peopled. Besides the Armenians, or old inhabitants, who are principally engaged in agriculture and trade, the population consists of Turks, Persians, and Russians; and wandering pastoral hordes of Turkmans and Koords. The principal towns are Erivan, Erzeroum, Nakhivan, Akhlat, Van, Akhaldikh, &c., which see.

Armenia, though it has long since been effaced from the list of nations, was governed, for a lengthened period, either by independent princes or by vassals of the Assyrian and Persian monarchs. It subsequently became the theatre of long-continued struggles between the Persians and Romans; and, notwithstanding the hardness of the inhabitants and the natural advantages of the country for defensive warfare, it seems never to have been able to oppose an effectual resistance to any invader. In the 13th century it was overrun by the Moguls; and in the succeeding century the last trace of its independence disappeared, and the Armenians ceased to have a country.

The people early began to seek an asylum in foreign parts from the oppression under which they suffered at home, and they are now widely diffused over Turkey, Persia, Russia, and India. Their emigrations have not, however, always been voluntary. In 1604, Eshah Abbas, emperor of Persia, in order to protect his dominions on the side of Armenia against the Turks, resolved to carry off the inhabitants, and to lay waste a large portion of the country, so that it might no longer be able to support an army! This monstrous resolution was executed with the most revolting barbarity. The inhabitants, driven off like cattle, perished by thousands, while their houses were burned down, and every vestige of civilization obliterated. A part of the survivors were settled in the suburbs of Isfahan, where they were kindly treated; but the greater number, being settled in an unhealthy part of the prov. of Mazanderan, were soon swept off by disease. Until recently, Armenia was divided between Turkey and Persia; but the former ceded to Russia, by the treaty of Adrianople, a considerable portion of her Armenian territories; and in 1897 Russia acquired the entire prov. of Erivan from Persia. These acquisitions have been consolidated into the government of Armenia.

Whatever may be its influence in other respects, there can be little doubt that the occupation of part of Armenia by the Russians is of singular advantage to its inhabitants. Great numbers of Armenians have already emigrated from the Turkish and Persian provinces to those of Russia, where they have been advantageously settled. The depredations of the petty chiefs and of the wandering tribes will now be effectually restrained; and, for the first time for these several centuries, the Armenians will be made aware of the advantages resulting from the security of property, and from living under a strong and (compared with those under which they formerly lived) a liberal and tolerant government. Col. Montekith bears decisive testimony to the benefits that have resulted to Georgia and other Transcaucasian countries from their occupation by Russia. "You may now, he says, "travel in perfect security, with post horses, from the mouths of the Phasis to the Kur and the Caspian, through countries where, in 1815, the roads were all but impracticable, and exposed to the unrestrained attacks of robbers and other banditti." (*Journal of the Geographical Society*, vol. iii., p. 37.)

The total number of the Armenian nation is estimated by Mr. Conder at about 2,000,000, of whom about two thirds may be within the Ottoman dominions. With the exception of the Jews, no other people is so much scattered. It is supposed that there are about 200,000 in Constantinople and the adjacent villages; about 40,000 in India; 10,000 in Hungary and the contiguous countries; and they are met with in Africa and even America.

Like the Jews, the Armenians found in foreign countries are mostly all engaged in some department of commerce, or of the employments connected therewith. The moment, in

## ARMSTRONG.

fact, that they leave their native soil, they endeavour either to get themselves or their children into some branch of trade. They begin with the lowest departments; the more able or fortunate ascending gradually from one grade to another, till they arrive at that of banker, the summit of their ambition. A large proportion of the foreign and internal trade of Turkey, Persia, Southern Russia, India, &c., particularly the first, is in their hands. They are exceedingly industrious; and, though not free from the vices produced by slavery and ignorance, are honest in their dealings, and less prone to practice deceit, than the Greeks.

The Armenians are Christians differing but little from those of the Eastern or Greek church. They reject the decrees of the council of Chalcedon, and admit only a divine nature in Christ. Their officiating clergy, or *parabeds*, are obliged to marry, but celibacy is enjoined upon those of a higher grade, as patriarchs, bishops, &c. The election of the officiating clergy is in the hands of the people, and is uniformly exercised by them; but, notwithstanding this circumstance, and that the priests have no fixed incomes, but depend entirely on fees and other perquisites, they do not appear to have much influence, or to be very attentive to their duties: they are uniformly almost in the last degree illiterate, and their morals are not represented in the most favourable point of view. (*Missionary Researches*, p. 243.)

The Armenians, with the exception of a small minority, do not acknowledge the supremacy of the pope; but since 1441 have recognised, as their spiritual superior, the patriarch of Echmiadzin, residing at the famous convent of the three churches, near Erivan, now in possession of Russia. The patriarchs of Constantinople and Jerusalem have no authority in ecclesiastical affairs; but the Turkish government consider the former as the head of the Armenian rishas: through him all applications are received and all orders issued; and he is accustomed to receive an annual stipend from the different bishops, which was paid him even by the patriarch of Echmiadzin till the latter became a Russian subject. Previously to 1441, the patriarchs of Sis and Athamar (a monastery on an island in lake Van) shared the spiritual authority with the patriarch of Echmiadzin; and latterly the Porte has been endeavouring to sever the connexion between its Armenian subjects and their old spiritual head, now under the control of a foreign power, by directing their attention to, and reviving the pretensions of, the patriarch of Sis, resident within the Turkish territories. (*Elliot's Travels*, i., p. 470.)

The language of Armenia is harsh, and overloaded with consonants. Besides a great many Indo-Germanic roots, it exhibits numerous relations with the Finnish idioms of Siberia, and other languages of N. Asia. Its grammar is exceedingly complex. The ancient Armenian is no longer spoken, and exists only as a dead language in books: it is so very different from the modern Armenian that it is no longer understood, except by those by whom it is studied. The modern language is largely made up of Persian and Turkish words; and its grammar, and the construction of its phrases, are totally distinct from those of the ancient language.

The alphabet of the Armenians, introduced A.D. 406, and still in use, consists of thirty-eight letters, of which thirty are consonants, and eight vowels. At an early period, the Armenians had a literature and learned men; and though the great bulk of the nation be now plunged in the grossest ignorance, they continue to this day to possess both, and works of considerable merit are still printed in their language. They have printing-presses at Constantinople, Venice, Moscow, Calcutta, and other places. (For further particulars, see *Thurneysen*, vol. ii., p. 389-418; *Jaubert, Voyage en Arménie et en Pers.*, *passim*; *Smith and Dwight's Missionary Researches in Armenia*, with the learned Introductory Discourse by Conder; *Colonel Montekith's Paper in the Journal of the Geographical Society*, vol. iii.; and the excellent article by Klaproth, in the *Encyclopédie des Gens du Monde*.)

ARMENT, a village of Upper Egypt, near the left bank of the Nile, 16 m. N. Eané. It occupies the site of the ancient *Hermontis*. It has in its environs a temple, on the walls of which, among other figures, is a giraffe—an animal now unknown in Egypt.

ARMENTIE-RES, a frontier town of France, dep. du Nord, cap. cant., on the Lys, 13 m. N.W. Lille. Pop. 6512. It is well built, clean, and handsome; has a communal college; an establishment for spinning cotton; fabrics of table-linen, mattresses, laces, thread, tobacco, &c., with bleaching-grounds, soap-works, distilleries, and a refinery of salt. Large quantities of bricks made in the environs are exported by the Lys, and boats are built for its navigation. It has a celebrated market for seed corn.

ARMSTRONG, county, Pa. Situated centrally in the W. part of the state, and contains 575 sq. m. Drained by Alleghany river and its tributaries. There were, in 1840, 26,110 neat cattle, 54,815 sheep, 29,031 swine; and there

## ARNAU.

were produced 299,789 bushels of wheat, 132,190 of rye, 171,068 of Indian corn, 508,998 of oats, 170,046 of potatoes. It had seventy-nine stores, two woolen-factories, twelve fulling-mills, sixty-eight grist-mills, ninety-one saw-mills, twenty-five tanneries, five potteries, three furnaces, two printing-offices, two weekly newspapers, two academies, with 166 students, 105 schools, with 1936 scholars. Of bituminous coal there were produced 705,490 bushels, of salt 322,030. Pop. 23,365. Capital, Klittingau.

**ARNARONG**, I, Indiana co., Pa., 7 m. W. Indiana bor. Drained by Crooked creek, and contains three stores, three grist-mills, seven saw-mills, two schools, 76 scholars. Pop. 1054.

**ARNAU**, a walled town of Bohemia, on the Elbe, 18 m. N.E. Giechlin. Pop. 1400. It has manufactures of linen, bleach-fields, print-works, and copper forges.

**ARNAY-LE-DUC**, a town of France, dep. Cote d'Or, cap. cant. near the Arroux, 29 m. S.W. Dijon. Pop. 2617. It has manufactures of cloth, serges, druggists, &c. On the 25th of June, 1570, the great Huguenot leader, Admiral Coligny, defeated near this town the army of the Marshal de Cosse-Gonor.

**ARNEDO**, a town of Spain, prov. of Burgos, on the Cidacos, 10 m. S. Calahorra. Pop. 1600. It is said to have had no fewer than *six* parish churches! Good wine is made in its neighbourhood.

**ARNEE**, a town of Hindostan, prov. Carnatic, 74 m. S.W. Madras, lat. 19° 46' N., long. 79° 27' E.

**ARNEMUYDEN**, a small town of the Netherlands, island of Walcheren, 3 m. E. Middelburg. Its port, which was formerly considerable, has been filled up, and it is now nearly two miles from the sea; with which, however, it is connected by a canal.

**ARNHEM**, a town of the Netherlands, cap. prov. Guelderland, on the right bank of the Rhine, at the foot of the Veluwe hills, 24 m. E. by S. Utrecht, lat. 51° 56' 47" N., long. 5° 54' 43" E. Pop. 14,606. It is a fortified place of the first class; its fortifications having been greatly improved and enlarged, in 1702, by the famous engineer Coehoorn. The ramparts, planted with elms, afford an agreeable promenade. The town is well built, has a good port on the river, which is crossed by a bridge of boats, and is advantageously situated for trade. It is the residence of a governor, and is the seat of a court of assizes, of a tribunal of original jurisdiction, and a tribunal of commerce; and has a college, a literary society, an agricultural commission, &c. In the church of St. Eusebius are the tombs of the old dukes and counts of Guelderland.

**ARNO**, a considerable and celebrated river of Italy (Tuscany), the *Arno*s of the Romans has its source in the Apennines, at mount Falterona, 5 or 6 m. N. Pratovecchio. At first it flows S. to Ponte a Buriano; thence N.W. to Pontassiere, where it receives the Sieve; whence it pursues a westerly course, flowing through Florence and Pisa; 7 m. below which it falls into the Mediterranean. Its embouchure was formerly a good deal farther to the S.; but having become obstructed, it was diverted into a new channel cut for it in 1603. Its course may be estimated at from 140 to 150 m. It is naturally navigable from the sea to Florence, and has been made navigable from Florence to near its source by means of twenty-seven locks; but its navigation is liable to many obstructions, at certain seasons from floods, and at other seasons from droughts: to guard against the injurious influence of the former, it has been embanked for the greater part of its course. The Val d'Arno, or the country between Florence and Pisa, is one of the richest, best cultivated, and most beautiful of any in Italy.

**ARNSBERG**, a town of Prussian Westphalia, cap. reg. and circ. of the same name, on the Ruhr, by which it is almost encompassed, 57 m. N.E. Cologne. Pop. 4500. It is the residence of the provincial authorities, and has a court of appeal for the regency, a Catholic gymnasium, an agricultural society, &c. The inhabitants are principally employed in the preparation of potashes, and in distillation.

**ARNSTADT**, a well-built town of Saxony, principality Schwarzburg-Sunderhausen, on the Gera, 11 m. S. by W. Erfurt. Pop. 4500. It has a castle, a college, a cabinet of natural history, and fabrics of cotton and brass, with a considerable trade in corn, timber, wool, furs, and colonial produce.

**ARNSTEIN**, a town of Bavaria, circle Lower Mayne, on the Werra, 16 m. N.W. Wurzburg. Pop. 2000. It is the birthplace of the historian Schmidt.

**ARNSWALDE**, a town of the Prussian states, prov. Brandenburg, cap. circle, 19 m. S.E. Stargard. Pop. 3800. It is nearly surrounded by three lakes well supplied with fish.

**AROLSEN**, a town of the principality of Waldeck, on the Aar, 12 m. N. by W. Waldeck. Pop. 1500. It is the residence of the prince, and the seat of the principal authorities of the province; it is well built; has a fine castle, in which is a valuable collection of coins and antiquities,

## ARPINO.

with a library and a picture gallery; there is also a college, grammar school, &c.

**ARONA**, a town of the Sardinian estates, prov. Novara, on the Lago Maggiore, near its southern extremity, lat. 45° 45' 53" N., long. 8° 34' 18" E. Pop. 3000. Its fortifications, which were formerly considerable, were demolished by the French after the battle of Marengo. It is well built, has a gymnasium, a hospital, a collegiate church and three others, a port on the lake, with yards for the construction of vessels for its navigation, and a pretty considerable commerce. St. Charles Borromeo was a native of this town; and in 1687 a colossal statue was erected in honour of the saint, by the people of Milan, on a neighbouring eminence.

This immense work, the *chef-d'œuvre* of Zanelli and Falconi, stands on a granite pedestal 46 ft. high, and is itself 66 ft. high! The head, hands, and feet are cast; the drapery, and book which he holds in his hand, are hammered out of sheet copper, set on timber framing: the execution is very fine, particularly the expression of the countenance, looking down upon the world "more in pity than in anger." The attitude of the body is remarkably easy and simple, and the proportions are so good that the idea of a colossal does not enter the mind until a comparison has been made with objects of known dimensions situated near it, such as the travellers every day see at the foot of the statue. A sort of staircase leads from the bottom to the top of the statue. (*Simond's Italy*, p. 10; *Cramer's Italy*, vol. i. p. 310.)

**ARONCHES**, a town of Portugal, prov. Alentejo, 16 m. S. E. Portalegre. Pop. 3000. It has a church, a convent, a hospital, and a workhouse.

**AROOSTOOK**, county, Me. Situated in the N.E. part of the state, extending N. to the St. John's river, separating it from Canada. Watered by Aroostook and Matawake rivers. It is unsettled in its N. part. There were, in 1840, 6109 neat cattle, 9005 sheep, 4303 swine, and there were produced 41,989 bushels of wheat, 36,518 of oats, 21,919 of buckwheat, and 108,554 of potatoes. It had 90 stores, two flouring-mills, thirteen grist-mills, thirteen saw-mills, twenty-eight schools, 1150 scholars. Pop. 9413.

**AROOSTOOK**, river, Me., rises in Penobscot co., crosses Aroostook co., and enters the St. John's river in New-Brumswick. The lands on this river are very fertile, and well adapted to wheat. A road passes from Bangor to fort Fairfield on this river, on the E. boundary of the United States. The length of the river is over 100 m., and its course is circuitous.

**ARPAGON**, a small town of France, dep. Seine et Oise, 11 m. W. Corbeil. It has tanneries, a brewery, and some trade in flour.

**ARPAIA**, a miserable, bleak-looking village of Naples, prov. Principato Ultra, between Capua and Benevento, 3 m. E. Arieno. It would be unworthy of notice were it not that it is supposed by some to occupy the site of the ancient *Caudium*, memorable for the great disaster that there befell the Roman arms, anno 311 B.C. But the better opinion seems to be, that the defile situated a little to the N. of Arpaia, between St. Agato and Moiano, is the real scene of this disaster, and the place so celebrated by the name of the *Feræ Caudinae*. The Forks consist of a small plain, traversed by a stream, having a narrow outlet at each end, and shut up everywhere else by continuous and impracticable mountains. A powerful Roman army having unwarily entered this defile, the Samnites immediately blocked up the farther outlet; and the Romans, having retraced their steps, found that their enemies had anticipated their movement, by blocking up the pass by which they had entered as well as the other. Caught thus, as it were, in a trap, they were obliged to accept the terms dictated by the Samnites, who granted them their lives, on their delivering up their arms, and passing one by one half naked under the yoke. (*Liv.*, lib. ix., cap. 1-7.)

**ARPINO** (an. *Arpinum*), a town of Naples, prov. Terra di Lavoro, 6 m. S.W. Sora. Pop. 9000. It is agreeably situated on some eminences, has various churches, a hospital, with manufactures of the best cloth made in Naples, paper, and tanneries. This is a very ancient city. Having been wrested from the Samnites by the Romans, it became a municipal town, and its citizens were enrolled in the Cornelian tribe 302 years B.C. (*Liv.*, lib. x., § 1, and lib. xxvii., § 36, and *Cicero pro Cæ Plancio*.) But it is chiefly memorable for being the birthplace of two of the most distinguished men Italy ever produced—Caius Marius, surnamed the third founder of Rome, and M. Tullius Cicero, the prince of Roman orators. The latter frequently alludes to Arpinum in his Letters, and dwells with complacency on the rude and primitive simplicity of its inhabitants. (*Cramer's Ancient Italy*, vol. ii., p. 114.)

In its environs is a paper-mill recently established at an expense of above £11,000, and employing 200 work-people. Balbi says that it produces sixty reams a day, and that the pulp is converted into dried paper in less than a minute! We suspect this is an exaggeration, otherwise it exceeds anything done in this country; about three minutes being

## ARQUA.

required here, in the best mills, for the conversion of pulp into dried paper. (*Sbriga*, ed. 1837, p. 415.)

ARQUA, a town of Austrian Italy, prov. Padua, 12 m. S.W. Padua, in the bosom of the Euganean hills. The population does not exceed 1000; and the place would not be worth notice but for its having been the residence of Petrarca during the latter years of his life, and the place where that great poet and restorer of modern literature breathed his last, on the 19th of July, 1374. "His ashes are preserved in the churchyard of the town, in a sarcophagus of red marble, raised on four pilasters on an elevated base, and preserved from an association with meaner tombs." The kindred genius to whom we are indebted for these details observes,

"They keep his dust in Arquà, where he died;  
The mountain village where his latter days  
Went down the vale of years; and 'tis their pride—  
An honest pride—and let it be their pride,  
To offer to the passing stranger's gaze  
His monument and his sepulchre: both plain  
And venerably simple, such as raise  
A feeling more accordant with his strain,  
Than if a pyramid form'd his monumental fane."

"The house in which Petrarca resided is on the edge of a little knoll overlooking two descents, and commanding a view not only of the glowing gardens in the dale immediately beneath, but of the wide plains, above whose low woods of mulberry and willow, thickened into a dark mass by festoons of vines, tall single cypresses, and the spires of towers, are seen in the distance, which stretches to the mouths of the Po and the shores of the Adriatic. The chair in which the poet breathed his last is still shown among the precious relics of Arquà." (*Childe Harold*, canto iv., § 31, and note 9.)

ARQUA, an ancient village of Austrian Italy, on the Castagnaro canal, 5 m. S.S.W. Rovigo. Pop. 3500. It has some trade in cotton and silk.

ARQUENÈRES, a village of Belgium, prov. Hainault, 13 m. N.W. Charleroi. Pop. 1500. It has valuable lime and marble quarries.

ARQUES, a small decayed town of France, dep. Seine Inferieure, about 3 m. from Dieppe. During the middle ages this was the principal bulwark of Normandy towards the N.; its castle, now in ruins, having withstood several sieges. In the vicinity of this town, in 1593, Henry IV. defeated the troops of the League under the Duc de Mayenne.

ARRAN, an island of Scotland, co. Bute, in the arm of the sea between the Mull of Cantire and the Ayrshire coast; being separated from the former by Kilbrannan sound, and from the latter by the frith of Clyde. It is 44 m. from the nearest point of the Isle of Bute, 3½ m. from the nearest point of Cantire, and 10½ m. from Ardrossan point in Ayrshire. It is about 16½ m. in length from N. to S., and from 6 to 9 in breadth,\* comprising about 72,000 acres, of which about 11,000 may be arable. It exhibits a striking contrast in its N. and S. divisions: the former, or that of the N. of Brodick, presenting lofty bare and rugged granite mountains, connected by steep ridges and intersected by deep valleys and ravines. Gannell, the highest mountain in the island, rises to the height of 2985 feet above the sea. The S. and largest division of the island is composed of undulating hilly ground, the eminences of which are of a flattened or rounded configuration, and covered with a deep stratum of peat and other alluvial matter. Round the greater part of the coast an almost uninterrupted broad bank or girdle of gravel has been formed by the action of the sea, the soft greensward on which affords a pleasant and convenient access along the sea side. The shores are generally steep and rocky, but high cliffs are not frequent. Three deep bays indent the island—Ransa on the N.W., and Brodick and Lamish on the E.; the latter, being defended from the W. gales by Holy-island, 1 m. in length, is one of the best asylums for shipping in the frith of Clyde. Marble, Jasper, agates, calrin-garns, and a fine species of rock crystal, called the Arran diamond, are met with. The red deer and wild goat, formerly very abundant, are now nearly, if not entirely, extirpated. Cheviot sheep are generally introduced; and the native breeds of cattle and horses are being superseded by the larger and more esteemed breeds of Ayrshire and Ayrshire. Swine are raised in considerable numbers; and the steam boats that touch at the island have opened a new market for fowls and eggs. Grouse and black-cock are very plentiful. The system of agriculture formerly followed in Arran was as bad as can well be imagined; the lands were held jointly by several tenants on the common or *run-rig* plan (see *ARVILE*), and were scourged by a constant course of corn crops, which succeeded each other in a series, unbroken except by the occasional introduction of potatoes, as long as the soil would produce anything; but, since 1815, the duke of Hamilton, who is

## ARRAN.

proprietor of nearly the whole island, has laboured strenuously and successfully to introduce a better system; partly by letting farms to individuals for a fixed term of years, excluding subtenants and assignees; partly by introducing conditions into the leases fitted to insure a better system of management; and partly by expending large sums on the building of houses, enclosing, making drains, roads, &c. The people at first were very much opposed to the change; but their prejudices have gradually given way, and they are now for the most part sensible that it has been an advantageous to them as to the proprietor. Since the occupiers have enjoyed possessions each might call his own, they have steadily advanced in habits of industry; and though in this respect they are still behind the tenants and labourers of the mainland, it is believed that in no insular Highland district is greater industry shown than in Arran.

There are now a number of large farms enclosed, subdivided, and well cultivated, having valuable stocks of cattle and comfortable farm-steedings, where formerly there were numerous huts without chimneys or windows, and ridges running in all directions without a single enclosure or subdivision. The general rotation, except on the shores, is, 1. Oats; 2. Green crop—potatoes, turnips, beans, or peas, with manure; 3. Bar or bigg, wheat, or oats, often manured; 4. Hay; 5. Pasture grass; 6. Pasture, sometimes grass a year or two longer. On the shores and holms, the rotation is, 1. Oats; 2. Green crop; 3. Bigg or wheat—these often with manure; 4. Hay; and then oats, &c., again. These rotations are not always adhered to by the tenants having the small possessions, but they all sow grass seeds with the corn crop which succeeds the green one; and this of itself necessarily leads to better management than they formerly practised. Wheat to a considerable extent has for a few years past been raised by the tenants of the larger possessions, and a great number of the small tenants also grow from half an acre to two acres each of that grain.

By these changes in the mode of possession, and by the improvement of the soil, it will easily be seen that more and better cattle may be reared and supported than formerly, and the produce of milk is also much greater. Since 1823, the duke of Hamilton has supplied good Ayrshire bulls, at his own expense, for the cattle on his property, keeping always in the island from 20 to 30, placed at convenient distances. The consequence of this arrangement is, that the cattle have been surprisingly improved in every respect. On a few of the larger farms stocks of Ayrshire cows are kept, and succeed very well.

The rental of the island amounts to from £11,000 to £12,000 a year.

A number of boats employed in the herring fishery belong to Kilbride and Brodick, the principal villages. But the herring fishery in the frith of Clyde and loch Fyne is not nearly so prosperous at present as it once was. Luckily its decline is little, if any, loss to the island; for, having no considerable town population, the fishery is principally carried on by the cottiers and small farmers, engrossing their attention at the time their services are most necessary on shore, at the same time that it has a tendency to generate and keep alive idle and dissipated habits. Kelp used to be produced in considerable quantities, but its manufacture has now nearly ceased. Most of the woollen cloth formerly used in the island was made by the women, but a good deal is now imported.

The yearly export of produce from Arran cannot be given with perfect accuracy; but the following statement is believed to be a pretty near approximation to its quantity and value:

|                                                               | £.       |
|---------------------------------------------------------------|----------|
| 600 black cattle, at 8l. 10s. . . . .                         | 8,150    |
| 460 swine, at 12l. 10s. . . . .                               | 600      |
| Fowls and eggs . . . . .                                      | 700      |
| Sheep and wool . . . . .                                      | 1,500    |
| Bar or bigg, 3500 qrs., at 25s. . . . .                       | 2,500    |
| Wheat, 700 bolls, at 24s. . . . .                             | 840      |
| Beans and peas, 500 bolls, at 14s. . . . .                    | 700      |
| Oats, in grain and meal, 3000 qrs., at 20s. . . . .           | 3,000    |
| Potatoes, 3000 bolls, at 10s. . . . .                         | 1,500    |
| Herrings caught by 100 wherries, at 60s. per wherry . . . . . | 4,000    |
| Butter and cheese . . . . .                                   | 1,000    |
| Shell-fish, about . . . . .                                   | 100      |
| Freestones and limestone . . . . .                            | 600      |
| Total . . . . .                                               | £ 21,890 |

A good deal of illicitly distilled whiskey was formerly exported; but that branch of industry, if it may be so called, has all but ceased.

Brodick, the principal village, is finely situated, at the bottom of Brodick bay on the E. side of the island. Near it is Brodick castle, a seat, and occasional residence, of the dukes of Hamilton. Though Gaelic be generally spoken, English is understood by everybody.

Arran is divided into two parishes. Its population amounted, in 1755, according to Dr. Webster, to 3646; in 1801 it amounted to 5179; and in 1831, to 6427. It declined somewhat during the ten years ending with 1831, but is again on

\* These are the dimensions as given in John Armstrong's map. It is generally represented as much larger, or from 20 m. to 25 m. in length, and from 15 m. to 20 m. in breadth.

## ARRAN.

the increase. (*Anderson's Highlands; M'Donald's Survey of the Hebrides; and Paterson's Account of the Duke of Hamilton's Improvements in Arran, in the Transactions of the Highland Society.*)

ARRAN (S. ISLES OF), on the W. coast of Ireland, co. Donegal, opposite Dingle, the most N. extremity of the largest, called Arranmore, being in lat. 55° N., long. 8° 29' W. A light-house is erected on this point, with a fixed light elevated 200 feet above high-water mark. This island contains about 2000 acres, and nearly 1000 inhab., the land being divided into the minutest portions, such as a "cow's foot," or the quarter of a cow's grass. They are mostly fishers. On a smaller island, a fishing village, called Rutland, was erected by the Fishing board, in 1786, but it is now nearly deserted.

ARRAN (S. ISLES OF). These consist of three islands stretching N.W. and S.E., about 12 m. along the mouth of Galway bay, in Ireland, being part of the co. Galway. They contain in all about 7000 acres; the largest, Arranmore, comprising about 4607; Innis More, 1336; and Innis Leer, 900. Pop. 3191. They are the property of Mr. Digby, and yield a rent of above £2000 a year, the tenants paying from £2 to £6 each. They are very fertile, but occasionally suffer from a scarcity of water. The fishing of cod and ling is carried on to a considerable extent, a pier having been constructed at the village of Killaney (pop. 1000) on the largest island, at the expense of the Fishery Board, for the accommodation of the craft employed. The principal products are fresh and cured fish, oats, feathers, the produce of puffins, a superior kind of yearling calves in great demand by the Connaught graziers; to which were formerly added, great quantities of smuggled whiskey. A light-house, with a revolving light, has been erected on the highest point of the largest or most northerly of the islands, lat. 55° 7' N., long. 8° 40' W., having the lantern elevated 498 feet above the level of the sea. These islands give the title of Earl to the family of Gore. The inhabitants, who are very poor, continue in a very primitive state, and the Irish language is universally spoken. (*Dutton's Statistical Survey of Galway, p. 2, &c.; Reports on the Fisheries of Ireland, App. p. 104, &c.*)

ARRAS, a city of France, dép. Pas de Calais, of which it is the cap., on the Scarpe and the Crinchon, 60 m. S.E. Calais, lat. 50° 17' 54" N., long. 2° 46' 25" E. Pop. 23,485. It is situated in the middle of an extensive and fertile plain: the Scarpe divides it into two parts; it is well built; houses stone; several of its squares and public buildings handsome, and worthy of notice. Among the latter are the old Gothic church of St. Waast, the hôtel of the Préfet, theatre, belfry, barracks, &c. The cathedral, a fine old Gothic building, was destroyed during the revolutionary phrensy. Arras was fortified, during the reign of Louis XIV., by Vauban. The citadel, which is very strong, is separated from the town by an esplanade, but it is included within the line of the works. It is the seat of a bishopric; and has a court of assizes, a tribunal of original jurisdiction, a college, a grand diocesan seminary, a secondary ecclesiastical school, a school of engineering (*école régimentaire de génie*), an academy of belles-lettres, a literary society, a botanical garden, a school for deaf and dumb, a school of design, a cabinet of natural history and antiquities, a museum of pictures, a public library containing 36,000 volumes, &c. There are establishments for the spinning of cotton, manufactures of cotton stuffs, hosiery, lace, coarse woollen stuffs, and potteries; and fabrics for the preparation of beet-root sugar, soap, starch, beer, rape-oil, &c. The Scarpe becomes navigable at this point.

Arras is a very ancient city, and has been the theatre of many sanguinary contests. The revocation of the edict of Nantes gave a severe blow to its manufactures. It also suffered much during the revolution, having been for a considerable time at the mercy of Lebon, a ferocious terrorist, a native of the place. Robespierre, of infamous memory, was also a native of Arras; as was Damiens, the assassin of Louis XV. (*Hugo, France Pittoresque, art. Pas de Calais.*)

ARRAYOLLOS, a town of Portugal, prov. Alentejo, 15 m. N.N.W. Evora, at the foot of a mountain on the summit of which is a citadel. Pop. 1900. It has some fabrics of stained paper.

ARRIÈGE, a dep. in the S. of France, on the Spanish frontier, having S. the Pyrenean mountains, E. the dépts. Pyrénées Orientales and Aude, and N. and W. the Haute Garonne. Area, 455,000 hectares. Pop. 260,536. This dep. consists principally of the N. slope of the Pyrenees; the mountains, which cover the greater part of its surface, increasing gradually in elevation as they approach its S. frontier; the altitude of the highest summits varying from about 7000 to about 10,500 feet above the level of the sea. The principal valleys are those of the Arriège and the Salat, the only navigable rivers in the dep. According to the official tables, the cultivable lands occupy about 148,900, meadows

## ARTA.

34,000, woods (on the mountains) 90,000, vineyards 11,630, and heaths, wastes, &c., 136,000 hectares. Gold has been found; and there are valuable iron mines near Vic Demon, and other places. The N. portion is pretty fertile and well cultivated, producing wheat, rye, oats, maize, millet, &c. Horses an inferior breed, and oxen and mules frequently employed in their stead. The total produce of wine is estimated at 115,000 hectolitres a year; but the quality is inferior, and is wholly retained for home use. The forests have not been taken proper care of; and in many parts, owing to the consumption of the iron furnaces, and the want of sufficient attention, there is a scarcity of wood. The working of metals is the principal branch of manufacturing industry; but there are also manufactures of cloth, serge, flax-silk, cotton stuffs, &c. It returns three m. to the Ch. of Dep. Const. in 1838, 806. Public revenue, in 1831, very near 3,000,000 fr. Principal towns, Foix, Muret, Pamiers, &c. (*Hugo, France Pittoresque, art. Arriège.*)

ARROW ROCK, p. t. Saline co., Mo. 72 m. N.W. Jefferson city, 986 W. The village is situated on the S. side of the Missouri river, on an elevated bluff, with a good landing. A ferry here crosses the Missouri. The town or precinct has seven schools, 179 scholars. Pop. 2093.

ARROYO-DEL-PUERTO, a town of Spain, Extremadura, 10 m. W. Cáceres. Pop. 5000. It has a parish church, adorned with some good pictures by Morales; with manufactures of cloth and earthenware.

ARS-EN-RE, a sea-port town of France, dép. Charente Inférieure, on the W. coast of the Ile de Ré. Pop. 3696. Salt is produced in its vicinity, and shipped in considerable quantities from its port.

ARSIERO, a village of Austrian Italy, prov. Vicenza, 6 m. N. by W. Schio. Pop. 2400. It has paper fabrics, and a quantity of fine white veined marble.

ART, a town of Switzerland, cant. Schwitz, at the S. extremity of the lake of Zug, 7 m. S. Zug, at the foot of mountains Rigi and Romsburg. It is well built. The church of St. George is remarkable for its architecture, and for an immense fountain, formed of a single block of granite. There is a convent of Capuchins, with a good library. The valley of Art is very picturesque and interesting, from its position among the highest mountains of breccia anywhere to be met with.

ARTA, a town of Spain, island of Majorca, on its N.W. angle. Cape Pera, where there is a small fort, depends on it. Pop. 8000. Its territory, which is very fruitful, produces cotton, and has mill-stone quarries.

ARTA, a town of Turkey in Europe, Albania, on the Arta, about 7 m. above where it falls into the gulf of that name. It is a place of considerable size and trade. When visited by Dr. Holland, in 1812, it contained six mosques, a large cathedral, and a great number of Greek churches, and was supposed to have a population of about 6000. It suffered severely during the Greek insurrection; and Lieut. Wolfe, by whom it was visited in 1830, says that, in many places, masses of ruins impeded the passage of the streets, and that an aspect of desolation and misery hung over it. We understand, however, that it has begun to improve. Its population was estimated by Mr. Wolfe at 7000 at a maximum. It is governed by a bey, under the pacha of Yannina, and is the seat of a Greek bishop. It has manufactures of cottons, woollens, and leather. The foccates, or shaggy capotes made here, are reckoned very superior. Embroidery is said to be brought to considerable perfection; and all articles of dress from Arta are highly prized. Each trade has its separate street or bazar; but, by a judicious regulation, butchers are obliged to kill and sell their meat outside the town. The market is abundantly supplied with fruit and vegetables. There is a curious Venetian bridge over the river, consisting of one large and several very small arches.

There can be no doubt that Arta occupies the site of the ancient *Ambracia*. Traces of the ancient walls may be seen in many places, but especially under the more modern remains of the ruined castle: the stones consist of vast quadrangular blocks, so admirably fitted that it is with difficulty the point of a penknife can be inserted between them: no mortar seems to have been used in their construction. There is here, also, the ruins of a convent, built in 845, now converted into a caravanserai. (*Holland's Travels in Albania, &c., p. 73, 4to ed.; Wolfe's Observations on the Gulf of Arta, Journal of the Geogr. Society, vol. III, p. 77.*)

ARTA (GULF OF), the *Sinus Ambracius* of the ancients, is a deep inlet of the gulf of the Ionian sea, between the Turkish province of Albania and the N.W. part of the new kingdom of Greece. The entrance to it, between Prevesa on the N. and the fort of La Punta on the S., is only 700 yards across. The fort now mentioned is built at the extremity of a low, narrow, tongue of land, celebrated in history as the *Promontory of Actium*. Outside the entrance is a bar, composed of gravel, coarse sand, and sea weed, with 15 feet water when shallowest. On entering the gulf, we first come to what is called the bay of Prevesa, occupying the

## ARTAGONA.

space between the mouth of the gulfs and the capes La Scuro on the N. and Madonna on the S., and it is only after passing these headlands that the gulf properly opens. It is a noble sheet of water; its extreme length from W. to E., including the bay of Prevesa, is about 25 m., and its greatest breadth about 10 m.; but in several places it is a good deal narrower: the depth varies from 13 and 14 to 36 fathoms. The S. shore consists of high land, with bold promontories, clothed with rich and extensive woods; the N. shore is for the most part low, and has encroached considerably on the water. Part of the vast chain of Pindus is seen from the gulf. It has been long celebrated for the variety and excellence of its fish: red and gray mullet are the most abundant; and there are plenty of soles, eels, prawns, &c.: sardine fishing is extensively carried on.

The entrance to the gulf of Arta was the scene of one of the most memorable and important conflicts recorded in history. The battle of Actium, which decided the fate of Augustus and Mark Antony, and of the Roman world, was fought off the promontory of that name, at the southern entrance to the gulf, anno B.C. 31. The exact space occupied by the hostile fleets has been disputed. Most probably the battle raged all round the promontory, but principally on its W. side, or in what is now called the harbour of Prevesa, and the contiguous sea. (See the authorities cited in the previous article, *Ferguson's History of the Roman Republic*, cap. 35; *Plutarch's Life of Mark Antony*, &c.)

**ARTAGONA**, a walled town of Spain, Navarre, 15 m. S. Pampeluna. Pop. 3069.

**ARTAKI**, a small sea-port town of Turkey in Asia, on the E.W. coast of the peninsula of Cyzicus (which see), sea of Marmora, 75 m. W.S.W. Constantinople. It has a convenient anchorage.

**ARTERN**, a town of Prussian Saxony, reg. Merseburg, on the Unstrut, 30 m. W. by S. Halle. Pop. 2400. It has a castle, a brine-spring, and a distillery.

**ARTHUR'S SEAT**, a hill in the immediate vicinity of Edinburgh, on the S.E. side of the city, rising 632 feet above the level of the sea. Its ascent from the latter is gradual and easy; but on the side towards the city, it rises abruptly, and, in parts, almost perpendicularly, from the low grounds. On the S. side of the hill, above the footpath leading from Edinburgh to Duddingstone, is a superb range of porphyritic greenstone columns, from 50 to 80 feet high. The part of the hill nearest Holyrood-house is called Salisbury Crags, and all within these few years, its quarries furnished most part of the paving stones used in London. The view from the top of Arthur's seat is one of the most diversified and fine in the empire.

**ARUDY**, a town of France, dep. Basses Pyrénées, cap. cant., on the Ousse, 13 m. S.E. Oloron. Pop. 1735. It is the centre of an active and considerable commerce with the neighbouring valleys.

**ARUNDEL**, a burgh, m. town and pa. of England, co. of Sussex, on the N. bank of the Arun, about 34 m. from its embouchure, 55 m. S.S.W. London. Pop. 2803. The town is pretty well built, and has a thriving appearance. It derives its entire consequence from its being immediately contiguous to Arundel Castle, formerly a strong fortress, now the magnificent baronial residence of the Dukes of Norfolk, having been rebuilt at a great expense by the late duke. The possessor of this castle enjoys, without further creation, the dignity of earl. Previously to the Reform Act, Arundel returned two members to the H. of C., the right of voting being vested in the inhabitants paying scot and lot; but since the Reform Act it only returns one member. Constituency, 1836-47, 336. The Arun, which is here crossed by a neat bridge, is navigable thus far; and is joined by canals with the Thames, on the one hand, and Chichester harbour on the other.

**ARVERT**, a town of France, dep. Charente Inférieure, 24 m. W. Saintes. Pop. 2320. It is the chief place of the peninsula of the same name formed by the Gironde, the Beudre, and the sea. It has a considerable trade in wine, and fresh and salt fish, particularly sardines.

**ARZAMAS**, a town of Russia in Europe, gov. Nijni Novgorod, cap. district, at the confluence of the Choka and Tiocha, 62 m. S. Nijni Novgorod. Pop. 8000. It is old and ill built; has twenty-two churches and two convents, with soap-works, tanneries, print-works, iron foundries, &c. It has two great annual fairs.

**ARZANNO**, a town of France, dep. Finistère, cap. cant., arrond. Quimperle. Pop. 1937.

**ARZANO**, a village of Naples, in the immediate neighbourhood of the capital. Pop. 4500. It has numerous villas; and flax and hemp are largely produced in its environs.

**ARZEW** (an. *Freemaria*), a sea-port town of Algiers, prov. Tlemcen, at the mouth of the Elgg, 30 m. N.N.E. Oran, lat. 32° 45' N., long. 4° 54' E. The bay is small, but, though open to winds from the E. and N.E., it is the best on this part of the coast. The modern town, which is ill built and

## ASCENSION.

inconsiderable, occupies the site of the ancient *Armaria*: fragments of columns, inscriptions, cisterns, and other remains of the ancient city, being scattered all round. Corn and salt are both exported. The latter is obtained from the salt pits of Arzew, about 5 m. inland.

**ARZIGNANO**, a town of Austrian Italy, 10 m. W. Vicenza. Pop. 4000. It is situated in an agreeable plain, surrounded with cultivated hills; and has fountains of silk, fabrics of cloth, dye-works, and brick-works. Its territory produces good wine, and has two coal mines.

**ASAPH** (ST.), a city of N. Wales, county Flint, 185 m. N.W. London, 5 m. N. Denbigh, finely situated in the vale of Clwyd, on an eminence on the banks of the Elwy, near its confluence with the Clwyd, over both of which it has bridges. Pop. of parish 3144, of city 3000! It consists principally of a single street; and is remarkable only as being the seat of a bishopric, worth £3300 a year. The cathedral, a plain building, was erected towards the end of the 15th century, but has since undergone many repairs: it is not used for public worship; the parish church, in the lower part of the town, being appropriated to that purpose. Drs. Barrow (uncle to the famous Dr. Isaac Barrow), Beveridge, Tanner, Horsley, &c., have been bishops of this see; and in the cathedral is a handsome monument, erected in 1699, in memory of the celebrated Dean Shipley. It has a free grammar school, endowed by Bishop Beveridge; and an almshouse, for eight poor widows, endowed by Bishop Barrow. It unites with the other boroughs of this co. in returning a m. to the H. of C.

**ASARO**, a town of Sicily, prov. Catania, 9 m. S. Nicosia. Pop. 3000.

**ASCALON**, an ancient sea-port town of Palestine, 15 m. N. Gaza, and 45 m. E.S.E. Jerusalem, lat. 31° 39' N., long. 34° 23' E. There is not a single inhabitant within the old walls, which are still standing; but a modern suburban village, called Bealona, from the ancient name, has a pop. of 300 or 400, and is frequented by the small vessels trading to this coast.

The ruins present a strange mixture of Syrian, Greek, and Gothic remains. There are also the remains of a Roman amphitheatre, and the columns of a temple, supposed to be that of the Syrian Venus, mentioned by Herodotus (l., § 105), or a Greek edifice raised in imitation of it.

Ascalon is exceedingly ancient. Before the establishment of the Israelites in Palestine, it was one of the lordships of the Philistines. Subsequently, it became one of the ports belonging to the tribe of Judah; and, on the downfall of the Jewish kingdom, it fell to the king of Assyria. It afterward formed part of the Persian empire, then of the kingdom of the Ptolemies; and, on the subversion of the latter in the last century B.C., it was subjected to the dominion of Rome. It was a bishop's see in the first ages of Christianity; was conquered by the Saracens at the commencement of their conquests, and became the scene of more than one battle during the time of the Crusades. It was one of the strongholds of the W. Christians; but Saladin, on gaining possession of the town, destroyed its works. It has since continued in a state of decay: the prophecy of Zechariah, "Ascalon shall not be inhabited," and that of Ezekiel, "It shall be a desolation," are now actually fulfilled.

Ascalon stands at the mouth of a stream (the Sorek), where the accumulation of soil is so great, that the ruins are every day removing farther from the sea. (*Volsey*, ii., 283; *Robinson*, i., 21.)

**ASCENSION**, an island in the Atlantic ocean, between Africa and Brazil, about 8 m. in length by about 6 in breadth, its fort being in lat. 7° 28' N., long. 14° 24' W. It is of volcanic formation, and one of its hills, of tuffous limestone, rises to the height of about 9800 feet. It has a bleak and barren appearance; and was uninhabited till the imprisonment of Napoleon at St. Helena, when it was garrisoned by a small British force, through whose exertions it has been partly cultivated and wonderfully improved. Springs of fresh water have been discovered. Vast numbers of turtle are taken on its shores. The climate is remarkably healthy, and the anchorage, though open, is said to be good. The object in occupying it is, that it may serve as a dépôt for stores, and a place for watering ships cruising on the coast of Brazil or in the South Atlantic ocean. Its name is derived from its having been discovered on Ascension-day, the 30th of May, 1501, by a Spanish navigator in the service of Portugal.

**ASCENSION**, parish, La. Situated in the S.E. part of the state, and contains 400 sq. m. It lies on both sides of the Mississippi, and is subject to be overflowed at high water, the immediate bank of the river being the highest land in the parish. The La Fourche, one of the outlets of the Mississippi, passes off at Donaldsonville. It produces sugar, cotton, oranges, figs, peaches, &c. It had in 1840, 3815 neat cattle, 2645 sheep, and 1023 swine. It produced 280,735 bushels of Indian corn, 1,028,050 pounds of sugar, and 13,563,000 of cotton. It had twenty foreign commercial

houses, seventy-eight retail stores, three saw-mills, three academies with 56 students, two schools with 60 scholars. Pop.: whites 9355, slaves 4553, free coloured 143; total, 1051. Cap. Donaldsonville.

ASCH, a town and lordship, N.W. frontier of Bohemia, circle Elnbogen, 14 m. N.W. Eger. The town has 2500, and the lordship, which belongs to the family of Zedlitz, above 8000 inhab.

ASCHAFFENBURG, a city of Bavaria, circ. Lower Mayne, on a hill, on the Mayne, which is here crossed by a stone bridge, 38 m. N.W. Würzburg. Pop. 7000. The town is indifferently built, and the streets are narrow and crooked. It has, however, a fine palace, formerly occupied by the electors of Mayence, to which magnificent gardens are attached. It has also an old Gothic church, containing the tombs of its princes, a town-hall, &c.; with a lyceum, a gymnasium, an ecclesiastical seminary, a school of design, a public library, a collection of pictures, &c. It manufactures tinted papers, and has a good deal of trade in timber, wine, tobacco, &c.

ASCHERSLEBEN, a town of the Prussian states, prov. Saxony, reg. Magdeburg, at the confluence of the Elbe and the Wipper, 14 m. E.S.E. Quedlinburg. Pop. 8730. It has five Protestant churches, one Catholic do., a synagogue, a gymnasium, two hospitals, &c.; and very considerable manufactures of woollen and linen stuffs, and earthenware.

ASCOLI, a town of Italy, states of the Church, cap. deleg. same name, on the angle formed by the junction of the Castellano with the Tronto, 15 m. above where the latter falls into the Adriatic, lat. 43° 51' 24" N., long. 13° 25' 15" E. Pop. 12,000. It is a well-built handsome town; has a cathedral and numerous churches, many of which are ornamented with valuable paintings by native artists. The church of St. Gregorio Magno consists principally of the remains of a Roman temple. Of modern buildings, the principal is the *Palazzo Ascanale*, containing a museum, a library, and a theatre: there is also the palace of the governor, and numerous palaces belonging to resident nobles. Ascoli is a frontier town, on the side of Naples, and is a place of some strength, being surrounded by old walls and towers, and furnished with a citadel. Its harbour at the mouth of the Tronto, is a good deal frequented by coasters, and is defended by two small forts.

Ascoli, the *Asculum Picenum* of the Romans, is one of the most ancient of the Italian towns. It is described by Strabo as a place of great strength, surrounded by walls and inaccessible heights. It was the first city to declare against the Romans when the Social war broke out; and, in the course of that war, it sustained a long and memorable siege against Pompey; by whom, however, it was finally taken. (*Cramer's Anc. Italy*, l. p. 288.)

ASCOLI DI BATRIANO (an. *Asculum Apulum*), a town of Naples, prov. Capitanata, 13 m. E. by S. Rovipo. Pop. 6000. It is situated on a hill; has a fine cathedral, a diocesan seminary, a hospital, and some convents.

This town is very ancient. It was under its walls that Pyrrhus encountered the Roman legions for the second time, with no decisive advantage on either side. It was almost entirely destroyed by an earthquake in 1400.

ASCUTNEY, mountain, Vt. Situated on the boundary between Windsor and Weatherfield. It is an isolated summit, which rises to the height of 3320 feet above tide water, and 3116 above the level of Connecticut river, at Windsor. Its summit presents an extensive and beautiful prospect, and is often ascended by the inquisitive traveller.

ASDOUD (the *Ashdod* of Scripture, and *Asdod* of the Greeks), a sea-port town of Palestine, on the coast of the Mediterranean. Lat. 31° 45' N., long. 34° 37' E., 35 m. W. Jerusalem, and 11 N.E. Accalon, on the summit of a grassy hill, surrounded by luxuriant pasture grounds. Its present pop. is very limited, probably not more than 300, or 300. It has no ruins; and would be unworthy of notice, were it not for the figure it makes in sacred history. It was one of the five lordships of the Philistines (Phœnicians); and thither the Ark of the Covenant was brought when that people took it from the Jews. (1 Sam., v. 1.) It may be gathered, generally, that the Philistine power yielded to the arm of David (2 Sam., v. 29, et seq.; 1 Chron., xviii., 1); and it is probable that Ashdod was then a Jewish town. If this, however, were the case, it did not remain so; for, 900 years later, the destruction of the walls of Ashdod is reckoned among the triumphs of Uzziah over the Philistines. (2 Chron., xxvi., 6.) It appears to have fallen into the hands of the Assyrians soon after this; and subsequently, according to Herodotus (ii., § 157), stood a siege of twenty-nine years by the Egyptians, under Psammetichus. It is not afterwards heard of as a place of importance. The existing village is celebrated only for the number of scorpions that infest it. The water upon this part of the coast is shallow, and the land perceptibly gaining on the sea. (*Volsky*, ii., 269; *Robinson*, i., 21.)

ASHANTEE, an extensive native kingdom of W. Africa,

lying along the Gold coast of Guinea; extending from 4° 37' to 18° N. lat., and from 4° 48' W. to 10° 10' E. long., being about 980 m. in length and as many in breadth. It may contain about 70,000 sq. m.

*Physical Features of the Country.*—*Mountains and Plains.*—This is a mountainous country, though it has few eminences very abrupt or precipitous. None of the mountains approach the snow line, being, like those of Africa in general, more remarkable for breadth and extent than for height. With regard to composition, all the species of granite, quartz, and slate are met with, but there is an almost total absence of calcareous stone. There are some small tracts of level land on the E. and W.; and the whole country N. of 74° or 80° lat. is a large plain, terminated on the N.W. by a mountainous country, called, from the nature of its surface, *Kose*,\* and on the N.E. by the sandy desert of Ghofan. (*Isert*, *Poy. Guin.*, 249; *Bowditch*, 163, &c.; *Durpuls*, par. ii., 30, &c.; *Capt. Adams's Remarks*, 176.)

*Rivers and Lakes.*—Though not lying in the basin of any one of the first-class African rivers, few countries are better watered. Along the coast are found the embouchures of several respectable streams, the various affluents of which intersect the country in every direction. The *Assinie*, a large river, is usually reckoned the line of demarcation between the Gold and Ivory coast, and forms, for some miles from its mouth, the W. limit of Ashantee. The *Voita*, or *Asweda*, the largest of the Ashantee rivers, runs into the sea in 30° E. long.; its length is estimated at about 400 miles. There are several lakes which, in the summer season, frequently overflow their banks.

*Climate.*—*Soil and Natural Products.*—The heat and insalubrity of the climate of Guinea are proverbial, but both appear to be exaggerated. It seems to be now admitted that countries under and near the equator are less hot than those under and near the tropics, the annual motion of the earth keeping the latter regions for a much longer period vertically beneath the sun. From this cause, therefore, the heat of Ashantee might be expected to be less than that of countries 12° or 15° farther N. The accumulation of water serves also to lower the general temperature, and, upon the whole, though during six months, or from October to March, the heat is extremely violent, during the other half year it is so far from being inconvenient, that fires and warm clothing are frequently desirable. The nights (always nearly of the same length) are cold, even during the hot months, and, in a night-halt in a forest, a blaze is as necessary against the cold heavy dews as against the ferocious beasts. (*Roemer*, 90; *Berket*, 193, 194; *Hutton*, 143; *Adams*, 234.) The coast is, however, extremely unhealthy, especially to Europeans. *Roemer* (90, 93) ascribes this partly to the scorching days followed by chilling nights, but more to a sulphureous mist (apparently a species of miasma) which rises from the valleys and the neighbourhood of rivers every morning, especially during the rainy season. Poor food, bad accommodation, and exposure to the night air, add to these evils, which are still farther increased by a want of regularity in living among both natives and Europeans; but, after all, the climate of this coast is not worse than that of most others similarly situated, and much superior to that of W. Africa farther N., or to that of Guinea, in the same lat., on the other side of the Atlantic. The interior, though covered with dense forests, and consequently exposed to the effects of vegetable decomposition under a vertical sun, enjoys a comparatively salubrious atmosphere; and *Isert* (p. 235) recommends the erection of hospitals, in the inland parts, for the benefit of sufferers from the European fevers on the coast. The air is usually calm, except in the case of tornadoes, and the wind from the desert, called *Harmattan*. The former, however, are pretty frequent, and, in the dry season, particularly annoying, from being followed by violent cold rains. The *Harmattan* is mostly experienced between the end of December and the beginning of February. It has a N.E. or an E.N.E. direction; is perfectly dry, extremely cold, and loaded with an impalpable powder, sufficiently thick to obscure the sun at noon. It is exceedingly destructive; its dryness being such that it absorbs the moisture from everything with which it comes in contact: opening the seams of ships, the joints of floorings, and destroying all animal and vegetable life opposed to its unmitigated violence. It is, in fact, a cold simoom (see *ARABIA*), dried in passing over the Great desert, and subsequently cooled in crossing the high mountains S. of the Niger. It blows usually for two or three days, but occasionally for a fortnight at a time, and with much force. Like other tropical countries, Ashantee has its dry and rainy seasons, or, rather, two rainy and one dry season in each year. The first rains, ushered in by violent tornadoes, occur about the latter end of May or the beginning of June; being followed by fogs and hazy weather, extremely pernicious and particularly

\* *Kong* is the generic term for a mountain, in the language of the Mandingoes. (*Park's Travels*, Appendix, lxxxvi.)

# ASHANTEE.

powerful in July and August. The second rains come on in October, and thence till April is the dry and hot season. The range of the thermometer, in 1817, at 9 P.M., was between 80° (Jan. 2) and 71½° (Oct. 19); this was at Cocumma, among the mountains. In a sandy plain, near the mouth of the Volta, Inert (*Obser. Nat.*, 95) once saw it rise to the extraordinary height of 136°; but even there the average, at 1 P.M., was not more than 76° (*Boesman*, 90-99; *Barbot*, 191-194; *Inert*, 268; and *Obser. Nat.*, *passim*; *Bowditch*, 315, 407; *Adams*, 45, 104-105; *Hutton*, 358; *Dupuis*, 1, 84).

A small part of the coast, towards the E. and W. boundaries, is sandy, but the greater portion, and all the interior, is an argillaceous and aluminous soil, mixed with a rich black earth. This, with the abundance of water, renders the country extremely fertile. From 7½° N. lat. down to the water's edge, Ashantee presents a solid mass of forest, extending E. and W. from the Volta to the Annies rivers. (*Dupuis*, par. ii., 99.) The trees have all the stupendous characteristics which mark African vegetation, but are strikingly different on the coast and in the interior. Near the sea flourish the gigantic boubah (*Adansonia digitata*), the cactus (probably introduced from America), the mangrove (*Rhizophora mangle*), various species of palm, the cotton, and other large trees, mixed with a wild entanglement of thorny bush, itself growing to a size inconceivable to a European. (*Inert*, 95, 103, 140, &c.; *Barbot*, 905.) About 15 m. inland, on reaching the summit of the first mountains, the boubah disappears, but a tree equal in magnitude supplies its place (*Inert*, 255); the mangrove also vanishes, and palms become very scarce, except the oiliferous (*Elaeis guineensis*), and the viniferous (*Phœnix*). Instead of these appear many peculiar species, among which is one tall tree of great elegance, bearing flowers like the tulip; a new kind of rice and citron; and, in a word, a whole forest of trees unknown elsewhere. (*Inert*, 944-947.)

N. of 7½° or 8° lat., trees and shrubs appear only in widely-distant patches, the lands are covered with jungle and Guinea grass, which grows to an enormous height and thickness; and which, being fired, is used by the natives to measure their plantations. (*Dupuis*, par. ii., 30, 34.) The sugar-cane grows wild; and the country produces, besides, tobacco, maize, dhourra, millet, yams, rice, potatoes, and all the alimentary plants, in the utmost profusion. Of fruits the list is interminable; including the pine-apple, orange, banana, cocoa, fig, papay, and, in short, all that are produced in any part of the world between the tropics. Of gums and aromatic plants the list is very great; as is likewise that of dye and hard woods. The exuberant abundance of aloes, balsams (*Gliricidia sepium*), tuberoses, lilies, and amarantus, give to the flora of Ashantee a splendor and magnificence nowhere excelled, and but rarely equalled.—(*Boesman*, xiv., 367, 369; *Barbot*, 190-205; *Inert*, 118, 130, 153, 363; *Adams*, 173.)

The animals are as various and numerous as the plants. Elephants, rhinoceroses, giraffes (*Dupuis*, i., 55), buffaloes, deer, antelopes, cloths,\* civet cats, apes, monkeys, baboons, porcupines, and goats, are among the harmless kinds; Hons (*Dupuis*, i., 24, 49, &c.), tigers, leopards, jackals, wolves, wild boars, and wild cats, among those of a ferocious sort. The rivers swarm with hippopotami and alligators of several species, some of which are eaten by the natives. A gigantic rat, an odoriferous mouse, and a small animal called srompe (man-eater), which digs up and devours dead bodies, seem to be peculiar to Ashantee. The domestic animals are the same as those of Europe; but the horse is scarce, and of a bad breed, and the sheep peculiar in form. Reptiles are prodigiously numerous: serpents of every size, from the enormous boa to a frightfully venomous creature, scarcely a yard long, infest not only the woods and long grass, but the dwellings of the natives, and the forts of the Europeans. Scorpions (sometimes as big as a small lobster) and centipedes—the wound from which, though not dangerous, is extremely painful—abound in every place; and toads and frogs are not only as plentiful as in Europe, but the former grow to such a size, that Boesman, when he first saw one, took it for a land-tortoise (p. 357). Lizards of all sizes; from the iguana downward, including two species of camelians, are found here. (*Boesman*, 294-347, 257-259; *Barbot*, 206-216; *Inert*, 23, 163, 185, &c.; *Bowditch*, 387, 329; *Adams*, 184-188.) Of birds, there are pheasants, partridges, wild ducks (of a beautiful plumage), doves, crown birds, parrots, perouquets, Guinea sparrows, beccaficoes, and a multitude of all kinds, great and small, many of them yet unclassified by naturalists. The water-fowl—are herons, bitterns, and sea mews: the birds of prey—eagles, kites, and a

peculiar species, which, though not larger than a dove, is bolder and more rapacious than any other. A large and ugly bird, called the pookoo (of great service in destroying the field-rats), is peculiar here, as is also a creature about twice the size of a sparrow, with a remarkable hollow and piercing voice, the sound of which is regarded by the natives as of evil omen. The general characteristic of the Ashantee birds is extreme beauty of plumage; but pleasing voices are rare among them, the nightingale and thrush being the only songsters known. Sparrows and swallows are very numerous; and the domestic fowl are the same as those of Europe. (*Boesman*, 299, 349-356; *Barbot*, 217-230; *Inert*, 21, 104, 185, 257, &c.) The woods abound in bees, and the destructive species of ant, called termites, is so numerous and rapacious, that a sheep attacked by them during the night has been found a perfect skeleton in the morning. (*Boesman*, 360.) It is said they will attack any animal, even the most powerful and venomous serpent, and destroy him. (*Dupuis*, i., 98.) Fire-flies, dragon-flies, a fly exactly resembling the cantharides in appearance and scent, together with all the insect tribes common to the tropics, except the mosquito (*Bowditch*, 391), are found upon the coast; and in the interior, Inert, among a vast variety of species, observed several which appeared to be peculiar. The locust is not wholly unknown, but its destructive visits are rare; owing, probably, to the great distance of the desert, and the intervention of high mountains between it and Ashantee. Black and hump-backed whales are numerous on the coast between September and December. Sharks are very numerous, are frequently captured, and form the most common food of the Gold coast negroes. Other sorts of sea fish are very abundant; and the rivers are as well supplied as the sea, yielding, among others, great quantities of oysters and crabs, which feed upon the branches of the mangrove and other trees, but are not good for food if the water be fresh. (*Boesman*, 16, 259-266; *Barbot*, 231-237; *Inert*, 95, 257, &c.; *Adams*, 189-195.) Gold is more abundant in Ashantee than in any other part of Africa, probably than in any other part of the world, not excepting even S. America. It is procured partly by washing the sands in the beds of rivers and torrents after violent rains, and partly by sinking mines or pits, in a very artificial style, among the mountains, whence it is dug up for use. Of the amount obtained annually, Europeans are, and must be, ignorant; for the superstition of the natives deprives them of access to the mines, all of which are dedicated to the national gods, and some considered too sacred for even an Ashantee to cut into. The pits and washings in Tokoo alone, are, however, reported to yield sometimes as much as 2000 oz. per month; and Boesman, in 1795, gave the following as the average amount of the exports, which are now, probably, exceeded:

|                          | Barbs. | Lbs.   |
|--------------------------|--------|--------|
| Dutch West India Company | 1500   | = 750  |
| English African Company  | 1300   | = 650  |
| Dutch Private Traders    | 1500   | = 750  |
| English                  | 1000   | = 500  |
| Portuguese and Danes     | 1000   | = 500  |
| Portuguese and French    | 800    | = 400  |
| Total                    | 7000   | = 3500 |

Or above 1½ tons annually. (*Boesman*, 61-97; *Adams*, 169.) *Population, Habits, Manners, and Customs.*—Bowditch (p. 316) estimates the pop. of Ashantee Proper at 1,000,000; of whom 204,000, he says, are warriors; 101,000 children under ten years; 50,000 boys between ten and sixteen; 7000 old men; and 638,000 females; and the pop. of the whole empire may, perhaps, be somewhere about 3,000,000. The men are well made, more muscular on the coast than in the interior, free from the more revolting peculiarities of negro form and feature, and some of them have even aquiline countenances. The higher order of females (those not subject to hard labour) may be said to be handsome, with features rather of an Indian than an African mould. Both sexes are cleanly, washing from head to foot every day, and afterwards anointing themselves with the grease of the shea, or butter-tree; a good cosmetic, and a preservative of the skin in this hot climate. The clothes of the better classes are convenient, and not ungraceful, consisting of immense cloaks, exactly like the Roman toga, manufactured of the most costly silks. The war-dress substitutes for this a close vest, covered with metal ornaments and scraps of Moorish writing, as spells against danger, loose cotton drawers, and large boots of dull red leather. The superior chiefs have gold breast-plates; and all who can procure them wear gold ornaments in profusion. Some of these are well wrought, others are merely lumps of rock-gold hung to the wrist: the war-cap consists of gold or gilded ram's horns, supporting an extravagant plume of eagle's feathers. In peace, the head-dress is usually a fillet. The lower orders wear nothing but a piece of cloth fastened round the waist. Boesman (119-116) enumerates five degrees, or orders of so-

\* These creatures, called by the natives Fotto and Yonne, do not appear in Cuvier's list of Edentata. (V., 273-276.) They differ in many respects, as the size of the head, nature of the fur, &c., from the *Tardigrada* of America, but their habits are identical, and, unless withal and gratuitous deception be supposed in authors of scarcely high credit, their existence in this part of Africa cannot be questioned. (*See Barbot*, 287; *Bark*, 312; *Dupuis*, i., 84.)

clay—the king, the caboceers, the gentry, the traders, and the slaves. Besides the king, however, there is, in fact, but one distinction, that of slave and freeman; to the latter appertain, of course, all the better employments of war, state, &c.; to the former, all the meaner and more laborious occupations, of which the women get much more than their fair share. The caboceers (magistrates of towns and villages) are taken indiscriminately from the gentry; and these, again, are merely such as have enriched themselves by trade or inheritance, and who, not unfrequently, were born slaves. The occupations of trade are practiced alike by the poorer freemen and the better class of slaves. The intercourse between the sexes is on the worst possible footing. Marriage is effected by paying a sum of money to the parents of the girl, and a family feast. The property of the man and woman (if she have any) does not become common. Polygamy is allowed; the king's wives amounting to the extravagant number of 3333, a mythical number which is carefully kept up, to enable him to reward any distinguished caboceer by the present of a woman, but never exceeded. Few, however, except the richest individuals, have more than one wife, and very many have none; for the husband having unlimited power of life, limb, and liberty, over his wife, (and prostitution being noways discreditable), females frequently refuse to marry; the father, in such cases, never attempting compulsion, but instantly disclaiming all future interest in his daughter. Infants are not unfrequently married to infants. The food of the higher classes is very various; soup of dried fish, fowls, beef, or mutton; wild hog, deer, and monkey's flesh; together with the whole host of vegetables which the soil produces. Well-stocked and well-regulated markets are held in the towns, for the supply of these necessities, as well as for articles of clothing and European manufacture. The poorer classes, excepting household slaves, live almost exclusively on fish and *dhourrah*. The common drink is palm-wine, one species of which is said to create a ravenous appetite.

The Ashantees have two high festivals; one annually, at the yam harvest, in September; the other at intervals of about 21 days. The last is called the *adal* custom, and alternately the great and little *adal*. It forms the calendar; the year, which commences in October, being divided by it into equal parts, and terminated by the great yam festival. At these festivals, as on all public occasions, the most brutal excesses, and the most atrocious cruelties are practiced. The skulls of all the kings and chiefs whose fall has swelled the power of the reigning monarch, together with those of rebellious caboceers, to the amount of more than 900, are paraded before the assembled multitude. Rum and palm-wine are swallowed like water, till the guests are brought to a state of intoxication and madness, when hundreds of human victims are sacrificed. They seem, in fact, to delight in cruelty and blood. The death of a free person is, in almost all cases, attended by the slaughter of a human being, to "*wet the grave*;" and that of a chief invariably causes a frightful sacrifice of life. If a man of ordinary rank marry a royal female, he must be killed on his wife's grave, should he happen to survive her; and the *ocrae* (personal attendants on the king) are all murdered on their master's grave, together with many others, male and female, often amounting to some thousands. Cannibalism, as far as respects the blood and heart of an enemy, is practiced, though not avowed; and the teeth and smaller bones of vanquished foes are ostentatiously worn as ornaments, the skulls and larger joints being preserved as public trophies. Such are the disgusting enormities perpetrated by this nation of savages; who, if they contrast advantageously with other negro tribes in energy and decision of character, yield to none in that cruelty and bloodthirstiness which seem to be leading features in the African character.

Singular as it may seem, the music of the Ashantees is said to be pleasing and melodious, and Bowditch has recorded to notes several airs that struck him as possessing merit. Their instruments are horns made of elephants' tusks, reed flutes, a sort of bagpipe without a drone, gongs, and cymbals. They have a game of chance, called *worra*, played with a number of shells and a board full of holes.\* They play also the *Folash* draughts, and a third game, which, from its description, appears to resemble the childish amusement called "*fox and geese*," in Europe. To complete their character, it may be further observed, that they are great thieves and extraordinary observers of etiquette. (*Bosman*, 100-120, 160-170, &c.; *Leart*, 162, 210, 218, &c.; *Bowditch*, 374-308; *Hutton*, 84, 99, 92, &c.; *Dupuis*, 1, 140, &c.).

*Diseases and Remedies.*—The Ashantees are subject to several malignant disorders, of which the most peculiar, and perhaps the most dreadful, is the "*Quinea-worm*," a reptile which, formed beneath the skin, causes the most

frightful sufferings. It is sometimes as large as to pass quite round the body, but more frequently varies from five or six to eight or nine inches in length. Extraction is the only cure; but if in effecting this the worm be broken, to avoid which much care and patience is necessary, the part left behind corrupts in the body, tainting the whole mass of the wretched patient's blood. This loathsome disorder is supposed to be owing to bad water, which is the more probable as it is confined to the coast: in the interior, where the water is pure and good, it is unknown. Charms and amulets are much resorted to for cures: they have, however, some knowledge of medicine. Bowditch gives a list of thirty-seven simples, as forming their *Materia Medica*. Surgery does not form one of their arts; and those who are wounded, and recover, are indebted for their restored health to the *vis medicatrix nature*. (*Bosman*, 94-96; *Leart*, 217, 223; *Bowditch*, 370-380; *Hutton*, 353.)

*Industry, Agriculture, Arts, Manufactures, Commerce.*—Dupuis (1., 67) has justly remarked, that the labour of clearing away obstructions in a rankly luxuriant soil is about equal to that of overcoming sterility in poor and barren lands. The former is the chief employment of the Ashantee agriculturist; and in this his chief instrument is fire, by means of which he both clears the ground, and spreads a mass of rich manure upon the soil. The only implement in use is a rude hoe; but this is sufficient, in productive grounds, flooded twice a year, to produce two crops of most kinds of corn, and an abundant supply of yams and rice. The plantations are laid out with considerable order and neatness, and the cultivated grounds are pretty extensive, though inadequate to the wants of the consumers. Despite the fertility of the soil, the approach of harvest is almost always preceded by scarcity, if not by famine. Though they do not smelt metals, the Ashantees, like several of the African nations, have blacksmiths and goldsmiths of a superior grade to what might be expected. The former manufacture all their arms (except muskets), razors, &c. The goldsmiths forge sundry ornaments, as rings, chains, brooches, &c., and cast figures of tame and wild beasts. They are also great *ido-makers*, and are able to produce fine gold thread. The fineness, variety, and brilliance of the cloths of the native weavers would not disgrace an English loom; the patterns are painted by means of feathers, with sufficient regularity to have the appearance of a coarse print. Dyers, potters, tanners, and carpenters, complete the list of Ashantee artificers; of whose handiwork a number of manufactured and other articles, in case 6, room 1, of the British Museum, are specimens. The houses, generally of one story, are thatched, and the external walls decorated with a rude hieroglyphic sculpture: they are usually painted, but not floored; and pretty closely resemble an English barn. It should be mentioned, to their credit, that all good houses have their cloacas, which agree well with the Ashantee character for cleanliness; and evinces, in this respect, a superiority to most other negro nations. Commerce with Europe having now been carried-on for some centuries, the natives have become shrewd and expert dealers: they practice all sorts of frauds; and their dexterity in adulterating gold equals that of a first-rate chemist. Barbot (239) affirms, that the Portuguese taught them this art, as a means of driving the other European nations from the coast; and if this be true, they have shown themselves, in this instance, much more expert scholars than in any other. Gold is now, perhaps, the chief article of export; and some little is also done in the way of exporting ivory, and dye and hard woods. Slaves are exported on every possible opportunity; and, notwithstanding the vigilance of the British cruisers, there is reason to think that considerable numbers find their way across the Atlantic. The imports are principally muskets and other arms, gunpowder, spirituous liquors, tobacco, iron, tin, copper, lead, with cotton and Indian goods, which are taken, chiefly for their colours, to be unravelled and remanufactured in the native looms. The last-mentioned articles are, however, received chiefly through the interior from *Dagomba*, *Fezan*, &c., with which the Ashantees maintain a very extensive trade, supplying them in return with liquors, iron, and other European commodities, but never with arms. The currency is gold, either in dust or small lumps; but the cowrie-shells, in use farther N., are not unknown. The denominations and values may be given as follows: 200 cowries (5 strings) = 1 tokoo (about 8d.); 8 tokooks = 1 akie; 16 akies = 1 newneme (ounce); 24 ounces = 1 benda; 11-9th benda = 1 penguin. (*Bosman*, 6, 109, &c.; *Barbot*, 199, 227-235, 262, &c.; *Leart*, 107-116, &c.; *Bowditch*, 304-314, 330-343, &c.; *Dupuis*, par. 1., 65-67, par. ii., 69-73, &c.).

*Government, Constitution, Laws, Revenue.*—Before the power of the Ashantee king had swallowed up that of the other states, each possessed its own peculiar form of government and administration; some, as *Fantee*, *Mina*, &c., were republics; others, and by far the greater number, were despotisms; but now all are alike brought under the Ashantee constitution, the legislative power of which lies professedly

\* This game is played also in Syria, and is well described by Dr. Hogg (*Visit to Alexandria, Damascus, and Jerusalem*, ii., 67) under name of "*magala*."

## ASHANTEE.

in the king, an aristocracy, consisting of only four persons, and the assembly of caboceros or captains. The aristocracy was formerly much more numerous; but Sai Cudjo, who reigned between 1753 and 1785, began to reduce it, by uniting the stool (seat of authority) of a deceased noble to that of one still living (*Bowditch*, 236); and this plan has been successfully pursued till the present result is the consequence. On all questions of foreign policy the aristocracy have a voice equal to the king's, extending even to a veto on his decisions. In domestic affairs they have considerable influence, but it is exercised in both cases privately, the public announcements always appearing to emanate from the sole will of the monarch. The assembly of caboceros has no deliberative voice: they are mere recipients of the laws promulgated by the king and aristocracy, to which, by their office, they are bound to give effect in their several governments. The influence of the aristocracy is curbed by their poverty: they are privileged from capital punishment, but may be despoiled for any offence, a regulation that has made and keeps them beggars; and thus, in effect, though not in form, the monarch is absolutely despotic. He is also heir to the gold of every one. The king's family are not exempted from capital punishment, but their blood must not be shed: if death be awarded them, they are drowned in the Dah. Death is the punishment for cowardice; for picking up gold dropped in the market-place; for killing an equal; for treason; and, in some cases, for theft and adultery. The common punishment for the latter is, however, fine, or, if committed in the open air, slavery; for the former, restitution by the friends of the thief. Mutilation is inflicted for many offences; but all accusations are mostly made at the peril of the accuser, who, if he fail to establish his charge, must himself undergo the penalty of the offence. Property is hereditary, but in a way that will appear rather extraordinary to Europeans, the children of the sister succeeding, on account of the uncertainty as to the wife's fidelity! This also is the law of succession to the Stool, or Throne. The state of the country, as respects security, may be inferred from the fact that interest of money is at 24 per cent. for 40 days, and the creditor has the power of seizing his debtor and family as slaves. Two or three species of ordeal are practised in doubtful cases, one of which consists in making the accused chew about one-eighth of an ounce of a poisonous bark, and then drink three or four calabashes of water. If he vomit, he is pronounced innocent; but if his stomach be potent enough to retain the poison, it is held to be a conclusive proof of guilt. The revenue, as far as it can be ascertained, consists of—1st. The gold of deceased persons, and the goods of disgraced nobles. 2d. A tax on slaves purchased for the coast. 3d. The gold mines and washings in Sokoo, Dinkra, Akim, and Assin. 4th. The washings of the market-place. (*See Nat. Prod.*) 5th. Tributes from the recently conquered states, varying from 50 bendas to 200 penguins of gold annually. In some cases this tribute is taken in kind, the largest amount for any one town being 500 slaves, 200 cows, 400 sheep, 400 cotton cloths, and 200 silk cloths. (*Boorman*, 136-139, 171-177. *Bowditch*, 252-260, 319-321. *Hutton*, 87, 314-320.)

**Religion.**—The allegory of "The Book and the Calabash" is prevalent through all the Gold coast and the states of Ashantee. The Great Spirit, after creating three white and as many black men and women, placed before them a large calabash and a sealed paper, giving to the black race the choice of the two. They took the calabash, which contained gold, iron, and the choicest productions of the earth, but left them in ignorance of their use and application. The paper, on the contrary, instructed the white men in every thing; made them the favourites of the Great Spirit; and gave them that superiority which the negroes always readily acknowledge.\*

From this fable it is clear that they have some notion of one supreme deity; but they have, notwithstanding, lapsed into the absurdities of fetishism (*see AFRICA*), or of the lowest and grossest species of idolatry. They have an evil principle, of whom they stand in great dread, but it is denied that they pay him adoration. On the contrary, it is said that one of the most solemn ceremonies of many tribes is an annual assembly of men, women, and children, to drive the evil spirit from the towns and villages. They have a fixed belief in a future state—kings, priests, and caboceros being believed, after death, to reside with the Great Spirit, in an eternal renewal of their earthly state: and it is said that the sacrifices of so many human beings on the graves of their kings is intended to supply them with attendants in the future world. The victims also, it is affirmed, are not altogether averse from this sacrifice; since by it they believe they will partake the superior heaven of their chiefs; their own being, at best, merely a release from labour in the house of some inferior fetish. An uncommon number of charms, omens, lucky and unlucky days, and an implicit

submission to the fetish, complete the superstition (for it would be absurd to call it religion) of the Ashantees. In some tribes, Tuesday is observed as the general Fetish day or Sabbath; but different families generally consecrate different days; all, however, observing one. There are many Mohammedans among the Ashantees; some, by their lighter complexion, attesting their Arabic origin; but the majority are not distinguishable from the other negroes. They have great influence in the court of Coomassie, are subject to their own officers in all spiritual affairs, and, where very numerous, as is the case in several towns, are governed by them also in temporal matters. - (*Boorman*, 121-126; *Bartol*, 304-317; *Isert*, 187-196; *Bowditch*, 261-273; *Dupuis*, par. ii., 10, 15; *Adams*, 196-200.)

**Language.**—The European who has observed the affinities among the languages spoken in his own division of the world, the W. of Asia, and even the N. of Africa, is ill prepared for the Babel of tongues that prevails S. of the Sahara. In 60 m. of the Gold coast, no fewer than seven or eight languages are found, each unintelligible to the tribes speaking the other, and bearing no relation whatever to any other (*Boorman*, 81.). *Bowditch* (*Appendix*, 503) gives the numerals of thirty-one tribes, whence it appears that, though some few may be considered as variations from the same root, the majority do not assimilate in the slightest degree. The Ashantees, Fantees, Wassaus, Akimees, Aminees, and Aquapims, speak dialects of the same language; but for the rest of the tribes that make up this barbarian kingdom, an imaginary line often separates two who possess no means of social intercourse. This formidable obstacle to all communication is, no doubt, a chief cause of the continued degradation of the negro race, more especially as none of their languages possess symbolical characters. In Ashantee, as in other parts of Africa, the only persons who can read or write are the Moslems, and the only written language the Arabic. (*Isert*, 180-182; *Bowditch*, 344-350; *Hutton*, 308-364; *Adams*, 195.)

**History.**—The Ashantees have two traditions as to their first establishment in their present homes; first, that they came in twelve tribes from a country nearer the sea (the Atlantic?); the other, that they were driven from the interior by the Mohammedan conquests in the first days of Islamism. (*Bowditch*, 228; *Dupuis*, 224.) It may be that these accounts, though apparently contradictory, are but different versions of the same tale. But, without stopping to inquire into this, we find them, in 1840, seated in the centre of their present possessions, and occasionally exercising an influence over the surrounding states of Akim, Assin, Quabon, and Akwea. Then, and for near a century later, the paramount state of the gold countries was Dinkra; but in the beginning of the 18th century, the king of that country having deflowered a wife of the Ashantee monarch, the latter, though considered a very inferior potentate, invaded the Dinkra territories, defeated his enemies in two decisive battles, killing, it is said, 100,000 men, and carrying off immense plunder. (*Boorman*, 67.) Dinkra, upon this, became attached to the Ashantee dominions, and from this epoch the extension of the latter proceeded rapidly. One by one the different states between the Assinee and Volta rivers were subdued; and, in 1807, the invasion of Fantee brought the Ashantees into collision with the British. Cape Coast castle, the principal fort of the English on the Gold coast, was in the Fantee country, and held, like the other European forts upon that coast, not as a territorial right, but at a rent from the native government. After the conquest of Fantee, the rent was claimed by and paid to the king of the Ashantees; but some difficulties made about recognizing his sovereignty led to much discussion, and to two embassies (those of *Bowditch* and *Dupuis*) to the court of Coomassie. In justice to the king it must be admitted, that, whatever may be thought of his conduct to the natives, an uncommon degree of forbearance marked his behaviour to the British authorities. The treaty concluded by *Dupuis* in 1820 was not ratified by the council at Cape Coast castle, because, by the fifth article, it recognised the questioned sovereignty of the Fantee country; but the heart-burning necessarily consequent on this step did not break out for some time after. The death of Sai Quasima (king of Ashantee), who, according to *Dupuis* and *Bowditch*, was the steady friend of the whites, seems to have been the signal for hostilities. His successor declared war against the English; and on the 21st of January, 1824, Sir C. McCarthy, governor of Cape Coast, at the head of 1000 men, was totally defeated by the Ashantees. It took almost three years before the English power on the Gold coast recovered from this blow; but in 1828, the Ashantees having suffered a ruinous defeat, consented to pay 6000 oz. of gold as the price of peace, and to send the king's son for education, or, rather, as hostage, to Cape Coast castle. The Ashantee power on the coast, since this event, may be considered as nearly destroyed. (*Bowditch*, 228-250; *Dupuis*, 224-264; 194-223; *Public Papers* for 1826.)

\* Some believe that the reward of virtue in this world is, to be transformed into white men in the next. (*Boorman*, 131.)

## ASHBOURNE.

**ASHBOURNE**, a m. town of England, co. Derby, on the E. side of the Dart, 123 m. N.W. London, 134 N.W. Derby. The parish, in which the town is situated, contains 13,000 acres, and had, in 1831, 4884 inhab., of which about a half belong to the town. It has an old church with a fine spire, a free grammar school, two elementary schools, one for 36 boys, and the other for 30 girls, almshouses for poor men and women, and some other charitable institutions. Dove-dale, famous for its romantic beauties, is in the immediate vicinity of this town.

**ASHBURNHAM**, p. t., Worcester co., Mass., 53 m. N.W. Boston, 495 W. It occupies the height of land between Connecticut and Merrimack rivers, its streams flowing to the former through Miller's river, and to the latter by Nashua and Souhegan rivers. Incorporated in 1765. It contains three churches, one Congregational, one Methodist, and one Baptist; five stores, one cotton factory, three grist-mills, eighteen saw-mills, three tanneries, ten schools, 549 scholars. Pop. 1652.

**ASHBURNTON**, a borough, m. town, and par. of England, co. Devon, hund. Teignbridge, the borough being situated within 13 m. of the Dart, on the high road from London to Plymouth, 170 m. W.S.W. London, and 19 m. S.W. Exeter. The parish contains 8390 acres, and had, in 1831, a pop. of 4165, of whom 3467 belonged to the town. It has a handsome Gothic church, with a tower 90 feet in height, a grammar school, and free schools, which supply elementary instruction to about 100 children. It is the seat of one of the stannary courts. Serge is, or was, manufactured in the town; and there are tin and copper mines in the vicinity. Previously to the Reform Act, Ashburnton returned two m. to the H. of C., the franchise being vested in freeholders having lands and tenements holding of the borough only. The Reform Act deprived it of one m., and made the boundaries of the parish and pari. bor. identical. Constit. in 1836-37, 1851. It was the birth-place of Dunning, the famous lawyer, who was created Baron Ashburnton; and of William Gifford, the translator of Juvenal, and the original editor of the Quarterly Review, who, on his death, left a legacy to the town. It now gives the title of baron to the head of the family of Baring. (*Boundary Reform, &c.*)

**ASHBY-DE-LA-ZOUCH**, a m. town and par. of England, co. Leicester, hund. W. Goscote, 116 m. N.W. by N. London. The par. contains 9300 acres, and 4727 inhab., of whom about 4000 may belong to the town. It consists of one main street, and some smaller ones; has an old church, several free schools, for girls as well as boys, and manufactures, on a small scale, woollen and cotton stockings, and hats, and has some trade in malting. In the vicinity are the extensive remains of Ashby castle, built by Lord Hastings, in the reign of Edward IV., and dismantled in that of Charles II.

**ASHBY**, p. t., Middlesex co., Mass., 47 m. N.N.W. Boston, 443 W. A head branch of Nashua river affords water power. It has two Congregational churches, four stores, two grist-mills, seven saw-mills, one academy, 50 students, nine schools, 375 scholars. Pop. 1246.

**ASHE**, county, N.C., situated in the N.W. part of the state, and contains 840 sq. m. Drained by head waters of the Great Kanawha and Holston rivers. There were, in 1840, 13,611 neat cattle, 16,522 sheep, 24,071 swine, and there were produced 10,636 bushels of wheat, 17,905 of rye, 150,279 of Indian corn, 108,505 of oats, 57,962 of potatoes. It had eight stores, fifty-seven grist-mills, twenty saw-mills, ninety-seven distilleries, three tanneries, two schools, 58 scholars. Pop.: whites 6911; slaves, 497; free coloured, 50; total, 7487. Capital, Jefferson.

**ASHFIELD**, p. t., Franklin co., Mass., 106 m. W. Boston, 403 W. Watered by branches of Deerfield and Westfield rivers. Incorporated in 1764. It contains four churches, one Congregational, one Episcopal, and two Baptist; four stores, three fulling-mills, two woollen factories, one grist-mill, ten saw-mills, thirteen schools, 368 scholars. Pop. 1610.

**ASHFORD**, a m. town and par. of England, co. Kent, lathe of Scray, the town being situated on an eminence near the junction of the upper branches of the Stour, 47 m. E.S.E. London, 14 m. S.W. Canterbury. The par. contains 3950 acres, and 2809 inhab. The church, a Gothic fabric of considerable note, has a lofty, well-proportioned tower, and several ancient monuments. There is a free grammar school of some eminence, founded in the reign of Charles I. by an ancestor of the present Sir Edward Knatchbull, and some other charities.

**ASHFORD**, p. t., Windham co., Ct., 32 m. E. Hartford, 368 W. Several small streams afford good water power. Incorporated in 1714. It contains seven churches, three Congregational, three Baptist, and one Methodist; twelve stores, two woollen factories, two grist-mills, eight saw-mills, one academy, 32 students, eighteen schools, 817 schol. Pop. 2651.

**ASHFORD**, p. t., Cattaraugus co., N.Y., 295 W. by S. Albany, 345 W. Drained by Cattaraugus creek and its tributaries. It contains one store, one fulling-mill, one-grist-mill, five saw-

## ASHVILLE.

mills, two schools, 346 scholars. Pop. 1400. The village contains one church, thirty dwellings, and about 500 inhabitants.

**ASHLAND**, p. v., Richland co., O., 79 m. N.W. Columbus, 368 W. It contains two churches, one Methodist and one Presbyterian, seventy dwellings, and about 500 inhabitants.

**ASHPORT**, p. v., Lauderdale co., Tenn., 206 m. W. by S. Nashville, 298 W. Situated on the E. side of the Mississippi, at the lower end of the Canadian reach, and contains several warehouses and a steam-mill. Pop. about 500.

**ASHRUFF**, a town of Persia, prov. Maganderan, about 8 m. from the W. extremity of the bay, and 52 m. W. from the city of Asterabad. Near it are the ruins of an extensive and magnificent palace, built by the greatest of the Persian monarchs, Shah Abbas. The town, which was in a great degree dependant on the palace, has been seriously affected by the decay and ruin of the latter, and did not, in 1821, contain above 500 houses, thinly scattered through an extensive jungle. (*Preser's Caspian Sea*, p. 18.)

**ASHTABULA**, county, O., situated in the N.W. part of the state, and contains 700 sq. m. Watered by Grand and Ashtabula rivers, which flow into lake Erie. The head waters of Shemango creek, in its S.E. part, flow into Beaver river, and thence into the Ohio. Organized in 1811. It had, in 1840, 30,619 neat cattle, 38,638 sheep, 13,143 swine, and produced 105,093 bushels of wheat, 4229 of rye, 171,576 of Indian corn, 4495 of buckwheat, 142,256 of oats, 154,365 of potatoes, 53,975 pounds of tobacco, and 148,568 of sugar. It had six foreign commercial houses, sixty-six stores, sixteen fulling-mills, four woollen factories, four furnaces, twenty-nine tanneries, four distilleries, thirty-four grist-mills, seventy-two saw-mills, two printing-offices, issuing two weekly newspapers, four academies, with 421 students, 133 schools, 5709 scholars. Pop. 23,794. Capital, Jefferson.

**ASHTABULA**, p. t., Ashtabula co., O., 904 m. N.E. Columbus, 341 W. Situated on the S. shore of lake Erie. Watered by Ashtabula river. It has thirteen schools, 720 scholars. Pop. 1704. The village is situated on both sides of Ashtabula river, 3 miles from its entrance into lake Erie, and contains two churches and ten stores.

**ASHTON-UNDER-LYNE**, pa. of England, co. of Lancashire, hund. Salford, 6 m. long N. to S., 4 m. broad; area, 9300 acres. Pop. in 1801, 15,633; 1821, 25,967; 1831, 33,597; nearly half of whom resided in the town of Ashton; and about 10,000 in the hamlets of Lees, Mosley, Audenshaw, and part of Staley-bridge. At present (1839), the pop. probably exceeds 42,000. Most parts of the parish abound in coal. There are about twenty shafts in operation, and the number of miners may be from 600 to 700. This is one of the principal seats of the cotton manufacture, and most part of the pop. are employed in and dependant upon it for support. There were, in all, about eighty cotton factories, employing about 18,000 hands, in the parish in 1839; of which forty-two factories and 9000 hands belonged to the town of Ashton; twenty-eight factories and 7000 hands to Staley-bridge, Mosley, &c.; and ten factories and 3000 hands to the rest of the parish. Stout printing calicoes and ginghams are the articles principally produced. The woollen manufacture is but inconsiderable. The manor and ecclesiastical patronage belong to the earl of Stamford.

**ASHTON-UNDER-LYNE**, a m. town of England, co. of Lancashire, in the above pa., on the N. bank of the Tame, 187 m. N.W. by N. London, and 84 m. E. Manchester. Pop. in 1821, 9230; in 1831, 14,670. It is well laid out, well built, and is eminently thriving. Its rapid growth is owing to the still more rapid extension of the cotton manufacture. Exclusive of the factories engaged in the cotton department (see previous article), it has a hat manufactory and a silk-mill; an old and a new church, with numerous chapels and other places of worship; an excellent market, the buildings connected with which cost above £10,000, has been erected within these few years; and it has a court-house, a theatre, concert-room, &c. The free school is but slenderly endowed; but there are several other schools; a mechanics' institute, with 300 members, and six large Sunday schools, having each from 1000 to 1200 children.

There are at present (1839) four banks in the town. Market-day, Saturday. There is a cattle market on the first Saturday in each month. Fairs, March 23, April 22, July 14, 15, and 25, Nov. 10, and Nov. 21.

Ashton is admirably situated for trade and manufacture, in the centre of a populous neighbourhood, having an unlimited command of coal, and communicating by means of canals and railways (now in the course of being formed) with all parts of the empire. It was anciently a borough, but, for some cause or other, has long been disfranchised. The Reform Act conferred on it the privilege of sending one m. to the H. of C. It had in 1831, 612 £10 houses, and, in 1837-8, a constituency of 617.

**ASHVILLE**, C.H. p. v., capital of Buncombe co., N.C., 258 m. W. Raleigh, 486 W. Situated on French Broad river, and contains a court-house and several stores and dwellings.

**ASHVILLE**, C.H., capital of St. Clair co., Alabama, 97 m.

## ASHUELOT.

N.E. Tanglewood, 730 W. Situated on the S.E. side of Canoe creek, and contains a court-house and several dwellings.

ASHUELOT, river, N.H., rises on the S. of Sunapee mountain, in Washington, and flows S. and E. to its entrance into Connecticut river, in the S. part of Hinsdale.

ASIA, the largest, most early civilized, and, in many respects, the most interesting of the great divisions of the globe, extends from  $10^{\circ} 30'$  to  $70^{\circ}$  N. lat., and, when the islands belonging to it are included, from  $110^{\circ}$  E. lat. From west to east it extends from  $90^{\circ}$  to  $180^{\circ}$  E. long. The most northerly point of the continent is cape Taimura,  $75^{\circ}$  N. lat.; the most easterly, cape Tshukotskoi Nos,  $180^{\circ}$  E. long.; the most southerly, cape Buros,  $10^{\circ} 30'$  S. lat.; and the most westerly, cape Baba, in Asia Minor,  $20^{\circ}$  E. long. Cape Taimura and cape Buros are more than 5300 m. distant from each other, and this, consequently, is the extent of Asia from N. to S. Its greatest breadth occurs under the parallel of  $70^{\circ}$  N. lat. between cape Baba and the E. coast of the Corea, where it extends about 5600 miles from W. to E. Its surface is supposed to cover about 17,500,000 sq. m., being about four times the area of Europe.

**SKETCH OF ASIA.**—On the N. Asia is washed by the Arctic sea, which separates it from the Arctic countries of America; on the E. by the Pacific ocean, which divides it from the continent of America; on the S. by the Indian ocean, which lies between it and Australia; on the W. it is continuous with Africa and Europe. The boundary line between it and Africa is formed by the gulf of Aden, the straits of Babelmandel (where both continents are only about 16 miles apart), the Red sea, and the isthmus of Suez, where both continents unite for about 70 miles. Asia is separated from Europe by the Mediterranean sea, the Aegean sea or Archipelago, the straits of the Dardanelles, the sea of Marmora, the channel of Constantinople, and the Black sea. From the eastern shores of the latter sea, the boundary line runs along the crest of mount Caucasus to the Caspian sea, which constitutes the boundary as far as the mouth of the river Oural. Thence it follows the course of that river up to its source in the Ouralian range, which latter forms the remainder of the boundary line to the gulf of Kara, E. of the island of Nova Zembla.

To the S. and S.E. of Asia is the greatest of all archipelagos, containing many thousands of large and small islands. These belong partly to Asia, and partly to Australia, but they are not separated by any natural boundary. When the Portuguese and Spaniards began to be acquainted with the islands of India, they conquered or settled those only which were supposed likely to repay the expense and trouble. These were then, and are still, considered as belonging to Asia. The others, which did not offer such advantages, and were not settled or visited at that time, are now included in Australia. In this way, Japan, Formosa, the Philippines, the Moluccas, and that long chain of islands, which in the east begins with Timorant, and on the west terminates with Java, are considered as belonging to Asia, while the numerous islands dispersed between the Moluccas and New Guinea, and lying at a short distance from the former, are included in Australia.

In looking at the map of Asia, we are struck by observing that the Pacific ocean, which divides it from America, nowhere reaches immediately to the coasts of the continent, but is separated from them by several chains of islands, which, with the coast, form a number of smaller sea-basins. The most northerly of these sea-basins is the sea of Kamtschatka, lying between the N.E. extremity of Asia and the N.W. of America, and separated from the Pacific by the Aleutian islands. The Kurilian islands, extending from cape Lopatka to Yezo, the most northerly of the islands forming the empire of Japan, separate another sea-basin from the Pacific; it is called the sea of Tarsak, from the large island forming its W. side, and commonly called Saghalien. Farther E. lies the sea of Japan, shut up by the islands constituting that empire and the opposite coasts of Manchouria and Corea. Then follows the sea, called *Tung-Hai* (Eastern sea) by the Chinese, with its extensive northern gulf, the Wang-Hai (Yellow sea). This basin is more open towards the Pacific, its entrance being shut up only by two or three small groups of islands, among which the Loo Choo have obtained some celebrity in later times. The island of Formosa forms the southern boundary of this basin. From this island to the equator extends the *Han-Hai* (Southern sea) of the Chinese, called by the Europeans the *Chinese sea*, because it is traversed by them in their voyage to China. The eastern boundaries of this basin are the Philippines and the islands of Palawan and Borneo, and it forms two great gulfs in the continent, those of Tonkin and Siam. The formation of these five sea-basins is partly owing to the three great peninsulas which project from the continent, the peninsula of the Tshuktshe, occupying 60,000 sq. m., and those of Kamtschatka and Corea, which are nearly of the same extent.

## ASIA.

The E. coast of Asia is not surrounded by close seas, but is quite open to the Indian ocean, except where it borders on the Chinese sea; but in these parts are several gulfs which deeply penetrate into the continent, and thus form extensive peninsulas. The principal are the bay of Bengal, the sea of Arabia, the Persian gulf, the gulf of Ajan, and the Red sea, separating Asia from Africa. The peninsulas which occur on this side are those of India without the Ganges, which has an area of nearly 800,000 sq. m., India within the Ganges, and Arabia. Each of the last-mentioned comprising upwards of a million sq. m.; the three together being nearly equal to Europe in extent.

Where Asia approaches Europe, we meet the large peninsula of Asia Minor, covering a surface of more than 300,000 sq. m., which, being surrounded by the Mediterranean and Black sea, facilitates the intercourse of both continents by sea as well as by land.

The N. coast of Asia, indented by numerous deep bays, and having several projecting tongues of land, would give great advantages to maritime intercourse with other countries, did the severity of the climate not render them inaccessible all the year round. They are nearly everywhere enclosed by ice.

**1. Great Northern Plain.**—*Conformation of the Surface.*—*Rivers.*—Along the coasts of the Arctic sea, always covered with ice, except in the summer months, when it is open along the shores to a distance of a few miles, extends the greatest plain of the globe. This plain not only covers nearly the whole of northern Asia, but advances westward, extending over the east of Europe, and reaching to the very shores of the North sea, opposite Great Britain. We may even affirm, that the low and level countries which in England occur along the North sea between the Thames and Humber, constitute the farthest W. corner of this vast plain. For, a traveller departing from London, and advancing eastward between the parallels of  $52^{\circ}$  and  $53^{\circ}$  N. lat. as far as  $85^{\circ}$  E. long., and hence between  $52^{\circ}$  and  $58^{\circ}$  N. lat., will arrive at Takutsk, on the river Lena ( $130^{\circ}$  E. long.), without having passed any mountain-range. The highest ground in his way would occur about  $60^{\circ}$  E. long., between the river Oural and the sources of the Tobol, where a chain of hills rises, but only to an absolute height of less than 9000 ft. In this long journey he would have traversed  $130$  deg. of long., or more than a third part of the curvature of the earth, and this is the length of the great plain in this parallel. But along the Arctic sea it stretches farther east, and terminates at  $165^{\circ}$  E. long. on the banks of the river Kolyma.

This plain would extend from the Atlantic to the Pacific sea, but for two mountain-ranges, which rise at its western and eastern extremities, like high walls, to protect it against the encroachments of the sea. At its western extremity are the Scandinavian mountains, lying N.N.E. and S.S.W. At its eastern extremity are the Aldan mountains, which extend from  $53^{\circ}$  N. lat., close along the shores of the sea of Tarsak or gulf of Okhotsk in a W.S.W. and E.N.E. direction, till they terminate on Behring's strait with East cape and cape Tshukotskoi Nos. The S. extremity of this range is at the sources of the river Aldan (about  $53^{\circ}$  N. lat.), closely connected with the chain of the Great Khing-Khan. It occupies a considerable width, being probably nowhere less than 150 miles across, but does not rise to a considerable height, the highest of its summits which have been measured attaining only 4055 feet above the sea, and its mean elevation being estimated at less than 3000 ft. Its N. branches fill up the whole country between the peninsula of Kamtschatka and the Polar sea with mountains of moderate elevation, many of which, however, are always covered with snow on account of their high latitude near the polar circle.

It is worthy of remark, that in the seas adjoining the two boundary ranges two of the most active volcanic systems are met with. To the west of the Scandinavian mountains a great number of volcanoes are placed on the island of Iceland, and, as it seems, also on the neighbouring island of Jan Mayen. On the east of the Aldan range the peninsula of Kamtschatka offers a similar phenomenon. It seems that the chain of mountains is mostly covered with volcanic matter, and several very high summits are still active volcanoes. The highest of the two summits of the volcano of Shivelush rises to 10,591 feet above the sea, and that of the volcano Klutshewsk even to 15,925 feet. The tracts of low land which extend along the sea coasts of this peninsula are partly covered with thick forests, and partly with fine grass, but neither agriculture nor the rearing of cattle is attended to, the very scanty population finding it more easy to get its subsistence by fishing.

Besides the two ranges, forming the boundary of the plain to the E. and W., it is nearly in its middle traversed by another chain, the Ouralian mountains, which run nearly due N. and S., on both sides of  $60^{\circ}$  E. long. This range, which in breadth occupies hardly anywhere more than 50

## ASIA.

or 60 m., exhibits near its N. extremity a few summits, which rise to from 4000 to 5000 ft. But the mean elevation is probably not more than 3000 ft. above the sea. Between 50° and 54° are also some summits which attain between 4000 and 5000 ft. At the sources of the river Oural the range lowers considerably, and divides into several ridges, of which one, called the hills of Mugodsharak, advances in a S.W. direction, and terminates on the plain which divides the Caspian sea from the lake of Aral. Thus this chain does not join the mountain ranges in the interior of Asia.

Nearly in the middle of the S. border of the Great Plains, on both sides of the hills of Mugodsharak and the countries lying S. of it, between 45° and 64° E. long., occurs the most remarkable depression on the surface of the earth. A tract of country, extending over an area of more than 300,000 sq. m., exclusive of the Caspian sea, is, according to the supposition of Humboldt, lower than the surface of the ocean. The lowest part of it is occupied by the Caspian sea, which was supposed by Humboldt to be no less than 348 ft. below the surface of the Black sea; but later, and it is believed more correct, measurements make the level of the Caspian sea only 116 ft. below, and that of the lake of Aral 14 ft. above the level of the Black sea. According to Humboldt, this depression extends between the rivers Kooma, Volga, and Oural, up to a line drawn from Saratow to Orenburg, whence its boundary runs to the lake of Ak-sa-kal (46° N. lat., and 63° E. long.), and then includes the countries traversed by the lower courses of the Sir-Daria (Sihoon, Jaxartes) and Amoo-Daria (Oxus). This country is so little elevated above the great lakes, which lie in the midst of it, that a strong N.W. wind of some continuance forces their waters over many miles of the adjacent tracts. Its soil consists partly of sand and partly of hard clay, on which neither trees nor shrubs grow, and which, only in spring, after the melting of the snow, is covered with a scanty but nourishing grass and numerous flowers. It is only used as pasture by the nomadic tribes which wander about in this desert. Natural wells are nowhere found, but water is met with on digging some feet down in those districts which have a sandy soil, but not in those where it consists of clay. Along the banks of the water-courses trees and shrubs grow, and the soil is fit for agricultural purposes, but is commonly used as meadows.

Along the shores of the Caspian sea this low and desert country extends to the very edge of the table-land of Iran (Persia), where it terminates between 36° and 37° N. lat., but from the table-land of Eastern Asia it is separated by a mountain region, which comprehends the countries of Khokan and Badakshan, and between them and the desert extends Bokhara, whose surface is broken into ridges of moderate height, and valleys of considerable width, which, being watered by artificial means, are very productive of all kinds of grain and fruit. This country, therefore, offers a succession of fertile and sterile tracts over the whole of its surface.

The Caspian sea, which covers a surface of 190,000 sq. m., is very deep towards its S. extremity, where it is surrounded by the mountain ranges of Iran, but where it borders on the desert it is shallow. Its waters are salt. The lake or sea of Aral, lying farther east, has a surface of between 40,000 and 50,000 sq. m., and its waters are likewise salt, as is the case with all the numerous smaller lakes which occur in the abovementioned depression. The lake of Aral receives the two largest rivers, which drain the S. parts of the desert, and descend from the table-land of E. Asia. The Sir-Daria, which in its upper course flows through Khokan, runs about 950 m., and the Sir-Amoo, which rises in Badakshan, and flows through Bokhara, and afterwards through the desert, has a course of nearly 1100 m.

The Oural dividing Asia from Europe, the great plain is divided between these two continents. Though that portion of it, which belongs to Europe, has immense tracts of very fertile land, especially in the centre of Russia, the plain of Siberia nowhere exhibits such a soil. Those parts which lie contiguous to the great depression, and as far E. as 82° E. long., are steppes, that is, level countries with a sandy, gravelly, or clayey soil, destitute of trees, except along the bottoms of some of the rivers, and covered partly with low shrubs, and partly with coarse grass, which affords only very scanty pasture. In most parts they are destitute of water. The great steppe of Barinskaja, between the river Yrtish and Obi, is partly covered with large swamps, and intermingled with numerous salt-lakes, some of considerable extent; the remainder has a dry sterile soil, but when it begins to rise in hills towards the Altai range, many districts are fit for agriculture and are cultivated. This last observation applies still more to the countries farther E., between the river Obi and Yenesei, where agriculture has already advanced from 50° N. lat., to Krasnoyarsk. This portion of the plain is considered the granary of Siberia. Its surface is rather hilly. The countries lying E. of the Yenesei do not exhibit a level plain, but rather an undulating surface, which in some parts is even broken. But as the

climate is less mild than farther west, agriculture is only pursued in a comparatively few sheltered places, and the rearing of cattle and the chase affords subsistence to its scanty population. This part of the plain is covered with immense forests of pines, birch, &c. of which the W. steppes are destitute, and its pastures are also much richer. That portion of the plain which extends N. of the polar circle has its surface frozen ten months of the year, and even in July ice is met with at the depth of a foot. It is an immense desert, covered with moss, and interspersed with numerous lakes and swamps. In summer its whole surface is changed into a swamp, and then it is inaccessible. This mossy desert is called *tundra*. It is worthy of remark, that at the mouth of the Lena, and between it and that of the Indighirka, immense masses of bones, and even entire skeletons of elephants, rhinoceroses, and antediluvian animals, are found imbedded in the ice, which never is dissolved by the rays of the sun.

This plain is drained by numerous rivers, which, descending from the Altai mountains, on the southern border of the plain, traverse it in a northerly direction. Some of them may be enumerated among the largest rivers of the globe. Such are the Obi or Oby, which unites with the Yrtish, and whose whole course rather exceeds 3000 miles. The Yenesei is still longer; for if we take for its source the Selenga, which falls into the lake of Balkal, and issues from it under the name of Lower Angara, but changes it afterwards into that of Upper Tunguska, it runs not less than 2500 m. The Lena, which is joined by the large tributaries Vitim and Aldan, has a course of hardly less than 3000 m. Farther E. is the Yana, which flows about 400 m., the Indighirka about 700 m., and the Kolyma 900 m.

3. *Elevated Table-land of Eastern Asia.*—The boundary of this extensive region lies near the parallel of 50° N. lat. between 88° and 120° E. long. On the W. the boundary is formed by a line extending first from 50° N. lat. and 88° E. long., to 40° N. lat. and 73° E. long., and hence nearly due S. to 34°. From this point it follows the range of the Himalaya mountains in its S.E. direction, to 88° E. long., where this chain, which constitutes the S. edge of the table-land, begins to turn nearly due E., and continues in that direction as far as 97° E. long., near the parallel of 38° N. lat. Hence it passes S.E. to the table-land of Yu-nan, 25° S. lat., and 103° E. long., which forms the most southerly point of the Great table-land of Eastern Asia. The eastern boundary runs along the range of the Yun-ling mountains, which extend from the most southerly bend of the river Yang-tse-kiang (36° N. lat., and 103° E. long.), in a N.N.E. direction to the most northerly bend of the river Hoang-ho (41° N. lat., and 100° E. long.). At this place the Yung-ling is divided only by the narrow valley of the river from another mountain range, the In-shan, which hence forms the boundary of the table-land running E. to 116° E. long., where, turning to the N., the mountain chain is called Khing-khan, and meets the N. boundary of the table-land between 51° and 53° N. lat., and 121° E. long.

The whole of the immense area included within these lines is considerably elevated above the level of the sea. Only a few comparatively small tracts of country are supposed to have less than 3000 ft. of absolute elevation, and many of its southern plains rise to more than 10,000 ft. According to our scanty information, we may suppose that the whole country rises continually higher in form of terraces as it approaches its southern boundary, the Himalaya range. But, examining the course of the rivers, we are obliged to suppose, that this country gradually declines towards the east, as those rivers which flow from it to the west rise only on the very borders of the table land, but many of those, which traverse its internal plains, descend to the Pacific sea. Even those, which are not connected with the sea, but terminate in lakes having no outlet, run mostly from W. to E.

This table land does not extend in one uninterrupted plain, but besides its being almost everywhere surrounded by mountain ranges, its interior is likewise traversed by several extensive chains. We shall first indicate the ranges which are met on its borders, then those in the interior, and make a few observations on the countries lying between the mountain chains.

Along the N. edge of the table-land runs the Altai range, a chain of mountains which varies in width between 300 and 300 miles, and extends along the table-land about 1400 miles in length, but it continues more than 600 miles farther E., terminating at the mouth of the river Amur. The name of Altai properly applies only to the W. portion as far as the lake of Balkal, that portion which lies S.E. of the lake being called by the Russians Da-urian mountains, and by the Mongols Khing-gan. That part of the chain, which lies farther E., is named by the Russians Yablond Khrebet, and by the Mongols and Chinese Khing-khan Tugurik. The highest part of the range is near its W. extremity, where, on the banks of the river Talnuysa, an upper

branch of the Oby, it rises in some summits to more than 18,000 ft. above the level of the sea, and is always covered with snow. The mean elevation of the whole range probably does not exceed 5000 or 6000 ft., but the larger portion of it, lying within the Chinese empire, has not been examined. In this range is embosomed the greatest alpine lake, that of Baikal, 355 m. in length, by 30 and 40 m. in width, and covering a surface of 14,800 sq. m., so that it is larger than half Scotland.

The W. boundary of the table-land, between 50° N. lat. and 80° E. long., and 40° N. lat. and 70° E. long., is not formed by a mountain chain, but by a country with a broken surface, which we shall notice hereafter. But between 40° and 34° N. lat. a continuous range rises to a great height. It is called, on our maps, Bolor Tagh, but, by the natives, Tartash, and by the Chinese geographers Tartash-i-ling. We know nothing of it, except that it rises to a very great elevation.

The vast range of the Himalaya mountains runs along the S.W. and S. edge of the table-land, from 34° N. lat. and 73° E. long., to 28° N. lat. and 97° E. long., being about 1300 m. in length, and from 350 to 350 m. across. From the low plains of India, which border on the range on the S.W., the mountain mass rises abruptly to about 4000 or 5000 feet. Behind it lies a belt of an extremely broken surface, from 100 to 900 m. in breadth, overtopped by numerous high summits, which grow higher and higher as they approach the table-land. The base on which they rest also rises gradually, till it attains near the table-land the height of 8000 or 9000 ft. Then follows the highest portion of this stupendous range, the crest of the *Himālaya* or *Imāns* of the ancients, some of whose summits exceed by 10,000 and 11,000 ft. the altitude of Mont Blanc, and are the highest in any country hitherto discovered. The Dhawalagiri (28° 30' N. lat., and 83° 30' E. long.) attains 36,892 ft. above the sea, and the Chamalari (28° N. lat., and 80° 30' E. long.) is probably but little lower. The Tawahr (30° 30' N. lat., and 79° 57' E. long.) rises to 25,749 ft. There are probably above 300 summits which rise more than 18,000 ft. above the sea, and are covered with eternal snow. In fact, the name Himalaya or Himalah is merely a Sanscrit term for snowy; a circumstance of which Pliny was well aware when he says *Imāns incolarum lingua niveam significans*. (*Hist. Nat.*, lib. vi., § 17.) By far the greater number of these high summits lie W. of the Chamalari; for E. of that high pinnacle, the mountains, which attain the snow-line seem huge, but few. On the S.W. are the plains of India, which are nowhere more than 1000 ft. above the sea; and on the N. of the range are the plains of Tibet, which have at least 10,000 ft. of absolute elevation. The highest crest of the range towards this table-land is between 16,000 and 18,000 ft. high, the Neotoc pass, one of the lowest, rising to 16,569 ft. above the sea.

The country which lies between the E. extremity of the Himalaya range (97° E. long.) and the table-land of Yu-nan (between 100° and 104° E. long.) is entirely unknown. It contains the sources of the Irrawaddy, and seems to rise to a great elevation, and to be overtopped by high summits. The table-land of Yu-nan itself must be of considerable height, as the winters are very cold, though it be placed near the tropic. Some mountain summits, which rise from it, attain the snow-line; they are mostly situated along the most southerly bend of the river Yang-tse-kiang, and may be considered as the most southerly extremity of the Yun-ling.

The Yun-ling, which rises on the E. edge of the great table-land, and runs in a N.N.E. direction between the great bends of the rivers Yang-tse-kiang and Hoang-ho, is also of considerable height, so that it is frequently called by the Chinese the Sine-ling (Snow range). The snow-capped summits are numerous, between 30° and 36° N. lat., and more especially between 32° and 34°. The length of this range is little short of 1200 m.

Respecting the In-shan and Khing-khan ranges little is known; the first has never been seen by a European, and we have only acquired some notion of its position from the Chinese geographers. But towards its E. extremity it is traversed by the great road leading from Kiachta to Pekin, and here the highest part of the mountain pass rises to 5325 ft. above the sea-level. The Khing-khan seems not to rise much above the elevated plains which extend from its western declivity westward, but it is much elevated above the valleys contiguous to its E. descent. Its absolute elevation does not appear to be great, as at the places where it was traversed by European travellers it was covered with stunted trees and low bushes to its very summit. The length of the In-shan does not exceed 360 m. But the Khing-khan, whose northern extremity advances to the most northerly bend of the river Amur, has a length of nearly 800 m.

The most northerly of the mountain ranges traversing the interior of the great table-land of Eastern Asia is the Thian-shan. It begins at the northern extremity of the Tartash-i-ling, or Bolor Tagh, (40° N. lat.) with which it forms nearly

a right angle. But, properly speaking, it projects under the name of Ak-Tagh into the plains of Bokhara, lying farther W. The Thian-shan runs from W. to E., between 70° and 90°, and then it terminates abruptly in the plain. Its western portion, which is called Muz-tagh, does not rise to a great elevation, and is passed by the caravans between Guldsha and Khazar. Here its breadth does not exceed 30 or 40 m. But near 70° E. long., where it is traversed by the road between Puldsha and Akau, the highest part of the mountain pass is covered with snow, and leads over a glacier. Hence this pass is called Muzsar dabkan, or the glacier pass. Farther E. is the high volcanic peak, called Feshan. The centre of the whole range is occupied by an extensive mass of very high rocks, which rise far above the snow-line, and this mass is known as one of the highest mountains in northern Asia by the name of Bogdo Oöla. To the E. of this high mountain mass occurs another volcano, named the volcano of Ho-theou (Fire-town). Snow-capped mountains appear likewise on the E. of the Bogdo Oöla, but we are very little acquainted with this part of the range.

It was formerly supposed that a high mountain range, running S.W. and N.E., connected the western extremity of the Thian-shan with the western extremity of the Altai range, but it is certain that no such range exists. The country lying between these ranges is indeed traversed by several lower ridges, of which some are of considerable extent, but they are not connected with each other, wide plains extending between them. These plains do not much differ from the steppes of western Siberia, being only covered with coarse grass; but along the rivers are considerable tracts of land, fit for agriculture, and yielding rich crops of rice and millet. Besides, there are similar tracts along the foot of the ridges. But, as this country is placed between two great deserts stretching far to the E. and W., and inhabited only by nomadic nations, agriculture was entirely unknown down to the middle of last century, when it was conquered by the Chinese, who took great pains to introduce agriculture, which is now in a flourishing state in several districts. This country is, besides, remarkable for the great number of large lakes which are met with over its whole surface. The most remarkable are the Balkash, which is said to extend from 130 to 140 m. from N. to S., the Issyk or Temurti, which is half as long, the Ala-kul, Zalsan, Kijilbash Noör, Ike-Aral Noör, Ubra Noör, and a great number of smaller ones. Except the Zalsan, they have no outlets, and the water of none of them arrives at the sea. Another remarkable circumstance is the occurrence of volcanoes, at a distance of about 1000 m. from the sea. For, besides the volcanoes noticed N. of the Thian-shan range, there occur others to the N. of the chain; and one is found on an island in the lake of Ala-kul.

Not far from the S. extremity of the Tartash-i-ling (between 35° and 36° N. lat.) another mountain range, running E. and W., is connected with it. This chain is called, by the Chinese geographers, Kuen-luen, or Kulrun. We know very little of it, except that it stretches over the whole breadth of the great table-land, and nearly in the middle of its extent (about 90° E. long.) divides it into two ranges, of which that which declines somewhat to the N. is called Nan-shan, and is probably connected with the In-shan by the Ala-shan, a range of mountains extending along the banks of the Hoang-ho, where it flows N. The other branch of the Kuen-luen, which declines somewhat to the S., is called the Bayan Kara mountains, and frequently also the Kuen-luen, and unites with the Yun-ling about 33° N. lat. Nothing else is known of these ranges, except that they rise to a great height, and in many parts are covered with snow all the year round; whence they frequently are called Sine-mountains (snow-mountains) by the Chinese.

The immense tract of country which lies to the N. of this range (on the W. between it and the Thian-shan, and on the E. between it and the Altai mountains), is known by the name of Cobi, or more properly Gobi (the Desert in the Mongolic language), or Shamo (Sand-sea in Chinese). But the whole of this tract is not a desert. The W. portion of it, between 70° and 90° E. long., or between the Thian-shan and Kuen-luen, is only from 300 to 400 m. across, and nearly 1200 m. in length. Here we find a tract of country from 50 to 80 m. across, along the foot of the Thian-shan range, fertile in many districts, producing different kinds of grain, cotton, wine, and fruit, or covered with nourishing grass. Through this tract runs the great commercial road, which connects W. Asia with the more eastern countries, and here are situated the commercial town of Khasgar, Akau, Kutshé, Karashar, Turfan, and Khamil, or Hami. The W. portion (between 70° and 77° E. long.) is also not a desert. Though the tracts separating the rivers are steppes, i.e. plains without trees, and producing only a coarse grass, the lands bordering the banks of the water courses are fertile in grain and cotton. Here is the town of Yarkand, and, towards the Kuen-luen, Khotun, through which two places a

## ASIA.

road runs, which connects N. Asia with India. It is supposed that the term *cettina* is derived from the name of the last-mentioned town. The remainder of this region is a desert, and mostly of the worst kind, where the sandy surface, according to a Chinese author, moves like the waves of the sea. This desert is sometimes distinguished by the name of Shashin, or the Gobi of Lop Noôr. The Lop Noôr is one of the extensive lakes without an outlet, which frequently are met with in this desert. It receives from the W. the Ergbengol, or river of Yarkand, which runs probably not less than 1000 miles. This part of the great table-land is supposed to be between 4000 and 5000 ft. above the sea level.

It seems that under the meridian of Khamû (90° E. long.) the desert is narrowed to about 150 miles across by the fertile districts of Tangut, which skirt the N. declivity of the mountains of Nan-shan, and protrude far northward into the desert. The desert, dividing it from Khamû, and called Gobi of Tangut, is also less level, more stony, and better adapted for pasture the farther E. or W. Hence the Chinese government has extended its N.W. province of Kansû, through this desert to the N. side of the Thilia-shan mountains.

The Great desert, Ta-Gobi, extends from the eastern extremity of the Thilia-shan (90° E. long.) to the Khing-khan (190° E. long.), nearly 1500 miles in length, and its width between the Altai range on the N., and the Nan-shan, Ala-shan, and In-shan, on the S., varies between 500 and 700 miles. Through the middle of this tract extends, in the whole of its length, what is properly called the Shamo (Sand sea). It is from 150 to 350 miles across; and in it sand almost exclusively covers the surface, which commonly is level, but in some places rises into hills, on which masses of loose stone are met with. Small and shallow lakes are frequent, but their water is either salt or bitter. The vegetation is very scanty, and affords but indifferently pasture. In a few places a small number of stunted trees are met with. This part of the Gobi is about 3,000 ft. above the sea level, but it sinks in some places even to 3600 feet. In those parts of the Gobi which lie to the N. and E. of the Shamo, the surface is between 3000 and 4000 ft. above the sea. Here it is not, in general, covered with sand, but with gravel and pebbles, and in many places rocky. The vegetation is much more vigorous, and the pastures consequently richer. It is even thought that, in many districts, agriculture would succeed, if the Nomadic nations inhabiting these countries would attend to it; and in some districts which border on China, millet is grown abundantly, and even wheat and barley, though not to a great extent. Trees are also met with, as well on the N. as on the S. of the Shamo, especially fir, birch, and poplar, but not in large forests. The countries are likewise better provided with water than the Shamo, which could not be traversed, if wells were not dug at certain places where the roads pass. The northern and southern districts have also a less level surface, ridges of stony and rocky hills traversing it in many places; they run commonly from W. to E., and are called the Black Clouds. The few and sluggish rivers which are met with, are lost in lakes without outlets. Only in the north-eastern angle are the Kerlon and Khalka-piya rivers, which, joining, form the Argoun, the principal branch of the Amur. The temperature of the air is extremely low over the whole Gobi, the waters being covered with ice six months of the year.

The country, which is included between the two branches of the Kuen-luen range, the Nan-shan, and Bayan Kara mountains, is called Thong-hai, or Khookhoo-noor. The latter name is derived from an extensive lake in its N.E. district. It is very little known, and seems to exhibit a succession of narrow valleys and very high mountains, whose numerous summits pass far beyond the snow-line. These mountains form very extensive and high masses in the bend of the Hoang-ho, which river has its sources in the W. districts of this region.

The whole country, S. of the Kuen-luen mountains, as far S. as the Himalaya range, is comprehended under the name of Tibet. It is, doubtless, the highest part of the great table-land of eastern Asia, and there are good reasons for assigning it an average absolute elevation of 10,000 ft. above the sea level, though, towards the east, the valleys of some rivers may be considerably less. A mountain range runs through it from W. to E. It is connected with the Himalaya range by a level table-land of 14,000 ft. elevation, which surrounds the sacred lakes of Manassa-rowora and Ewan-hrad, and on which, or near which, are the sources of three great rivers, the Indus, Ganges, and Yaroo-zangbo-tsu. The mountain chain itself is called Gang-di-rî on the W., but further E. it bears the name of Zang. Its E. extremity is separated from the Yun-ling by the valley of the Yang-tse-kiang, which here flows from N. to S. Little, or rather nothing, is known of this range, which probably being placed on so elevated a base, passes with its summits the line of congelation.

Of the country which lies to the N. of this range very little is known, if we except the most westerly corner, where the Indus river, issuing from a table-land between mountain-ridges, enters the spacious, level, and fertile valley of Leh, or Ladak, and runs in it about 300 miles, till it breaks through the mountain ranges which oppose its course, and enters the plain of India. On the W. of this line, but elevated valley, is the Himalaya range; and on the E. another high chain, the Karakorum mountains, which, extending N.W. and S.E., connect the Kuen-luen chain with the Gang-di-rî mountains.

The country east of the Karakorum mountains, and extending between the Kuen-luen and the Gang-di-rî ranges, is called Katshe, or Kor Katshe. There occur in it some ranges, but the greatest part extends in wide plains, similar to the steppes, but abundantly provided with good pasture. More is not known of it. Near the Gang-di-rî range is an extensive lake, called Tengri, and N. of it are the sources of the Yang-tse-kiang, and perhaps also those of the rivers Mackhun and Thalien.

The country between the Gang-di-rî range and the Himalaya mountains is Tibet Proper, and is somewhat better known, at least as far E. as HLYAN, its capital. Its surface exhibits only low rocky hills, without any signs of vegetation, rising on extensive arid plains, covered at certain seasons with rich grass, and affording pasture to numerous herds of cattle. The valleys in which the rivers run are considerably depressed below the surface of the plains, and in these valleys agriculture is carried on with great care. All kinds of European grains are cultivated, and in some places rice. Most of the fruit-trees of Europe also succeed. But, as the portion of the country which is fit for agriculture is only a small part of the whole, the population, though far from numerous, is partly supplied with corn from the adjacent countries. The climate is very severe, and the rivers covered with ice for some months. The E. part of Tibet is very little known; it seems to be traversed by high ranges, and not to exhibit the large plains which occur farther W. In Tibet is the lake Paito, which has a large island in its centre, so that the lake has the form of a ring. The Yaroo-zangbo-tsu, or Sampa river, runs through this country from W. to E., and, after a course of more than 1000 miles, breaks through the chain of the Himalaya range, about 95° E. long., and joins the Brahmapoutra under the name of Di-hong.

The table-land of Yu-nan, which forms the most southerly portion of the great table-land of eastern Asia, has an extremely diversified surface, being a succession of mountains which in some places rise above the snow-line, and of valleys, which, however, frequently widen to small plains. The climate indicates a considerable elevation above the sea level, but it is not so high as to preclude agriculture, corn being raised in the valleys and plains, and in some districts rice. Towards the N.W., however, it rises much higher, as there the rearing of cattle forms the principal occupation of the inhabitants, who have herds of chowry-tailed cattle (*Bos grunniens*), which are only found in very cold countries.

3. *Countries lying to the East of the Table-land of Eastern Asia.*—East of the desert of Gobi extends Shing-king, or Manchouria (the country of the Manchoes), to the coast of the Pacific. It is divided from the desert by the Khing-khan mountains, which on the side of the desert are destitute of wood, but towards Manchouria are covered with fine forest-trees, among which oak is frequent. The N. boundary is formed by the Yablouki Khrebet, or Khing-khan Tugurick. From this range (56° N. lat.) it extends to the neighbourhood of the Hoang-hai, or Yellow sea (41° N. lat.); from which it is divided only by a range of hills. But in advancing farther E. these hills rise to a high mountain chain, the Chang-pe-shan, or Shan Alin, which attains the snow-line where it runs on the boundary between Manchuria and the peninsula of Corea. It then approaches the coast and runs so close along it as to leave only at some places a very narrow strip of low country until it terminates at the mouth of the river Amur, opposite the Yablouki Khrebet. Along this coast the mountain chain rises with great steepness to from 4000 to 5000 ft. above the sea. The countries enclosed by these mountain ranges exhibit different characters. The S.W. part of it, N. of the river Sira Muren, or Leao-hô, is a desert, and may be considered as part of the Gobi, which here projects beyond its natural boundary, the Khing-khan range. It has a scanty vegetation, and is only inhabited by nomadic nations. E. of it, and as far N. as the Amur river, the country is traversed by ridges of mountains and hills, between which, however, spacious valleys extend, whose fertile soil is in some places well cultivated, and yields rich crops. The mountains and hills are partly covered with trees, and partly afford rich pasture-grounds for numerous herds of cattle and sheep. The climate of this portion of Manchouria is very temperate. N. of the river Amur the whole country is covered with mountain-

masses, intersected by narrow valleys. Here agriculture ceases, and cattle form the principal riches of the inhabitants, who also apply themselves industriously to the chase of animals affording fur, of which there is a great abundance. The principal river is the Amur, whose upper branch, the Argoun, runs through the N.E. districts of the Gobi, and, after entering the mountains, joins the Shilka, when the river is called Amur, or Sukhalien. The whole course of this river does not fall short of 2000 miles.

The peninsula of Corea is separated from Manchooria by the Chang-re-shan, and from this range another branches off to the S., which runs close to the E. shores, towards which it descends with great rapidity; and in these districts the level or cultivable tracts are of small extent. The numerous offsets to the W., which are less steep and elevated, contain between them large and well-cultivated valleys. But the whole country seems to have a considerable elevation above the sea-level, as its climate is very cold, its N. rivers being covered with ice for four months; yet rice, cotton, and silk, are produced in abundance.

China Proper occupies the remainder of the countries lying between the great table-land of eastern Asia and the Pacific. Several mountain ranges issuing from those that surround it, traverse its interior. Where the In-shan and the Khing-khan meet, stands a high summit, the Petsha, more than 18,000 ft. above the sea level, and from it a chain runs first S.W., and then S., 400 m., and terminates at the last great bend of the Hoang-ho. It is called Kho-thsing-shan, and though high, does not rise to the snow-line. Near 34° N. lat. two ranges branch off from the Yun-ling, the Pe-ling (northern range) and the Tapa-ling, and they continue as high mountain chains as far E. as 111° or 112° E. long., when they sink down to hills. These ranges contain some snow-capped summits towards the W., and are steep and rugged. From the E. side of the table-land of Yu-nan branches off another range, called Nan-ling (southern range), which constitutes the most extensive mountain system in China. It runs E. as far as 116° E. long., passing about 150 miles to the north of Canton; it then inclines to the N.E., in which direction it continues with a slight bend to the W. to its termination on the sea, near the harbour of Ning-po, opposite the islands of Chusan. Several summits of this range rise above the snow-line, W. of 110° E. long., and here it extends also to a considerable width. East of 110° E. long. no snow-capped summits occur, though some rise to a great elevation, but every where the descent of the range is steep and rugged.

The country lying between the Kho-thsing-shan and the Tapa-ling is full of high and extensive mountain-masses, and intersected by valleys; which are very narrow, except two which are drained by the Wei-ho, a tributary of the Hoang-ho, and by the Kan-kiang, a branch of Yang-tse-kiang. These are wide, and afford large tracts for agricultural purposes. The large tract, which extends between the Tapa-ling and the Nan-ling, is traversed by many ridges of mountains and hills, which mostly branch off from the last-mentioned range; but these elevations rise only to a moderate height, and the gentle declivities are mostly cultivated. Besides, they are separated from one another by very wide valleys, which frequently are intersected by pretty extensive plains, that every where recompense the industry of the careful cultivator. They are, in fact, hardly inferior in fertility to the great Chinese plain.

This great plain occupies the N.E. part of China, extending in length 700 miles from the great wall, N. of Pe-king, to the confluence of the rivers Yang-tse-kiang and Kan-kiang, near 30° N. lat. Its breadth is various. North of 35° N., where it partly extends to the shores of the Hoang-hai, and partly borders on the W. declivity of the Chang-tung mountains, a low range, occupying the peninsula of that name, the width of the plain varies between 150 and 250 m. Between 35° and 34° N. lat. the plain enlarges, and in the parallel of the Hoang-ho it extends more than 300 m. E. and W. Farther S. it grows still wider, and reaches nearly 500 m. inland, in the parallel of the mouth of the river Yang-tse-kiang. This large plain, though the N. districts have mostly a sandy soil, and the E. between the embouchures of the Hoang-ho and Yang-tse-kiang, are partly covered with swamps, is, perhaps, the best cultivated and most populous portion of the globe, producing abundance of rice, cotton, wheat, and tobacco, &c. It contains at least 210,000 sq. m., so that it is seven times as large as the most fertile plain of Europe, that of Lombardy. The internal communication of this fertile tract is rendered easy by the Great or Imperial canal, which traverses it from S. to N., and whose length exceeds 500 m. in a straight line, but probably its whole length is not less than 700 m. It is also traversed by the lower courses of the two great rivers of China, the Hoang-ho and the Yang-tse-kiang, which flow through it from W. to E. The Hoang-ho runs upward of 3000, and the Yang-tse-kiang more than 2900 miles, if their bends be taken into account.

4. *Countries lying to the South of the Great Table-land of Eastern Asia.*—This region comprises the two peninsulas, which are known in Europe by the name of India within and without the Ganges.

The peninsula without the Ganges is traversed by four mountain ranges, of which the three farthest east are connected with, or branch off from, the table-land of Yu-nan, the most southerly extremity of the great table-land. The most easterly, which may be called the Anam range, begins at 23° N. lat., and runs S.E. till it approaches the Chinese sea, near 17° N. lat.; hence, farther south, it proceeds parallel to the shores of that sea, and terminates at cape St. James (10° 15'). This range occupies about 100 m. in width; its elevation has not been ascertained, but it seems to be considerable, though far from rising to the snow-line, except, perhaps, where it is connected with the table-land of Yu-nan. Two other mountain chains branch off from the S.W. side of the same table land, between 25° and 27° E. long., and run nearly due S., including the narrow valley of the Thaluén river. The most westerly, which may be called the Birmah range, terminates as a chain of considerable elevation at the mouth of the Thaluén river; the other, which runs to the E. of that river, and may be called the Shan or Siam range, continues farther S., but gradually declining in height till it disappears entirely N. of the most narrow part of the peninsula of Malacca, the Isthmus of Kra (11° 30' N. lat.): for the low mountains, which occupy the interior of the S. part of that peninsula, are not connected with it.

Between the Anam range and the gulf of Tonkin lies a large plain, that of Tonkin, about 100 m. in length and width: it is low, level, and extremely fertile, especially as far as it can be irrigated. It is surrounded on the N. and W. by very fertile valleys, and traversed by the river Songka, which rises on the table-land of Yu-nan, and runs in an E.S.E. direction probably more than 700 m. The plain of Tonkin terminates between 19° and 20° N. lat.: farther S. the offsets from the Anam range approach close to the sea, and leave only between them larger or smaller valleys, which commonly are very fertile. South of Cape Avarella steep rocks occupy nearly the whole of the country.

We know very little of the N. portion of the country occupying the extensive tracts which separate the Anam range from the Shan range. It would seem, that as far S. as 16° N. lat. it exhibits several pretty high mountain ridges, which include valleys and surround elevated plains. S. of 16° N. lat., however, low plains constitute the general character of the country: for though several ridges occur, they do not seem to rise at any place above the elevation of high hills. These low plains have a greater abundance of water than any other country of Asia. A considerable portion of their surface is covered with permanent lakes: others are formed during the rainy season, by the inundation of the numerous and large rivers; and at that season a great portion of the land is changed into immense swamps. Though the soil is very fertile, and yields very rich crops of rice and every kind of vegetables cultivated for food between the tropics, civilization is less advanced than either in China or Hindostan; because its inhabitants, being unable to turn this abundance to their advantage, it acts as an incentive to idleness. Three large rivers drain this country. The most easterly is the Sal-gun, which runs along the Anam range, and falls into the sea near Cape St. James: its upper course is entirely unknown, but from its size towards its mouth it is supposed to run from 500 to 600 m. The Mackhaun, or river of Cambaja, is called by the Chinese Lan-tan-kiang, and rises in the interior of the great table-land, so that its whole course probably exceeds 3000 m.: it falls into the sea, W. of the mouth of the Sal-gun river. The third river is the Menam, or river of Siam, which runs about 700 m., and falls into the gulf of Siam.

The valley, in which the Thaluén runs between the mountain ranges of Siam and Birmah, is narrow; its soil is stony, and too much elevated to be irrigated by the water of the river, which rushes with great impetuosity down its confined bed, descending from the great table-land, where it is called Loo-kiang, or Noo-kiang. Its whole course probably exceeds 1500 m.

The peninsula of Malacca, which constitutes the most southerly part of the continent of Asia, and terminates with the capes of Buros and Romania, between which the island and town of Singapore are situated, is connected with the main-land by the Isthmus of Kra (between 9° and 11° S. lat.), about 150 m. long, and from 70 to 80 m. wide. It is low, and its soil is formed by alluvium. The peninsula itself contains a mountain ridge, in the interior, which rises to 3000 or 4000 ft., and is mostly covered with thick wood, but along the shores extends a level country, which in some districts is very fertile, but mostly not very productive.

The most westerly of the four mountain chains, which traverse the peninsula beyond the Ganges from N. to S. nearly in its whole length, is the Aracan range, dividing

Aracan from the Birman empire. It is not connected, like the others, with the table-land of Yu-nan, but with the Himalaya range. The Himalaya mountains are considered to terminate at the sources of the Brahmaputra ( $97^{\circ} 30'$  E. long., and  $28^{\circ}$  N. lat.). The mountains which surround the upper course of that river are called the Langan mountains, and many of their summits rise above the snow-line; the highest of those which have been measured, the Dupha Boom, attaining 13,713 ft. above the sea level: the passes which lead over it do not sink below 11,000 ft. From these mountains, which rather constitute a large mountain knot than a range, a chain issues, running W. parallel to the Himalaya range. That portion of the chain, which is immediately connected with the Langan mountains, is called Paikoi mountains; it seems to be much lower, and more accessible. Farther W. they are called the Naga mountains, which are still lower, and extend to about  $92^{\circ} 30'$  E. long., where they are succeeded by the Garro hills, which rarely rise to more than 6000 ft., and terminate opposite the mountain ridges which surround the enormous pinnacle of the Chamalarai in the Himalaya range.

Between this range and the Himalaya mountains extends the valley of Asam, or of the Brahmaputra, one of the largest in Asia: its length exceeds 400 m., and in width it varies between 30 and 50 m. Its soil is very fertile, and the climate such as to bring to perfection nearly all productions cultivated between the tropics; but here also the too great abundance of water retards the progress of agriculture and the increase of the population.\* The Brahmaputra runs more than 500 m. through the centre of this valley, and is here joined by the Di-hong, which, under the name of Sampo, or Yaroo-zangbo-tai, flows through the plains of Tibet, and has run a course of more than 1000 m. before it reaches the Brahmaputra. Issuing from the valley of Asam, the Brahmaputra runs 360 m. farther through the plain of Bengal.

The country which extends along the mountain chains constituting the S. boundary of the valley of Asam, and advances as far S. as  $24^{\circ}$  N. lat., seems to be considerably elevated above the sea, the plain on which the town of Moolpore is built having an elevation of nearly 2500 feet. But the plains are commonly not of great extent, and the valleys are narrow, though the mountains which cover the greater part of the surface do not rise to a great elevation. As far as is known (for the eastern portion of this region has not been visited by European travellers) these ranges run S. and N., and form right angles, or nearly so, with the range from which they issue. One of these ranges, extending along the meridian of  $91^{\circ}$  E. long., is called the Khibudun mountains, between Moolpore and Katsihar, but farther S. the Aracan mountains. This chain, whose length rather exceeds 700 m., attains, towards the S., only a mean elevation of about 3000 ft. above the level of the sea, though some of its summits rise to 5000 ft. and upward. Its mean width may be 50 miles: it terminates at cape Negrais.

Between the Aracan mountains and the Birman range lies the greatest part of the Birman empire. A small portion of its surface consists of rich cultivable lands; these lie in the wide valley of the Irawaddi, and in two large plains; one, situated between  $23^{\circ}$  and  $25^{\circ}$  N. lat., along the N. side of the great bend of that river, and the other between  $16^{\circ}$  and  $18^{\circ}$  N. lat.: the latter comprehends the large delta of the Irawaddi and the adjacent low country as far E. as the Birman mountains, and may have a surface of nearly 100,000 sq. m. But its agriculture suffers from excess of water. The country E. of the Irawaddi, and S. of its great bend, is a high country, from 1500 to 2000 ft. above the level of the sea; whose hilly surface suffers from want of water, the soil being sandy and dry. The Irawaddi, which drains the Birman empire, rises in that unknown region E. of the Langan mountain knot, and runs upward of 1300 miles, if its bends be taken into account.

Aracan, or the country lying east of the Aracan mountains, is hilly, and even mountainous in its northern districts, the Table mountain (near  $21^{\circ}$  N. lat., rising to 6340 ft. above the sea; but its middle parts are occupied by the rather wide valley of the Huringun or Aracan river, and this is continued farther S. to  $19^{\circ}$  N. lat., being separated from the sea to the S. of the mouth of the river, by a ridge of broken hills, which rise to between 500 and 700 feet. The rains during the south-west monsoon being extremely heavy, and of long continuance, agriculture is here also retarded by the abundance of water.

Hindustan, or the peninsula within or on this side the Ganges, is not connected either with the table-land of eastern or that of western Asia, being separated from each by a wide plain, extending first from the mouth of the Ganges along the southern declivity of the Himalaya range to the shores of the river Indus, in a W.N.W. direction, and thence along the mountains, forming the boundary of the table-land

of Iran, in a S.S.W. direction to the mouth of the Indus. Thus this plain has the form of a right angle; and is, on account of its different character in the eastern and western district, with propriety divided into the plain of the Ganges and that of the Indus.

The plain of the Ganges may be compared with the great plain of China, in respect of fertility and extent, though not of population. Its length is upward of 1000 m., and its width varies between 120 and 350 m.: it covers an area of more than 300,000 sq. m. From the mouth of the Ganges it rises imperceptibly towards the N.W.; but, even at a distance of 300 m. from the sea, its surface is not 1000 ft. above it. The country between the W. mouth of the Ganges, the Hooghly, and that of the Brahmaputra, to a distance of nearly 100 m. from the sea, is extremely low, and frequently inundated by high tides. It is called the Sunderbunds, and is nearly uninhabited on account of its unhealthiness, being covered with large forest trees, and frequented by tigers and other beasts of prey. The country which lies N. of the Sunderbunds, to an extent of 300 m. and upward, is subject to the annual inundations of the Ganges; by whose deposit it is fertilized, so as to give the most abundant crops of rice. It is cultivated with the greatest care, and nourishes a very numerous population. N. of  $25^{\circ}$  N. lat., the annual inundations of the river cease; and where no artificial means are employed to effect an irrigation for the culture of rice, the country produces wheat and other grains. But the natural fertility of the soil decreases as we advance higher up the river. It becomes more sandy, and N. of Delhi the tracts along the rivers only can be cultivated. At  $30^{\circ}$  N. lat. it is a complete desert. Between this plain and the lowest range of the Himalaya mountains extends the Taryana, a narrow stripe of land from 12 to 30 m. wide, covered with immense forests, and frequented by a great number of elephants, tigers, and other animals. It is uninhabited, on account of its unhealthiness, the surface in the rainy season being converted into an immense swamp; but between November and March it may be visited without danger. The people inhabiting its borders are disfigured by goitres.

The river which drains this plain, the Ganges, rises in the highest and most northerly range of the Himalaya mountains, bordering on the table-land of the sacred lakes of Manassa, Kowarra, and of Hrawan Hrad. Its several sources unite before it issues from the mountains at Hurdwar. It soon begins to change its W. into a S. and south-easterly course. In the latter direction it traverses the upper part of the plain. But from its junction with the Jumna it runs E. to the neighbourhood of Rajmahal, where it again turns to the S.E., and soon after begins to form its extensive delta, dividing in a great number of branches, of which the most easterly and principal falls into the bay of Bengal, a few miles W. of the mouth of the Brahmaputra; but the western mouth, called the Hooghly, is in a strait line 180 m. distant from it. All rivers descending from the Himalaya mountains, between  $76^{\circ}$  and  $90^{\circ}$  E. long., increase its waters, and most of them inundating the lands contiguous to their banks during the rainy season, contribute to increase the fertility of the plain. The course of the Ganges exceeds 1300 m.

The plain of the Indus is somewhat less in extent, and greatly inferior in fertility. It extends in length about 600 m., and in width 300 at an average. Its surface may cover an area of 180,000 sq. m. Its N. part is called the Penjab (country of five rivers), from being watered by five large rivers, which afterward join the Indus. This tract is commonly very fertile along the water-courses, and there are even, between the rivers, districts whose soil recompenses the labour of the husbandman; but in general they have a light soil, which frequently passes into sterile sand or clay. This description also applies, for the most part, to the tract of land which lies on the right of the river, between it and the ranges which separate it from the table-land of Iran. But on the left of the Indus extends an immense sandy desert, which in the N. is called Marooz-hall, or the Great desert, and to the S. Thur, or the Little desert. It extends over the delta of the Indus, and occupies nearly half the whole plain. At its southern extremity is the Ruun, an extensive salt morass, connected with the gulf of Cutch. In the desert also occur smaller lakes and marshes, in which salt is produced. It is only inhabited in a few places, where rocks protrude through the sand, having their surface covered with scanty grass. The Indus, which drains this plain, has its sources near those of the Ganges; descending through the spacious valley of Lah or Ladak; it breaks through the mountains at the north-western extremity of the Himalaya range. Its whole course amounts to upward of 1500 m.

Where the two plains of the Ganges and Indus meet, in the parallel of Delhi, between  $76^{\circ}$  and  $77^{\circ}$  E. long., begin the mountainous countries of Hindostan, which extend to its most southern extremity, cape Comorin (near  $6^{\circ}$  S. lat.). This immense tract may be divided into two triangles, connected at their bases at the Vindhya mountains, which extend between  $23^{\circ}$  and  $25^{\circ}$  from the bay of Cambay, to the

\* The eastern portion of the valley is hardly more than 400 ft. above the sea level, and at its western extremity it sinks down to 500 ft.

## ASIA.

plain of the Ganges, N.W. of Calcutta. This chain is of moderate elevation, its highest summits probably not exceeding 3000 ft. above the sea, and the most frequented of its mountain passes, that of Jaum, only rising to 2338 ft. At its western extremity, about 30 m. from the bay of Cambay, it is connected with another chain, the Aravalli range, which first runs N., in broken masses, up to the vicinity of 24° N. lat., but farther N. forms a continuous range, running N.N.E. It descends westward, with a steep declivity, to the desert of Marooat'hall, and prevents the sand of that district from encroaching on the fertile country lying farther E. Its average elevation probably does not exceed 3000 ft., though some summits rise higher, and the Abos or Aboda peak (between 24° and 25°), even to more than 5000 ft. These two chains, the Vindhya mountains and the Aravalli range, constitute two sides of the northern triangle, and from them the country gradually lowers, until it meets the plain of the Ganges, not far from the banks of the Jumna. Contiguous to the mountains are two considerable plains; the table-land of Malwa, well known by its extensive plantations of opium, skirts the northern declivity of the Vindhya mountains for about 300 m., and has an average breadth of 50 m. Near the mountains its elevation is between 1800 and 1900 ft. above the sea level; but towards the N. it imperceptibly lowers to less than 1300 ft. The table-land of Mawar extends along the Aravalli range; it is between 130 and 180 m. long, from S. to N., and from 70 to 100 m. wide. Its elevation near the mountains is about 3000 ft. above the sea, but on its eastern border it sinks to 1400 ft. In fertility it is much inferior to the plain of Malwa; it produces different kinds of grain, but little rice. The tracts of country which separate these plains and extend to the plain of the Ganges, have a very broken surface, which on the E. in Harraoutee, rises in steep and rugged hills, but farther W., in Bundicund, presents more gentle acclivities, and wider, as well as more fertile, valleys. The rivers which drain these countries fall into the Jumna, a tributary of the Ganges.

The peninsula of Gujerat, lying opposite the mouth of the rivers Nerbudda and Tapy, is united to the continent of Hindostan by an isthmus more than 50 m. long, between the southern part of the salt morass called the Ruin and the bay of Cambay. This isthmus is so low that, in the rainy season, the waters of both gulfs unite, and convert the peninsula into an island. The districts contiguous to this isthmus, as well as those bordering on the gulfs of Cambay and Cutch, have an undulating surface, and contain extensive tracts of fertile and well-cultivated land. The lands along the western coast are rather level, but their surface is stony, covered with little earth, and not fertile. The interior of the peninsula, and all the districts surrounding the southern coast, have a very broken surface, and are mostly covered with bare rocks, but contain a number of fertile valleys. The mountains in the centre of the peninsula attain a moderate elevation. The whole is well supplied with running water, except the north-western extremity, but is destitute of wood, except on the hills along the southern coast.

Contiguous to the eastern extremity of the Vindhya mountains, but S. of them (between 81° and 83° E. long., and 22° and 23° N. lat.), the country rises to a considerable elevation, probably to more than 5000 ft. It is overtopped by numerous summits which rise 3000 ft. higher. This rugged country, which seems to constitute a mountain knot, from which ridges and rivers run out in all directions, is called Omerkuntak. The most considerable of these rivers is the Nerbudda, which runs westward in a deep valley, overhanging on the N. by the steep acclivities of the Vindhya mountains, and bounded on the S. by another range, the S. Sautpoora mountains. This valley, which is wide, except at its eastern extremity, and of considerable fertility, is considered as the boundary line between Hindostan Proper, lying N., and the Deccan, extending S. to Cape Comorin. The length of the valley, and of the river, is about 600 m. Similar is the valley in which the Tapy runs along the southern declivity of the Sautpoora mountains, parallel to the Nerbudda; but its course does not much exceed 300 m.

To the S. and S.E. of Omerkuntak, between the lower part of the plain of the Ganges, and as far S. as the course of the river Godavery, extends a tract of country whose elevation above the sea has not been determined; but the comparatively low temperature of the air, and the healthiness of the climate, seem to indicate that it must be between 3000 and 4000 ft. Its surface is broken; the hills rise to 3000 ft. above it, but they are separated from each other by wide valleys, and frequently by plains of moderate extent and indifferent fertility, except along the foot of the ridges, where the soil commonly is rich. The eastern border of this rugged table-land is formed by a chain of mountains, which does not seem to rise considerably above it, but they are so steep as to be almost impassable for horse or wheeled carriages. Their distance from the sea varies between 60 and 80 m. The narrow tract lying between them and the sea is called the Circars. It is not a level, but commonly a suc-

cession of hills and dales; though there occur some levels of considerable extent. Its soil along the sea coast is generally sandy, but it improves gradually towards the mountains, and produces abundant crops of cotton, tobacco, and grain, including rice, when artificially irrigated.

On the mountain knot of Omerkuntak rises the river Manhanudda, which traverses this broken country in an E.S.E. direction nearly in the middle. It falls into the bay of Bengal, after a course of more than 500 m., and forms at its mouth an extensive delta.

South of the mouth of the river Tapy, and nearly in its parallel, rises suddenly from the plain a continuous mountain range called the Ghauts, extending southward as far as the river Ponany (11° S. lat.), through 10° of lat. In some parts it is 30 or even 40 m. distant from the sea; in others it constitutes its very shores. It rises abruptly with a steep ascent from the low coast, and attains a mean elevation of from 4000 to 5000 feet; but some of its summits rise much higher. The highest portion are the Nelgherry hills (11° S. lat.), which are more than 9000 ft. above the sea; the Lillidumale (13° N. lat.) is above 5500 ft.; and the Subramuni (13° 30') above 5400 ft. In many points, the range sinks down to less than 3000 ft., and over these depressions lead the ghauts or mountain passes, whose name has been transferred to the range itself.

The narrow tract of country which intervenes between this range and the sea coast is called Malabar. It is mostly occupied by the short effects of the Ghauts, which preserve their character of steepness, but include small valleys which display a vigorous vegetation. The narrow tract of level land along the sea, which seldom exceeds 3 m. in width, and is in general much less, is separated from the sea by low downs; this gives them the advantage of irrigation during the rainy season. The fresh water descending from the mountains has no vent, and must therefore stagnate until it evaporates: hence these tracts produce much rice, though their soil is poor, consisting chiefly of sand.

The Nelgherry hills constitute the S. extremity of the Ghauts, which are called the W. Ghauts, to distinguish them from another chain of mountains, called the E. Ghauts. The last-mentioned mountains begin on the banks of the river Cavery (11° 30' N. lat.) and extend thence, first in a N.E. direction, as far as 13° N. lat., where, opposite the town of Madras, they turn to the N., and continue so to the banks of the river Kistna (near 17° N. lat.). Between this river and the Godavery are a range of hills, which connects them with the mountains which separate the Circars from the elevated country lying further W. The E. Ghauts do not form an uninterrupted chain, being at several places broken by the rivers which rise on the E. declivities of the W. Ghauts, and descend to the Bay of Bengal. They also do not form one mass; but are frequently divided in several ridges, by longitudinal valleys. These mountains do not rise to the elevation of the W. Ghauts; yet to the W. of Madras, the Nalla Malla mountains attain 3000 ft. and more, and farther S. (near 13°) the Sherwarhy mountains rise to 4935 ft.

The extensive country enclosed between the two ridges of the Ghauts is an elevated table-land. Its surface extends nearly in a level, which is only here and there broken by short ridges or groups of hills, rising a few hundred ft. above it. Its elevation above the level of the sea, where it is contiguous to the W. Ghauts, varies between 2000 and 3000 ft.; but it sinks in approaching the E. Ghauts, where, in most places, it has barely 1000 ft. or less of elevation. Its soil is rather fertile, and well adapted to the culture of rice, where it can be irrigated, and where not, it produces abundance of wheat and other grain. The S. part is called the table-land of Mysore, and the N. that of Balahaut.

The eastern Ghauts are at a distance of about 150 m. from the sea, or coast of Coromandel. The surface of the intervening country extends mostly in wide plains, which here and there are interspersed by hills of no great elevation. The soil is dry, light, and sandy, but nevertheless it gives rich crops, wherever it is irrigated, which is rendered easy by the great number of rivers descending from the western Ghauts, or originating in the eastern Ghauts. The coast is low, sandy, and without harbours, surrounded by shoals, and exposed to a very heavy swell, which renders it extremely dangerous during the north-eastern monsoon. Europeans have, however, preferred it to other parts of India, having formed here more settlements than anywhere else. Three large rivers descend from the eastern declivity of the western Ghauts through the table-land of Mysore and Balahaut, to this coast, and fall into the bay of Bengal. The most southerly is the Cavery, which runs about 450 m. Farther N. is the Kistna, or Krishna, and the Godavery, the former flowing about 600, the latter 700 m. These rivers, though in many parts very valuable for irrigating the contiguous lands, are only navigable in the low plain of the Carnatic. On the table-land they in general have little water, and where they

## ASIA.

break through the eastern Ghauts, they are broken by numerous rapids and cataracts.

On the parallel of the embouchure of the Cavery river, (11° N. lat.), the peninsula may be traversed without passing any mountain. Here exists a great depression in the western Ghauts, called the Gap of Coimbatore. The narrowest passage is at the fortress of Anaimally (77° E. long.), where the level low country between two mountain ranges presents a valley about 12 m. wide. The elevation of the highest part of this gap is only 400 ft. above the sea level. The whole country in this district is covered with large forest trees, especially with teak; but during the rainy season it is converted into a swamp.

To the S. of the Gap of Coimbatore, the Ghauts rise again with a very abrupt ascent: they attain also a great elevation. The Permaul peak, situated W. of Dindigul, nearly in the middle between both seas, is 7367 ft. above the sea level, and according to the statements of the natives the mountains farther W. rise to the snow-line. The chain lies here farther from the sea, leaving a low tract from 30 to 40 m. across between them, and runs S.S.W. towards Cape Comorin, terminating abruptly at a distance of about 80 En. m. from the cape with a huge mass of granite, 2000 ft. high: a low rocky ridge extends to the cape. The mountains are here covered with thick forests.

The country W. of these southern Ghauts is wonderfully intersected by inlets of the sea, which often run for a great length parallel to the coast, receiving the various mountain streams, and communicating with the ocean by different shallow and narrow openings. Between Cochlin and Quillon these lakes form a continual series, being united to one another by short channels, and affording an easy means of communication. The low country, which extends for some miles inland from these lakes, has a good soil, and, being abundantly watered, gives very rich crops of rice and other tropical productions. Still more vigorous is the vegetation in the valleys which are enclosed by the offsets of the mountains, but they are not cultivated with equal care. The low coast is here exposed to a continual and very heavy swell from the ocean, and can only be visited by vessels during the N.E. monsoon (from Oct. to May).

The plain and nearly level country, which on the E. of the southern Ghauts extends to an average width of between 70 and 80 m., is partly covered with extensive forests and partly with cultivated fields, yielding rich crops of rice: their irrigation is rendered easy by the numerous small rivers. Along the shores of the gulf of Manar and of the Palk strait are a great number of salt swamps and lagoons, which mostly communicate with one another. Between them and the sea are sand dunes, which in some places extend to several miles across. The stagnating water renders these places very unhealthy.

Deccan, being placed between two seas and the conflict of the monsoons, is always cooled by sea breezes. Its surface being formed by a series of terraces, and lying within the tropics, enjoys all the advantages of tropical countries, without partaking of their disadvantages. On the sultry coast the luxuriance of vegetation is displayed in the coco-palm, the mango-tree, the cinnamon-laural, and the pine-apple; it thence passes through forests of teak-trees to the table-land of Mysore and of Balaghat, and still higher, on the cool summit of the mountains, it offers the fruit-trees and corn-fields of Europe, flax-plantations, and rich meadows.

5. *The Hindoo-Cooch.*—The N.W. extremity of the plain of the Indus is only about 300 m. distant from the plains drained by the Daria Amu, which form the southern districts of the level country that extends S. of the great depression, in which the Caspian sea and the lake of Aral are placed. This tract, between the S. and N. plains, is occupied by a mountain system, called the Hindoo-Cooch, which, like an isthmus, connects the great table-land of eastern Asia with Iran, the most easterly of the table-lands of western Asia. The whole tract is occupied by high and steep ranges, running in every direction, but the principal of them runs E. and W., and seems to be a prolongation of that high chain which is called on the great table-land of eastern Asia, the Kuen-luen range. Many summits in this range rise far beyond the line of congelation. One of them, the Son Tchooke-sur, N.E. of the town of Peshawar, is at least 23,500 ft. high; but that snow-capped enormous mass, which properly is called the Hindoo-Cooch, seems to attain a much greater elevation. The valleys of this mountain region are but narrow, except that in which the river of Caubul flows, which is of considerable breadth. The mountains present mostly naked rocks on their steep declivities, but afford pasture ground where the slopes are more gentle. Some parts of them are well wooded.

Western Asia, or the countries lying west of the plain of the Indus, the Hindoo-Cooch mountains, and the plains of Bokhara, is, like Eastern Asia, an elevated table-land, but each differs considerably from the other. While in Eastern

Asia the table-land forms one mass, extending in all directions, that of western Asia has nearly in its middle and in the direction of its greatest extent, from S.E. to N.W., a deep depression, which at its south-eastern extremity, where it is occupied by the gulf of Persia, varies between 20 and 200 m. in width, but farther to the N.W. extends over the basin of the river Euphrates and the adjacent desert, so as to be from 300 to 500 m. across. The whole length of this depression, from Cape Ras el Had (Sut), the south-eastern point of Arabia, to Romkha, where the Euphrates issues from the mountains and enters the plain, does not fall short of 1500 m. in a straight line. On the N.E. of this depression is the table-land of Iran, the mountain-region of Armenia, and the table-land of Asia Minor; the latter projects far beyond the depression. On the S.W. of it is the table-land of Arabia, which latter is connected with the table-land of Asia Minor, by the mountain range of Sorban (Byria), whose mountains separate the north-western part of the lowlands from the Mediterranean sea. Besides, the table-lands of western Asia do not rise to so high an elevation as the southern portion of the table-land of eastern Asia; they attain only the height of the northern region, but being placed farther to the S., and nearer the sea, they enjoy a better climate and are more adapted to agricultural purposes. It is also to be observed that the table-lands of western Asia descend almost everywhere with a steep descent to the adjoining plains or seas, and are not surrounded as those of eastern Asia on all sides by low lands.

6. *The Table-land of Iran (Persia)* extends from E. to W. from the plain of the Indus to that of the Euphrates, and from S. to N. from the gulf of Persia to the Dead Sea, or desert of Khiva (36° N. lat.), and the southern shores of the Caspian sea. The interior of this great tract of country extends in large and level plains, only in a few places broken by rocky hills, mostly unconnected with one another. The elevation of these interior districts seems rarely to exceed 5000 ft. above the sea level, and as rarely to descend to less than 3000 ft. These plains are bounded on every side by a hard border of more elevated tracts, whose surface is diversified by mountain-ridges, valleys, and some table-lands of moderate extent.

The highest portion of this elevated border is at the eastern boundary of the table-land, contiguous to the plain of the Indus. From this plain the country rises in several steep ridges, running parallel to the plain, and including deep and narrow valleys. These mountains are called, S. of 26°, Hala mountains, and N. of this, Soliman mountains. The former are somewhat lower than the latter, which seem to preserve in the greatest part of their extent more than 10,000 ft. of elevation, its highest summit, the Takht Soliman (the throne of Soliman), attaining 12,836 ft. Adjacent to these parallel ridges, on the W. side, are several elevated plains of moderate extent, especially the plains of Kelat (29°), Kweila (31°), and Ghilmi (33° and 34° N. lat.); of which the former is elevated between 7000 and 8000 ft., and the latter probably more than 9000 ft.: yet they are cultivated, especially towards the hills that surround them, and the depressions of their surface, which frequently descend some hundred feet: the higher districts afford good pasture. All these tracts are very cold, and covered by deep snow during the winter.

The southern border of the table-land of Iran, extending from the plain of the Indus as far W. as the strait of Ormus, does not rise to a great elevation. From the sea, however, the mountains rise rapidly, having only a narrow low stripe along the shores, but their height probably does not exceed 9000 ft. North of this ridge is a mostly level plain, which, as it contains extensive plantations of date-trees, cannot have a great elevation; it is otherwise sterile, and has few spots which can be cultivated. North of this plain is another much more elevated chain, the Wushutee mountains, which probably attain 5000 ft. In this part the mountainous border of the table-land is hardly 190 m. across; but towards its western extremity a mountain group projects northward (near 60° E. long.), the Surhad mountains (cold mountains), which seem to attain a higher elevation, but have several fertile valleys towards the E. From this mountain group issues northward a rocky ridge, which is narrow, and in general low, but has a few elevated summits. This ridge, advancing to the northern border, divides the interior plain of Iran in two parts, and forms the political boundary between Afghanistan, or East Iran, and Persia, or West Iran.

By far the greater part of the plain of East Iran is occupied by a sandy desert, which, from the Wushutee mountains, extends northward to the parallel of Ferah. Ghirish, and Kandahar (from 37° to 33° 10' N. lat.), nearly 400 m., and from E. to W. nearly the same distance. Its southern part, the desert of Beloochistan, is covered with fine sand, which, when moved by the wind, raises some feet above the solid surface. It is entirely uninhabited. The northern portion, the desert of Sigistan, or Seistan, has a few small oases, and considerable tracts of fertile and cultivated ground along

the banks of the river Heernud, which rises on the western declivity of the Hindoo-Cooah, and runs about 500 m. Half its course is through the desert, and it loses itself in the lake of Zareh, about 190 m. long and 50 m. wide, but when swelled by the melting of the snow in the more elevated regions, it occupies a space more than double these dimensions. Along the northern border of the desert lies a country whose surface is partly hilly and partly undulating, but its breadth is not considerable, being between 50 and 80 m. across.

The northern border of East Iran is formed by an extensive table-land of very broken surface; the upper part extends in wide level plains, but they are frequently intersected with deep valleys. This region, the Paropamisus of the ancients, has been called by modern geographers the mountain region of the Eimaks, and Hazareh, from the savage nations which inhabit it. It extends S. and N. about 400 m., and nearly double that extent E. and W. The ground is cultivated in the narrow valleys, but the extensive pastures nourish large herds of cattle and sheep. On the N. it is separated from the plain of Bokhara by the Hazareh mountains.

The interior plain of West Iran is of greater extent, its length from the boundary of Afghanistan to the neighbourhood of the Caspian sea, N. of the town of Kabin, exceeding considerably 500 m., while its mean width may be 400 m.; but towards the north-western extremity it narrows to 150 m. and less. Its middle is occupied by a desert, called the Salt desert, its surface being impregnated with nitre and other salts. Towards the boundary of Afghanistan it may be 250 m. across, but farther W. its width hardly exceeds 100 m. Its length is 400 m., or nearly so. It is entirely uninhabited. Those portions of the plain which extend on both sides the desert have a broken surface, but the level plains are extensive, and the hills, though sometimes high, do not occupy a great space. These districts, far from being infertile, are frequently well cultivated and abound in pastures. In many districts fine fruits are raised plentifully: but rocky plains also occur frequently.

The northern border of West Iran seems not to exceed 100 or 150 m. in width. It is likewise composed of different ridges, which mostly run in the direction of the table-land E. and W. Though very rugged and steep, the mountains do not rise to a great elevation above the elevated plains lying southward, before they arrive at the meridian of 50° or 55°. From hence, westward, they rise higher, but their width narrows to from 60 to 80 m. This more elevated part of the chain is called the Elburz mountains, and runs parallel to the southern shores of the Caspian sea, at an average distance of 30 m., descending to it with a descent which is extremely rapid. Its offsets, which are not less steep, though less elevated, fill up the space between the principal range and the sea, with the exception of a narrow stripe along its shores. The valleys, though not very wide, are very fertile. The mean elevation of the Elburz mountains may be 7000 or 8000 ft.: some summits rise higher: the highest is the Demawend, N.E. of Teheran, which exceeds 10,000 ft. above the sea.

The S.W. mountainous border of the plains of West Iran is still more distinctly marked. The mountain tract, about 80 or 90 m. wide, extends from the straits of Ormuz along the gulf of Persia, and farther N. along the plain of the Euphrates, to the place where the Tigris, breaking through the mountains, enters the low plains N. of the town of Mosul. This mountain tract consists of from three to seven ridges, running parallel to each other, and separated by as many narrow longitudinal valleys, which sometimes are many days' journey in length. They are separated from the sea by a narrow low coast called the Gurnair (warm region), and rise in the form of terraces towards the interior. The valleys in the southern portion of this region are cultivated, but N. of the parallel of 30° N. lat. they are inhabited by different tribes of Kurds, who prefer a nomadic life and the rearing of cattle. This northern range was anciently called Zagros, but is now known under the general name of mountains of Kurdistan. Their elevation has not been ascertained, but some summits rise to the snow-line.

The great commercial road which connects the western countries of Asia with India, traverses the table-land of Iran. It runs between the deserts and the northern mountain border, through the fertile and cultivated district between them, and passes from the town of Tabriz in Azerbaijan through Casbin to Teheran, and thence to Nishaboor, Meshed, and Herat. Thence it declines from its eastern direction to the S. to avoid the mountain region of the Eimaks and Hazareh, and leads to Kandahar, where it passes over part of the table-land of Ghizni to Cabul. It then follows the valley of the river Cabul to Peshawar and Attock, where it passes the Indus, and traversing the Panj-ab, enters the plains of the Ganges.

7. *The Mountain Region of Armenia.*—The most northern and narrow extremity of the interior plain of Iran reaches

to the vicinity of the river Kizil Ozein, and N. of it extends a country filled with mountain-masses, which rise higher and higher as they proceed northward. East of Tabriz is Mount Selsevan, which attains an elevation of 12,000 or perhaps 13,000 ft. above the sea level, and other summits seem not to be much lower. Between these mountains are numerous deep valleys, which are partly cultivated, but the inhabitants mostly depend on their herds of cattle and sheep for subsistence. A few plains lie embosomed between the mountains: the most extensive are those which are filled up by the lakes Urmia and Van. The former is 300 m. in circumference, and its waters are salt, more salt than those of the sea, but they are perfectly clear. The lake of Van is somewhat less in extent, and its waters are likewise salt, but not to such a degree. N.E. of the lake of Van the mountain-region attains its highest elevation in mount Ararat, whose summit is 17,320 ft. above the sea level, and the country which extends W. of it to the sources of the river Aras and the two upper branches of the Euphrates, the Kara-en and Murad, has at least 6000 ft. of absolute elevation, as the town of Erzeroum is 5300 ft. above the sea level. Four mountain ranges, rising from 4000 to 5000 ft. above their bases, run E. and W. between 38° and 41° N. lat., and the most northerly descends to the Black sea with great steepness, and so close to its shores that no road can be made along the coast E. of Trebizond. Though the mountains occupy the greater portion of its surface, the valleys along the large rivers are so wide that they may be taken for plains, being from 10 to 15 miles across. These valleys, though cold, are mostly very fertile, and yield rich crops of corn, whilst the declivities of the mountains afford abundance of pasture. The farthest south of the above-mentioned mountain ranges, that which, branching off from mount Ararat, contains the sources of the Murad river, or eastern branch of the Euphrates, and which farther W. is broken through by this river, after its two upper branches have united, is to be considered as the continuation of mount Taurus, which traverses Asia Minor. But it does not constitute the southern boundary of the mountain-region of Armenia: this is constituted by a much less elevated mountain ridge running E. and W. between the rivers Euphrates and Tigris, about 37° 30' N. lat. and on whose southern declivity the town of Mardin is built. After breaking through this range at Romkale, the Euphrates enters the plain; the Tigris does the same N. of Mosul.

8. *Natalia, Nadii, or Asia Minor.*—This extensive peninsula is to be considered as a western continuation of the mountain region of Armenia. It is nearly of the same breadth, and lies between the same parallels (37° and 41°); but there is doubtless some change in the direction of the mountains where both regions border on each other. From the gulf of Iskenderoon, on the side of the Mediterranean, to the town of Trebizond on the Black sea, the ranges run from S.W. to N.E., as is also clearly indicated by the south-western course of the Euphrates between 30° and 36° N. lat. It would therefore seem that these ranges are only a prolongation of those of Soristan, which continue southward in the same direction. The middle part of this tract, between the towns of Sivas, Malatiah, and Cæsaria (Kaisariyyeh), seems to form a table-land of considerable elevation, as the winters are severe and snow falls abundantly; the summers are short and not warm. Probably its height above the sea is from 5000 to 6000 feet. Its surface is a succession of levels, divided from each other by ridges of low elevation; the plains are fertile, and produce rich crops of corn. The southern border of this table-land is mount Taurus (near 38° N. lat.), which seems to rise to a great height, and sends off some branches to the Mediterranean, among which the Alma mountains (Mons Aman) which enclose the gulf of Iskenderoon on the E., seem to attain the highest elevation. A northern offset of the Taurus, the All Taghi mountains, terminates near Cæsaria with mount Erlich, which is always covered with snow, and probably rises to 12,000 feet above the sea level. The mountains extending from Sivas to Trebizond are also high, but we know very little of them.

From this eastern and much elevated border the peninsula extends nearly 500 m. westward. Along the Mediterranean, as well as along the Black sea, it is traversed by ranges of mountains. That which runs along the Mediterranean constitutes a continual range of elevated mountains, the Mons Taurus of the ancients. The average distance of the highest part of it from the sea may vary between 30 and 70 m.; but the whole tract lying between them is filled up by mountains of considerable elevation. They attain the greatest elevation on the broad peninsula between the gulfs of Adalia and Makry (39° and 31° E. long.), where mount Taghtalu is 7800 ft. high. But the mountains farther inland are even in August covered with snow for a fourth part of the way down their sides, which indicates an elevation of at least 15,000 ft. above the sea level. Farther W. the mountains rapidly decrease in height, and are only of moderate elevation where they terminate on the shores of the Aegean

see, on both sides of the gulf of Koa. The rocky masses of this chain press so closely on the shore of the sea, that commonly only a narrow strip of low or hilly surface intervenes, except along the innermost part of the gulf of Adalia, and along the N. shores of that of Iskenderoon, where low plains of moderate extent occur. In some places high mountains constitute the very shores of the sea, for many miles together.

The mountains which occur along the Black sea do not form a continual range, being frequently broken by deep, and commonly open valleys, by which several larger or smaller rivulets find their way to the sea. They therefore constitute several separated ranges, and have neither in ancient nor in modern times been designated by a general name. The several ridges which lie between these valleys run E. and W., parallel to each other, forming commonly a wider mountain border on the N. of the peninsula, than the higher chain of the Taurus on the S.; their mean breadth may be 100 m. None of their summits seem to pass the snow-line; the highest which has been measured is Dimaun-Tagh, the Mons Olympus of the ancients, S.E. of Brusa, more than 9000 ft. above the sea level. The wide and extensive valleys which lie between the mountain ranges of this tract contain much cultivated land, which sometimes extend, even on the gentle slopes of the mountains themselves, whose higher parts are used as pastures, while nearly the whole of mount Taurus is only available for the latter purpose.

The country which lies between these two mountain-districts, and the meridians of Camsaria (35° 30') and Kutahiya (30° 30') is, properly speaking, a plain whose elevation has not been determined, but it does not seem to be much above or below 3000 ft. above the sea. Its surface is not everywhere level, but it exhibits extensive level plains, and the ranges of hills which occasionally occur do not occupy much space, nor are they commonly much elevated above their base. The soil is dry, but not sandy; and along the water-courses, or where water for irrigation can be got, rather fertile; but the tracts where no water can be procured are very extensive, and serve in winter as pasture grounds to several nomadic tribes, who in summer retreat to mount Taurus, or the high lands E. of Camsaria: even the fertile tracts are not cultivated, because exposed to the continual robberies of these tribes. The soil in the S. districts is strongly impregnated with nitre and other salts, and hence in these parts a considerable number of lakes occur whose waters are salt, and from which great quantities of salt are procured. These lakes have, as is commonly the case with salt lakes, no outlet. The most important of the rivers which drain this table-land is the Kizil-irmak, which rises at a short distance E. of Sivaz, and runs 200 m. westward, and afterward nearly 300 m. N.E. and N. It is the Hays of the ancients.

The table-land seems to extend even W. of the meridian of Kutahiya, but in these parts its surface begins to be broken in hills and dales. The hills seem to increase in height as they proceed westward, and the valleys to sink deeper, and to become wider. Both the hills and valleys continue to the shores of the *Ægean* sea, which is indicated by the indented sea coast, which consists of boldly projecting promontories and deep bays between them, forming excellent harbours. This is by far the best portion of Asia Minor, the cultivated land extending over the valleys, and on the sides of the mountains, and yielding rich crops of rice, cotton, and corn, whilst the gardens produce many kinds of excellent fruits. This region is also the most populous, and contains, probably, more than half the population of the peninsula.

9. *Seriatian, or Syria*, which unites the table-land of Naddol with that of Arabia, is a country which has a very peculiar physical constitution. Two elevated ranges run from its northern extremity (37° N. lat.) through its whole length, and terminate on both sides the gulf of Akaba, (30° N. lat.) the farthest E. of the two gulfs which the Red sea forms at its northern extremity. Both mountain ranges, with the intervening valley and the adjacent shores of the Mediterranean, occupy only a space from 60 to 70 m. across. The most easterly of the two mountain chains towers considerably soon after having branched off from the Alma Tagh; and in the parallel of Aleppo (36° 10' N. lat.) it sinks down to hills of moderate elevation, nor does it rise much higher until it reaches 37° 30', where it rises to a considerable height, probably 5000 feet and more: it is called Jebel Esharki, the Antilibanus of the ancients. It preserves a considerable elevation as far S. as 33° 55', where it lowers again, but soon widens in an extensive mountain region, called El Kura, which extends to 33° 10'. Hence it continues as a rocky ridge of moderate elevation on the eastern side of the Dead sea, to its southern extremity E. of the gulf of Akaba. The western chain is much higher, at least in the northern districts. As a high mountain range, it skirts the eastern sides of the gulf of Iskenderoon, and at some distance

S. from it is broken by the river Aazzy (Orontes), but S. of that river it again rises to a considerable elevation. Its highest portion, however, is between 34° 30' and 33° 30': this is the famous Libanus of the ancients, its northern and more elevated portion still retaining the name of Jebel Liban: but towards the S. it is called Jebel el Drus, from its being inhabited by the Druses. The highest summits of the Jebel Liban are always covered with snow, and that which bears the name of Jebel Miskel (34° 12') attains to 12,000 ft. above the sea. S. of 33° 30' the mountains sink much lower, and these low ridges continue to its southern extremity, on the rocky peninsula between the gulfs of Akaba and Suez. Near the most southerly point they terminate with the stupendous and famous mountain-mass of mount Sinai, whose highest summit is probably more than 9000 ft. above the sea.

The valley, which extends between the two ranges, has nowhere a great width. N. of 33° N. lat. it may vary between 8 and 30 m., but is much wider N. of 34° N. lat. than between the two ranges of the Libanus. From the southern extremity of the Dead sea to the gulf of Akaba it is reduced to a narrow, rocky, and waterless cleft in the mountains, probably not more than 1 m. or 1½ across. The northern and wider part of the valley is watered by the river Aazzy (the Orontes of the ancients); the middle and highest part, lying between the two ranges of the Libanus, by a small river, the Liettanie; this district is probably 3000 ft. above the sea. S. of the Liettanie, the valley is watered by the Jordan, which traverses the lake of Tiberias, and empties itself in the Dead sea, after a course of about 100 m. The Dead sea, called by the Arabians Bahr-el-Loot, is about 30 m. long, and nearly 15 m. broad where widest; it is remarkable for the asphalt or bitumen found on its shores, and for the remarkable events and associations connected with its history.

Between the western mountain-range and the shores of the Mediterranean are some extensive plains, S. of 33°, where the country for many miles inland is low and sandy, but without harbours. Between 33° and 35° is the country of the ancient Phœnicians, lying between the sea and the Libanus. The whole tract from the sea to the mountains is filled with hills, and, in advancing to the shores, these hills form numerous small harbours: the country farther N. is of the same description.

The southern part of the region just described is nearly a desert. S. of the Dead sea the surface is mostly nothing but bare rocks, destitute of vegetable mould and water. It is therefore called Arabia Petrea, or Stony Arabia. N. of it is Palestine, whose plain towards the Mediterranean is nearly a desert, on account of its sandy surface; but the higher portion, between this plain and the Jordan, is rather fertile where cultivated, though some districts have a stony soil. The valley of the Jordan is not distinguished by fertility. The country W. of the Libanus is more fertile, especially along the range, and in its small valleys, and even on its declivities; but on its side some of the valleys are sterile, and the E. declivity of Libanus is a naked rock. N. of Libanus the country improves, and is in general fertile, and partly well cultivated. E. of the mountain region is the Syrian desert, which belongs to the great depression in the interior of western Asia; but this desolated country does not advance to the foot of the ranges: it is divided from them by a tract of most fertile country, interspersed with sandy spots. This tract may be 50 or 60 m. across, but it becomes more sandy and sterile in advancing farther E.

10. *Arabia* is a table-land of considerable elevation, but we are unable to determine the line where it begins to rise from the low plain of the Syrian desert. Probably this line is a good way S. of the caravan road leading from Damascus to Busrah, but not far from a line drawn from the most northerly corner of the gulf of Akaba to the mouth of the Euphrates. The table-land rises abruptly on the other three sides, at a distance of from 3 to 40 m. from the sea, except along the northern coast of the gulf of Persia, to which it descends with a gentle declivity. The low, narrow border, with which the table-land is encompassed on all sides, is called the Tehama, and the table-land itself Nejd, or Nedjed. The rocky and uneven border, which divides the Nejd from the Tehama, is mostly called Jebel (mountain), or Hedjaz.

The Nedjed is divided into two parts by a rocky ridge, which cuts the tropic circle with an angle of about 30°. It begins on the W. near 28° N. lat., and terminates near the gulf of Persia, near 25°. This ridge, called Jebel Aared, divides the table-land into two parts, of which the southern is nearly a complete desert, and seems almost uninhabited. North of the Jebel Aared, sand also covers by far the greater part of the Nedjed, but is in numerous places interspersed with rocky tracts and some hilly grounds; where, during the rainy season, water collects and forms small streams, by which these tracts become inhabitable, and even fit for the culture of some kinds of grain; especially

*Shourra*, a kind of millet. There occur also extensive plantations of fruit-trees, especially dates. The sandy desert which separates these habitable spots is also covered, after the rainy season, with grass and flowers, and the Bedouins, or wandering Arabs, find there all the year round subsistence for their horses, camels, and sheep. It has not been determined to what elevation above the sea level any part of the Nedjed rises, but its cold climate in winter seems to indicate that it exceeds the general elevation of the table-land of Iran, though probably not that of Ghizl or Kelat.

The Hedjaz, or rocky edge of the Nedjed, is narrow N. of the tropic, where it probably never exceeds 15, or at the utmost 20 m., except in two or three places, where it is contiguous to a rocky district of the Nedjed. S. of the tropic it considerably widens, and here its mean breadth may be about 50 m. S. of Mekka the Tehama and Hedjaz together extend more than 100 m. from the Red sea. The Hedjaz resembles much the rocky tracts enclosed by the Nedjed, except that water is more abundant, and that therefore it is better adapted to agriculture. In it are extensive plantations of coffee.

The low plains of the Tehama have a sandy soil, which it is supposed has been deposited by the sea along the foot of the great mountain mass, by which the Hedjaz and Nedjed are supported; and it is maintained that it is still increasing in width. As it does not rain, frequently for many consecutive years, it could not be cultivated but for the water-courses, which, during the rainy season, descend from the adjacent Hedjaz. Irrigated by them, with the addition of some artificial means, these sultry dry plains yield good crops of some kinds of grain, and are rich in fruits, dates especially.

11. *The Plain of the Euphrates* comprises the whole of the great depression in the interior of western Asia, except that portion which is occupied by the gulf of Persia. Its northern boundary is formed by that range of mountains which, on the W. of the Tigris, begins a little above Mosul, and running westward near the towns of Merdin and Orfa, terminates on the banks of the Euphrates, near Rumkoka. On the W. it is bounded by the table-land of Iran, on the E. by the mountain region of Syria, and on the S. by the northern declivity of the Nedjed. That portion of it which lies contiguous to the Nedjed and Syria, up to the eastern banks of the Euphrates, is a complete desert, mostly covered with sand, and subject to the pestiferous blast of the *simoom* or *ensaim*. It is, however, inhabited by some wandering tribes of Arabs; and through it run the roads which lead from Aleppo and Damascus to Basorah. It is called the Syrian desert. It spreads even beyond the Euphrates to a considerable distance from the river in its middle course, where its banks are hardly better inhabited than the desert itself. In the northern districts of the plain and also prevalent, but it is frequently interspersed by extensive tracts of rocky ground; and as these patches have commonly mould on them, they are cultivated and planted with trees. This tract, through which runs the road from Aleppo to Bagdad, extends on the banks of the Tigris to the last-mentioned place. S. of Bagdad the country between the two rivers is fertile, when irrigated, which is done by water derived from the rivers themselves, and from several canals; but those tracts, which lie to the E. and W. of these rivers, are only cultivated along their banks, sandy deserts beginning at a short distance from them. The two rivers which water this great plain, the Euphrates and Tigris, rise nearly in the same parallel, between  $36^{\circ} 30'$  and  $39^{\circ} 30'$  N. lat., on the declivities of the same mountain range in Armenia; but the Euphrates, running first W., has already had a course of 500 m. before it arrives at the parallel of the sources of the Tigris. It then by degrees turns S.E., and continues in that direction, approaching gradually nearer to that river, and unites with it about 100 m. from its mouth. The united river is called the Shat-el-Arab, and falls in the northern extremity of the gulf of Persia.

12. *Mount Caucasus*, which at present is considered as the boundary between Asia and Europe, does not constitute a part of the table-lands and mountain regions of Western Asia, being separated from the mountain masses of Armenia by a kind of valley, about 100 m. across. This valley is a level plain, where it approaches the Caspian sea, and at a distance of about 100 or 150 m. from it. Farther W. the surface of the valley is hilly, intermixed with some undulating plains, of moderate extent. It rises in higher hills between  $43^{\circ}$  and  $44^{\circ}$  E. long., where a ridge of low mountains forms the watershed between the river Kur (the Cyrus of the ancients) and the Rioni (the Phasis of the ancients). The most westerly district of the valley, which is watered by the Rioni, is almost entirely filled with hills, the valleys and level tracts occupying only a small part of its surface.

Mount Caucasus itself rises from this valley, with a rather steep descent, and forms a continual mass of high rocks, running from E.S.E. to W.N.W., from the shores of the peninsula of Abcheron, on the Caspian sea, to the small town of

Anapa, on the Black sea, a distance hardly less than 700 m. Its width does not exceed 130 m. where widest, and hardly more than 60 or 70 m. where narrowest. This mass of rocks covers 56,000 sq. m., or nearly the surface of England and Wales. Its highest summit, mount Elbrooz, or Elborus, attains an elevation of 17,785 ft., and is situated nearly in the centre of the range. The portion of the range, which extends W. of that high pinnacle, nowhere rises to the snow-line, but several snow-peaks occur to the E. of it, among which mount Kasbeck is 14,500 ft. high. Traces of agriculture are met with in but few of its valleys, the inhabitants living almost exclusively on the produce of their flocks. This mountain system is remarkable for the great number of nations, belonging to different races, which inhabit its elevated valleys. At both extremities of mount Caucasus are places where the soil is impregnated with naphtha or bitumen, especially in the peninsula of Abcheron.

13. *The Islands of Asia*.—The *Alutian* islands, which extend between the peninsula of Kamtschatka and the peninsula of Alaska in America, as well as the *Kuril* islands, which lie S. of cape Lopatka, and terminate near the eastern shores of Japan, are of volcanic origin, and in some of them are still found active volcanoes. Their soil is mostly rocky, and destitute of wood, but the most southerly islands of the last-mentioned group are cultivated on the lower grounds.

The large islands, which, between  $45^{\circ}$  and  $55^{\circ}$  N. lat., extend along the coast of Manchouria, called *Sakhalin*, *Tera-kai*, or *Kerakta*, is very little known, except that it forms an enormous mass of rocks, which rise towards its centre probably to the height of 3000 or 4000 feet, and perhaps even higher. It is mostly destitute of trees, and no part of it is cultivated; its scanty population subsist on the produce of their fisheries.

The islands of Japan, consisting of four large (*Yesso*, *Nippon*, *Sichok*, and *Kioosio*) and a considerable number of smaller ones, are also formed by immense masses of rocks, which, especially on Nippon, rise above the snow-line. In most places the steep or gentle declivities of the rocks extend to the very shores of the sea, but at others plains of considerable extent extend between them. Though the soil does not seem to be distinguished for fertility, it is rendered productive by the great care with which it is everywhere cultivated; corn-fields extend on the slopes of the mountains to a considerable elevation. In many districts the surface consists of lava.

The island of *Formosa*, divided from the continent by a channel about 70 or 80 m. wide, extends from N. to S. more than 900 m. Its southern extremity is a level, but not of great extent, for not far from it rises that mountain range which traverses the island in its whole length, and which in its higher parts seems to attain an elevation of from 10,000 to 12,000 ft. above the sea. Its valleys towards the western shores, and the small level spots which occur along the sea, are fertile and well cultivated. The country E. of the range is not known.

The island of *Hainan*, near the S. coast of China, is separated from the mainland by a strait hardly more than 100 m. across. It extends from S.W. to N.E. more than 180 m.; its average width is about 100 m., or somewhat more. In its centre rises a mountain mass to a considerable height, from which some lateral ridges branch off, but they do not reach the shores, except in some parts on the E. coast. Everywhere else a low flat country separates the mountain from the sea. The flat districts are either sandy, or covered with grass and without trees, like the savannah; in some places they are cultivated and fertile, as are also the valleys.

The extensive group of the Philippines, which lies between  $18^{\circ} 30'$  and  $30^{\circ} 30'$  N. lat., comprises more than 100 islands; of which, however, most of the smaller ones are uninhabited. Most of them are mountainous, and the smaller ones naked rocks; but the larger islands contain many plains of considerable extent, and of a very fertile soil. They are well watered—perhaps too much so; some of them are volcanic.

The *Sooloo* islands, between Magindano and the eastern coast of Borneo, have a rocky and uneven soil, but it is very fertile, being covered with a thick vegetable mould. But the large island of Palawan, lying farther N., is a rocky mass rising in the middle to a high range, in which some summits attain a great height. The rocks are commonly bare; in some parts the sides of the mountains are covered with trees; but agriculture is confined to a few small spots on the coast.

*Borneo*, the largest of the Asiatic islands, and not much inferior to France in extent, is nowhere mountainous except in the peninsula which projects N.E. from the main body of the island; and even there, as it appears, the mountains do not attain a great elevation. The remainder, which comprises at least four fifths of its whole surface, seems to be a

plains, on which a few ridges occur at great distances. This plain has an alluvial soil, to a distance of several miles from the shores, and afterward the country rises gradually, perhaps 200 or 300 feet. The whole of this plain, as far as it is known, seems to possess great fertility; and the want of culture, which everywhere is visible, is probably the effect of the too great abundance of water, as the island is subject to continual rains. All kinds of productions and fruits, commonly met with between the tropics, grow to perfection.

The island of *Celebes*, divided from Borneo by the strait of Macassar, is traversed by four ranges of mountains, which, however, do not attain a great elevation, except where the four mountain ranges and the four peninsulas, of which the island consists meet together; in this part the mountains are of considerable height. The surface of the whole island is hilly or mountainous, the flat tracts along the coast being of small extent. Its soil is rather sandy, and not distinguished by fertility. Its produce in rice is not equal to the consumption of the inhabitants; but it produces many tropical fruits, and sugar in great abundance.

The *Maluccas*, lying W. of *Celebes*, consist of some hundred of smaller and larger islands, divided in several groups between 5° N. lat. and 6° S. lat. They rise mostly with a steep ascent from the sea shore, but rarely to a considerable elevation. Many of them seem to owe their origin to volcanoes; and on eight still exist volcanoes in activity. Their soil, though mostly sandy and stony, is fertile, and particularly adapted for some productions. Amboyna has large plantations of cloves, and the Banda group furnishes nutmeg and mace. The culture of rice and other grains is very limited, as the soil seems not favourable to their growth; but this want is supplied by the extensive plantations of sugar-trees.

That series of mostly considerable islands which begins on the E. with the island of Timour and terminates on the W. with that of Bali, including the islands of Roti, Savoo, and Sandelbosh, which lie S. of the series, are called by geographers the *Lesser Sund Islands*, to distinguish them from the group of the *Larger Sund Islands*, comprising Borneo, *Celebes*, Java, and Sumatra. The *Lesser Sund Islands* are mountainous; and in some of them the mountains rise to 8000 or 9000 feet above the sea, and probably higher. Several of them are active volcanoes, which frequently bring destruction over the islands in which they are situated. We are not well acquainted with these islands, nor with the degree of fertility they possess; but from the few indications we have received, it may be inferred that, in general, they are as far from being sterile, as from an exuberant productiveness. Many of the tropical productions grow to perfection.

Java, the most important of the islands of the Indian ocean, is properly a continuation of the former series. It extends in length nearly 700 m., but its breadth hardly exceeds 100 m., where widest. A continuous chain of mountains runs through the island in its whole length, lowering more rapidly towards the N. than the S., where the coast is high and nearly inaccessible. Some summits of this chain rise to more than 12,000 or 13,000 feet. The highest are the *Bombero* and *Tagal*. Most of these summits are volcanoes, either extinct or still active, and their frequent eruptions have in later times laid waste several districts. The more fertile tracts lie along the northern shores, which are low, and from which a flat country extends several miles inland. Their fertility is very great, and produces rich crops of every kind of grain or roots cultivated between the tropics. But part of these flat lands are so low and so badly drained, that they are converted into swamps during the rainy season. Some tracts preserve their swampy soil all the year round; and hence arises the insalubrity of these coasts.

Sumatra, only second to Borneo in extent, is 900 m. long and from 150 to 230 m. wide. In its length it is traversed by a mountain chain of great elevation, several of its summits exceeding 12,000 ft. of elevation; mount Ophir exceeds even 13,000 feet. Many of these summits are volcanoes, but most of them appear to be extinct. The volcano Gunong Dempo is more than 11,000, those of Ber Api and Barawi more than 13,000 feet high. The declivities of these mountains extend in many places to the western shores, which therefore afford several good harbours. The eastern shores are flat and sandy, and the adjacent plains extend in some places 100 m. and more inland. Some tracts of these plains are swampy, and others sterile and covered with sand. Still a great part of its surface is fertile, and affords many valuable productions. The western districts, being more uneven and consequently better drained, are more fertile and much more healthy. In the extensive woods, which cover the declivities of the mountain, the camphor-tree is frequent, and yields the best camphor. From the eastern shore extensive shoals extend far into the straits of Malacca, and render the navigation tedious and difficult. East of this island, and towards its southern extremity, is the island of Banca, famous for its inexhaustible mines of tin.

*Ceylon*, divided from the peninsula of the Deccan by the gulf of Manasar and Paik strait, is from S. to N. 350 m. long, but its greatest breadth does not exceed 140 m. In the middle of the island, and towards its southern extremity, on both sides of 7° N. lat., is a mountain mass, which extends over nearly an eighth part of its surface. The mean elevation of this mass may exceed 1000 feet above the sea, though some of its more elevated valleys rise to nearly 4000 feet. This mountain mass is overtopped by several high summits, among which the Adam's peak attains 6159 feet; but Pedrolallagalla, the highest pinnacle, is 6380 feet above the sea. This mountain region is surrounded by a hilly country, to a distance of 10 or 12 m. and more. Its mean elevation above the sea varies from 400 to 1000 feet. This hilly region may in some degree be said to extend to the very shores of the sea in the S. districts; for the country contiguous to the coast between Batticaloa, on the E. coast, and Negumbo, on the W., is not level and undulating, and the coast itself is rather high. The northern half of the island is a level plain, and it is supposed, that even in the interior, it does not rise above 300 feet. Its coast is everywhere flat and sandy, and remarkable for the great number of lagoons, with which it is skirted. These lagoons increase in size during the rainy season, so as to flow into one another, affording an inland navigation for boats, in some places for 60 or 80 miles. Along the whole of the eastern coast, from point Pedro to Dondrah head, and hence to Negumbo, the sea is deep, and may be navigated by vessels of any burden; but the W. coast, N. of Negumbo, as far as point Pedro, is surrounded by a shallow sea, in which only vessels of 100 tons can be used; and the common vessels employed in this trade vary between 25 and 50 tons. The fertility of the island is very great; sandy tracts indeed occur, but they are not extensive, and produce commonly good crops, when irrigated. Swamps, which in the other islands of the Indian ocean, cover great tracts of the low country, are rare in *Ceylon*, and of small extent.

II. BOTANY OF ASIA.—Temperature, soil, humidity, and light are the principal agents in the geographical distribution of plants. These elements exist under greater variety in Asia than in any other region; and hence the amount and diversity of Asiatic vegetation are absolutely without a parallel. It is not alone the extent in lat. of this vast continent, though stretching from the equator to the highest N. parallels; it is not simply the different elevations of its surface, though of these the greatest and least are respectively 37,000 feet above and 110 feet below the level of the sea; it is not even the abundance of water in one district, and its almost total absence in another—which will or can account for this amount and diversity. Powerful as are these causes in influencing the physical conditions of any region, one still more powerful exists in Asia, viz., the very peculiar nature of its conformation. The centre is a high table-land, varying from 6000 to perhaps 15,000 feet of elevation, bounded on every side by high mountains, which effectually shut it out from the sea, and on the exterior sides of which the kingdoms of Asia are arranged in every variety of inclination. The difference of aspect thus induced, still more than either lat. or elevation, serves to divide the whole continent into five great botanical regions, which, however subject to division among themselves, are distinguished from each other by peculiarities as striking as though the Atlantic or Pacific rolled between them. N. from the great table-land, the vast country of Siberia slopes to the Arctic ocean. The intensity and duration of the cold in this dreary region prevent the thriving of any but the most hardy plants, except in the S. districts; where, in addition to the effects of lower lat., vegetation is protected by mountain ranges, which screen it from the freezing N.E. winds. The oak and hazel are found in Daouria, on the border of the country of the Manchous (*Gmelin, Flor. Sib.*, 1, 50); but their size is diminutive, their vegetation languid; nor are they met with in any other district N. of the Altai mountains. (*Pallas, Flor. Russ.*, 1, 3.) Yet the well-watered lands of S. Siberia abound in thick forests, consisting of birch, willow, juniper, maple, ash, pine, alder, fir, larch, poplar, aspen, and elm trees. (*Gmelin*, 1, 150–180; *ib.*, 150; *Pallas, Flor. Russ.*; and *Voy. en Russ.*, *pass.*) Of fruits there are the Siberian cedar (*Pinus cembra*), the nut of which is an article of commerce; two or three species of raspberries, blackberries, and other brambled fruits; a species of cherry (*Prunus fruticosus*), from which is distilled a wine; bilberries, whortleberries, and the Siberian apricot. *Gmelin* (*ib.*, 173) gives a list of four species of currants; and *Pallas* (*Flor. Russ.*, 1, 90–92) one of five species of pears; but the fruit of these is valueless, with the exception of one species of currant, which is confined to the banks of the Argoon, a tributary of the Saghalien, in the S.E. corner of Daouria. During the short but powerful summer, the Siberian soil is covered with flowering and aromatic plants in fragrant profusion. (*Gmelin* and *Pallas, passim*. See also *Georg's Phys. Geog.*, vol. III.) But these, as well as the tim-

## ASIA:

ber, gradually diminish towards the N.; till above the 60th parallel scarcely anything remains but the hardy beech and a few of the more vigorous lichens and mosses. Gmelin remarks (*Preface*, xliii.), that vegetation undergoes a marked change E. of the Yenisei; and, as it is a well-known fact that temperature decreases towards the E., it is not surprising that this should be the case; but the unproductive nature of the soil seems to have been overrated; for, in 1830, an agricultural society was founded at St. Peter and St. Paul, in Kamtschatka, from whose paper (of Nov. 30, 1830) it appears that the return of wheat, raised in that district, was 131 for 1, of rye 21 for 1; and that the cultivation of buckwheat, Himalaya barley, and other grains had proved equally successful. The potato, cabbage, onion, beet-root, chicory, and melon had also thriven; and though the cucumber had failed, its failure was owing not to the impracticability of the soil, but to the vines having been destroyed by rot.

The second botanical kingdom of Asia is contained in the great central table-land itself. This is unquestionably the highest and most extensive plateau in the world, having for its bearers the mountains of Altai and Yablonoi to the N.; the Manchurian mountains E.; the Himalayas and the mountains of China to the S.; and on the W. the Beloi Tagh, the Elburz, and the Persian mountains. Lying at a great though not equal elevation, bounded and intersected by lofty mountain ranges, and without a single natural outlet to the ocean, the climate, soil, hydrography, and general physical features of this vast region (occupying more than 400 of Asia), are all of a very peculiar kind. The characteristics of the first are dryness and coldness; the second consists of a dry soil, sometimes broken by patches of verdure, at others stretching out into immense deserts, like that of Gobi or Shamo; and the water system consists of lakes without outlets, the final recipients of many rivers, some of them very respectable for length and magnitude. Many of the streams are, however, absorbed in the sandy soil. From these circumstances it may be reasonably imagined that the vegetation is also peculiar; but unfortunately little is known upon this subject, and the investigations of Rubraquis, Marco Polo, and others in the 13th century, and of the Jesuit missionaries in the 17th, were till very lately the only sources from which knowledge could be gained; and though Lord Macartney (*Embassy to China*) and Timkowski (*Voyage à Pékin et travers la Mongolie*) afford more recent, they scarcely afford more extensive, information concerning a region which is still, in a great degree, a *terra incognita* to science. Wood of all kinds is extremely scarce in these high and consequently bleak regions; so scarce that the nomadic inhabitants use the dung of their cattle for fuel (*Du Halde*, iv., 18), and similar materials not unfrequently serve for the groundwork of their gilded idols. (*Marco Polo*, lib. i., c. 49.) On the S. slopes of the table-land are found oaks, aspens, elms, hazels, and walnut trees; but all, even on the immediate confines of China, diminished to mere shrubs; while on the high lands and N. slopes of the same frontier the only wood consists of some wretched thorny brambles. (*Lord Macartney*, ii., 900.) This remarkable absence of timber throughout so great an extent of country is owing, probably (even more than to the nature of the soil), to violent and cold tornadoes, which are extremely frequent, especially during the summer.\* (*Carpin*, cap. xvi., art. 1.) In the N. parts of Mongolia the timber approaches in character to that of S. Siberia, but is still very inferior both in kind and quantity. (*Timkowski*, i., 44; *Il*, 280, &c.) Considering the vast number of beasts that traverse these plains (see *Zoology*), there must be, notwithstanding the extensive deserts, a great variety of grazing herbs and grasses; but except in the E. (*Timkowski*, ii., 329) agriculture is not practised, and the vegetable food of man unknown. The natives live exclusively on flesh and milk (*Carpin*, c. xvi., art. 4; *Rubraquis*, cap. v.; *M. Polo*, lib. i., cap. 57, &c.); and when questioned as to why they so totally neglect the earth, their reply is, that "God made herbs for beasts, but the flesh of beasts for men." (*Du Halde*, iv., 23.) Timkowski saw in the N. parts of this region red currants, peaches, hemp, and flax, all growing wild. (*Il*, 280.) There is also here a very remarkable fungus, called, from its resemblance to the animal, the Tartar lamb; and there can be little doubt but that the flowering and aromatic plants of this region are numerous and peculiar.

The E. slope of the table-land, comprising the basin of the Seghalien (or Amoor) and other great rivers which flow into the Pacific ocean, forms the third great kingdom of Asiatic botany; and is, in every respect, strongly contrasted with its immediate neighbour. Here are immense forests; so extensive that it required nine days to traverse one of them, and so thick that it was necessary to fell several trees in order to take an observation of the sun's meridian. (*Du Halde*, iv., 7.) The cold is very severe to as low a lat. as

43°; and consequently the trees are of the kind usually met with in the more N. parallels of Europe. Of fruits, this district possesses apples, pears, nuts, chestnuts, and filberts, all in great abundance; and of grain, wheat, oats, and millet, are produced, together with a peculiar species, unknown in Europe, called *mai-se-mi*, partaking of the nature of both wheat and rice. Rice itself is grown, though in no great quantities; and, in fact, from the little that is known of this great region, it would appear, that there is no large district of the earth better adapted for the residence of an agricultural population. Its capabilities are, however, wholly neglected by the Chinese government; while the natives of the soil (the Manchoes), though they do not, like the great majority of the Mongols, utterly neglect the pursuits of husbandry, yet, in general, they may be described as a race of hunters, resembling strongly in habits and manners the aboriginal inhabitants of America. The cotton shrub grows here; but owing to the low temperature (the lat. being remembered), it does not thrive well. Esculent roots of very many kinds are, however, plentiful; and the medicinal herb ginseng is found nowhere but in this country and N. America. The Chinese believe this plant to be an infallible remedy for every disease, mental and bodily; and it is sought amid incredible fatigues and dangers by parties who are marshalled under officers, almost in the manner of an army. Ginseng has no reputation with European physicians; but this may arise from their having used the American species only, which the Chinese declare to be greatly inferior to their own. One attempt was made, by the Jesuit Lourino, to raise the Asiatic plant in Europe; but the result was a complete failure, the seeds, though sown under circumstances of soil and temperature precisely resembling those natural to them, refusing to germinate. Some parts of the soil are swampy and full of wild desert marshes; but sand is almost unknown, and, in general, the ground bears a strong resemblance to the best parts of N. Europe in the thickness and vivid colouring of its grasses, and the variety of its flowering plants. It is a curious fact that the roses, lilies, and other flowers of this part of Asia, excel greatly those of Europe in beauty, but are very deficient in point of odour. The pines and oaks that clothe the mountains are of great size, but diminish rapidly as they approach the sea. (*Du Halde*, iv., 5-7, &c.; *La Perouse*, iii., 16, 17, 21, 75, &c.; *Müller*, *Bot. Diet.*, iii., art. *Panax*.)

The three foregoing districts of Asia, though very extensive, are each remarkably uniform in their productions and general physical appearance. It is true they are comparatively little known, and future discoveries may, it is not unlikely, bring to light many and important deviations from this uniformity; but, at present, wherever surveyed, the variations in different parts of each have been of degree, not of kind; and whatever peculiarity of vegetation marks any one part of any region, appears to mark the whole, and to distinguish it from both its adjoining neighbours. The case is different on the W. slope of the great table-land, the fourth botanical kingdom of Asia. The region is uniform as far W. as the deep depression of the Caspian sea, but beyond this all becomes changed: the face of the country, the direction of the rivers, the natural productions, everything constituting the physical geography of a region, puts on a new appearance; and the Caspian seems placed by the hand of nature on the precise spot where it could most decidedly mark the limits of two large districts possessing few things in common. The great plain of Tartary (the only true W. slope from the table-land) is very productive in its E. parts; that is, in the countries of Kokhan, Badeskhan, and Bokhara. The description of Ebn Haukel, an Arab geographer, is particularly vivid. "The cultivated plains of Bokhara," he says, "extend above 13 farsangs; and the Soqd (the *Sagdana* of ancient geography) is, for eight days' journey, full of gardens and orchards; corn fields and running streams, reservoirs and fountains, both on the right hand and the left." (*Ouseley's Trans.*, 337.) Corn of all kinds and rice are here very prolific; so much so that, according to Hadgi Khalifa, a field of one or two *dunams* (acres) is simply sufficient to support a family. (*D'Herbulet*, 307.) Of fruit, grapes, melons, pears, apples, figs, &c., grow to such perfection, and in such abundance, that they are exported to Persia, and even to the more fertile region of Hindostan. The pasture grounds are also extremely luxuriant; but it may be gathered as it recedes W. and N. and the whole country deteriorates as it recedes W. and N. The soil of the Kirghiz country N. of the Sihon is chiefly of a saline character, but the pastures must still be good, since immense numbers of animals, wild and domestic, are fed in the extensive steppes. Trees of the hardier kinds, larch, beech, and fir, appear also on the banks of the rivers. (*Pallas*, i., 618, 630, &c.) In journeying W. the country for a time exhibits the extremes of richness and desolation (*Burser*, i., 333); the former, however, gradually diminishing till the whole soil becomes a wretched, unproductive sand, except in the immediate neighbourhood of

\* Timkowski (i., 600) remarks the frequency of these winds, but denies their violence.

## ASIA.

rivera. (*Burmes*, ii., 1, 10, 16, 46, &c.) There is not, perhaps, in the world a more sterile district than that between the Aral and Caspian seas. In the countries W. of the latter, a strange contrast is presented: on the N. slopes of the Caucasus, indeed, a constantly deteriorating country terminates at last in the wretched wastes of Astrakhan; but even here corn fields and rich pasture grounds dispute the soil with the tamarisk, the camel's thorn, the abeyanthium, and other desert plants; while on the E., W., and S. declivities of the same mountains magnificent forests of cedars, cypresses, savins, red junipers, beeches, oaks, &c., flourish in great luxuriance; while, of fruit, the soil boasts the almond, fig, peach, quince, apricot, pear, date, jujube, olive, &c.; and of flowers, the rhododendron, Christ's thorn, ponticum, asolia pontica, laurel, seringa, jessamine, lily, Caucasian rose, and a whole host of others. The bread corns and the most useful roots are also produced in most parts of this mountainous country. (*Gradenstadt, Com. Petrop.*, xx., 49, 435, 463, &c.; *Palles*, ditto, 1779, ii., 374.) With regard to Asia Minor, Mesopotamia, and Syria, it is impossible to give, within any reasonable limits, the slightest sketch of their numerous productions; though the two last are partially desert, and their deserts be of the most sterile character, yet their fertile spots are scarcely inferior to any on the earth's surface. Rice and barley yield a return of 100 fold; the cotton shrub flourishes, and indigo, sugar, and tobacco are among the useful productions. Lemons, oranges, tamarinds, apricots, dates, and grapes are a very few among the fruits of these regions; which produce in great abundance also nearly all the esculent roots, pulses, and grains. Wood is extremely scarce in Mesopotamia (the date palm is the only tree known there), but in Syria the majestic cedar of Lebanon maintains the fame which it acquired in the days of Jewish greatness; while majestic oaks, cypresses, planes, sycamores, savins, olives, mulberry trees, pistachios, junipers, and fig trees clothe the sides of the Anatolian and Syrian mountains, and spread their arms over plains where flourish almost every species of flowering roots and shrubs. Among the oaks of Asia Minor is the *Quercus infectoria*, the gall of which is an important article in dyeing. The pistachio is rarely found beyond the neighbourhood of Aleppo. (*Folsey*, ii., *passim*; *Niebuhr*, *Voy. en Ar.*, ii., 350, &c.; *Olivier*, iv., 30, 134, 197, &c.; *Leake*, *passim*; also in *Walpole*, ii., 303, &c.; *Belen*, 79, 163, 166, &c.)

The fifth kingdom of Asiatic botany remains to be noticed. It comprises the S. slope of the central plateau, and contains the three great peninsulas of Arabia, India, and Malaya, together with the extensive territory of China proper, and the S. shore of Persia and Beloochistan.\* The W. part of this region is badly watered (see ARABIA, LARISTAN, BELOOCHISTAN), and consequently consists chiefly of deserts, or of pasture grounds depending on rain for their fertility. The vicinities of the few and small rivers are, however, even here, crowded with vegetation; and from the Indus eastward (where the hydrography is on a scale of the most profuse luxuriance) a district is comprised unequalled for the abundance and variety of its productions, by any other part of the world. Nearly every plant of the E. continent is indigenous, or can be raised in some part of S. Asia. The following is an imperfect list of the trees alone; and these are not, in general, confined to particular localities, but, in most cases, spread over the whole region:

| Forest Trees. |            |            |              |
|---------------|------------|------------|--------------|
| Bamboo.       | Fr.        | Oak.       | Form.        |
| Birch.        | Larch.     | Palm.      | Poplar.      |
| Chestnut.     | Mangrove.  | Pine.      | Teak.        |
| Cypress.      | Myrtle.    | Faintia.   | Willow.      |
| Hard Woods.   |            |            |              |
| Aloe.         | Ebony.     | Linga.     | Sandal-wood. |
| Agave-wood.   | Iron-wood. | Rose-wood. |              |
| Fruits.       |            |            |              |
| Almond.       | Citron.    | Jamboo.    | Peach.       |
| Apple.        | Cocoa.     | Lemon.     | Pear.        |
| Apricot.      | Coffee.    | Lime.      | Plum.        |
| Banana.       | Date.      | Mangostia. | Pomegranate. |
| Banyan.       | Durum.     | Mulberry.  | Shaddock.    |
| Betel.        | Fig.       | Olive.     | Tamarind.    |
| Bignonia.     | Guava.     | Orange.    | Vine.        |
| Bread Fruit.  | Guava.     | Pandanus.  | Walnut.      |
| Cashew.       |            |            |              |
| Spice Trees.  |            |            |              |
| Camphor.      | Cinnamon.  | Mac.       | Nutmeg.      |
| Casia.        | Clove.     |            |              |

Many of these trees yield gums, resins, odoriferous blossoms, or are otherwise useful beyond the generality of their class. There are also several species which cannot be con-

veniently classed under either of the four foregoing heads; as the champaka, malor, and tanjang, flower-bearing tree; the souki, from the bark of which the Asiatics manufacture a paper; the faang, which yields a rich red dye; the tallow tree, which exudes an unctuous matter, whence its name; the upas, the most deadly of vegetable poisons; the cotton tree; and, above all, the tea plant.

The other kinds of vegetation are not less abundant. Grain of every kind, including twenty-seven species of rice; and some varieties of dhourrah and barley, scarcely known in other regions, is grown with little labour to the cultivator, the richness of the earth in many places precluding the necessity and even the possibility of using manure, though two crops are produced annually. The leguminous plants now common in Europe came, in most instances, originally from S. Asia; but, in addition to the peas, beans, lentils, &c., there are here a whole host which have never found their way W., as the lotus, moong, murhus, tanna, tour, toll, &c. (See INDIA, CHINA, &c.) A root called katchill supplies the place of the American potatoe; but this last root, as well as the yam, is abundantly cultivated, especially in China and the E. peninsula of India. This is also the native home of the arrow-root, galanga, jalap, sarsaparilla, datara, anise, opium, and other drugs. The fields abound in flax, hemp, tobacco (a native plant, according to *Lord Macartney*, ii., 174), together with flowers of every kind and dye; though it is remarkable that those of powerful scent are confined to the N. parts. The fine rose that yields the attar is rarely found S. of 36°, and is chiefly limited to the plains of the upper Ganges and Penjab. (See LUCKNOW and CASIMERE.) Dye plants are very numerous; the magar cane grows luxuriantly, and among the numerous strongly-odoriferous gums attempts have been made to identify the spikeard, bellium, malabathrum, sepechra, and other precious ointments of the ancients, but without much success. (*De Haide*, i., 14, &c., ii., 64, &c.; *Lord Macartney*, ii., 43, 165, &c.; *Crawf.*, *Emb. to Siam*, *passim*; *Russell's Int. to Roxburgh's Plants of Coromandel*, 1-66; *Fislayson's Mission to Siam*, *passim*; *Asiatic Researches*, and *Journal of Asiat. Soc. Beng.*, *passim*.)

With regard to the number of species in each order of plants, it is to be remarked that Humboldt gives the Cryptogams as 1-15th of the whole vegetation for equinoctial plains; as 1 for equinoctial mountains; as 1 (on an average) for the regions of the temperate zone; and as the sole vegetation of mountains in polar lands. The same authority gives the Monocotyledons (of the old continent) as 1/10th for the torrid, 1/10th for the temperate, and 1/10 (on an average) for the frigid zone. (*Dict. des Sci. Nat.*, xviii., 436.) De Candolle, following Persoon, makes the proportions somewhat different; namely (for the whole world), Crypt. 1/10th, Monoc. 1/10th, Dico. 4-6ths of the whole vegetation. (*Ibid.*, 385.) From these data, and the various authorities cited throughout this article, the following approximate table of Asiatic botany is deduced. But it is necessary to observe, that the absolute number of known species is very uncertain. In 1806 there were but 27,000; Brown's splendid addition of Australian plants increased the amount by nearly one sixth, and since that time discovery has been rapidly at work. It may, however, be doubted whether the very love of science has not betrayed some of its followers into too nice distinctions. De Candolle thinks that Persoon's 27,000 species should be increased to 36,000, and that the number of plants yet unknown or unclassified would swell the list to 110,000 or 120,000. (*Dict. Sci. Nat.*, xviii., 430.) Lindley is more moderate; he makes the gross number of species 86,000. (*Intro. to Botany*, 504.) That assigned in the table (44,000), is from Humboldt's data.

| Orders.          | Whole No. of known species. | Whole No. of known Asiatic species. | No. of species common to Asia and other regions. | No. of species peculiar to Asia. |
|------------------|-----------------------------|-------------------------------------|--------------------------------------------------|----------------------------------|
| Cryptogamous     | 6,000                       | 1,987                               | 930                                              | 697                              |
| Monocotyledonous | 6,908                       | 1,960                               | 875                                              | 1,075                            |
| Dicotyledonous   | 31,091                      | 4,050                               | 2,169                                            | 1,881                            |
| Total            | 44,000                      | 7,997                               | 3,944                                            | 3,653                            |

III. ZOOLOGY OF ASIA.—Asia is the native home of all the more useful species of animals; with the exception, perhaps, of the sheep. From some district or other of this continent came, originally, the ox, horse, camel, goat, &c., together with the whole race of domestic poultry, except the turkey, which is a denizen of the New Continent. Utility may, indeed, be regarded as the leading characteristic of Asiatic zoology; for, though its carnivorous mammals be numerous as compared with the whole number of species, the majority are not merely harmless to man, but a considerable degree useful to him, consisting of several kinds of seals, and the fur-bearing quadrupeds of the north. Birds of prey are remarkably scarce, when the great extent of mountain land is taken into consideration; and of those existences which have little but peculiar or anomalous for-

\* The high lands of Persia and Cabul, though directly S. of W. Tartary, appear to belong naturally to the second kingdom; that, namely, of the central table-land. They have the same physical conformation, the same peculiar hydrography and vegetation, and are connected with the Mongolian plateau by a mountain *isthmus* (the Hindoo-Cochin), which divides the low levels of Bokhara and the Punjab, in a manner very similar to that in which the Atlantic and Pacific oceans are divided by the mountain ridge of Panama. (See *Mongolia*, *Cabul*, *India*, &c.)

## ASIA.

reason to distinguish them, Asia is all but destitute. The truth of these remarks will be at once evident from the following tables, constructed, with as much care as possible, from *Cuvier's Règne Animal*; *Shaw's Zoology*; *Pennant's Hist. of Quad. Genera of Birds*; *Arctic Zoology*; and *View of Hindostan*; *Du Halde's China*; *La Perouse's Voyages*; *Georg's Geog. Phys. and Nat.*, vi. and vii.; *Pallas's Spicilægia Zoologica*; *Travels*, &c.; *Gmelin's Reise der Sibirien*; *Reise der Russland*, &c. &c.

The Reptilia are divided into *genera*, not *species*, according to the text of Cuvier. The list of species is sufficiently long in some other authors; but the French naturalist warns his readers to receive them with extreme caution, as they abound with repetitions of the same species under different names and in transpositions of synonyms (ix., 253). Similar considerations forbid the attempt to classify the Pisces, Insecta, or Mollusca, a tabular arrangement of which classes would not, indeed, possess much interest.

A glance at these tables will exhibit, at one view, the zoological riches of Asia. Of the class Mammalia, more than a third of the whole number of species are found upon its soil, and nearly a fourth (accurately 7-30ths) are peculiar to it. In the more important species, these proportions are considerably increased. The Asiatic Ruminantia are nearly two fifths of the whole; those peculiar to the soil, nearly two sevenths. The Pachydermata are in a still higher ratio; the Rodentia and Carnivora, which two orders include the more useful and interesting animals, in nearly the same. The strong-winged Chiroptera are indeed almost equally numerous; but the Quadrumanæ are reduced to little more than a fourth of the whole, and the anomalous orders of Marsupialia and Edentata can scarcely be said to have a place in Asiatic mammalogy. But it is not either the actual or relative amount of animal life that constitutes the chief advantage of Asia in this respect; among its numerous species of the more important orders it reckons the most important of the species themselves. Of these, the first in rank, with reference to its locality, is, perhaps, the camel. Other animals are more generally useful to man; but without this patient and intelligent servant, a large, perhaps the largest, part of Asia would be no home for the human race. Expressly formed for existence in a desert, it has been domesticated for a period long antecedent to all history, and for countless generations has been the means of connecting districts otherwise effectually separated, and has formed the principal wealth of their inhabitants. The camel has this peculiarity to distinguish it from other domestic animals, that it does not follow its master in his wanderings. The other tribes, with one exception (the rein-deer), have become denizens of every corner of the earth, however remote from their native home. It seems, indeed, a law that the lower animals which herd with man shall follow him, with

these two exceptions; but these, though fully as subservient and as useful as any others, have never become naturalized beyond the limits where they were first found. The attempts to establish the camel in Greece, Italy, Jamaica, and Barbados, have been signal and decisive failures. Yet the animal can support as great a range of climate as most others, being found in N. Tartary, as far as the shores of lake Baikal (from 50° to 55° N. lat.), where the average temperature is scarcely, if at all, higher than that of Lapland, and where the winter's cold is frightfully severe, as well as under the scorching sun of intertropical countries. It is true, in these N. lands, its size becomes diminutive; but it preserves its hardy character, multiplies abundantly, and forms the wealth of the Burai and Mongol not less than of the Arab and Syrian. (*Marco Paulo*, ii., 130; *Pallas's Spicilægia*, xi., 4; *Du Halde*, iii., 483; *Pennant's Hist. Quad.*, 120; *Cuv.*, iv., 8, &c.)

Of the ox tribe, the most useful species are Asiatic, as the common ox (*Bos Taurus* of Linneus), the aurochs, the buffalo, and the yakk. Their varieties are almost numberless; but those enumerated are considered by Cuvier (iv., 29-31), as the only distinct species, with the exception of those not found in Asia, such as the American bison, the Cape buffalo of Africa, and the musk ox. The most striking distinction between the Asiatic and non-Asiatic species of this genus, is, that the former only are domesticated, or appear capable of domestication. In all other respects they exhibit a general resemblance, amounting almost to identity; their gregarious habits, their food, their internal formation, all are extremely similar; nay, they breed promiscuously, and the issue of a cross are prolific: but while the Asiatic species have been domesticated as long as society has existed, the others remain to this day as untamed as when they first took possession of their native woods. A natural result of this distinction has been the distribution of the common ox from the Arctic circle to New-Zealand, and round the whole world in longitude; while the American and African species appear incapable of multiplying beyond their original limits. The buffaloes, or humped, are less dispersed than the straight-backed species, and appear to be less capable of supporting a low temperature; but wherever the climate is at all adapted to them, they, like the others, are found to be naturalized, and thus they have spread from India (apparently their native home) over N. Africa and E. Europe; nor can there exist any reasonable doubt but that they would equally thrive in Australia, Polynesia, and Temperate America, were the experiment tried.

The auroch and the yakk (or grunting ox) are only partially reclaimed, if indeed, the former do not still exist in all his original wildness; but Cuvier seems to be mistaken when he limits his locality to the Carpathians and Caucasus. Tartarian travellers describe the breed as existing in a state of semi-domestication on the plateau of Mongolia, and breeding with the domestic cow, thereby producing a cross much stronger and more fit for labour than the common ox. (*Marco Paulo*, ch. lxi., p. 32; *Rubriqueis*, ch. xviii., p. 57.) This creature is, next to the rhinoceros, the largest of land animals. It has been by some naturalists supposed to be the original specimen of the domestic variety; but Cuvier has pointed out some osteological differences, which plainly refer it to a different species. It has also the grunting voice of the yakk, which might by possibility be regarded as a small variety of the aurochs, were it not for the tail, which in the yakk resembles that of the horse, and is the same which composes the standards of the Turkish officers. The number of cattle fed by the wandering Tartar nations seems almost incredible: every fertile plain, and some plains that are almost sterile, are covered by them; and some one or other of the species thrive upon the sides and even upon the summits of the wintry mountains of Tibet and Daouria. The domestic ox was unknown in Kamtschatka till introduced there by the Russians; and the musk ox appears to be unknown in Arctic Asia, though remains of the creature have been occasionally found, especially a skull (not fossil), near the mouth of the Ob, in the latter end of the last century. (*Pallas's Nov. Com. Pet.*, xvii., 601; *Gmelin's N. C. P.*, v., 331, &c.; *Du Halde*, iv., passim, &c.; *Finkowski*, ii., 388, &c.; *Pennant's Hist. Quad.*, i., 15-27; *Cuvier*, iv., 29-31.) Nor are sheep less plentiful in Asia than cattle, though it may perhaps be doubted whether this useful creature be not one of the very few treasures which belong originally to Europe; the derivation of the various woolly species is doubtful between the Mouton of Italy and the Argali of Siberia. (*Cuvier*, iv., 37.) There is no race of animals, except the dog, so subject to vary; and amid the multitude of breeds now distributed all over the world, it is probably useless to attempt to identify the original. The Argali, found in Siberia and all the mountainous regions of Asia, is, like the European varieties, distinguished by its short tail. Like other arctic animals, the Argali, also, changes its covering, which is rather fur than wool in the winter. In India the sheep are long-tailed; and

## ASIA.

in Persia, Tartary, China, and Syria, the tail is not only elongated, but loaded with a mass of fat. The power which this creature possesses to accommodate itself to climate seems almost unlimited: in the hot plains of Asia its covering becomes coarse and scanty; while in the frozen regions of Tibet its thick wool has an underlining of the finest kind, forming an important article in manufactures and commerce. (*Pallas's Spic. Zool.*, xi., 3-31, 56-62; *Gmelin's Reise durch Rußland*, iii., 486, et seq.; *Reise durch Sibirien*, i., 168, et seq.; *Du Halde*, iv., pass.; *Pennant*, 33-46; *Cuvier*, iv., 25-28.) There can be little doubt but that the *Capra Egegrus* of Gmelin, the *Ibez Alpinum Sibericum* of Pallas, is the original stock whence all the varieties of the goat tribe are derived. It herds in the mountains of Taurus, Tartary, Persia, China, E. Siberia, and Kamtschatka. Inhabits differently all climates, but assumes a very different appearance under different circumstances. The Angora goat of Cappadocia, the Tibet goat, the Bouquetin or Ibez, and the domestic species, *Capra Hircus*, are the most noted varieties. The animal is in a very high degree serviceable to man, especially to the nomadic races of its native country; its coat furnishing an important article of manufacture, its skin the leather of which the wanderer makes his water-bottles and packing-cases: its milk is salutary in many complaints; and, when young, it affords a nutritious and agreeable food. (*Pallas's Spic. Zool.*, xi., 31-57; *Pennant's Hist. Quad.*, 46-56; *Cuvier*, iv., 23-25.) The rein deer is common to the arctic regions of Asia, Europe, and America. It runs wild in the snowy wastes of Siberia and Kamtschatka, but is likewise domesticated, and supplies to the tenants of these dreary regions the place of the horse, cow, sheep, goat, and camel. It is not, however, so extensively domesticated in N. Asia as in Lapland. (*Hist. Kamtschatka*, 238; *Bell's Travels*, i., 213; *Cuvier*, iv., 9.) The elk is also common to Asia, Europe, and America; it inhabits the cold regions of Siberia and Mongolia, where, though undomesticated, it is highly useful as an animal of chase, the flesh furnishing a good species of food, the tongue especially being esteemed a great delicacy, and the skin making a buff leather, capable, according to good authority, of turning a musket ball. (*Pennant's Hist. Quad.*, i., 93-96; *Cuvier*, iv., 9.)

Of other ruminants, Asia has the muck, apparently throughout its whole extent from Siberia to Ceylon (*N. C. Pat.*, iv., 303; *Pallas's Spic. Zool.*, xii., 3-45; *Bell's Travels*, i., 249; ii., 88; *Du Halde*, i., 63, 324; *Hamilton's Voy. E. Ind.*, i., 561), together with a great variety of deer and antelope; it is, however, among these, with the llamas of America and the giraffe of Africa, unquestionably the least useful of the order, that the only Ruminant wanting in Asia will be found. (*Pallas's Spic. Zool.*, i., 3-44; xii., 3-71; *Cuvier*, iv., 5, 8-23.)

In its Pachydermatous tribes, Asia exhibits the same superiority over other regions: the elephant, horse, ass, and hog, have their home in its forests and plains; while the animals of this order absent from its soil are the useless hippopotamus, and the inferior species Tapir, Peccory, Phaco, Damans, &c. The elephant rarely propagates in a domestic state; but it is an error to suppose that this never takes place: the tame females sometimes escape to the woods in breeding-time, and, after coupling with the wild males, return to the herd, or are brought back, and produce their young at the end of nine months. The locality of the Asiatic elephant is limited: it does not appear to be found W. of India or N. of the Himalaya mountains; but in India, Malaya, Birmah, China, and the islands of the Eastern Archipelago, it is numerous both in its wild and domesticated state; and, besides its utility as a beast of burden, and the value of its tusks as an article of commerce, it is held in great regard for many occult medicinal properties supposed to exist in its flesh, eyes, bones, &c. (*Du Halde*, iii., 480; *Crawford's Em. Si.*, 429, 479; *Pennant's Hist. Quad.*, 150-161; *Cuvier*, iii., 326.) The horse and ass are both indigenous to Asia, and originally peculiar to that continent. Species of the same genus are indeed found in Africa, but, as in other similar cases, they seem incapable of domestication; while the Asiatic species, especially the Arabian variety, have supplied the whole world with two of the most useful quadrupeds that wait on man. The Dzirgetai, a creature intermediate in size between the horse and ass, still runs wild in the Asiatic deserts; like his congeners, he is gregarious, and, like them too, his numbers seem almost unlimited: a similar remark will apply to the Koulan or wild ass. (*Du Halde*, ii., 17, 50; iv., 30, et passim; *Bell*, i., 225; *Pennant*, 1-13; *Cuvier*, iii., 340-343.) The hog is so spread over the world that it is difficult to assign its original locality; the fact that the species now peculiar are all African and undomesticated, seems, however, to imply that the original stock of the domestic swine is Asiatic; the more especially as the creature is dispersed over every part of the continent from its S. extremity to the N. shores of lake Baikal in 55° N. lat. (*Bell's Travels*, i., 279; *Pallas's Spic. Zool.*, ii., 3; *Crawford's Embassy to Siam*, 479; *Cuvier*, 330-332.) Two species of the rhinoceros are peculiar to Asia and the Indian

islands, the latter distinguished by a double horn like the *Rh. Africana*. (*Du Halde*, i., 220; *Crawford*, 420, 478; *Pennant's Hist. Quad.*, i., 138; *Cuvier*, iii., 336.) Tropical Asia possesses most of the fiercer Carnivora: lions, tigers, leopards, black panthers, ounces, and tiger cats, of the cat genus; wolves, hyenas, and jackals, of the dog tribe. They do not, however, all exist in equal numbers, nor equally in every part. The lion is becoming very rare in Asia; he is now found only in the deserts of Mesopotamia, Persia, and India, and, perhaps, in some parts of China. He does not appear to be heard of in Siam or Cochin China; to which districts, the wolf, hyena, and jackal, as far as is yet known, are also strangers. (*Crawford's Em. Si.*, 428.) The manul, lynx, and wild cat are most numerous in temperate Asia; the first extending, however, almost to the arctic regions, the second stretching into both the frigid and torrid zones; but the last (scarcely ever met with beyond the Caucasian mountains) appears originally to have been European. The dog and fox, in all their varieties, are common to all the continent; the former, in some parts (as Kamtschatka), supplying the place of a beast of burden, in others being used as an article of food. The Angora and Persian cat are celebrated for the fineness of their fur, as is also the blue cat of Siberia; though the last, if not the two former, seem to have been derived, as well as the domestic cat, from Europe. Formidable as are some of these creatures, they constitute a considerable portion of the wealth of the countries which they inhabit; their skins form an important article of commerce; and what is remarkable, the bones of the tiger are supposed, like those of the elephant, to possess medicinal qualities, and are highly valued accordingly. (*Crawford's Em. Si.*, 428.) The smaller Carnivora are also found in great abundance, as the different species of martens, among which the ermine and sable stand pre-eminent for their fur; the Asiatic civets, which possess the odour, though not the glandular excretion of the African species; and the Mangoust or ichneumon, which attacks and destroys the most dangerous serpents: bears, badgers, gluttons, sea otters, morses, walruses, seals, complete the list of the Asiatic Carnivora. (*Bell*, i., 100; ii., 81, et pass.; *Du Halde*, pass.; *Pallas's Spic. Zool.*, xiv., 29, et seq.; *Crawford's Em. Si.*, 428, 478; *Pennant's View of Hindostan*, i., 193-197, et pass.; *Hist. Quad.*, 219-260; *Cuvier*, ii., 23-61.) The Insectivora and Rodentia consist, the first, of hedgehogs, shrew mice, and moles in their various species; the latter, of the more important animals, beavers, hares, rabbits, lemmings, marmots, squirrels, dormice, porcupines, jerboas, rats, mice, &c. Of these, the Asiatic species are very numerous, and they form, with the smaller Carnivora, the principal wealth of Siberia, since among them are found many that afford some of the richest furs, especially in the winter, when the covering of the creatures become thicker in texture, finer in quality, and generally superior in colour. Animals of this order do not appear to be numerous in S. Asia. *Crawford* remarks, that the hare and rabbit are unknown in the lower parts of Siam. The porcupine, on the other hand, are not found in the N. regions; and the jerboas seem peculiar to the wide, open plains. (*Gmelin's Reise durch Sib.*, passim; *Crawford's Em. Si.*, 428, 478; *Cuvier*, iii., 63-95; *Pennant's Hist. Quad.*, 368-409; *Pallas's Spic. Zool.*, pass.; *Com. Ped. pass.*) Of the Quadrumana the principal Asiatic species are the orang outang and the gibbons; the smaller apes and monkeys are numerous in the S., especially in India, China, and the islands. As a general fact, the Asiatic monkeys are inferior in structure and intelligence to the African, but much superior to those of America. (*Cuvier*, i., 207-230.) The Chiroptera are numerous all over the world; they seem, however, to abound more in the Asiatic islands than on the continent: some of them, as the Rousette of the Sunda and Molucca Isles, are accounted delicate food; others, as the Timor bat, rather large and destructive; but the more powerful and mischievous species of this order appear to be American, and strangers to the soil of Asia. (*Pallas's Spic. Zool.*, iii., 3-35; *Pennant's Hist. Quad.*, 548-563; *Cuvier*, ii., 4-15.) The Marsupialia of this continent consist of but two Phalangers, *Phal. Rufus* and *Phal. Chrysorrhos*. (*Buflon*, xiii., 10; *Temminck*, 12.) They are peculiar to the Moluccas, Java, and Celebes, exhibiting thus, at the extremity of Asia, the first indication of the anomalous Mammalogy of Australia. The single Edentata is the short-tailed Manis, which, like the last order, is peculiar to the Indian islands, except some few instances found in Bengal. (*Pennant*, 305.) Marsden (*Sumatra*, p. 18) seems to imply that the African long-tailed Manis is sometimes found in that island. Lastly, the Cetacea consists of dolphins, maneti, porpoises, sea unicorns, and whales, of which some one or other species is found on all the coasts of Asia. (*Pennant*, 538-545; *Cuvier*, iv., 430-443.)

A single glance at the table will exhibit the fact, that the Ornithology of Asia is less rich than its Mammalogy; the former containing considerably less than a fourth of all the known species, while the latter possesses very much more than one third: the continent maintaining, however, in this

## ASIA.

respect, as in the former, the peculiar character of utility in its possessions; for of the Galline, unquestionably the most useful order to man, the number of its species is between a third and a half of the whole, and fully a third of the whole is peculiar to its soil. Among these species are reckoned the original stock of all the domestic poultry, except the turkey, which is American; the pheasants, partridges, peacocks, and whole flights of pigeons. The species in which it is most deficient are among the grouse, quails, and pintades; but there is scarcely a genus of this useful order of which Asia is wholly destitute. Of other birds, the order Grallæ furnishes the ostrich, crane, heron, work, bittern, plover, spoonbill, ibis, &c., many of which are highly useful in tropical climates as destroyers of serpents and other dangerous reptiles: the Scansores consist of those climbing birds, parrots, paroquets, woodpeckers, macaws, &c., the beautiful plumage of which adds so much to the splendour of equatorial forests; and the Syndactyles (the smaller order of bright plumages), of bee-eaters, kingfishers, and hornbills; which last, from their greater size and peculiar habits, have far less resemblance to the other genera of the order than they have to each other. In all these orders, it will be observed that Asia is relatively rich, except with regard to the Scansores, which, having little but their beauty to recommend them, are the least useful of any yet-enumerated. In the others the proportion becomes still lower; and though among the palmipeds, petrels, albatrosses, pelicans, gulls, geese, ducks, swans, &c., Asia has some which the natives have turned to account, as the great cormorant, taught by the Chinese to fish; yet the great home of this order of birds lies in other quarters; America, Africa, Australia, and even Europe. Of birds of prey (Accipitres) Asia has its eagles, vultures, falcons, owls, and hawks; but here, again, the number of species is comparatively small, though in some cases the individuals of a species are very numerous; and in the four remaining orders, consisting of all the tribes of granivorous and insectivorous birds, shrikes, pies, thrushes, crows, swallows, gnatcatchers, birds of paradise, and the various songsters, the Asiatic woods are very poor; their chief tenants, of these orders, being generally such as are distinguished for beauty of plumage. Song birds are very scarce. (*Pallas's Spic. Zool.*, iv., v., vi.; *Gmelin*, i., 48-76, 132; ii., 163-193; iii., 86-106, 249-251, 364, 373, &c.; *Pennant's Gen. Birds*, pass.; *Crawford's Em. St.*, 433-450; *De Haldæ, pass.*; *Cuvier*, vi.-viii.)

In Reptiles, as in birds, Asia is less abundant than some other regions. Of the Chelonis it has several fine species of edible turtle, and others that are chiefly valuable for their shell. Lizards are very numerous in individuals, though not in genera, and probably not in species; among these, two or three kinds of *Scorpiones* are very destructive in the rivers of India. Of serpents, the most dangerous is the Indian Python (improperly confounded with the box constrictor); but there are many others highly venomous, and some which are extremely beautiful and quite harmless. Frogs and toads abound in all marshy places, and it seems doubtful whether they be of many different kinds. (*Pallas's Spic. Zool.*, vii.; *Gmelin*, iii., 58, &c.; *Pennant's View of Hind.*, pass.; *De Haldæ, pass.*; *Cuvier*, ix., xiv., xv.)

The seas and rivers appear to possess every known kind of fish, and some that are peculiar (*Pallas*, vii., viii.); and the insect tribe are numerous throughout the whole continent; the ravages of some, as the locust, in Arabia, Syria, and Persia, being far more dreaded than the attacks of carnivorous animals. (*Pallas*, ix., x.; *Cuvier*, ix., xiv., xv.)

IV. RACES OF PEOPLE AND LANGUAGES.—Not only the majority of the human race in number, but also the greatest variety in the species, is found within the limits of Asia. The subject, as well from extent, nature, and, in many respects, deficiency of information, is one of great difficulty; but we shall, nevertheless, offer some observations upon it, founded on the physical form, intellectual character, and genius of the language of the races. Some of these families or races consist of many millions, while others embrace but a few thousands; a circumstance which has naturally arisen from the favourable or unfavourable position in which they have been located on their original distribution, and perhaps also from an intrinsic difference in the capacity of the races themselves—causes which have multiplied some into numerous, powerful, and civilized nations, and kept others in the condition of petty and rude tribes. We begin our classification from the west.

The first family, which may be called the *Caucasian*, comprises all the original inhabitants of the mountainous region lying between the Black sea and the Caspian, from about the 36th to the 43d degree of N. lat. It includes the mountaineers of the valleys of the Caucasus—such as the Abasians, Ossetes or Iron, Lezgians, and Kisti; and, in the more level country, or wider valleys lying to the south of the Caucasus, the Georgians, Mingrelians, and Armenians. In personal form this family may be described as European, but in mind Asiatic. The face is of an oval form: the fore-

head high and expanded; the nose elevated, with a slight convexity; the mouth small; the lips moderate in size, and the chin full and round. The complexion is fair, without, however, the clearness of the European; the eyes are generally dark, and the hair of the head rarely of any other colour than black or brown; and, indeed, it may here be, once for all, observed, that the great variety in the colour of this segment, with which we are familiar, is confined to Europe—black being nearly universal in every other part of the world. The hair on other parts of the body, with the Caucasian family, is abundant; the stature is nearly equal to that of the European, and the form of the whole person is symmetrical and handsome. The personal beauty of this race has induced Blumenbach and some other eminent naturalists to assume its form as the type of the European, or first of the *Ææ* great varieties into which they have, fancifully enough, divided the whole of mankind. They have even gone the length of fancying that the entire European family sprung from the mountaineers of the Caucasus; a hypothesis for which it is almost unnecessary to say that there is not a tithe of historical, philological, or any other evidence. Notwithstanding undoubted advantages of physical form, no nation of this family has ever made any eminent advance in civilization. Many of them, with a country not unlike Switzerland, though with a better soil and climate, are, at the present day, not more advanced in civilization than the Swiss or Germans, who attained to Caesar near 3000 years ago. The Armenians alone of the whole family have made a considerable, though far from a distinguished progress. About five centuries before the Christian era they constituted an extensive society, and even exercised some influence in the political events of Western Asia; they alone of all the nations and tribes composing the Caucasian family, possess a national literature; but even their invention of alphabetic writing dates only from A.D. 406, for previously to that time they used the characters of the Greeks and Persians: always acting a secondary and subordinate part, they have been successively subdued by Persians, Greeks, Romans, Arabs, Turks, and Russians. Language, it should here be observed, considered as the test of unity of race, must be viewed, as respects its genius and the general character of its formation, and not the identity or dissimilarity of individual words, which, through the accidents of conquest, settlement, religion, and commerce, often find their way even into languages of very opposite genius. As happens in rude and early stages of society, in every part of the world without exception, the number of languages spoken by the nations of the Caucasian family is very great. The tribes inhabiting the valleys and mountains of the Caucasus are said to speak seven distinct languages, besides many dialects; a number, however, which falls far short of those spoken within a similar extent of territory in many parts of America as well as of the islands of the Indian ocean. The only language of the Caucasian family, of which Europeans have any critical knowledge, is the Armenian, of which we possess dictionaries and grammars: those who have examined it consider it as quite peculiar and distinct from all other known tongues; it abounds in rough consonants: its structure is exceedingly complex: it has an article at the end of nouns; its nouns and adjectives have each ten inflections in the singular and as many in the plural, and the verb is agreeably varied by corresponding changes. All this, which applies, however, more especially to the ancient language, implies that the Armenian is a primitive and original tongue, which, like the Sanscrit, Arabic, Greek, the Latin generally, and, for the most part, the German, has suffered little change in structure from the commixture of foreign nations and their languages. The modern Armenian has been simplified in its grammatical structure by the mixture of the people with foreign nations, especially the Persians and Turks; changes similar to, but not so extensive as, the Latin language, has undergone in its conversion into Italian, Spanish, French, &c., &c. From this account of the Armenian language, taken together with differences in the physical form and mental qualities of this people, it is not improbable but that, on a better acquaintance with both, it may be found a family entitled to be classed separately from the inhabitants of the Caucasus.

The second Asiatic family has been called by philologists and naturalists the *Arabian* or *Semitic*, the last name being given to it on the hypothesis that the whole is derived from the eldest son of Noah: it embraces all the aboriginal inhabitants of Palestine, Asia Minor, Syria, and Arabia from the east coast of the Mediterranean and Red sea, up to the west coast of the Persian gulf. A brunet complexion; more or less intense black or dark brown eyes; long hair, and almost always black crinal hair; bushy large beard, generally black, but sometimes of a reddish tinge; an oval face in bold and distinct relief, with a nose always elevated, and not unfrequently aquiline; high forehead, and stature nearly of the European mean—are among the most promi-

## ASIA.

ness characteristics of this family, as we occasionally see it exhibited in one of its handsomest forms, the Jewish: we may occasionally, for the differences existing between the Jews settled in different foreign nations show plainly enough that they have more or less mixed their blood with the people among whom they have established themselves; for they are fair in Germany, brown in Poland, and nearly black in India. Compared with the European, the whole form of the Arabian is spare, slender, and of small bulk and weight. The wrists are comparatively slender, the hand small, and the fibre throughout soft and flexible. These last characters, however, it is to be observed, belong more or less to the inhabitants of all warm climates. In intellectual power and energy, the Arabian family stands unquestionably next to the European. The history, institutions, and literature of the Jews; the early civilization of the Assyrians; the commerce and colonies of the Phœnicians; and the conquests, settlements, and literature of the Arabs, attest the truth of this assertion. The influence of the Hebrew institutions has pervaded the whole civilized world; while the language, literature, and religion of the Arabs may be traced from the western confines of Spain and Africa to the Philippine islands over 130 degrees of longitude, and from the tropic of Capricorn to Tartary, over 70 degrees of latitude. Among a race, so energetic, civilization made a very early progress, and it is not improbable that 4000 years ago the Phœnicians, Hebrews, Assyrians, and Arabs had already domesticated many of the useful animals, cultivated many valuable plants, and were acquainted with the useful and even precious metals. Several of the nations of this family had invented alphabetic writing, in times far beyond the memory of history—as the Jews, Phœnicians, Arabians, and Assyrians. Their literature has always been of a more vigorous and masculine character than that of any other Asiatic people, but still has never evinced the taste, sound judgment, and practical common sense displayed by several European nations in various periods of the history of the latter people. For the fine arts, if we except architecture, they have not exhibited a glimmering of capacity. There is one circumstance, however, in the position of this family, which has always proved a serious obstacle to its advancement in civilization—the unsuitableness of much of the country which it inhabits for any other than the pastoral state of society, owing to its heat, drought, and sterility. Hence the people are necessarily divided into two opposite and hostile classes, a roving and predatory, and a settled and industrious one; the first incapable of advancing itself, and sure to oppose the advancement of the last. In the genius and structure of the languages of the Arabian family, there is a common affinity. They possess sounds which no other people can articulate: while their neighbours have sounds in their languages, which they, in their turn, cannot imitate. In grammatical structure they resemble each other, and the words of their language are readily interchanged, while they rarely, if ever, admit those of neighbouring tongues. While the dead language of India, for example, has found its way into the ultra-Gangetic languages as far even as New-Guinea—into many of the Mongolic and Turkish languages, and into most of the ancient and modern languages of Europe: it has made no impression whatever on the languages of the Arabian stock of nations; so that in the Arabic, the most copious of them all, Sir William Jones could point out but a single word (one of the many synonyms of the *sun*), as common to it and the Sanscrit.

Between the Caspian sea and Persian gulf to the west, the ocean to the south, India to the east, and an indefinite line to the north, extending at least to 50° of latitude, there are several races which have much resemblance, but which differ enough in person, mind, and language, to entitle us to class them as different families. The first of these, beginning in a westerly direction, is the *Persian*. With this family, the complexion is fair without transparency; there is little or no colour in the cheek. The hair is long, straight, and almost always jet black; the beard abundant, bushy, generally black, but now and then with a reddish tinge. The features, according to European notions, are regular and handsome, though generally minute; and, beard excepted, rather effeminate. The stature is little short of the European standard; and the body gracefully, but not strongly formed, being altogether less robust than that of the European. The present inhabitants of Persia are much mixed with the blood of Arabian and Turkish settlers; and probably, therefore, the purest sample of the genuine Persians will be found in the emigrants established in foreign countries, called *Parsees*, who scrupulously abstain from intermixture with the people among whom they are settled. The Persians were among the earliest civilized nations of mankind; but their progress has not been in proportion to their precocity. It is probable that a thousand years before the Christian era they had tamed the useful animals, cultivated useful plants, were acquainted with the useful met-

als, and constituted a considerable community. That they had at an early period a written language, and that it was national, is attested by the existence of the undeciphered and peculiar characters, of unquestionable antiquity, still found at Persepolis and other places. When the Arabs conquered and converted the Persians about the middle of the seventh century, they found three spoken languages, viz., the *Parsee*, *Pehlvi*, and *Deri*, besides the *Zend*, or language dedicated to religion. The first of these has superseded the rest, which are known only by name, and become the universal language of the country. The modern Persian is of simple structure, like English, French, or Italian, that is, it possesses few or no inflections, prepositions governing its cases, and auxiliary verbs its tenses and modes. Many of its roots can be readily traced to the Sanscrit. Since the Arabian conquest, it has received a large accession of Arabic words easily discovered by their exotic sounds, for there are many sounds peculiar to one people which are foreign to the utterance of the other. The entire literature of the Persians dates since the Arabic conquest, and, therefore, the earliest portion is little more than 1600 years old, while the great bulk belongs to the fifteenth and sixteenth centuries. It consists of songs of considerable merit; of poetical romances, wild and extravagant; of loose chronicles without date, founded on tradition alone; and of treatises on morals, written to little purpose, for one of the most sensual, mendacious, and astute, but also one of the cleverest people of Asia. For the history of the Persians, for 1500 years before the Arabian conquest, we possess, from themselves, nothing but incongruous fable; and were it not for the occasional, but always unsatisfactory information respecting them communicated by the Greeks first, and then by the Romans, we should have known as little of their early history as we do of that of the Hindoos or Mexicans. The intellectual capacity of the race may be judged of by such facts as these. For 2500 years they have certainly not been wholly stationary; but, measured by the European standard, they have made surprisingly little progress. It is just, however, to state, that the physical geography of their country is not propitious to civilization. Much of it, like Arabia, is, from drought and sterility, unfit for agriculture, and fitted only for occasional pasture; and hence, at all times, the roving and predatory habits of a large portion of its population; while the same character belonging also, and even to a greater degree, to the countries which surround it, the progress of industry and civilization has not only been obstructed by internal, but also by foreign enemies. The Persian family has never been distinguished for the bold spirit of enterprise, or capacity for social improvement, which has characterized the Arabians.

It made some early but temporary conquests in northern India, and often mastered some of the Turkish tribes; but it never made any settlement in Europe, and a few petty Greek states were sufficient to baffle it in its utmost strength. Very different from the Jews and Arabs, such has always been the mediocrity of talent among the Persians, that they have no name which belongs to history, except that of Zoroaster.

The next family of nations we shall notice is the *Turkish* or *Scythian*. The extensive country in which this family is found, or rather its parent country, lies between the 35th and 60th degrees of latitude from the Hindoo Koosh, a continuation of the Himalaya, to the *Belur Tugh*, a spur of the Altai chain, and from the Caspian sea to the western boundary of the desert of *Cobi*, where they are mixed with the Mongols. The family consists of the Scythians and Parthians of antiquity, and of the true Tartars and Turcomans, with the eastern and western Turks, of the moderns—the *Uzecks*, *Tadjiks*, and *Kirgis*. To the west it has, probably, been considerably intermixed with Greek and Caucasian blood; to the east and north, with Mongolian; and to the south, with Persian. The complexion of this race is a light brumette. The hair generally black, strong, and long; but when the complexion is remarkable for its fairness, it is brown, and also of a more delicate texture. The colour of the eyes is a light brown, but the form somewhat contracted. The skull is remarkably globular, the forehead broad, and the space between the brows very prominent; the proportions of the face are symmetrical; the upper jaw-bone is singularly short, and the basis of the lower jaw is also remarkable for its shortness: the facial line is nearly vertical. The body is stout, but the stature shorter than the European. Abstracting hair, complexion, colour, form of the eye, and stature, with the intellectual powers as they have been hitherto developed, the Turk is in fact a European. The Turkish language is one of simple structure, like the Persian or English; and its sounds, but not its words, resemble those of the former. By the conquests of the various nations who speak it, it has been spread from Greece to Chinese Tartary, and from Persia to the 55th degree of latitude; but, unlike the Arabic or Persian, the more cultivated languages of a more civilized

## ASIA.

people, it has nowhere superseded or much mixed itself up with the dialects of the conquered people; nor in the government of a conquered people have the Turks ever exhibited the skill or tolerance of the Arabs or Mongols. What has been said of the character of the physical geography of the native country of the Arabian and Persian families, is still more applicable to the Turkish. A great portion of it is mere desert, without trees and water; and the cultivable portions are, in fact, but so many patches along the banks of rivers, thinly scattered over a boundless waste of sand. In these patches industry and civilization spring up, surrounded in every direction by robbers and freebooters, and liable at every moment to be crushed by them. To use the words of Mr. Erskine, in his excellent introduction to the "Translation of the Memoirs of the Emperor Baber," we find among the Turkish family "tribes who, down to the present day, wander over their extensive regions, as their forefathers did, little, if at all, more refined than they appear to have been at the dawn of history. Their flocks are still their wealth,—their camp their city; and the same government exists of separate chiefs, who are not much exalted in luxury or information above the commonest of their subjects around them." This cause, however, it must be admitted, will not account for the backward civilization of the Osmanli Turks, who have now for centuries occupied some of the finest regions of Asia and Europe, and been during the same time in close communication with the civilized nations of the latter.

That some nations of the true Turkish family were early civilized to a certain extent, is not to be doubted. It was among them that Alexander, more than three centuries before the Christian era, found the principal materials for founding his Greek kingdom of Bactria; and from time immemorial the horse, ox, camel, and dromedary, ass, hog, and dog, have probably been domesticated among them. The ass and hog are still wild animals of the country; and, in early times, it is not improbable the others were so also.

The Turkish or Scythian family seems to have invented no written character, and hence, in early times, to have had no literature. The evidence of some Bactrian coins, shows, that when the more improved nations among them had advanced to writing, they used the alphabetic characters of ancient Persia. The best and most fertile portion of the country of the Turks was conquered by the Arabs towards the end of the seventh century, and this was followed by the adoption of the Arabian alphabet, and by much of the language and literature both of the Arabs and Persians. It was not, however, until the establishment of a firm government under Jaghatul, the son of Jenghis Khan, that the Turkish language—from him called the Jaghatul Turkish—began to assume the character of a polished speech, and to be written; and its most flourishing period is comprised in the short time from the death of Timur, in 1405, to the death of Baber, in 1530. Its literature consists chiefly of popular poetry, in the form of odes or songs: but there are also some prose compositions, religious and chronological; of which last the most remarkable are the memoirs of Timur and Baber. Turkish composition, as described by Mr. Erskine, is less inflated and rhetorical than Persian and Arabian; and, judging by his own translation of the last of the works above mentioned, we should be disposed to consider Turkish literature as making a nearer approach, on the whole, to the good sense, taste, and simplicity of that of Europe, than any other literature of Asia.

In the south-eastern angle of what is commonly considered Persia, and now known by the name of Beloochistan, we have three races of men, distinct in person and language, living in the same country, and dwelling together, yet not often intermixing their blood—a circumstance which will frequently be found in what remains of our review of the "Races of Asia." These are the Beloochees, Brahoos, and Dewars. The *Beloochees* have dark-brown complexions, black hair, long visages, elevated features, with tall and active, but not robust persons. Half their language is a corrupted Persian; and, although the nature of the other be not ascertained, we have little doubt of its being primitive and original. The *Brahoos* are described by Pottinger as wholly unlike the Beloochees. They have, according to him, thick short bones—are, in fact, a squab instead of a tall people. Their faces are round, and their features flat, instead of being raised. Frequently they have brown hair and beard, from which we should augur a fairer complexion than is ascribed to them. The language of the Brahoos is entirely different from that of the Beloochees; it contains no Persian, and but a few words of the neighbouring dialects of the Hindoos. The *Dewars* have blunt features, high cheek-bones, bluff cheeks, and short persons, being altogether rather an ill-favoured race. What is remarkable of them is, that their language is that of a people to whom they bear no personal resemblance, the Persians. This, it may here be observed, is also the case with the Tadjiks of the Turkish family, who claim to be the aboriginal inhabit-

ants of Bokhara; but then the Tadjiks, though stout in stature, have elevated features, and a ruddy brown complexion. None of these nations have a national literature, or seem ever to have invented an alphabet. Even in the time of Alexander, although rude barbarians, they were far from being savages; for they had oxen, goats, and camels, and cultivated wheat, barley, and several fruits.

To the N. of the races now described, and in the N.E. angle of Persia in its widest acceptance, we find another race, the *Afghans*. This family is marked by a brown complexion, black hair, sometimes brown, a profusion of beard of the same colour, high noses, high cheek-bones, long faces, a robust person, and a stature short of the European. Their language, called Pashtoo, is peculiar; it contains few Sanscrit words, but a good many of those of the popular language of upper India, or Hindi; the sounds are rough, and some of the consonants are such as have no existence in the Persian. They have no alphabet, and use the Arabic characters; and their national literature, consisting chiefly of lyrics, is said not to be above 150 years old. In the time of Alexander these people were rude barbarians, but not savages, for they had towns, and corn, and cattle, and were probably on a level with the Germans and Britons in the time of Cæsar. It is only in comparatively late times that they have made any figure in history. Conquered by a Turkish nation, in the last years of the 10th century, they continued, by their military enterprises and invasions, to exercise great influence over the affairs of Hindostan, and some even over the affairs of Persia, down to the middle of the 18th century.

Among the high mountains and narrow elevated valleys, which lie E. of the country of the Afghans, exists a people, of whom little is known beyond their names: these are the *Kaffers*, or *infidels*, so called by their Mohammedan neighbours, the *Dards*, *Tibet-balt*, *Chitral*, *Hazaras*, and *Atmaks*. These people are described as remarkable for their fairness; the possession, occasionally, of light hair, and blue eyes, and great personal beauty. They speak many languages, which are absolutely unknown to Europeans. According to a most judicious writer, Mr. Erskine, they constitute "a series of nations, who appear never to have attained the arts, the ease, or the civilization of the southern states; but who, at the same time, unlike those to the north, have, in general, settled on some particular spot, built villages and towns, and cultivated the soil." Letters seem to be unknown to these people: they cultivate small quantities of wheat and millet, but their principal wealth consists in oxen and goats. The mountain barriers which surround them have protected them from invasion; and the narrow valleys which comprise their country, divides them into numerous tribes, and hinders their civilization. For want of a better name, this may be called the *Dard* family.

Proceeding eastward, we come to a great and numerous family, the *Hindoos*, spread from the 7th to the 35th degree of N. lat., and from the 68th to the 95th of E. long. Correctly speaking, this is, perhaps, not one family, but an aggregate of races, bearing such a general resemblance to each other, as the European varieties do among themselves, although wider in degree. The colour is commonly black, or at least a deep brown; and hence the name of *Hindoo*, applied to them by their fairer Turkish and Persian invaders: for that word, in the Persian language, is equivalent to negro in ours. The hair is always long, coarse, and black; the beard of the same colour, and not deficient; the eye invariably black, or deep brown; the face oval, and the features well raised, symmetrical, and handsome; so far, at least, as the absence of colour and transparency will allow, but generally with an effeminate cast: with some defect in the lower limbs, the person is well formed. The stature is generally short of the European; the body is spare, and deficient in strength and capacity of enduring toil, if compared with the surrounding families; but the want of force is in some measure compensated by lightness, flexibility, and dexterity. Judging by the form of the skull, modern naturalists have placed the *Hindoos*, or, still more whimsically, "the higher orders" of them, in the same class with the natives of Europe. This is but an ingenious philosophical dream; and Orme, who knew them well, and who never suspected the possibility of placing them in the same category with men of white skins, robust frames, and high enterprise, justly describes them as having been "from the earliest ages of antiquity a people who have no resemblance, either in figure or manners, with any of the nations contiguous to them." Their general appearance to a stranger is truly and graphically described by Mr. Ford, chaplain to the factory at Surat in the commencement of the 17th century. "A people," says he, "presented themselves to mine eyes, clothed in linen garments, somewhat low-descending; of a gesture and garb, as I may say, mildly, and well-nigh effeminate; of a countenance shy, and somewhat estranged, yet smiling out a glozed and bashful familiarity." "Clearness and subtlety, rather than depth with vigour, characterize the intel-

## ASIA.

lectual capacity of the Hindoo. In practical good sense they are below the Chinese; in energy, vigour, and enterprise, below the Arabs, Persians, and Turks; but they are equally astute with any of these, if, indeed, they do not, in this respect, surpass them all. They have been repeatedly, and, for so numerous a people, easily conquered; but, on their side, they have never gone abroad for conquest.

The Hindoos were probably among the earliest civilized of the families of mankind. Nearly 2900 years ago the Greeks found them composing communities, whose advance in the arts of life was equal to that of the Persians of the same period; and to have attained such a state must have been the work of many previous centuries. The country they inhabit has a favourable climate and fruitful soil, and nature presented to the exercise of their natural ingenuity many valuable products in the animal, vegetable, and mineral kingdoms, such as the useful animals, many of which are still found in a wild state in the country, with several descriptions of corn, esculent roots, cotton, and silk. All the languages of the Hindoos are of simple grammatical structure, except one, the dead Sanscrit, as complex as the Greek or Arabic. There are at least ten alphabets, which we hold to have been each separately invented, but afterward more or less improved by borrowing from that of the Sanscrit, the most comprehensive of them all, particularly in the adoption of its regular and almost philosophical arrangement. We know as little of the people whose language the Sanscrit was, as we should of the Romans, if we had no writings in Latin but what were mythological, dramatic, or poetical; that is, if we had neither Roman history nor Roman monuments. We should, in that case, point to the modern language which approached the nearest to the Latin, and certainly decide upon Italy as the native country of the Romans. The Hindoo language which contains the greatest amount of Sanscrit is the modern Hindi; and at the close of the 10th century, on the first Mohammedan invasion, a language was spoken at Delhi and its vicinity as nearly resembling it as Saxon does English. The nation then, of which the Sanscrit was the vernacular language, probably had for its primitive seat the countries on both banks of the Jumna, about the 28th degree of N. lat.; and this is, indeed, pointed out by many intelligent Hindoos as the locality of the ancient people whose language and institutions have exerted so great an influence over a large portion of mankind. As we diverge from this focus, the proportion of Sanscrit found in the dialects of India becomes less and less; and in some of the languages of the South, not more of it is to be found, nor in any other shape, than that in which we find Latin in English. Hindoo literature, notwithstanding the unquestionable antiquity of its culture, is extravagant, rhapsodical, puerile, and destitute both of instruction and amusement. In ingenuity and invention it can bear no comparison with that of the Hebrews, Arabs, or Persians; nor in common sense or authenticity with that of the Chinese, tame and mechanical as is the latter. The authentic records of the Hindoos cannot be carried back by any ingenuity beyond eleven centuries; and even this much is the work of European antiquaries. That period, then, carries Hindoo chronology only to the middle ages of European history, corresponds with the Arab conquest of Spain, and is long posterior to the conquest of England by the Saxons, of France by the Franks, and of Italy by the Lombards. The capacity of the Hindoo family, then, tried by the test of literature, stands lower than that of any of its considerable neighbours. We have already said, that though in colour, form, and feature, a common character belongs to the whole Hindoo family, there exist also striking differences. We shall endeavour to point out a few of these. Beginning from the N.W., we have the *Cosmarians*, with genuine Hindoo features, brunette complexions, and rather stouter and taller persons than the inhabitants of the plains of Hindostan. They have a peculiar language and a national alphabet. South of these, and on the plain, we have the more numerous and powerful nation of the *Seiks*, or *Singhs*. "The features of the whole nation," says Burnes, the traveller who has most recently described them, "are now as distinct from those of their neighbours as the Indian and Chinese. With an extreme regularity of physiognomy, and elongation of countenance, they may be readily distinguished from the other tribes." We shall add to this, that they are a tall, active, handsome race; of very dark complexions, but of features strongly marked by the genuine Hindoo character. Their language is a dialect of the Hindi. Between the 25th and 33d degree of N. lat. and the 72d and 87th degree of E. long., exists a numerous people, now, for the most part, speaking also a dialect of the Hindi, which has, in consequence of the Mohammedan conquest, received a large admixture of Persian, just as the Saxon did of French, and almost at the same period. They are generally taller and fairer than the people of the south, and of all the Hindoo family may be considered as having made the greatest advance in civilization. Their language

is written in the same alphabet as that used in writing Sanscrit. Throughout India they are known as *Hindostanians*. To the east of these, and inhabiting the extreme eastern portion of the country of the Hindoos, we have the Bengalee race, distinguished by dark complexions, low stature, and feeble and slender frames beyond any other Hindoo people. The Bengalees have a peculiar language of simple structure, without inflexions, the parts of speech being formed by the use of particles and auxiliaries. Sanscrit words and roots enter largely into its composition, and it has been alleged of this, and of most of the other vernacular languages of India, that Sanscrit forms their groundwork, as Latin forms that of Italian, French, and Spanish. This, however, is unquestionably not true of all the languages of the south of India; and we think it very doubtful if it be so even of that of the Bengalees. This last has a peculiar alphabet, formed on the principle of the Dewanagari, an alphabet of the Sanscrit, the basis most probably having been a rude character of indigenous invention. There is no Bengalee literature which goes farther back than the 15th century, and very little even of this. The Bengalees, like the other Hindoos, have no history; and the first authentic date in their chronology is the year 1903, when the country was invaded and conquered by the Turko-Persians, from Delhi. Upon the whole, the Bengalee race may be looked upon as the least energetic, physically and mentally, of the Hindoo family. Even within Hindostan, they have never ventured, as conquerors or emigrants, beyond the limits of their own country; while, from the earliest ages, they seem to have been invaded and subdued by all their western neighbours. In flexibility and acuteness, however, they equal any other Hindoos, and in our times have exhibited a capacity for improvement beyond them all.

To the south of the Bengalees, we find the *Orias*, or *Orias*, taller and stronger than the former, but still with slight and delicate figures. This race is remarkable, even among Hindoos, for a lack of spirit and intelligence. They have a peculiar language, of simple structure, into the composition of which both Sanscrit and Bengalee enter largely, but its foundation is most probably native. The alphabet is founded on the principle of the Dewanagari, and the literature consists almost wholly of translations and paraphrases from the Sanscrit.

To the south of the Nerbudda river, and of the *Orias*, we have the populous race of the *Telingas*, stouter, taller, and much more energetic. These are the people called by the earlier European settlers *Gentooes*. Their language is inharmonious, harsh, not very simple in its structure, and is written in a peculiar national alphabet; following, however, as all the Indian alphabets do, the convenient classification of the Dewanagari. Sanscrit is found in it, as French exists in English, Greek in Latin, Arabic in Persian, or Turkish and Persian in the dialects of northern India. Their national literature is considerable in extent, but that is all that can be safely asserted of it. This is the only Hindoo race which has exhibited any thing like a spirit of foreign enterprise, and that enterprise is wholly mercantile. Their commerce and their migrations at present extend, and seem from very remote periods to have extended, to the islands of the Indian ocean, and the countries beyond India and China. The spread of the language and institutions of the Hindoos, indeed, to these countries, was most probably in a great measure their work.

To the west of the Telingas we find the *Mahrattas* race, smaller in person; indeed, rather of meagre and diminutive form, of ungraceful make, and taciturn aspect. The Mahratta language is peculiar; and in reference to the admixture of Sanscrit found in it, the same observations apply as to the Telingas. Among all the considerable races of the Hindoo family, the Mahrattas had long been the most backward in civilization, and were totally unknown to history as a people, until the beginning of last century, when they suddenly entered on a career of conquest, which threatened, and, but for the presence of an European power, would probably have effected, the subjugation of all India.

The south of India, beyond the Telingas and Mahrattas races, is occupied by four distinct races, differing in language, and, in some respects, in physical form and intellectual character; but as in both respects it would be difficult to define the differences with precision, we shall content ourselves with their simple enumeration. Of all of them it may be observed, that they are (the inhabitants of Bengal excepted) of shorter stature, but of more compact form than the Hindoos of the north. They are commonly also of darker complexions. Immediately to the east of the Telingas is the *Tamil* race, occupying the whole of the level country below and to the east of the great table-land of the peninsula as far as cape Comorin. South of the river Krishna, and occupying the table-land, is the *Kannara* or *Cannarese* race, considerably civilized, and wide spread in this part of India. Below the table land, and on the western coast, we have two races, the *Malabar*, and the *Tulu*,

to the south, peculiar in their physical organization, intellectual character, and language. Besides these well ascertained races, there are evidences of the existence of distinct races also in the peninsula of Gajrat and Kutch, and in the territory of Sind; in all of which there seem to have been peculiar languages, reduced at present to dialects by the admixture of conquerors and settlers from the north. Among the Hindoo races must be included the aboriginal inhabitants of Ceylon, or *Cingalees*, who resemble the Hindoo, and no other family, in their colour, the form of their persons, the character of their features, and the texture of their minds. They have a peculiar language, an indigenous alphabet, following the Sanscrit arrangement, and their speech contains an abundance of Sanscrit words.

But besides these more considerable races of the Hindoo family, there are a good many rude tribes, differing essentially in language, and often in person, from their more civilized neighbours, and from each other. If we took these last at not more than half a dozen, we shall find that the whole Hindoo family of nations does not consist of less than eighteen different races, differing more or less from each other in stature, strength, mein, and intellectual endowment. If we carry our minds back to a period of Hindoo history when society was in as rude a state as in America on its discovery; before the time when some of the races, by their superior energy, and more favourable position, had destroyed or absorbed those that were more feeble, or less amply situated, we shall probably be led to conclude that the number of races and languages was, in proportion to extent, as great in India as we have found it to be in the New World, uniform as the Hindoo physical form and mind is commonly considered to be.

From the eastern limits of the country of the Hindoos to the western limit of China, and from the 7th to the 98th degree of N. latitude, there exists a great family, which has a common character, that is, the different races, or nations, or tribes composing it, agree as much among themselves as Europeans, Hindoos, or Chinese. We shall give this family a name which has been already applied to it, viz. the *Hindoo-Chinese*, though perhaps it would be better to apply to it that of one of its leading varieties. The following is an outline of its physical form. Head generally well proportioned, but of remarkable flatness in the occipital part. Features never bold, prominent, or well defined, as in the nations of central Asia. Nose small, round at the point, but not flattened; and the nostrils, instead of being parallel, diverge greatly. Mouth wide, but the lower part of the face does not project; lips rather thick; eyes small and black. Eyebrows not prominent, nor well marked. The face, instead of being oval, as in the Hindoo, Persian, Turkish, Arabian, and European families, is of a lozenge form; arising from its great breadth across the cheeks, and the prominence of the latter. Complexion a light brown; much fairer than the Hindoo, but darker than the Chinese. It is never black, as in many Hindoos and most negroes. The people described are themselves aware that they are a fairer race than the Hindoos; and, like the Turks and Persians, call the latter "black men." The hair of the head is always black, lank, coarse, and abundant. On every other part it is scanty; and the beard is throughout thin and defective. The average stature may be taken at five feet three inches; so that they are shorter than the Hindoos and Chinese, but rather taller than the Malayan family. The lower limbs are better formed than in the Hindoo family, and the hands larger and less effeminate. The whole person is robust, but without the lightness, flexibility, and grace of the Hindoo form. It is at the same time more vigorous, strong, and hardy. The languages of this family of nations are for the most part monosyllabic, and as we approach China wholly so. Even the polysyllabic words of foreign languages naturalized among them are pronounced as if each syllable were a distinct word. It follows, of necessity, that they are extremely simple in their structure, particles supplying the places of inflexions in all parts of speech, and words following each other in the natural order of ideas. There are, besides the Pali, or character of the religious language, six alphabets employed by as many distinct nations, which, however, on examination, may be reduced to three. The Birmees, Peguans, and Aracanese write in the same alphabet, with trifling modifications. The Siamese, Cambodjans, and, for the most part, the Laos, write in one alphabet—that usually called the Siamese. But a portion of the people of Laos also write in an alphabet distinct from these two. The Birmees and Siamese have adopted the classification of the Sanscrit, but not so the peculiar alphabet of Laos. We hold all three to be of native invention, and the introduction of the Sanscrit classification to be only recent and incidental. The fourth alphabet, or Pali, in which religious works are generally written is common to all the nations now mentioned, and is the same which is now used in Ceylon for a similar purpose, and which was once used in Java and other regions remote from India, the country in which it unquestionably originated.

The languages of the Hindoo-Chinese countries now mentioned have not only a common character as to sound, structure, and genius, but they contain also many words in common; the necessary effect of invasions, conquests, and settlements; the greater number of them, probably, in rude and early periods of society, and of which, with few exceptions, history has preserved no record. A large infusion of Sanscrit, through the medium of the Pali, is also common to them all. But what is the Pali itself? The common belief is, that it is the ancient language of Magadha or Bahar. It differs chiefly from Sanscrit in being more vocalic, more effeminate in its pronunciation, and less complex in its grammatical structure; and, in short, much in the same way that Romance and Italian differ from Greek and Latin. Most probably it was a language which arose on the ruins of the Sanscrit; and was the result of a conquest of the people who spoke the latter, effected by some other Hindoo nation, the principal seat of whose government was Magadha or Bahar. This theory would confirm the common and rational opinion, that the religion of Buddha is of more recent origin than that of Brahma. The Pali is not an intrinsic portion of the Hindoo-Chinese languages, but it is found to exist in them, as Arabic does in Persian or Turkish. It in fact embellishes them, but is not essential. The mind of this family, as exhibited in their literary efforts, ranks them below that of the Hindoos. In enterprise they rank also below the latter. Their wars and enterprises have been wholly confined among themselves; and they have never exercised the slightest influence over the other great families of mankind: nor have they produced a single great name known to history, or one remembered even by themselves a century after his death. Still their civilization must be of considerable antiquity, for the elements to promote an early advance unquestionably exist in their country, and these have never been presented to any family of mankind without begetting early improvement. The ox, the buffalo, and the elephant, are natives of their countries throughout; and very probably the horse and dog were so in early times. The soil too is generally of remarkable fertility; is well watered; and, in all likelihood, rice and some smaller grains, with some farinaceous roots and useful fruits, are indigenous. Inferior to the Hindoos, and still more to the Persians, Arabs, and Chinese, their superiority over all the negro and American nations is in a still greater proportion. Their progress in agriculture, in the common arts of life, the character of their religious and civil institutions, and their possession of a written character and a literature, to which they have been little indebted to foreigners, attest, in short, an early and considerable progress in society. Birmees temples, with every appearance of authenticity, can be traced back to the 9th century, corresponding to the ages of Charlemagne and Haroun-al-Raschid. This, to be sure, is no great antiquity, but the people who constructed such buildings were already far removed from being savages.

We shall now offer a brief sketch of the races or varieties of the Hindoo-Chinese family, beginning our examination from the westward. After leaving the country of the Hindoo family—of the men of black complexion, fine prominent features, slender person, and graceful form—we approach the men of brown complexion, flat features, and strong-built but squat persons. Still the Hindoo form, whether from admixture of races or original constitutional difference, has not wholly disappeared; and the half-civilized people of Cusay, Cachar, and Assam, with about a dozen small tribes in a wild and half-savage state, may be described as partaking of the physical form of both Hindoo and Hindoo-Chinese. All these speak different languages, and the more civilized write, some with the alphabet of the Bengalees, and some with that of the Birmees. Among a few, language is polysyllabic, but monosyllabic dialects prevail.

To the south and east of the savage, semi-barbarous or half-civilized tribes and nations now mentioned—extending to the south as far as the 7th degree of N. lat., and to the E. as far as the Anam race, we find six considerable nations, in which the physical character we have ascribed to the Hindoo-Chinese family is well marked, the genius of whose languages agrees, and who are nearly in the same state of social advancement. These are the Aracanese, Birmees, Peguans, Laos or Shans, Siamese, and Cambodjans. Each of these has its own peculiar language; and there exists even in their physical form, especially as to size, strength, and feature, differences which, though not very obvious to a stranger, are sensible enough to themselves. Living among them in scattered communities, as far as European inquiry has extended, there exist no less than eight tribes, migratory or savage, speaking as many distinct languages.

From the eastern frontier of Cambodja, to the western frontier of China, exists the Anam race, comprising the Cochinese and Tonquinese. These, though they have the common characters of the Hindoo-Chinese family, differ from the rest in so many particulars that they might prob-

bly have been considered, without impropriety, as a distinct family of the human race. In stature they are shorter than their neighbours, the Laos, Cambodians, and Siamese, and greatly shorter than the Chinese. Their persons are squat, but well-proportioned and active; their features are unseemly, their cheek-bones very high, and in that direction the face is very broad. Their language is purely monosyllabic, and in its terms has no admixture of the western languages. It has no alphabet; but, in lieu of it, uses, with little variation, the symbolic writing of the Chinese. Besides the Anam nation, there are two considerable tribes inhabiting the same country, the Vhamps and Mds; speaking their own distinct and peculiar idioms. Thus, throughout the whole of the Hindoo-Chinese countries, and among a people probably not by *one tenth* part so numerous as the Hindoos, we have thirty-two nations with distinct languages.

We now come to an important family, comprising, indeed, a very large portion of mankind, the *Chinese*. The outline of its physical character may be described as follows: Colour, a sickly white, or pale yellow; hair of the head lank, black, coarse, and shining; beard always black, thin, and decidant; there is but little hair on any other part of the body; eye invariably black, or dark; eyes and eyebrows oblique, turning upwards externally; cheek-bones high, and face round, neither square, nor lozenge-formed, nor angular in its outline. Nose small, depressed at its extremity, and thick at the root; lips thicker than with Europeans, but moderate compared to those of the negro. The whole person is well built and symmetrical; there is not in it the lightness and agility of the Hindoo, but there is sufficient activity, and far greater strength. The hands are small and soft, like those of the other people of warm climates. The lower limbs are particularly well formed, far excelling in this respect those of all other Asiatic people. The languages of this people are purely monosyllabic; none of the nations comprising it having ever known how to put two syllables together. Three hundred and thirty poor monosyllables, beginning with a consonant, and ending in a vowel, a liquid, or a nasal, and each monosyllable admitting commonly of about four intonations, so as to make in all about 1300 words, make up the whole of their meagre colloquial dialects, which are no less than fifteen in number, corresponding with the ancient provincial divisions of the country, which, in early times, composed, probably, at least as many distinct nations. The Chinese monosyllables are neither affected by number, case, nor gender; by mood, tense, or person; but are designated by prefixed or affixed particles, about thirty in number. The language of the Hottentots is scarcely ruder, more uncouth, or inharmonious. The Chinese family never invented an alphabet. From knotted words they came to their present symbolic character, which bears no resemblance to the Egyptian or any other hieroglyphics. It is a language for the eye, and not the ear; a character which may be read in English, or in Arabic, as well as in any Chinese language, and probably, indeed, with more precision. The Chinese writing, in fact, is a universal character, like the Arabic numerals, and has, consequently, many conveniences; but it has also its inconveniences. It has prevented the culture of oral language; occasioned the continuance of many distinct languages in the same country; and these, wretchedly meagre in structure, sound, and comprehensiveness. The Chinese mind, as indicated by its literature, is frigid, mechanical, and unimaginative. For the fine arts, in which the Greeks and Etruscans had made such remarkable progress 2500 years ago, the Chinese have never, to the present day, exhibited any capacity. They are laborious, practical, orderly, a vast assemblage, in fact, of shopkeepers and mechanics. They are among those families that made the earliest progress in civilization. Whatever they have is, also, indigenous; for of all mankind they owe least to strangers. The Chinese carry their authentic history back to a period of near 3000 years; and their sage, Confucius, lived and wrote in the present character 2000 years ago; wrote, in short, his moral rhapsodies while Herodotus was writing history, and in the same age to which flourished Pericles, Philidas, Hippocrates, and Plato: so that China was obviously as inferior to Europe then as it is now. At that time, however, China, south of the Yellow river, which at present contains the greatest and most industrious portion of its population, was in a state of entire barbarism; and even the northern frontier was divided into many petty states: facts that only contribute, with many others, to prove the comparatively recent origin of the whole human race. Two hundred and fifteen years before Christ, or above two centuries and a half later, the Chinese built along their frontier a wall of 1500 miles in extent, some 30 feet high, and broad enough for half a dozen horsemen to ride abreast: the only human monument that makes "a conspicuous figure on the map of the globe." This was in the age of the Hannibals and Scipios, and in point of magnitude, but nothing else, far exceeded the power of the Romans and Carthaginians of the same period.

We may infer from it that a people who could erect such a work, and who, 2000 years ago, had a frontier of 1500 miles to defend, were already numerous, and to a certain degree industrious. We may safely infer, then, that the Chinese, from their early progress in civilization, from their invention of printing, their discovery of silk and porcelain, their progress in useful works, such as domestic architecture, bridges, and canals, and their acquaintance with the art of civil administration, are, if not the most showy and brilliant, at least the most practical and useful, of the Asiatic races. One thing has been always common to this and the Hindoo family—an absence of the spirit of enterprise. Is no age have the Chinese gone abroad in search of foreign conquests or adventures; and even their indirect influence on strangers has been confined to their own immediate neighbourhood, no doubt a wide circuit. Like all Asiatic people, too, they exhibit a disposition to stand still, after making certain advances in civilization, which, in their case, have undoubtedly been respectable. They, at all events, display none of that Unlimited facility of expansion which, in the history of our race has hitherto alone characterized the European family. The Europeans of the 19th century bear very little resemblance to those of the 15th, except in spirit and enterprise; but we perceive that the Chinese of these two distant ages are in all respects very nearly the same. The European has advanced at the speed of the race-horse, while the utmost that can be said of the Chinese is, that his pace has been that of the tortoise.

Even in the apparently homogeneous population of China there is to be found considerable diversity, both physical and intellectual, probably as great as in the European family or the Hindoo. It has been already stated that there are fifteen languages, belonging to as many provinces; and, indeed, several provinces have more than one language. The inhabitants of the southern and eastern coast are commonly more athletic than those of the centre and north; and among the latter are found some who have less of the obliquity of eye which is so characteristic of the Chinese, and whose features altogether approach more nearly to the European. There are even races within the empire that are not Chinese, either in person or speech, and who still preserve their independence, as the Meao-tse in the interior, the Lolo on the western frontier, with the mountaineers of Hainan and Formosa. These two islands, indeed, seem only to have been colonized by the Chinese, as the Saxons colonized Britain; while the aborigines, like the Welsh and Highlanders, have been confined to the mountains. The language of Formosa is, in fact, polysyllabic, and contains many of the words of the Malayan family of languages; and the Chinese colonization of this island we know to be only of two centuries' date.

Near the Chinese we have another great family, bearing it some resemblance, but still so distinct in physical and intellectual character that they are warranted in classing it separately. This is the *Japanese*, which occupies a country of great extent, in the fine and temperate climate from 30° to 45° N., and comprises a population inferior only to the Chinese. Their colour is tawny; stature short, but robust; noses flatish; eyelids thick, and, as it were, puffed; eyes, as usual, dark, but less sunk than those of the Chinese; lower limbs large and thick, not clean and well made, as with the latter. "In the main," says Kemper, "they are of a very ugly appearance." The language of the Japanese, instead of being monosyllabic, is polysyllabic. The Chinese can pronounce the aspirate *h*; the Japanese have no such sound in their language. The Chinese have, as *h* were, a natural incapacity of pronouncing the consonants *r* and *d*, which they always convert into *l*. The Japanese pronounce them with the same facility as Europeans. The different pronunciation of the two people made a lively impression on Kemper, who describes it as follows: "As to the pronunciation, that also is very different in both languages, whether we consider it in general, or with regard to particular letters; and this difference is so remarkable that it seems the very instruments of voice are differently formed in the Japanese, from what they are in the Chinese. The pronunciation of the Japanese language in general is pure, articulate, and distinct, there being seldom more than two or three letters, according to our alphabet, combined together in one syllable: that of the Chinese, on the contrary, is nothing but a confused noise of many consonants, pronounced with a sort of singing accent, very disagreeable to the ear." He adds that, with the exception of a very few commercial terms, the language of Japan does not contain a single word borrowed from the dialects of China; and hence he argues, with justice, that the two nations are wholly of distinct origin. The Japanese, to a certain extent, have adopted the symbolic writing of the Chinese; but they have also an alphabet of their own, which is syllabic, like that of the Manchoes, and like it, too, written from top to bottom. A Hindoo alphabet has also been recently discovered among them, confined to the priesthood, whose

ritual is in the Sanscrit or Pali language. The Japanese, from the accounts we possess of them, are a race of considerable physical and intellectual energy; inferior to the Chinese in ingenuity, but superior to them in spirit and courage. Favoured by a country enjoying many advantages of soil, climate, extent, insular position, with most probably the possession, on the spot, of many of the most useful plants and animals, they could hardly fail to make an early progress in civilization. Their authentic history, according to themselves, dates 660 years B.C. This is probably greatly over-rating its real authenticity; for it would carry us back almost to the foundation of Rome, and would precede by nearly two centuries the age of Confucius and Pericles. In fact, they admit that they are a people of more recent civilization than the Chinese by twelve centuries. They have had, however, a long time for improvement, and for the last three centuries may be considered as having been absolutely stationary; if, indeed, as the result of their self-exclusion from strangers within that period, they may not rather be considered to be in a more unfavourable position than before it. While Chinese civilization has been repeatedly interrupted by the invasions of the shepherds of the North, no strangers have ever successfully invaded Japan; and the only attempt at conquest, made by the Mogul emperors of China, between five and six centuries ago, the elements, and the courage of the Japanese, repelled, and punished by the destruction of 100,000 of the invaders. An industrious, and in many respects an ingenious, culture of rice, barley, and wheat; respectable manufactures of silk, cotton, pottery, and lacquered ware; letters, literature, authentic records, the art of printing, and political institutions; prove the Japanese to be capable of a respectable civilization according to the Asiatic standard; but they prove also that, notwithstanding their more favourable position, both as to climate and political security, their natural genius is inferior to that of the Chinese. That they are a peculiar and original family, we think there can be no question. This is their own opinion; and Komper observes, in reference to this subject, that they "fancy themselves highly affronted by the endeavours of some who busy themselves to draw the original of their nation from the Chinese or others of their neighbours."

We have described the individuals of the Japanese family as if there existed among them no differences, physical or intellectual; but if we know more of them, probably many considerable variations would be found in both respects. The inhabitants of Nipon, the principal island, are distinguished by "big heads, flat noses, and mucous, fleshy complexions," as Komper expresses it. Those of Saikok are short in stature, of slender make, but well-shaped and handsome. The inhabitants of the Loochoo islands are described by our navigators as being neither Chinese nor Japanese, but partaking of both: they are most probably neither, nor yet a mixture of both, as they fancy, but an original and distinct race. Their stature does not exceed 5 feet 2 inches, so that they are a very diminutive race. Their language is peculiar, partaking equally of the monosyllabic and polysyllabic character. In fact, the Japanese empire is an aggregate of small hereditary principalities, in which a little acquaintance would probably discover much diversity. In language, too, probably much difference would be found to exist; although, in all likelihood, not so great an extent as in China; owing to the existence of a more perfect oral language, a common alphabet, and, in general, the absence of the artificial medium of communication which is universal among the people of the latter country.

To the N.E. of China we have another family, the Coreans, occupying a peninsula equal to Britain in extent. The Coreans are described as superior in strength and stature to the Chinese and Japanese, but they are evidently a race very inferior in mental energy and capacity to either. Their language, or, most probably, languages, are peculiar, differing from those of their immediate neighbours, the Manchoes, Chinese, and Japanese. It would appear also, that they have a national alphabetic character, although occasionally having recourse also to the symbolic writing of China. In the useful arts they have made considerable progress; but the standard of their civilization is much below that of the Chinese and Japanese. Their authentic history goes back to 100 years B.C., or corresponds with the classic era of Rome.

The inhabitants of two thirds of the superficies of Asia, from the seats of the families already specified to the Frozen ocean, remain to be described. These have a common resemblance in some important features; but it is only such a resemblance, colour alone excepted, as exists in all the families already mentioned from the eastern shore of the Atlantic to the eastern confines of Hindostan. Modern naturalists have described the whole, including in it the nations to the E. of the Hindoos, which we have just classed, as one of the five permanent varieties of the human race, under the name of the *Mongolians*. A classification of this description, which arranges under a single head people differing

most widely in form of person, stature, strength, language, and mental capacity, appears to us of no value whatever, and we feel ourselves warranted in attempting a different one, though the materials before the public for such a purpose be exceedingly imperfect: and the subject itself, from its extent and variety, as well as the rude and wandering character of nearly the whole of the races concerned, is naturally of much complexity. We shall divide the races into those which inhabit the valleys or southern slopes of the Himalaya chain: those which dwell between the latter, the Chinese and Korean families, and the Altai mountains; and, lastly, those which dwell between the Altai range generally and the Northern ocean.

The first race, proceeding in the above order, and beginning from the E., is the Bootes, or inhabitants of Bootan. "It is not possible to conceive," says Turner, who was perfectly well acquainted with both, "a greater dissimilarity between the most remote inhabitants of the globe, than that which distinguishes the feeble-bodied and meek-spirited natives of Bengal, and their active and Herculean neighbours, the mountaineers of Bootan." They have invariably black hair; the eye is a very remarkable feature of the face—small, black, with long, pointed corners, as though stretched and extended by artificial means; their eyelashes are so thin as to be scarcely perceptible, and the eyebrow is but slightly shaded. Below the eyes is the broadest part of the face, which is rather flat and narrow from the cheek-bones to the chin. The skin, about as fair as that of a southern European, is remarkable for its smoothness; and the beard does not present itself until a very advanced age, and then is scanty. The Bootes are a stout, active race, and their stature occasionally rises to 6 feet. Mr. Turner, indeed, describes them "as models of athletic strength." The Bootes are a long-settled, agricultural people, and have made considerable progress in the arts; have a peculiar language; an alphabet which follows the Hindoo arrangement; and in civilization, allowance being made for their remote, insulated, and mountainous country, may be considered on a par with the inhabitants of the countries lying between India and China.

Westward of the Bootes is the country of the Nepal, which, independent of Hindoo colonists and settlers from the S., who are sometimes of pure blood, but have often mixed it with that of the natives, contains eight aboriginal races, viz. the Gorkhas, Magars, Gurungs, Jarjays, Newars, Murmis, Kirants, and Lapchas. This from the predominant race, may be called the *Gorkha* family. These are a short, robust people, of an olive complexion, and of features less Mongolian than those of the Bootes. Their languages are, for the most part, distinct from each other, and polysyllabic, and the greater number of them have a knowledge of letters. There is, among one of the races at least, the rudiments of a native alphabet; but the Dewangari, adapted by additions and omissions to their native pronunciation, has been adopted by the greater number. Their state of civilization is nearly the same as that of the Bootes; but they have, recently at least, exhibited a greater spirit of enterprise.

To the N. of Bootan and Nepal, and on the terrace of the grand chain of the Himalaya, at an elevation of 19,000 or 13,000 ft. above the sea, in a cold and dry climate, and an ungenial soil, are found the Tibetan family; which, as far as our knowledge goes, extends over 26 degrees of longitude, or from the 74th to the 100th. The Tibetans have what is commonly called the Tartar countenance—a face angular and broad across the cheek-bones, and small black eyes, with very little beard. Instead of being tall, like the Bootes, they are short, squat, broad-shouldered, but slow and sluggish in mind as well as body. They are mild in disposition, and have never exhibited the mental energy or enterprise of their neighbours either to the N. or S. The horse and ass, two species of the ox, the goat, and sheep, are domesticated among them. All these are probably natives of the country, and the two first are said still to exist in the wild state. Their language is guttural, nasal, and harsh, and is a great measure polysyllabic. They possess a peculiar alphabet, which bears some resemblance to that of the Hindoos in their neighbourhood, but does not follow its arrangement. For religious purposes they have another alphabet, much resembling the Pali, and which they no doubt received along with the religion of Buddha or Fo, which they have been the medium of communicating to many of the tribes of Tartary, including the two which have conquered China. They have long possessed the art of printing with immovable wooden blocks, which they use, however, only for the multiplication of religious works.

We come now to far more important races: those inhabiting generally the vast plateaux and extensive ascents between the Himalaya and Altai ranges, as far as the 140th deg. of long., and then between the former and the right bank of the Amur or Amour. This is the *Mongolian* family, and may be described as being generally comprised be-

tween the 40th and 50th degrees of lat., and ranging over 80° of long., or from the 60th to the 140th deg. E., although, in some situations, exceeding these limits N. and S. by a few degrees. We shall first give the general description of the whole family. Forehead low and slanting; head altogether of a square form. The cheek-bones stand out widely on either side; the *glabella* and *osseæ nasæ*, which are flat and very small, are placed nearly in the same plane with the malar bones; there are scarcely any superciliary ridges; entrance of the nose narrow; the malar *fossæ* forms but a slight excavation; the ulnar edge of the jaws is obtusely arched in front; chin rather prominent; body short of the European stature, broad, square, and robust; extremities short, but slender; shoulders high; neck thick and strong. Hair always black, and the eye invariably black or dark brown. Hair of the head long and lank; and there is a paucity of beard, as well as hair over the rest of the body.

There are two great divisions of this family known to Europeans, under the name of Eastern and Western Tartars. The first comprise chiefly the Manchoes, sometimes called also Manshurs and Manjurs. These are the present lords of China, of which their parent country constitutes but a dependency, though a favoured one. Those that are seen in China are not always easily distinguished from the Chinese. They are described as shorter and squatter than the Chinese, and having a more angular countenance and harsher features. It must be recollected, however, that a perfect similarity of dress and costume is apt to mislead the observer, and that most of the first conquerors marrying Chinese women, the nominal Manchoes of China are in reality, in a great measure, a mixed race. Inhabiting a more genial climate and a better soil than the Mongols or western Tartars, the Manchoes are a more civilized people than the latter. They have, for the most part, habitations, and some agriculture, though flocks and herds constitute their chief wealth. The great river Amur, or Baghalion, and its many branches, which abound in fish, passing through their territory, may exist as fishermen. The Manchou language is quite national and peculiar; it is polysyllabic, full, and sonorous. It has the sort of copiousness which characterizes the Sanscrit and Arabic, and which, in a perfect language, ought rather to be called redundancy. The number of words for the horse, ox, and dog, according to age, sex, size, colour, and other qualities, is, for example, overwhelming. The present alphabet of the Manchoes is syllabic, written in columns from the top to the bottom of the page, like the Chinese, but, contrary to the practice of that character, from left to right. It is said to have been invented only during the present dynasty, the Manchoes having previously used the same character as the Mongols. The Manchoes, though they have acted a considerable, have by no means acted an equally distinguished, part on the great theatre of the world with their neighbours the Mongols. In the 11th century, however, they established the great empire known in the middle ages by the name of Katay or Cathay, by uniting to their own country the northern half of China. This, after lasting 117 years, was subverted by the arms of Jenghis Khan; but in the year 1624, and at an interval of more than four centuries, the Manchoes again possessed themselves of China, and have now for more than two centuries governed that empire, and probably with a skill and wisdom never equalled by its native masters.

We come now to the true Mongols—to the race “whose rapid conquests,” as Gibbon expresses it, “may be compared with the primitive convulsions of nature, which have agitated and altered the surface of the globe.” They extend westward from the longitude of Pekin, or about 116°, to the sea of Aral, a sweep of at least 3000 miles, and with the same physical form, the same language, and no great variety of manners, embrace the communities or tribes known to us under the various denominations of Mongols, or Moghuls, Kalkas, Eliuths, Ogurs, Kokonors, Kamis, and Kalmaucks. It is peculiarly to this family that the descriptions given by European writers of “the Tartars” is applicable. They are, in fact, the same men as the companions of Attila, Jenghis Khan, and for the most part of those of Timur, who, though priding himself on being a Turk, was in reality a Mongol, whose family had been long settled in a Turkish country, and whose myriads were a mixture of both races. Gibbon, on the authority of Jornandes, describes the persea of Attila, and says that it exhibited “the genuine deformity of a modern Calmuck.” An ecclesiastic, quoted by Matthew Paris, gives, in 1243, a picture of the Mongols who were the instruments of the conquests of Jenghis and his sons, which is evidently drawn by an eye-witness. “The Tartars,” says he, “have firm and robust bodies, lean and pallid countenances, high and broad shoulders, short and distorted noses, pointed and prominent chins, a low and deep upper jaw, long teeth distant from each other, eyelids stretched out from the temple to the nose, eyes black and unsteady, an expression oblique and stern, extremities bony and nervous, large and muscular thighs, but short legs, with a stat-

ure equal to our own, the deficiency in the length of the lower limbs being made up in the rest of the body.” The Catholic missionaries, who in the reign of the Chinese emperor Kang-hi repeatedly travelled over the country of the Mongols, and actually surveyed a portion of it, confirm this description. The Mongols, by their statement, are a stout, squat, swarthy, and ill-favoured people, with the common Tartar countenance expressed in its boldest lineaments. The language of the Mongols is polysyllabic, and differs wholly from that of the Manchoes. What is remarkable, and almost peculiar to this people, is, that the whole race speak the same language, from the longitude of Pekin almost to the Caspian, and in some situations even into the heart of Siberia, and westward within the confines of Europe. This arises, no doubt, from their being physically the same race, from their ever-wandering and unfixed habits, the frequent mixture arising from these habits, the practice of a universal hospitality, and their having been repeatedly united under the same government, though never very permanently. Something similar to this may be found among the islands of the Indian ocean, the languages of which have a vast number of words in common, a pacific sea constituting in this case a common medium of intercourse and communication, like the steppes and deserts of the Mongols, the seas and the canoes, in fact, taking the place of the horse, the ox, and the camel. The country of the Mongols is cold, elevated, and dry, few parts of it being fit for culture, and a great portion of it consisting of deserts, or “seas of sands,” as the Chinese express it, in which there is neither herb nor water. It abounds, however, in game and wild animals. For the chase there is the tiger, leopard, deer, antelope, hares, and many species of the gallinaceous family. The camel, ass, and even the horse, are still found in it, in their wild state; and no doubt the ox and sheep were so also before they were appropriated. Such a country necessarily made the Mongols early a nation of shepherds and hunters, and chained them down as it were to that condition.

The Mongols, with the exception of a very small number, live exclusively on animal food; and their clothing and dwellings, or tents, are for the most part of animal tegument or fibre. When urged to agricultural employment, their answer is, “Herbs were made for the beasts of the field, and the beasts of the field for man.” (*Antiq.* p. 173.)

Their whole employment consists in the tending of cattle, war, and the chase. Their knowledge of letters is of the humblest order, and applicable only to the purposes of arithmetical, in the hands of their priests. One tribe, the Igurs or Ogurs, invented a meagre alphabet of 14 letters, which, improved and extended from that of Tibet, is still in use. Of their own history and important migrations, which civilized nations have recorded for more than 3000 years, they know as little as rats or marmots do of theirs. Jenghis Khan was wholly illiterate, and Timur and Baber had a knowledge only of Turkish and Persian letters. The immense country of the Mongols may be described as a vast nursery of soldiers, consisting of many camps, equipped, provisioned, and ready to march at a moment's notice, without inconvenience or expense. The people have strength and hardihood of body, and vigour and intelligence of mind, to avail themselves of these advantages; and whenever a leader of genius capable of uniting the tribes in a common adventure has sprung up among them, they have proved a pest and nuisance to all the civilized races of mankind within their reach. Such a union made it necessary for the Chinese to build their great wall more than two centuries before the Christian era; occasioned about the same period the destruction of the Greek kingdom of Bactria; caused the settlement of the Huns within the confines of Europe, with their acts of destruction and rapine in the finest parts of it, in the 4th and 5th centuries; and the conquest of Turkestan, Persia, India, and China, achieved by Jenghis Khan, Timur, and their descendants in the 13th, 14th, and 15th centuries. The Mongolian family is at this day very nearly what it was 3000 years ago, and in all intermediate times. Are mankind likely, then, to be again harassed by any of their great military expeditions? Such an event is very unlikely with any nation, the Chinese excepted; and as far as the European family is concerned, the invention of gunpowder and firearms, with other improvements since the 15th century, have made it all but impossible. Asiatics, indeed, though sometimes obtaining temporary advantages, have never been a match for the Europeans, even when the latter were comparatively weak and semibarbarous. Attala was defeated in the plains of Chalons by an inferior army of the barbarians of northern Europe; and the whole of his adventures were, after all, but so many predatory incursions on a large scale. Jenghis Khan, his successor, effected only the conquest of the weakest and rudest nations of Europe, the Russians, Poles, and Hungarians, and even their subjugation was temporary. Timur did still less, and the Sophorus was sufficient to stop the progress of a conqueror who had marched in triumph over 3000 miles of Asiatic territory.

The Franks defeated the Arabs in the height of their pride and power. A handful of Normans dispossessed them of Sicily, and the mountaineers of Biscay, after a long struggle, finally expelled them from Spain; so that within the memory of history no Asiatic people has formed anything better than a temporary establishment in Europe. Civilized Europeans have been conquered by barbarians of their own family; but not, since the historic age, by Orientalists. The researches of modern philologists, however, make us acquainted with the singular and apparently unaccountable fact, that the languages of India, the Manchooks, and Mongols, and of the Turkish, Persian, and European families, contain many words in common; not so much changed by the peculiar pronunciation of each people as not to be clearly identified; while the Arabic and other languages of the same family do not contain any such common words. It appears to us that this may be most rationally accounted for on the supposition of an invasion and settlement of Transoxiana, Persia, and Europe by the Mongols, in times far beyond the reach of history, before the invention of letters, when there were neither Greeks nor Romans to tell the story. How the Mongolian languages came to possess many words in common with the Hindoo, seems obvious enough. All the Mongolian nations at this day receive their religion, and the language in which that religion is explained, from the Tibetans; and the Tibetans, it is admitted, have received both from India. But what, it may be asked, could tempt the Mongolian nations to the invasion, conquest, and settlement of a country so rude and remote as Europe in the times we are supposing? The answer is, the same cause which produces constant international wars among themselves down to the present moment—the restless military habits engendered by their position—the constitutional animal courage of a race energetic and enterprising—the desire to find new pastures for horses, herds, and flocks, which a well-watered and (then) thinly-peopled country like Europe could well supply; and the victories of one tribe, forcing the conquered to abandon their own lands and seek new establishments. This was, in fact, the cause which drove the Huns of the 5th century B.C. upon the Greek kingdom of Bactria, and eventually brought that people to Europe in the 3d and 4th centuries after Christ, producing even their permanent settlement on its eastern confines. The conquests of Attila, and of Jenghis, it may be added, had similar objects in view, but took a different direction, and ended differently, owing to the resistance in their times of comparatively numerous, wealthy, and civilized people. Timur, with the strength which Europe had already attained, at the close of the 14th century, only threatened to invade it. Both he and Jenghis invaded and overran all the other countries of the West in the languages of which Indian words are to be found; but, like the remote invaders to whom our theory alludes, they never touched the Arabian peninsula, nor formed any permanent establishment in any country in which the Semitic class of languages is spoken.

The native capacity of the Mongolian family is sufficiently attested; by the production of such men as Attila, Jenghis, Timur, Baber, and Kublay Khan; as well as in the conquest, the retention for more than 900 years, and the skillful government during nearly the same time, of the vast empire of China. It is singular, indeed, that the most useful, if not the greatest public work in that country, the grand canal of 600 miles in length, was the work of the first Mongol emperor, who was the undisputed lord of the whole. Kublay Khan, the grandson of Jenghis, though born a shepherd, added to the enterprise and courage of his own race the learning and skill of the conquered people.

Between the Altal range and river Amur to the S. and the Frozen ocean to the N., there exist tribes almost as numerous as in any equal extent of the American continent, and far more distinct in physical form. Many of them are obviously distinct families; and others, not so considered, will, we are satisfied, be found to be such on a better acquaintance. The whole are so numerous, obscure, and unimportant, that it is difficult, or rather impossible, to classify them satisfactorily.

There are found near to, and on the banks of the Amur or Schanhen, four nations, called Solon, Kerchling, Daguri, and Naisia, all of which have languages wholly different from their immediate neighbours the Manchooks, while they differ also among themselves. They are rude, dull, and wholly without the knowledge of letters; live on fish; and with them we find the dog, from necessity, first substituted for the horse and the ox.

Sherbani, the grandson of Jenghis Khan, led a colony of Mongols into Siberia, amounting to 15,000 families, and his descendants reigned there for 300 years, or until the Russian discovery and conquest; so that the Mongols, although originally foreigners, now form a considerable portion of the population of Siberia, either pure or mixed up with the native tribes of the country. The Tunguses are said to be al-

lied to the Manchooks. They are of middling stature, with features more distinct and more in relief than the Kalmucks or Mongols; well made, active, and courageous. The *Buriats*, it is pretended, also, are of the Mongolian race; but it is evident from their physical form that this cannot be the case, notwithstanding the existence of Mongolian words in their language. According to Pallas, an eyewitness, they are short in stature; and so effeminate that six of them hardly equal, in point of strength, a single Russian. These cannot be of the same stock with the powerful and intrepid people that, centuries ago, conquered these same Russians. The *Wagwals* constitutes a small, firmly, dwelling between the Ouranian mountains and the Obi, of stature below the European, with black hair, scanty beard, and Tartarian face. The *Ostiaaks* are a family small and feeble, with hair of a light colour and reddish tinge. They can count no farther than 10, and live almost exclusively on fish. The *Semoyeds* extend along the Frozen ocean from the 40th to the 115th deg. of E. long. The stature of this very distinct family is commonly from 4 feet to 5 feet, and consequently at least a foot short of the European standard. Head disproportionately large; face flat; mouth large; ears also large, and the lower portion of the face projecting. The *Tchoukitchis*, *Yakagines*, and *Koriaks* occupy the extreme eastern angle of Asia fronting America, and are a coarse-featured, short people; without, however, the flat noses, or peculiarly small eyes of the Kamtschadales. They resemble the Esquimaux of America; and speaking three distinct languages, are probably as many distinct races. The *Kamtschadales* are a very short race, with broad shoulders, a large head and a flat elongated countenance, thin lips, small eyes, and very little hair. The *Aleutians*, or inhabitants of the Aleutian islands, are a different race from these. They are swarthy, short, but stout and well-proportioned. The people occupying the great island of Saghalien at the mouth of the Amur, and the whole chain of the Kurile islands, from the cape of Kamtschatka, to Joss in Japan, are a distinct race from any of those abovementioned.

The stoutest and most vigorous of the people of this part of Asia, or those found to the S., dwell in moveable tents, like the Mongols; have horses and oxen; and are not wanting in stature, strength, and the military virtues. On the contrary, the inhabitants of the bleak and inhospitable regions towards and on the shores of the Polar sea all exchange the horse, ox, and sheep for the rein-deer and dog; live in cabins or caverns instead of moveable tents; are small, weak, and pusillanimous: "a race," as Gibbon expresses it, "of deformed and diminutive savages, who tremble at the sound of arms." Among all the native races to the N. of the Altal mountains, letters are wholly unknown, agriculture is scarcely practised; far war on a large scale the people have neither disposition, capacity, nor means; and, to obtain food and clothing, nearly their whole time is consumed in fishing and the chase.

V. AMOUNT OF POPULATION.—POLITICAL DIVISIONS.—There are no means whatever by which to form anything like a correct estimate either of the extent or population of the greater number of Asiatic states. The estimates of the population of China only vary from about 150 to about 368 millions; and the differences in the estimates of the population of other countries, though much less in absolute amount, are quite as great in degree. There are also great discrepancies in the estimates that have been formed of the area of the different states, originating partly in the want of correct measurements, and partly in the fluctuating and ill-defined nature of their boundaries. The estimate (*inserted on the following page*) is not, therefore, put forth as if it were exempted from error but we are inclined to think that it will be found to be more nearly accurate than most of those by which it has been preceded.

VI. PROGRESS OF DISCOVERY.—The geographical knowledge of Asia may be considered as commencing with its western countries, and with Greece, the cradle of our present civilisation. Judas and Phenicia are the quarters from which the earliest information comes. The Jews scarcely recognised distinctly any object more easterly than the Euphrates, emphatically termed by them "the river," beyond which, at a vague and uncertain distance, they placed "the ends of the earth." Trade tried with several cities on its banks, but does not seem to have pushed her intercourse farther; though Dr. Vincent reasonably conjectured, that the chests of rich apparel, carefully bound with cords, brought by this channel, were from countries much more remote. A great traffic is mentioned with Dedan, a city of Arabia, which, from its many Isles, and its merchandise of precious cloths, must have been in the vicinity of Ormus, and have drawn these commodities from India. They were transported, by large caravans, across Arabia to Edom or Idumea, which was greatly enriched by this traffic. From the south of Arabia, Sheba, or Saba, sent caravans laden with gold and incense, both probably obtained from the opposite coasts of Africa.

# ASIA.

Estimate of the Area and Population of the different Asiatic States.

| States.                                                                                                                                   | Area in Sq. Miles (Engl.). | Population.        |
|-------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|--------------------|
| Chinese Empire and dependant States                                                                                                       | 7,144,000                  | 168,000,000        |
| Russian Empire                                                                                                                            | 5,846,000                  | 3,800,000          |
| Empire of Anam                                                                                                                            | 98,000                     | 5,000,000          |
| Birman Empire                                                                                                                             | 184,000                    | 2,000,000          |
| Siam                                                                                                                                      | 80,000                     | 2,800,000          |
| Malay Peninsula                                                                                                                           | 88,000                     | 600,000            |
| Cassay                                                                                                                                    | 7,000                      | 70,000             |
| Beloochistan                                                                                                                              | 300,000                    | 1,000,000          |
| Afghanistan, &c.                                                                                                                          | 300,000                    | 5,000,000          |
| Independent Tartary, or Turkistan                                                                                                         | 737,000                    | 5,000,000          |
| a. Khanat of Bokhara                                                                                                                      | 283,940                    | 2,000,000          |
| b. Khanat of Kokan                                                                                                                        | 135,680                    | 1,000,000          |
| c. Khanat of Khiva                                                                                                                        | 6,980                      | 800,000            |
| d. Independent Kirghis and Toorkis                                                                                                        | 330,500                    | 1,300,000          |
| Persia                                                                                                                                    | 482,000                    | 9,000,000          |
| Turkish dominions                                                                                                                         | 447,000                    | 12,300,000         |
| Arabia                                                                                                                                    | 1,000,000                  | 10,000,000         |
| Hindustan, with Assam, and the British provinces beyond the Ganges                                                                        | 1,382,000                  | 130,000,000        |
| Independent States:                                                                                                                       |                            |                    |
| a. Lahore (Punjab)                                                                                                                        | 114,500                    | 8,000,000          |

The knowledge of the Greeks, in the nearly cotemporary age of Homer, was far more limited. He seems to have had no distinct knowledge of any country east of Asia Minor. Colchos, on the Euxine, being supposed to contain the chariot of the sun, must have been viewed as the eastern extremity of the earth: the voyage thither by Jason, in the ship Argo, was regarded as an almost superhuman achievement. The name Asia was then applied only to a part of the coast of Asia, whence it was extended to the peninsula, and ultimately to the whole continent; after which the other was named the Lesser Asia.\*

The triumphant contest of Greece with Persia excited deep interest, and generated plans of conquest, which rendered every information respecting that empire acceptable. The most valuable contributor was Herodotus, who, during a residence at Babylon, collected materials for a description of the satrapies into which it was divided. To the north it extended over a part of the Caucasian provinces, enabling the writer to delineate tolerably the extent and boundaries of the Caspian. Maritima and Bactria probably reached to the Oxus, beyond which wandered the Scythian tribe named Massagete. India was the most easterly satrapy; but being described as containing no great river except the Indus, and bounded by an immense desert, it evidently contained only the western provinces, while the Ganges and southern countries were entirely unknown. Herodotus gives a somewhat rude description of the inhabitants, suggested probably by the bordering mountaineer tribes. The fact of its affording a revenue four times that of Egypt, shows clearly that it was already opulent and improved. Darius is said to have employed Scylax, the Caryandrian, to descend the Indus, sail along the southern coast, and come up the Red sea; a voyage accomplished in two years.

The next great source of information to the Greeks was the expedition of Alexander. It did not, indeed, extend

much beyond the already known limits of the Persian empire; but the countries, before known only by vague report, were then carefully examined and described. Under his direction two engineers, Diognetus and Bacton, made surveys of each march, which were published by the latter, but are unfortunately lost. To the north, Alexander pushed beyond the Jaxartes, but without being able to bring under subjection the rude tribes who tenanted those regions. On the side of India, he learned the existence of the Ganges and the fine countries on its banks, to which he eagerly sought to penetrate; but the mutiny of his troops compelled him to stop at the Hyphasis. The Greeks had then an opportunity of observing some of the peculiarities of the Indian people; their division into castes; their fantastical religious austerities; and the merit attached to suicide. Alexander descended the Indus to its mouth, and sent thence a fleet under Nearchus, who traced the coast of Asia as far as the Persian Gulf, which he ascended, and joined his master at Babylon. This voyage, now so easy, was then considered a most perilous achievement, and the party arrived in a state of distress and exhaustion. Alexander himself, in returning through the maritime provinces, became aware of their extremely desolate character, through which, indeed, his army was in danger of perishing.

On the partition of Alexander's empire, Seleucus obtained Syria, with as much of the countries to the eastward as his arms could hold in subjection. He is said to have attempted the conquest of India; but there is no distinct account how far he penetrated; probably it was not beyond Alexander's limit. He sent, however, an embassy, under Megasthenes, to Patalibothra (Pataliputra) on the Ganges, capital of one of the most powerful kingdoms ever formed in India; and through this channel a good deal of additional information was obtained. He also employed his admiral, Patroclus, in an attempt to circumnavigate Asia; and round even represents him as having accomplished this vast circuit, and entered from the northern ocean into the Caspian; but the manifestly fabulous character of this report makes it impossible to conjecture how far he really penetrated.

## ASIA.

All the materials thus collected were at the disposal of Eratosthenes, the learned librarian of Alexandria; and were employed by him in forming, on the astronomical principles of Hipparchus, the first systematic delineation of the globe. It is, however, as to Asia, extremely imperfect. The Ganges is made to fall into the eastern ocean, represented as bounding the habitable earth. The cape of the Colliaci (Cocorin) is made at once the most southerly and most easterly point of Asia. About ten degrees north of the Ganges, and a very little east, is placed, in the same ocean, the city of Thina, often alluded to as the extremity on that side of the habitable world; this appears the first very imperfect rumour, which reached the western nations of the Chinese empire. Not far from Thina, the coast turned westward, stretching along the great northern ocean, which bounds both Europe and Asia, but at so low a latitude that the Caspian was considered to be a gulf connected with it by a narrow strait. This was a retrograde step even from Herodotus, who had described it justly as an inland sea. Asia, thus wanting Tibet, China, the greater part of Tartary, and all Siberia, possessed little above a third part of its real dimensions.\*

The Romans did not, by their conquests, obtain any accession to the knowledge of Asia. Before they reached Persia, that country had been occupied by the Parthians, a brave northern people, the attempts to subdue whom were not only fruitless, but most disastrous. But the boundless wealth accumulated in the imperial capital, from the spoils of conquered nations, brought all sorts of commodities, however distant the place of their production, and however high their price, to its markets. The *Sericea serica* (silk), then first introduced, became for some time quite the rage, and was readily paid for at its weight in gold. The fragrant malabathum (betel, or tea), and the ornamented vessels, named *murrhina* (probably porcelain), brought also vast prices. The merchants of Alexandria and Byzantium were thus impelled, not only to embark large capitals, but to brave hardship and danger in reaching the remote extremities of the continent, where these commodities were produced.

Of the maritime route, Arrian, a merchant of Alexandria, has given a detailed and correct account, supposed to be written in the first century. He describes it as extending along Persia, Arabia, and India, as far as Nelisaurum (Nelumbus), on the coast of Malabar. The Greek navigators had not then proceeded farther east, but found in that port supplies of the important articles of silk and malabathum. This trade was carried on by ships that steered directly across the Indian ocean from the straits of Bab-el-Mandeb, by the route first discovered by Hippalus. Of the more easterly coasts, Arrian gives only hearsay accounts, becoming gradually fainter and more fabulous. But he distinctly indicates *Masulipatam* and the mouth of the Ganges, with the exquisitely fine cottons there fabricated. Even beyond this limit, he mentions *Chryse*, or the golden hill (Sumatra or Borneo). Thina is noticed, but in a manner still more confused than by Eratosthenes. But he gives a curious account of the collection of the leaves of malabathum by a people, the form of whose visage shows them to be Tartars or Chinese, and of the manner in which they were picked, dried, and curled. *Vossius*, *Vincent*, and most other writers, conceive this to be the betel. Mr. Murray, however, has lately endeavoured to show, that this last, being only used for wrapping the areca nut, must for that purpose be used fresh, and would be destroyed by the above processes; that it cannot consequently be, and is not, an object of trade, though the areca is; and that the malabathum alluded to was, therefore, most probably tea. The ancient accounts, however, give no distinct intimation how the article was used, nor any reason to think, supposing it to be tea, that it was by drinking the infusion, but rather, in some form, as an object of scent.†

About a century after, Ptolemy published his elaborate system of geography, which shows a very remarkable extension of knowledge in regard to Asia. He delineates, though rudely, a very large extent of coast from the mouth of the Ganges to Catigara, on the coast of the Sine; chiefly from a pretty detailed route of his predecessor Marinus, partly furnished by Alexander, a mariner, who, from his name, was probably a Greek. His statement that it reached 1200 miles S.E., and then about as much N.E., could only consist with a voyage from the head of the bay of Bengal to China. Bada, the point where he turned north, must be at or near Singapore. Thence he described a coasting voyage of 2500 miles, what he crossed "the sea" (evidently the broad mouth of the gulf of Siam), and reached what he terms the golden Chersonese, a name very naturally suggested by the rich mines on the opposite coast of Borneo.

Thence he had twenty days' coasting sail (along Cochin China and Tonquin); finally, a course, partly south, but more east, led to Catigara, which must thus have been on the southern coast of China, and from its name probably Canton. Ptolemy, however, though he professedly made this the basis of his delineation, evidently adopted, and unskillfully combined with it, information from other quarters. In his tables, the golden Chersonese, from its vast extension southward, and containing the names Malayo colon and Coast of the Pirates, very clearly designates Malacca, conjoined probably with Sumatra, which is not separately mentioned. The extreme point of Catigara, too, is placed on a coast, stretching, not east, as Alexander had described, but due south, with a view probably to harmonize with the strange theory, according to which the coasts of Africa and Asia formed a vast circuit, and met, enclosing the whole Indian ocean.‡

The same geographer describes a caravan route, formed through Asia by the merchants of Byzantium. Proceeding due east, through Asia Minor and Persia, they made some circuits in order to include Hircania (Astrabad), Aria (Herat), and Margiana (Khorassan): they then reached Bactra (Balkh), which seems to have been the main centre of the inland trade of the continent. The route, which had hitherto been through immense and level plains, led then over those lofty mountain ranges that lie to the north of India. After a laborious ascent, they reached a station called the Stone Tower, where the merchants, destined for the remotest extremities of Asia, united for mutual aid and defence: thence, by a route of seven months, checkered by many perils and vicissitudes, brought them to Sera, the capital of Serica. That this country is China is now so generally admitted, that we need scarcely notice the theories which assign to it a less distant position, especially that of Gosselin, who, in profound ignorance of the localities, would make it Sedmagur, in the north of India. The produce of silk, the character of the people, industrious, mild, pacific, timid, and shunning the intercourse of foreigners, all combine to exclude any other supposition. It is remarkable that northern China, reached by this route, is called Serica, while its southern coast is named that of the Sine. It is, in fact, uncertain, whether the two were then under one government; at all events, the names were probably those used by the neighbouring nations, as, at present, the term China, the same with Sina or Sina, is received by us from the people of the Oriental archipelago. Ptolemy's knowledge did not reach to the Eastern ocean; and, unlike Eratosthenes, he did not assume its existence, but bounded Asia on that side, as well as on the north, by a vast expanse of "unknown land."§

This communication, opened by Rome during her highest prosperity, was gradually lost amid the distractions and weakness of the empire, and when all the intermediate countries were occupied by the hostile Saracen power. Stephen of Byzantium, and the Geographer of Ravenna, about the eighth century, show only the most imperfect knowledge of the countries beyond Bactriana, including them under the vague term of India-Serica.

A new people now arose, who, impelled by ambition and religious zeal, explored and civilized a great portion of the world. The Arabs, under the impulse given by Mohammed, rushed from their deserts, and conquered an empire more extensive than that of Rome. They penetrated even into Scythia, which had remained impervious both to the Persians and Greeks, and established flourishing kingdoms on the banks of the Oxus and the Jaxartes. During the enlightened era of the caliphs, particular attention was paid to geographical knowledge. A number of leading positions were determined by astronomical observation, a process to which the Greeks had been almost strangers: India was well known to them, and ere long became subject to Mohammedan princes. China was never even approached by conquest, but commerce conveyed some pretty accurate ideas respecting that country; indeed, in the ninth century, two Arab merchants, *Wahab* and *Abusaid*, visited it, and published an account, in some respects very accurate, and accordant with modern observation. They mention its great fertility and populousness; the production and general use of rice, silk, tea, and porcelain; the rigid watchfulness of the police; the general diffusion of reading, and the preference of written over spoken language. It is remarkable that *Abulfeda* and *Edrisi*, the most eminent of the Arabian geographers, appear ignorant of this work, and their account is meagre and defective. On the north, some imperfect notices were received of Siberia and the Arctic ocean. This region excited intense interest from its being supposed to contain the castle of two enormous giants, *Gog* and *Magog*, the search after which impelled the caliphs to expeditions of discovery. After several fruitless efforts, one was despatched

ed, with strict orders not to return without having discovered this castle. Under this impulse they marched towards the Altai, and returned with a truly formidable description of the fortress, as surrounded by walls of iron, and with a gate fifty cubits high. This report was implicitly received, and the castle appears conspicuous in all the maps of the middle ages.\*

Europe, mean time, was buried in the deepest ignorance as to all that related to the Eastern world. Attention, however, was at last powerfully attracted to it by the crusades. Some direct accounts were received, and lights were sought in Ptolemy and other ancients: the result was a very confused mass of notions, which are curiously exhibited by Sannudo, in the map prefixed to his narrative of these expeditions, entitled, *Gesta Dei per Francos*. The world is there represented as a great circular plain, in the centre of which stands Jerusalem. Sera is borrowed from Ptolemy; but India is placed partly beyond it, and, under the titles of Major, Minor, and Interior, is scattered through different and distant parts of Asia. The Indus, in the text, is made the boundary of that continent. To the north, Albania and Georgia stretch almost to the sea of darkness, and in the same quarter appears the castle of Gog and Magog.

Attention was about the same time forcibly drawn to another Asiatic region. The Mongol chief Jenghis, and his descendants, established an empire of immense extent, comprising on one side China, and on the other Russia, which was long held under Tartar sway. Thence they marched through Poland into Hungary and Silesia. The duke of that country, having ventured to encounter them, was defeated and slain. Circumstances deterred them from proceeding farther; but their numbers, ferocity, and conquests, struck Europe with terror. In hopes of averting future invasion, it was determined to send embassies from the pope, as the chief of Christendom; and two monks, Carpinal and Rubruquis, were successively employed. They travelled by long journeys, of many months, over the vast plains of Tartary to Karkarum, a rude capital, situated far east in that region. They were tolerably well received, as Oriental courts are fond of the attention and homage which missions imply; but the threatened invasion was prevented by quite different causes. Being probably the first who had penetrated into those remote regions, they communicated new ideas respecting their vast extent, and the countries situated both at their eastern and northern extremities.†

About the same time that this intercourse with the East was opened, and partly in consequence of it, the spirit of industry and commerce revived among the maritime cities of Italy. Venice and Genoa had established factories and carried on trade, not only over all the Levant, but on the coast of the Black sea. From this last quarter, two Venetian nobles of great enterprise, of the name of Polo, undertook to visit the court of a Tartar prince, descended from Jenghis, with a view to dispose of some valuable commodities. Various vicissitudes led them on to Bokhara; and they were there induced to accompany a mission to Cambalu, the court of Kublay, named the Great Khan, who inherited the most valuable of Jenghis's conquests in China and the neighbouring countries. Having returned to Venice, they again set out for the East, taking with them Marco, one of their sons, to whom we are indebted for a most interesting account of his and their travels. On their outward journey, they passed through Balkh, Kashgar, Khotin, Tangut, and other countries in that great table-land of middle Asia, which we name little Bucharie, and respecting which we have little better information than Marco communicated.

Cathay, as northern China was then called, with Cambalu, its capital, the modern Pekin, completely dazzled the travellers. The walls forming a square, each side of which measured six miles—the lofty ornamented gates—the spacious streets—the immense palace, with its painted halls—the beautifully ornamented gardens—the pomp of the imperial festivals—all these objects, nearly on the same scale as now, far surpassed any magnificence of which Europe could then boast. Being well received, and even officially employed, Marco made an extensive tour through the western provinces, visiting part of Tibet, and obtaining information respecting Mien (Ava). This was followed by a more interesting journey into Mangi, or southern China, which not long before had formed a separate kingdom, but happened then, as now, to be subject to a power resident in the north. He describes it justly as more fruitful and populous than the region first visited. Its capital, Quinai, or the Celestial City, is painted quite in magic colours; its edifices, canals, ornamented bridges, spacious lake, and the palaces which embellished its shores. He indulges here in some exaggeration; yet Hangtchoofoo (as the place is now named, though it has long ceased to be a seat of empire), is described as

nearly as large as London, and surrounded by delightful environs.

Marco heard also of Xipangu, or Japan, as a rich insular empire, which the Great Khan had made a vain attempt to subdue. Returning by sea the travellers touched at Tricompa and Sumatra. They spent some time successively in Ceylon, Coromandel, and Malabar, and Marco gives a not unfaithful account of Indian manners and superstitions. Then sailing up the Persian gulf, they proceeded from Ormuz to Trebisond, whence they returned to Venice, 34 years after their departure. No travellers ever perhaps carried home so great a mass of important information; but the narrative, being interlarded with the marvellous, and resting on Marco's sole authority, became exposed to much of that scepticism, with which the first travellers into new regions are often unjustly assailed.\*

The great discoveries thus made were not, however, neglected. In the beginning of the fourteenth century, Juan de Monte Corvino, a Minorite friar, undertook a religious mission into the east. He penetrated to Cambalu, where he was allowed to reside for a number of years, and made many converts; the city was even erected into a see, of which he was named archbishop. About the same time Pegoiotti, an Italian merchant, traced the caravan route through Asia as far as Cambalu, and published his itinerary.† Another Minorite friar, Oderic of Portenau, narrated a voyage made to India, the oriental archipelago, and China, returning by way of Tibet. He describes some Chinese peculiarities, which could not seemingly have been copied from former writers; such as the pride taken by the female grandees in long nails and little feet; and the use of birds in fishing. He mentions, indeed, a country of pigmies, with other wonders, which have somewhat shaken his credit. These, however, being related only upon hearsay, indicate credulity rather than bad faith. This cannot be said of our countryman, Sir John Mandeville, whose relations for some time drew a much greater attention; his statements are mostly borrowed, and exaggerated, from Oderic, and, by pretending to have visited the pigmies, and seen other marvels, which the other stated only on report, he proves his work to be a complete forgery.‡

In the end of this century, the conquests and widely-extended empire of Timur, with his victory over Bajazet the Turkish sultan, resounded throughout Asia, and in some degree through Europe. Henry III. of Castile sent two successive embassies to the court of the Tartar conqueror, the last in 1403, under Clavijo, who spent some weeks at Samarcand, and though he has not added much to geographical knowledge, he gave an interesting account of the court and policy of that monarch.§

By these different means, a light, though somewhat dim, was thrown upon the farthest extremities of Asia; but it did not much avail the Italian republics, who were unable to reach its southern shores by sea, while the land route was too arduous and perilous to be so much frequented. The period, however, was now at hand when the farthest extremities of Asia were to be the scene of European enterprise and adventure. In 1497, Vasco de Gama doubled the Cape of Good Hope, and reached the shores of India at Calicut. In the short space of twenty years the Portuguese, by a succession of victorious armaments, established forts and settlements in Hindostan, the Malayan peninsula, and most of the islands of the archipelago, and even attempted them in China. Although this career could not be said to be one of discovery, almost all these countries being to a certain degree known, the hitherto doubtful accounts were authenticated, and they were surveyed with much greater precision. In the seventeenth century, a body of French missionaries, eminent for mathematical and astronomical knowledge, obtained permission to reside in Pekin, and were even employed in making a survey of China and the adjacent countries. The materials thus collected were transmitted to France, and arranged by D'Anville. Through the like agency, a less perfect knowledge was obtained of Japan.||

But though the south of Asia, including its finest regions, had thus become completely known, there remained north of the Altai mountains nearly a third part of the continent to which neither conquerors nor merchants had yet penetrated. Its discovery was reserved for Russia. After groaning for ages beneath the Tartar yoke, she emancipated herself, in the fifteenth century, under Joan Vassilievitch, and has ever since continued an active and increasing power. About the end of that century, having conquered the Comanches, she had the address to engage that active and hardy race to explore and conquer for her the vast region

## ASIA MINOR.

of Siberia. They proceeded step by step, till, in 1639, fifty years after the commencement of the undertaking, Dimitri Kopilof arrived at the gulf of Ochotsk, a branch of the Eastern ocean. Another division marched south-east upon the Amour, but there, having encountered the Chinese, were obliged to fall back. This progress, being along the southern part of the territory, did not bring them in contact with the coast forming the frozen boundary of the continent, which the English and Dutch were, in the meantime, exerting themselves to traverse as the nearest route to China. Middleton, Barents, Hudson, and other navigators, engaged in this attempt; but none of them reached beyond the gulf of Obi, a little east of Nova Zembla. About 1640, however, the Cosacs sent expeditions down the rivers Lena, Indigirka, Alaska, and Kolima, tracing their mouths, and the coasts between them. In 1646, they reached the extreme north-east peninsula of Asia, inhabited by the Tchutchi; in 1648, Deschnew and another chief undertook to sail round it, and though the accounts are imperfect, seem to have accomplished their object. Towards the end of the century, Behring discovered the most easterly cape of Asia; he and Tchirikoff afterwards made voyages to America. Cook, in his third voyage, sailed through these straits, and appeared to ascertain the disjunction of the two continents. It was still possible, however, that their coasts, by a vast circuit, might join each other; but this idea has been completely removed by the voyages of Wrangel on one coast, and of Beechey, Dease, and Simpson on the other. We may observe also that Cook, Perouse, and Broughton did much to explore the eastern boundary of Asiatic Russia, and its connection with the large island of Jesso, with Japan and China.\*

The entire coast of Asia has thus been explored, and in a great measure possessed, by Europeans. But the interior, never well described, and having ceased to be regarded in a commercial point of view, has continued comparatively unknown. The great range of the Himalaya, better described by Ptolemy than in many modern maps, has, however, been carefully surveyed, and its astonishing height ascertained. The expeditions of Turner and Moorcroft into Tibet, Elphinstone into Caubul, and Burnes into Bokhara, greatly extended our knowledge of these regions.† The embassies from Russia to China crossed Mongolia and the desert of Gobi; while Pallas and Humboldt, from that side, gained much information respecting these central regions. But Ferghanah, Yarcund, Kashgar, and the whole of Chinese Tartary, with its fine plains and lofty mountain ranges, are but little known, and would amply reward the enterprise of a traveller, who should elude the jealous policy by which they are shut against strangers.

### ASIA-MINOR. See NATOLIA.

**ASIAGO**, a town of Austrian Italy, prov. Vicenza, 24 m. N. Vicenza. Pop. 4700. It is built on the summit of a hill, and is celebrated for its dye-works, and fabrics of straw hats. The annual value of the produce of the latter is supposed to exceed 150,000.

**Asiago** is the chief town of a district containing seven communes, the inhabitants of which speak a corrupt dialect of the German. They are supposed, by some antiquaries, to be descended from fugitive Cimbric, escaped from the great battle in which that people were totally overthrown by Marius, 101 years B.C. Marco Pezzo, an ecclesiastic, and a native of the district in question, published a curious dissertation on this subject, a third edition of which appeared at Verona in 1763.

**ASOLA**, a town of Austrian Italy, on the Chiessa, 20 m. N. by E. Mantua. Pop. 3000. It is fortified, has a hospital, and a flature of silk. Its foundation dates from the remotest antiquity.

**ASOLA**, a town of Austrian Italy, 19 m. W.N.W. Treviso. Pop. 3000. It is finely situated on a hill, and is encircled by walls flanked with towers. It has an old cathedral, a public fountain, and some good houses. It is very ancient.

**ASPE**, a town of Spain, Valencia, 16 m. W. Allicant. In a mountainous country near the Taroffa. Pop. 5000. There are quarries of fine marble in its vicinity.

**ASPERG**, a town of Württemberg, 3 m. N.W. Ludwigsburg. Pop. 1400. Its church has some remarkable antiquities. At a little distance to the N. is the fort of Hohenasperg, on a steep rock 1105 feet above the level of the sea. It is at present used as a prison.

**ASPERN**, a small village of the arch-duchy of Austria, on the left bank of the Danube, opposite the island of Lobau, about 2 m. below Vienna. This and the neighbouring village of Eszling were, in 1809, the scene of a tremendous conflict between the grand French army, commanded by Napoleon, and the Austrians, under the Archduke Charles. After two days' (21st and 22d May) continuous fighting, with vast loss on both sides, Napoleon was obliged to with-

## ASSAM.

draw his troops from the field, and take refuge in the island of Lobau.

**ASPET**, a town of France, dep. Haute Garonne, cap. cant. 8 m. S.E. St. Gaudens. Pop. 2784. It has manufactures of nails, combs, and boxwood articles.

**ASSAM**, an inland territory of India beyond the Ganges, a dependency of the British empire, forming part of the E. frontier of our Indian possessions. It is included in the valley of the Brahmaputra, between 25° 50' and 26° 10' N. lat., and 90° to 97° 35' E. long.; having N. the Himalaya mountains, which separate it from Bhootan and Tibet; E. Tibet; S. the Naga and Garro mountains, which divide it from the Birman and Munneepoor territories; and W. Bengal: length, E. to W., about 460 m.; area, 18,200 sq. m.; pop. (Pemberton, 1835) 602,500. (*Hamilton's Hindostan*, ii. p. 740).

It is divided into,—

|                   | Area.            | Pop.    | Revenue.           | Chief Town. |
|-------------------|------------------|---------|--------------------|-------------|
| Upper Assam . .   | sq. m.<br>10,000 | 302,500 | Rupers.<br>180,000 | Joorhath.   |
| Central Assam . . | 5,635 }          |         | 4,000              | Georgopol.  |
| Lower Assam . .   | 2,565 }          | 400,000 | 316,000            | Cowball.    |

The general aspect of Assam is that of fine and fertile lowlands, inclosed by ranges of undulating hills, and these again by loftier ones, the surface of which is mostly covered by forests, but their summits in winter, are often covered with snow. The geology of this region has not been much studied: the mountains which form its S. boundary, which increase in height as they proceed eastward, consist in part of a hard gray granular slate; and on the inferior heights there are many scattered boulders of granite: shell limestone is found in large quantity near Dhurmpoor. (*Pemberton Boileau, Report on the E. Frontier of British India*, Calcutta, 1836, p. 73).

The most remarkable natural feature of Assam is the number of rivers, in which it surpasses every other country of equal extent. Besides the Brahmaputra, which runs through its centre in a S.W. direction, it has 34 rivers flowing from its N., and 24 from its S. mountains, all of which are navigable for trading vessels of some size! (*Hamilton, E. I. Gazetteer*, p. 39; *Pemberton, Report*).

In Upper Assam, the Brahmaputra divides into two streams, including the considerable island of Dehing, one of the most fertile tracts in the country, having an area of 1800 sq. m., and a pop. of 25,000. The inundations which prevail during a part of the year (*see* BRAHMAPUTRA), and give Assam the appearance of an extensive lake, and the great subsequent heats, render the climate most unwholesome and pestiferous both to Europeans and natives. The chief mineral products are gold dust in the sands of many of the rivers, the collection of which employs a great number of people, the produce of the Dhuburser river alone being estimated at 180,000 rup. a year; silver; iron; salt, chiefly from springs in Upper Assam; lead; coal; and petroleum. Throughout the whole length of the Assam valley, a forest 7 or 8 miles wide extends along the N. border, chiefly of a tropical character; but at the foot of the hill ranges, chestnut, alder, &c., are intermixed with the other trees. The timber is not remarkably fine, nor any of the trees large, excepting the caoutchouc (*Ficus elastica*, Roxburg), which grows solitary, sometimes to the height of 100 feet, and covering with its branches an area of 600 sq. ft. Tea, of a genuine kind, has been discovered in the region inhabited by the Singpho tribes, where it grows over a large tract of the peculiar yellowish soil so characteristically adapted to it: it has been brought to the London market, both black and green, and has fetched a high price; but it remains to be seen whether it can be produced as cheap and of as good a quality as in China. Our anticipations, we confess, are not very sanguine (January, 1839). This province is very favourable to the production of silk, which is of a very superior quality, but mostly made by wild insects, of which there are five different species; the sugar cane grows in Assam, but no sugar is made; a beautiful deep blue dye is obtained from *room*, a species of *Ruellia*, *Acanthaceae*; and a powerful poison is procured from some plant by the Assamese, into which they dip their arrows. The hills along the bed of the Trolich are very steep, and covered with dense jungle nearly to their summits. There are no tigers, but many bears, monkeys, squirrels, &c. The chief object of culture is rice, and next to this mustard seed; wheat, rye, barley, and millet are rare; many sorts of pulse, the banana, orange, and other fruits, black pepper, ginger, tumeric, capscum, onions, and garlic, are cultivated; and cotton by the hill tribes. Cattle and poultry are few; the buffalo is most used in agriculture. Villages rare, and the scattered huts mostly built of bamboo. There is some small trade with Bhootan and Tibet: several remarkable roads or causeways intersect Assam, the origin of which is not known, but they appear to have been constructed at a distant period; one of

\* Coxe, Muller, Bursey, Cochrane, Cook, &c.

† Asiatic Researches, vol. 6, 10, 11, 12. Fraser's Tour in Himalaya mountains, &c.

these extends from Cooch Bahar in Bengal to the extreme E. limits of this country. The land is tilled by *pykas*, or natives of four different classes, who are obliged, for a portion of the year, to give their services for the benefit of the rajah granting them their land. (*Pemberton*, p. 73; *Hamilton*, *E. I. Gazetteer*, p. 40, 41).

The manufactures are those of silk velvet and cotton stuffs, and are carried on by the women: silks are in general use for clothing, and similar to those of China. The trade is mostly with Bengal, the imports from which are broadcloths, muslins, chintzes, &c., salt, opium, liquor, glass, crockery, tobacco, betel, and rice; the exports being gold dust, ivory, silver, amber, musk, dace, Birmeese cloths, and a few Chinese cloths; in 1833, cotton was added to the exports from Assam. (*Pemberton*, p. 72). There is a duty of 10 per cent. on the value of all imports. The country is inhabited by a number of different tribes, who in central Assam are united under a rajah tributary to the British government. Upper and Lower Assam are in the direct occupation of the British, who keep at Suddya two companies of Assam light infantry under a British officer, and two gun-boats. (*Pemberton*, p. 71). Justice is administered by the heads of tribes and their punishments are of the most barbarous description, a capital crime involving the death, not only of the criminal, but also of all the members of his family! The religion is that of Brahma, introduced in the 17th century; before that period, the god Chang (probably the same as Boodhi) was adored: the priests have great influence, and are intriguing and vicious. The people are active, hardy, and enterprising; but barbarous, revengeful, and deceitful: they consist of numerous different tribes, as the Bor-khamti, Singphos, Miahknes, &c., each under a separate chieftain. Principal food rice, but they also eat serpents, rats, locusts, dogs' flesh, &c.; they use an Hindostanee dialect, the language of Assam being nearly extinct. Some of the tribes go quite naked; others have a covering round their middle, and over the head and shoulders: they wear moustaches, but shave the scalp and chin. Their habitations, even in the principal towns, are mere huts, with a clay floor and conical roof of straw or bamboo. In every respect, this country is in a state of abject barbarism. Little is known of their history; in 1638, they invaded Bengal, but were repulsed by some of Shah Jehann's officers, and lost some of their own frontier provinces. A general of Aurungzebe subsequently led an army into Assam, which he lost before Gergong, during the rainy season, by disease and the resistance of the enemy. Assam is one of the provinces ceded to the British by the Birmeese in 1826. (*Hamilton*, *Description of Hindostan*, p. 744, 745. *Hamilton*, *E. I. Gazetteer*, p. 41.)

ASSCHE, town of Belgium, prov. South Brabant, about half way between Brussels and Dendermonde. Pop. 4000. It has some trade in hops, flax, and corn.

ASSEERGHUR, a town and fortress of Hindostan, presid. Bombay, prov. Candahar, cap. distr. belonging chiefly to Sindia's dom., on a detached hill of the Sautporah range, 15 m. N. Boorhampoor, and 215 m. N.E. Surat. Lat. 21° 28' N., long. 76° 23' E. Pop. (1822) about 2000. The town, straggling and irregular, with one good bazar, stands at the base of the rocky hill on which the fortress is placed. The summit of this hill is about 1100 yds. from E. to W., by 600 yds. wide; it is enclosed by a wall, and surrounded by a precipice from 80 to 100 ft. in perpendicular height, so well scarped as to leave no means of ascent except at two spots, both of which are strongly fortified. A second line of works of excellent masonry protects it on the S.W. side, on the principal road to the fort; and a third line embraces the hill immediately above the town. It is, besides, protected by ravines and deep hollows on every side, and possesses the rare advantage of plenty of water. Magazines and a sally-port, easily blocked up by the garrison, are excavated within the rock. The approach from the N. is over a wild tract infested with tigers and wolves. Asseerghur is surrounded on every side except the S.W. by Sindia's dom., and is the nearest place in the Bombay presid. to Bengal. It was taken in 1803 and 1819 by the British, who have held it since the last-mentioned year. (*Hamilton*'s *E. I. Gaz.*, l. 64.)

ASSENDELFT, a village of the Netherlands, prov. Holland, 7 m. N.N.E. Harlem. Pop. 2300.

ASSENEDE, a town of Belgium, prov. East Flanders, 13 m. N. Ghent. Pop. 3300. It has manufactures of wool and cotton, dye-works, breweries, soap-works, &c.

ASSENHEIM, a town of the G. duchy Hesse-Darmstadt, at the confluence of the Nidda and the Wetter, 13 m. N.E. Frankfort on the Mayne. Pop. 4600. A part of this town belongs to the duke of Isenburg Budingen. A good deal of wine is produced in its territory, and it has considerable coal mines.

ASSENS, a sea-port town of Denmark, W. coast of the island of Fünen, on the channel called the Little Belt, 92 m. W.B.W. Odensee, lat. 55° 17' N., long. 9° 54' E. Pop. 1500.

It has distilleries, and a considerable trade in corn. It is the usual point of departure for persons leaving Fünen for Sleswick.

ASSISI, a town of Italy, states' of the Church, 13 m. E.S.E. Perugia. Pop. 4000. It is situated on a mountain, is the seat of a bishopric, has a cathedral and several other churches, some of which are ornamented with fine pictures. Metastasio belonged to this town.

ASSOUAN. See SYENE.

ASSUMPTION, or ASUNCION, a city of S. America, cap. Paragway, and residence of the dictator, finely situated on an eminence on the left bank or the great navigable river of that name, lat. 23° 16' S., long. 57° 37' W. Pop. circa 10,000. It was founded in 1535, and, from its advantageous situation, became of sufficient importance to be made a bishopric in 1547. It is miserably built; the streets being unpaved, and most of the houses no better than huts. The only good buildings are the convents. What has been called its "beautiful cathedral" is a paltry, white-washed fabric; and its government-house, with the title of palace, though extensive, is mean. The men are said to be well made and athletic, and the women handsome; the country round is comparatively well cultivated and populous. Assumption is the centre of a considerable trade in hides, tobacco, timber, mattle, or Paragway tea, wax, &c. (*Robertson's Paragway*, l. 283.)

ASSUMPTION, a small island of the Marianne archipelago, Pacific ocean, lat. 10° 45' N., long. 145° 54' E. It is cone-shaped, and consists almost entirely of lava and other volcanic products. It produces a few cocoa-nut trees, and is described by Perouse as a most wretched place.

ASSUMPTION, parish, La., situated in the S.E. part of the state, and contains 600 sq. m. The Mississippi bounds it on the N.E. Watered by Bayou La Fourche. It had in 1840, 6647 neat cattle, 1590 sheep, 6340 swine, and produced 265,650 bushels of Indian corn, 34,600 of potatoes, 2,106,769 pounds of cotton, 6,530,000 of sugar. It contained thirteen stores, one saw-mill, one college, 44 students. Pop.: whites, 4103; slaves, 2989; free-coloured, 50; total, 7141. Capital, Assumption C.H.

ASSUMPTION, C.H., or Napoleonville, p. v., capital of Assumption parish, La., 80 W. New-Orleans, 1961 W. Situated on the W. side of Bayou La Forche, and contains a court-house and several dwellings.

ASSUS, an ancient city of Asia Minor, in Troas, near the sea, whose ruins occupy a site contiguous to the modern and inconsiderable village of Belram, 12 m. E. Cape Baba (an. *Lectum*), 35 m. W.S.W. mount Ida, and nearly opposite to Mollivo in Mytilene. It is said to have been founded by a colony from Lesbos, and was famous in the history of Grecian philosophy from its having been the birth-place of Ceanthes the stic, and for a while the residence of Aristotle. Colonel Leake says of its ruins, that "they are extremely curious. There is a theatre in very perfect preservation; and the remains of several temples lying in confused heaps on the ground; an inscription upon an architrave on one of these buildings shows that it was dedicated to Augustus; but some figures in low relief on another architrave appear to be in a much more ancient style of art, and they are sculptured on the hard granite of mount Ida, which forms the materials of several of the buildings. On the W. side of the city the remains of the walls and towers, with a gate, are in complete preservation; and without the walls is seen the cemetery, with numerous sarcophagi still standing in their places, and an ancient causeway leading through them to the gate. Some of these sarcophagi are of gigantic dimensions. The whole gives, perhaps, the most perfect idea of a Greek city that anywhere exists." (*Leake's Asia Minor*, p. 123.)

ASSYE, a town of Hindostan, prov. Berar, in the Nizam's dom., 26 m. N. Jaulna. It is celebrated as the spot where the duke of Wellington commenced his career of victory. On the 23d of September, 1803, his grace, then General Wellesley, with 4500 men (of whom only 3000 were British), completely defeated the combined forces of Dowhat Row Sindia and the Nagpore rajah, amounting to 30,000 men. The confederates fled from the field, leaving about 1200 slain, ninety-eight pieces of cannon, seven standards, their whole camp equipage, and much ammunition. The British-Indian army lost 1566 men, killed and wounded.

ASTAFORT, a town of France, dep. Lot-et-Garonne, cap. cant. on the Gers, 10 m. S. Agen. Pop. 2527.

ATCHAFALAYA, an outlet of the Mississippi, which passes out on the W. side, a little over a mile below the mouth of the Red river, of about the same width, and carrying off from the Mississippi about as much water as the Red river brings in. A curve in the Mississippi westward throws an immense amount of floating timber into the Atchafalaya, which forms large rafts, and effectually obstructs the navigation. The medial width of the bayou is over 200 yards; its course is winding, giving it a total length to the gulf of Mexico of nearly 900 miles, though in a direct

## ASTERABAD.

course it is about 130. It receives in its course the Plaquemine, another outlet of the Mississippi, and constitutes the W. boundary of the delta of the Mississippi. By a recent passage of the Mississippi across the isthmus formed by a bend of the river, it pursues a more direct course than formerly, not passing the outlet of the Atchafalaya, shortening the distance between Natchez and New-Orleans 30 miles.

ASTERABAD, or ASTRABAD, a city of Persia, cap. of a small prov. of the same name, on the Gorgan, about 19 m. from where it falls into the S.E. angle of the Caspian sea, denominated the bay of Asterabad, lat. 36° 30' N., long. 53° 23' E. Mr. Frazer says that it contains from 3000 to 3000 houses, so that its population may be estimated at from 12,000 to 18,000. It is surrounded by a low mud wall, about 3½ m. in circuit. Formerly it was much more extensive than at present; a great part of it being in ruins, and there being also within the wall extensive gardens and numerous trees. Houses, chiefly of wood, are said to be picturesque and pleasant, and are frequently furnished with verandahs resting on wooden pillars; their roofs project far beyond their walls. The streets are well paved and clean, and are furnished with drains to carry off the water, which in most other Persian cities is allowed to stagnate in pools. None of the public or private buildings deserve notice. The palace of the prince, or governor, is a miserable fabric. The bazars, or public markets, are tolerably extensive; but they contain little besides the articles required for the consumption of the place. Asterabad, though in fact a port, has but little trade. It is said to be unhealthy; a consequence, most probably, of thickets and forests being allowed to approach the very walls. (*Frazer's Caspian Sea*, &c., p. 7.)

ASTI (an. *Asia* or *Hestia Pompeia*), a city of the Bardinian states, prov. Alessandria, on the Bourbo, near its confluence with the Tanaro, 98 m. E.S.E. Turin, lat. 44° 57' N., long. 8° 12' E. Pop. 22,000. It is surrounded by old walls in a ruinous condition, and was famous for its 100 towers, of which hardly thirty now remain. Streets narrow; but it is in general pretty well built. The cathedral, a modern building, occupies the site of a temple of Diana, and it has, besides, numerous parish churches and palaces. Asti is the seat of a bishopric, of a court of original jurisdiction, and a royal college, and has several silk flatures, with manufactures of silk, stuffs, &c. The vineyards in its vicinity furnish the best wines of Piedmont; and it carries on a considerable trade in them, in raw and manufactured silks, and other articles. One of the greatest poets of modern Italy, and, indeed, of modern Europe, Victor Alfieri, descended from an ancient and noble family of Asti, was born here on the 17th of January, 1749.

Asti is a very ancient city. In 1154 it was burned down by the emperor Frederic Barbarossa, but it had been previously evacuated by the inhabitants. (*Sismondi, Républiques Italiennes*, li. p. 57.) It soon recovered its ancient grandeur, and in the 13th century was able to contend with the forces of Charles I. of Naples. In the 14th century it formed part of the territory of the lords of Milan, and was transferred, in 1367, as the dowry of a Milanese princess, to the duke of Orleans, brother to Charles VI. of France. It remained under the dominion of the French till 1539, when it was ceded by the treaty of Cambray to the emperor Charles V. The latter made it over to one of his female relations, who married a prince of the house of Savoy, in whose possession it still continues. (*Corder's Italy*, l. p. 225.)

ATIER (ST.), a town of France, dep. Dordogne, on the Isle, 10 m. W.S.W. Périgueux. Pop. 2300.

ASTON, L. Delaware co., Pa., 30 m. W. Philadelphia. Bounded E. by Chester creek, watered by Painter's creek. It contains four stores, five cotton factories, with 7120 spindles, three grist-mills, four saw-mills, three schools, 70 scholars. Pop. 1469.

ASTORGA, a town of Spain, prov. Leon, 30 m. W. Leon, in an extensive and fertile plain near the banks of the Tuer, lat. 43° 27' N., long. 6° 10' W. Pop. 4000. It is very ancient, and was formerly fortified by a wall and a castle; but both of these have been allowed to go to decay. Some new defences were, however, constructed in 1810, previously to its reduction by the French under Junot, but we are not informed as to their present state. The town is ill built, and the streets narrow and dirty. It is the seat of a bishop, has a Gothic cathedral, celebrated for its high altar, four parish churches, and some convents.

ASTORIA, p. v., Newtown L., Queen's co., N.Y., 132 m. E. Albany, 223 W. Situated on the East river, just below Hell Gate, 6 m. N.E. New-York city, and contains four churches, one Dutch Reformed, one Methodist, one Episcopal, one Roman Catholic, a female seminary, two stores, one turpentine factory, one carpet factory, 100 dwellings, and about 600 inhabitants. A steam ferry connects it with New-York city.

ASTORIA, a trading-post, situated on the S. side of Columbia river, 8 miles from its entrance into the Pacific. It was established in 1811 by John Jacob Astor, of New-York city,

## ASTURIAS.

who was largely engaged in the fur trade. It was relinquished during the last war, but restored to its founder at its close. It is now occupied by the Hudson Bay company, and called Fort George.

ASTRAKHAN, an extensive gov. of Russia, in Europe, lying along the N.W. shore of the Caspian sea, and divided into two nearly equal portions by the Wolga. Area supposed to be about 83,000 sq. m. Pop. estimated by various authorities at from 250,000 to 320,000. This is one of the least valuable provinces in the empire. With the exception of the Delta of the Wolga, and a narrow strip of land along the banks of that river, it consists almost entirely of two vast steppes, one on each side the river, in part occupied with sand hills, but mostly low and flat; the soil consisting of mud and sand, strongly impregnated with salt, interspersed with saline lakes, and altogether unsuited to cultivation. In consequence, agriculture is all but neglected; but in the Delta of the Wolga gardening is practised with some success, and superior fruits are raised. In summer the heats are frequently excessive, while in winter the frosts are equally severe. Horses are of the beautiful Calmuck breed; and some of the wandering tribes have great numbers of camels. That fertility which nature has denied to the land she has given to the water. The fishery forms the principal source of the wealth of this government, and is carried on upon a great scale on the Wolga, which teems with fish, and along the shores of the Caspian. Sturgeon, carp, and seal, but particularly the first, are the fish most commonly taken. The annual value of the sturgeon fishery is estimated at from 2,000,000 to 3,000,000 roubles; and above 30,000 barrels of caviar, prepared from the roes of the sturgeon, have been exported from Astrakhan in a single year. Though few in number, the inhabitants consist of a great variety of races. They are mostly nomades; and, according to the official statements, there are, in the entire government, only 20,098 individuals subject to the capitation tax. With the exception of some fabrics in Astrakhan, manufacturing industry is unknown.

ASTRAKHAN, a city of Russia, in the cap. of the above government, on a small island in the Wolga, on the left bank of the main stream, about 30 m. from its embouchure, lat. 46° 30' 53" N., long. 47° 55' E. Pop. 31,000. This "Alexandria of the Scythian Nile," as it has been sometimes called, stands on ground elevated sufficiently to be above the reach of the inundations. It consists of three parts: the *Kremnia*, or citadel; the *Biologorod* (white town); and the *Slobodes*, or suburbs. In the first, or nucleus of the city, is the cathedral, a large square edifice surmounted by five domes, the convent of the Trinity, and the arch-episcopal palace; in the second are the buildings for the government functionaries, including an admiralty board, having charge of the flotilla kept on the Caspian, the gymnasium, and the bazars, or factories for the use of the merchants. The houses in the suburbs, where the bulk of the population resides, are of wood; whereas in the other two divisions they are of stone. Streets crooked, and mostly without pavement. It is the seat of an Armenian as well as of a Greek archbishop; and it has also Mohammedan, Hindoo, and Protestant places of worship. Exclusive of the gymnasium, there is an ecclesiastical academy, a district grammar school, and some inferior schools; but education is, notwithstanding, at a very low ebb here, and throughout the government. There are several manufacturing establishments for the production of cottons, woollens, and silks; with distilleries, tanneries, soap-works, &c. Astrakhan is the centre of the fisheries carried on in the Wolga and Caspian. Its burghers had formerly a monopoly of the fishery in the Wolga; but since 1803 they have been free in every one. During the season, the fisheries employ immense numbers of people and boats. The population of the city is then much augmented, and it presents an animated, lively scene. It is the grand fishing mart for all the interior of the empire; it is also the great entrepôt of the trade with Persia and the countries to the east of the Caspian, sending to them leather, furs, iron, copper, tallow, &c., and getting back silk and cotton goods, raw silk, cotton twist, drugs, carpets, &c. The exports to the countries in question in 1834 amounted to 1,447,169 roubles, and the imports to 912,416 roubles; but they have sometimes been more than double these amounts. This trade is principally carried on by Armenian merchants. (*Schaitzner, La Russie*, &c., p. 699; *Official Tables*, &c.)

ASTURIAS, a principality in the N. of Spain, now the prov. of Oviedo, lying along the bay of Biscay, between 40° 30' and 70° 10' W. long., having E. the Castilian prov. of Santander, S. Leon, and W. Galicia. Its area has been variously estimated, but may be taken at about 3650 sq. m. Pop. (1834) 434,635. Surface much diversified. Its S. border consists of a chain of high mountains, which gradually diminish in height as they approach the coast, along which there are extensive tracts of pretty level land. It is extremely well watered, being intersected by the Nalon, Navia, and other rivers, and has several sea-ports, as Gijon, Rivadossella,

## ASYLUM.

Cadillero, Aviles, &c. The climate along the coast is mild, but in the mountainous parts it is frequently severe, and it is distinguished by its humidity. But little wheat is raised, the inhabitants subsisting chiefly on maize, and a species of corn called *escanda*. Hazel-nuts are scarce; but chestnuts are very plentiful, and of excellent quality. The vine is cultivated in some parts; but the produce of wine is not sufficient for the consumption, the deficiency being supplied with cider, which is partly also exported. Oranges and lemons are produced in a few places, and great numbers of cucumbers. Besides the chestnut, the wood of which, as well as the fruit, is most valuable, the mountains are covered with forests of oak, beech, plane, &c. There is a considerable exportation of cattle and horses from this prov. to the interior. Iron, copper, lead, antimony, jet, amber, marble, mill-stones, &c., are found in different places. Coal is also found, and Miñano says that 90,000 quintals are shipped for other parts of the peninsula. With the exception of hardware, with many articles of which this prov. supplies the rest of Spain, its manufactures are in a very backward state. Mr. Townsend says of the inhabitants, "They eat little flesh; they drink little wine; their usual diet is Indian corn, with beans, pease, chestnuts, apples, pears, melons, and cucumbers; and even their bread, made of Indian corn, has neither harm nor leaven, but is unfermented, and in the state of dough: their drink is water" (II., 14). The principal towns are Oviedo, Gijón, Aviles, Navia, &c.

Asturias may be said to be the cradle of Spanish independence. The Saracens, who had overrun the rest of the country, were unable to overcome the Christians, who had taken refuge in the fastnesses of its mountains. Pelayo was proclaimed king in 718; and his successors having gradually extended their conquests, took, about two centuries after, the title of kings of Leon. In 1388 the prov. was erected into a principality, and became the appanage of the heir presumptive to the throne, who has since been styled prince of Asturias. Several peculiar privileges have been conferred on this province on account of the services it has rendered to the monarchy. (*Antillen, Miñano*.)

ASYLUM, p. t., Bradford co., Pa., 145 m. N. Harrisburg, 855 W. Bounded E. and N.E. by Susquehanna river. Wylissing rapids in the Susquehanna are opposite to the t. It has six schools, 196 scholars. Pop. 447.

ASZOD, a market-town of Hungary, co. Pesth, on the Galga, 23 m. N.E. Pesth, in a fertile valley. Pop. 2920, mostly Protestants. Here is a large and handsome country-seat belonging to the barons Podmaniczky, with a fine collection of coins and natural curiosities. It has manufactures of blue and green dyed sheepskins, for which there is a considerable demand. (*Nat. Essig, I., 134*.)

ATACAMA, an extensive district of Bolivia, or Upper Peru, lying along the Pacific ocean, between the river Lau on the N., and the Salado on the S., or between 21° and 25° deg. S. lat. Towards its N. extremity there are some fertile valleys; but by far the greater part of its surface is an absolute desert, covered with dark brown or black movable sand. The arid soil of this province is never refreshed with rain, and, except where a very few rivers descend from the Andes, it is both uninhabited and uninhabitable. Cobija, or Port La Mar, is built at the mouth of one of these rivers.

ATESSA, a town of Naples, prov. Abruzzo Citra, 14 m. W. Vasto d'Ammone. Pop. (canton, 1839) 7526. It is situated on a hill, has a fine collegiate church, with parish churches, convents, a hospital, and three *monte de pietà*. The port Cardone was a native of Atezza.

ATFIEH, a town of Egypt, cap. prov. same name, near the right bank of the Nile, 42 m. S.S.E. Cairo. Pop. 4000. It is supposed to be on or near the site of the ancient *Aphroditopolis*.

ATH, a town of Belgium, prov. Hainault, on the Dender, and on the high road from Tournay to Brussels, 15 m. N. by W. Mons, lat. 50° 42' 17" N., long. 3° 46' 32" E. Pop. (In 1835) 8817. It was fortified by Vauban, and the works have been materially improved and strengthened since 1815. It is well built. Principal public buildings, the arsenal, town-house, and the church of St. Juliana: the spire of the latter, 150 feet in height, was destroyed by lightning in 1817, and has not been rebuilt. Ath has a college, founded in 1416, a school of design, an orphan hospital, theatre, &c. It has manufactures of linen, woollen and cotton stuffs, hats and gloves; establishments for bleaching and dyeing; with oil-mills, soap-works, breweries, distilleries, &c. It is an entrepôt for the trade in coal, and for the produce of the surrounding country.

ATHAPESCOW, or ATHABASCO, an extensive lake of N. America, being about 200 m. in length, and from 14 to 15 in average width. Port Chipewyan, at its S.W. extremity, is in lat. 58° 42' N., long. 111° 18' W. It receives the Athapescow river; and the Slave river flows from it into Great Slave lake, lying about 170 m. N.E. Its N. shore is high

## ATHENS.

and rocky, whence it is sometimes called the lake of the hills.

ATHBOY, an inland town of Ireland, co. Meath, prov. Leinster, on a small branch of the Boyne, from which it is supposed to have its name, signifying "the yellow ford," 31 m. N.W. by W. Dublin. It is a place of no historical notoriety. Pop. in 1821, 1589; in 1831, 1939, forming two thirds of that of the par., which in 1834 amounted to 5491, of whom 333 were of the E. church, and 5158 E. Cath. The town, situated in a level and fertile district, consists of one long street; has a modern church, with an ancient tower; a large and elegant R. Cath. chapel, in the ancient English style, with a steeple 90 ft. high; a dispensary; schools, partly endowed and partly private, in which about 400 pupils are educated; and almshouses, in which 12 poor widows are supported. Fuel is supplied in plenty from an extensive neighbouring bog. The hill of Ward, near the town, 400 ft. high, is a striking object in this flat country. The town, which is a bor. by prescription, received a charter from Hen. IV., confirming and extending its privileges, which were confirmed and farther extended by subsequent monarchs, particularly by Elizabeth, who confirmed on it the right of sending two m. to the Irish par.; and by James I., by whom the municipal limits were fixed at a mile beyond the town in every direction, to which was added a right to hold a court of record. But these, and some manorial powers, have fallen into desuetude since the Union, when the borough lost its right to return m. to par. Petty sessions are held here on alternate Thursdays. There is a large flour-mill in the town. The market, held in the market-house on Thursdays, is well supplied with corn and provisions. The fairs are numerous; the principal being those held on the Thursday before Jan. 28, on May 4, Aug. 4, and Nov. 7; the others, held on Mar. 3 and 10, June 23 and 30, and on Sept. 23 and 29, are less important. The post-office revenue in 1830 was £301, and in 1836, £245. The town is a constabulary station. A *caravan*, conveying an average number of eight passengers each trip, plies between it and Dublin seven times a week. (*Municipal and Railroad Reports, &c.*)

ATHENRY, a decayed town of Ireland, co. Galway, 14 m. E. Galway. Pop. 1319. It was formerly of some importance, having been enclosed by walls, and possessed of a university. It returned a member to the Irish parliament.

ATHENS,\* one of the most famous cities of antiquity, and the capital of the new kingdom of Greece, is situated on the W. side of Attica, about 5 m. from the gulf of Egina lat. 37° 53' 1" N., long. 23° 46' 14" E. Its situation bears a considerable resemblance to that of Edinburgh, being built on the W. side of an abrupt and rocky eminence rising out of an extensive plain terminated N. by mount Pentelicon and Farnes, N.E. by mount Anchesmus, E. by mount Hymettus, S.W. by the hill Mædium, now called Philopappas, and W. by Lycabettus. During the protracted conflicts of the revolutionary war (1820-27) the town, which previously consisted of 1300 houses, was laid in ruins; and when the seat of government was transferred to Athens in 1834, it was with the greatest difficulty that the diplomatic body and their offices. It is, however, again rising rapidly into importance, but in general is meanly built, consisting, in great part, of mud houses. Several streets have been opened, levelled, and widened, the principal of which are Hæcmet, or Mercury-street, Æolus-street, Minerva-street, and the Bazar, or Market-street. The first of these traverses the town, which it divides into two equal parts, parallel with the Acropolis, and is crossed at right angles by that of Æolus, which terminates close under the Acropolis. Minerva-street, the broadest of all, runs in nearly the same direction as Æolus-street. Bazar, or Market-street, so called from its containing the shops for the supply of the various articles required by the population, is about 1 m. in length. The principal commodities are "caviar, onions, tobacco, black olives, figs, rice, pipes with amber mouth-pieces, rich stuffs, silver-chased pistols, dirks, belts, and embroidered waistcoats." (*Worswick's Residence in Attica*.) The houses, built in the modern German style, are generally supplied with "jalouses" and balconies, and contain shops and coffee-houses on the lower story. The other streets of Athens are hardly deserving contempt for regularity. The principal public buildings are, the royal palace, a large edifice recently constructed, with a portico facing the Acropolis, the mint, the royal stables, a military hospital, and a barrack. Many large private houses have been also lately erected, and building is proceeding "with such spirit that the sum of £300 is frequently given for half an acre of land." (*Wors-*

\* Athens, so called from *Ἀθήνη*, Minerva, the patroness of the city. There were several places of the same name in Greece. Sept. Art. (t. 1.) enumerates eight. The Romans used to designate the city of Minerva, *Athena Attica*.

## ATHENS.

werth.) The population of Athens amounts to about 17,000 (*Zeitung des Corresp.*), and is perhaps more heterogeneous in its composition than that of any city of its size. "Greeks, in their wild costume, are jostled in the streets by Englishmen, Frenchmen, Italians, Dutchmen, Spaniards, Bavarians, Russians, Danes, and Americans." (*Stevens's Travels in Greece*.) European shops invite purchasers by the side of Eastern bazars; coffee-houses and billiard-rooms, and French and German *restaurants*, are opened all over the city. The mixture of its population bears a striking analogy to the extraordinary contrasts presented by the city itself. "The same half acre of ground," says a recent traveller, "often contains two or three remaining columns of an ancient portico, a small Christian chapel of the middle ages, a Venetian watch tower, a Turkish mosque, with its accompanying cypresses and palm-trees, and a modern fashionable-looking residence;" thus, as it were, distinctly exhibiting the different phases of the varied existence of this celebrated city. Athens is the seat of a university, and has a gymnasium, in which the government has founded several exhibitions for the maintenance of students, three public seminaries, and two schools supported by private benevolence. Great efforts have been made to secure the health of the city, by cleansing and repairing the ancient sewers and by draining the marshes formed by the overflowings of the Cephissus, the exhalations of which were extremely noxious. There are thirteen churches, twelve belonging to the Eastern and one to the Western Church. Though the manufactures of Athens are very backward, its revenues are considerably improved: according to the official statement of 1853, they amounted to 160,000 drachms. At the Piræus, too, the harbour of Athens, several large houses have been built, and "some good streets, flanked by low but respectable dwellings, have already been completed." A large custom-house, a quay, and a lazaretto, have been erected, and though trade cannot be said to flourish, the town presents rather a bustling appearance, and contains about 1500 inhabitants. The communications between Athens and the Piræus have been greatly facilitated of late by the construction of a good road; and it is rumoured that a railway will soon be formed between the two places. Athens stands on a spot rich in remains of antiquity; and it is reasonable to suppose that its present tranquillity will prove favourable to the better illustration of monuments and places already identified, and that the excavations everywhere forming for laying the foundations of new buildings will lead to many valuable discoveries.

### The ancient city of Athens

"— The eye of Greece, mother of arts  
And eloquence, native to famous wits,  
Or hospitable—"

considerably exceeded in extent the modern town; and, unlike the latter, which, as already observed, spreads into the plain chiefly on the W. and S.W., encircled the Acropolis. It was enclosed in a sort of peninsula formed by the confluence of the Cephissus and Illyssus, the former of which flows due S. past the W. side of the city; the latter, which rises a few miles to the N.E. of the city, runs past it in a S.W. direction. At the time when Athens had attained its greatest magnitude, it was encompassed by a wall surmounted at intervals by strongly-fortified towers. The plan of this wall, many parts of which still remain, exhibits the form of an irregular oblong, having at its N. extremity the gate of Acharnæ, on the S. the Ionian gate and the fountain Callirhoë, on the W. the gate of Diocleares, and on the E. the Peiræic gate. In attempting to describe the leading features in the topography of Athens, we cannot do better than transfer to our columns an extract from an article on Athens in the *Penny Cyclopædia*, which exhibits within small compass a more distinct outline of that city than is anywhere else to be met with. "Beginning with the gate of Acharnæ on the N., as above stated, the wall ran eastward near the base of Anchesmus, and past the Demeian gate to the gate of Diocleares, which led to the Lycæum; it then continued parallel to the Illyssus on the western side of that stream to the fountain Callirhoë or Eneacrunce, and thence to the hill of the Museum, which it crossed, comprehending the still-existing monument of Philopappus within its circuit. Its course from the Museum was N., taking in the chief part of the Pnyx and mount Lycabettus, to the Dipylum, which led to the outer Ceramicus or great burying-ground, and to the Academia or school of Plato, in the depression between the Pnyx and Lycabettus. A line from Dipylum to the gate of Acharnæ completes the circuit." Athens had three great harbours, the Piræus, Munychia, and Phaleron. These ports formed a separate city larger than Athens itself, and were connected with it by means of the long walls (*μακρά τείχῃ*) the identification of which has involved the learned in interminable disputes. The harbour of the Piræus was a spacious basin embraced by two arms of rocky land which formed gigantic natural piers. Even

now it is considered a safe port, and in former times it constituted at once the harbour, dockyard, and arsenal of Athens.

Athens, at its most flourishing period, contained about 10,000 houses (*Xen. Mem.* lib. ii. 14), which were for the most part so small and mean in appearance that, according to Dicaearchus, it was to the public edifices alone that it owed its attractions. The inhabitants were comprised under three classes, citizens (*πολίταις*), sojourners (*μετοίκαις*), and slaves (*δούλοι*); of these, the slaves greatly preponderated, though it is difficult to make an accurate computation of their numbers. Indeed, the whole question as to the population of Athens is involved in great obscurity. Hume, Letronne, Boeckh, Leake, Clinton, and others, have, in our own times, directed their efforts towards its elucidation, and have supported their reasonings with great learning and ingenuity, though with little unanimity or success; among the difficulties that surround the subject, from the vagueness, inaccuracy, and discrepancy of the *data*, are so great as almost to preclude the possibility of arriving at anything like a satisfactory conclusion. Boeckh has estimated the population of the city and its ports at 180,000; Clinton at 160,000; and Leake at 116,000. The statement of Athenæus that the number of slaves in Athens (or Attica) was 400,000, is universally admitted to be grossly exaggerated. The commercial operations of Athens embraced every known country and commodity. "All the products of foreign countries," says Boeckh, "came to Athens, and articles which, in other places, could hardly be obtained singly, were collected together at the Piræus. Besides the corn, the costly wines, iron, brass, and other objects of commerce which came from all the regions of the Mediterranean, they imported from the coasts of the Black sea, slaves, timber for ship-building, salt-fish, honey, wax, tar, wool, rigging, leather, goat-skins, &c.; from Byzantium, Tharsus, and Macedon, timber, slaves, and salt-fish; slaves from Thessaly; carpets and fine wool from Phrygia and Miletus." "A. the finest products," says Xenophon (*De Rep. Ath.* lib. ii. 7), "of Sicily, of Italy, Cyprus, Lydia, Pontus, and the Peloponnese, Athens, by her empire of the sea, is able to collect into one spot." Nor were manufactures neglected. It is true that commerce was regarded as the chief point of national policy, and that every encouragement was given to it which high protecting regulations and other privileges could bestow. But no restriction was imposed upon industry: the meanest manual occupation was attended by no disgrace; hence every branch of industry flourished, and the manufactures of Athens were everywhere esteemed. The native products of Athens, too, were of great importance: they consisted chiefly of olives, figs, and honey, and have been celebrated in all ages. The wealth of the city was also augmented by the silver mines of Laurion, and these sumptuous edifices, which constituted the pride of the Athenians, and the admiration of the present day, owed their origin to the marble quarries of Pentelicon. (*Diodor. l. Greece*.) The opulence, prosperity, and power of Athens are fully exhibited by Thucydides (lib. ii. 13). Previously to the Peloponnesian war, the treasury contained 9700 talents, besides a great quantity of gold and silver deposited in the temples of the gods and in other public edifices. The city was defended by 1800 cavalry, 1600 bowmen, and 13,000 heavy-armed troops; 18,000 men were stationed in the fortifications, and the coast was guarded by 300 well-manned ships. The same historian has distinctly indicated (lib. ii. 40) that the freedom of the Athenian institutions, so pre-eminently adapted to develop the energies of the human mind, was the chief source of their unparalleled greatness; but our limits preclude us from entering into details on the government and public economy of Athens, and we can only refer the reader to Boeckh's invaluable treatise on this difficult and interesting subject.

We now proceed to notice briefly the monuments of antiquity which still exist at Athens, as they have been described by Chandler, Clarke, Geil, Stuart, Dodwell, Leake, and other travellers. The most striking object is the Acropolis,\* or old Cecropian fortress, founded by Cecrops, about anno 1556 A.C., rising abruptly out of the Attic plain, and covered with relics of Athenian grandeur. At its W. end, by which alone it was accessible, stood the Propylæa, the gate, as well as the defence of the Acropolis. Through this gate the periodical processions of the Panathenæic jubilee were wont to move; and the marks of chariot wheels are still visible on the stone floor of its entrance. It was of the Doric order, and its central pediment was supported by six fluted marble columns, each 5 ft. in diam., 39 in height, and 7 in their intercolumniation. On the right wing stood the temple of Victory, and on the left was a building deco-

\* The Acropolis alone formed the ancient city, and from its elevated position was termed ἡ ἀνω πόλις; in contradistinction to the lower part, ἡ κατὰ τοὺς ἄλκας πόλις. Athens, including the upper and lower parts, was styled, by way of eminence, *πολις*, or *αἰὶς*; the city.

## ATHENS.

rated with paintings by the pencil of Polygnotus, of which Pausanias has left us an account. In a part of the wall still remaining there are fragments of excellent designs in baso-relievo, representing the combat of the Athenians with the Amazons; besides six columns white as snow, and of the finest architecture. Near the Propylæa stood the celebrated colossal statue of Minerva, executed by Phidias after the battle of Marathon, the height of which, including the pedestal, was 60 ft. But the chief glory of the Acropolis was the Parthenon, or temple of Minerva. It was a peripteral octostyle, of the Doric order, with seventeen columns on the sides, each 6 ft. 9 in. in diameter at the base, and 34 ft. in height, elevated on three steps. Its height, from the base of the pediments, was 65 ft., and the dimensions of the area 333 ft. by 192. The eastern pediment was adorned with two groups of statues, one of which represented the birth of Minerva, the other the contest of Minerva with Neptune for the government of Athens. On the metopes was sculptured the battle of the Centaurs with the Lapithæ; and the frieze contained a representation of the Panathenæic festival. Ictinus, Callicrates, and Carion, were the architects of this temple; Phidias was the artist; and its entire cost has been estimated at 1½ million sterling. Of this building, eight columns of the eastern front and several of the lateral colonnades are still standing. Of the frontispiece, which represented the contest of Neptune and Minerva, nothing remains but the head of a sea-horse and the figures of two women without heads. The combat of the Centaurs and Lapithæ is in better preservation; but, of the numerous statues with which this temple was enriched, that of Adrian alone remains. The Parthenon, however, dilapidated as it is, still retains an air of inexpressible grandeur and sublimity; and it forms at once the highest point in Athens, and the centre of the Acropolis. On the N.E. side of the Parthenon stood the Erechtheum, a temple dedicated to the joint worship of Neptune and Minerva. There are considerable remains of this building, particularly those beautiful female figures called Caryatides, which support, instead of columns, three of the porticoes; besides three of the columns in the north hexastyle with the roof over these last columns. The rest of the roof of this graceful portico fell during the siege of Athens, in 1827. Such is an outline of the chief buildings of the Acropolis, which, in its best days, had four distinct characters; being at once the fortress, the sacred enclosure, the treasury, and the museum of art of the Athenian nation. It was, so to speak, an entire offering to the deity, unrivalled in richness and splendour; it was the peerless gem of Greece, the glory and the pride of art, the wonder and envy of the world. In the city of Athens itself there are still some monuments of antiquity to be found. Of these, the principal are three exquisite Corinthian columns crowned by architraves; the temple of the Winds, built by Cyrrhestes, of an octagonal figure, with a representation of the different winds on each of its sides; and the monument of Lysicrates, called by the modern Greeks the Lantern of Demosthenes. This building consists of a pedestal surrounded by a colonnade, and is surmounted by a dome of Corinthian architecture; it was supposed to be the spot which Demosthenes used as his study; a supposition which has, however, long been overthrown. Beneath the southern wall of the Acropolis, near its extremity, was situated the Athenian or Dionysiac theatre. Its seats, rising one above another, were cut out of the sloping rock. Of these, only the two highest rows are now visible, the rest being concealed by an accumulation of soil, the removal of which would probably bring to light the whole shell of the theatre. Plato affirms it was capable of containing 30,000 persons. It contained statues of all the great tragic and comic poets, the most conspicuous of which were naturally those of Æschylus, Sophocles, and Euripides, among the former, and those of Aristophanes and Menander among the latter. On the south-west side of the Acropolis is the site of the Odæum, or musical theatre of Herodes Atticus, named by him the theatre of Regilla, in honour of his wife. On the north-east side of the Acropolis stood the Prytæneum, where citizens who had rendered services to the state were maintained at the public expense. Extending southwards from the site of the Prytæneum, ran the street to which Pausanias gave the name of Tripoda, from its containing a number of small temples or edifices crowned with tripods, to commemorate the triumphs gained by the Chorus in the theatre of Bacchus. Opposite to the west end of the Acropolis is the Areopagus, or hill of Mars, on the eastern extremity of which was situated the celebrated court of the Areopagus. This point is reached by means of sixteen stone steps cut in the rock, immediately above which is a bench of stone, forming three sides of a quadrangle, like a triclinium, generally supposed to have been the tribunal. The ruins of a small chapel consecrated to St. Dionysius the Areopagite, and commemorating his conversion by St. Paul (Acts of the Apostles, xviii. 34), are here visible. About a quarter of a mile south-west from the centre

of the Areopagus stands Phryx, the place provided for the public assemblies at Athens in its palmy days. The steps by which the speaker mounted the rostrum, and a tier of three seats hewn in the solid rock for the audience, are still visible. This is perhaps the most interesting spot in Athens to the lovers of Grecian genius, being associated with the renown of Demosthenes, and the other famed Athenian orators.

"Whose restless eloquence  
Wilded at will that fierce democracy,  
Shook the arsenal, and faindained over Greece  
To Macedon, and Artaxerxes' throne."

On proceeding without the city, our attention is attracted by the ruins of the temple of Jupiter Olympius. This was one of the first conceived and the last executed of the sacred monuments of Athens. It was begun by Pisistratus, but not finished till the time of the Roman emperor Adrian, 700 years afterward; but of the 130 columns which supported it, only 16 remain. The last ruin to which we shall allude, is the temple of Theseus, built by Cimon, shortly after the battle of Salamis. This is one of the most noble remains of the ancient magnificence of Athens, and the most perfect, if not the most beautiful, existing specimen of Grecian architecture. It is built of Pentelic marble: the roof, frieze, and cornices still remain; and so gently has the hand of time pressed upon this venerable edifice, that the first impression of the mind in beholding it, is doubt of its antiquity. Such is an outline of the remains of the chief Athenian edifices, which link bygone times with the present, and which, as long as there is taste to appreciate, or genius to imitate, must arrest the attention and challenge the regard of every intelligent mind. We shall devote what remains of our limits to a short notice of the Athenian history, from the earliest ages down to the present time.

Concerning the early inhabitants of Athens, we are almost wholly destitute of information; and even after its history begins to emerge from obscurity, the events which distinguish it are for long time scanty and doubtful. Though Ogyges is mentioned as the first king of Athens, it is not till three centuries later that Athenian history assumes a definite form, when Cecrops (A.C. 1556) a native of Egypt, by marrying the daughter of Actæon, obtained the sovereignty. He collected the hitherto scattered inhabitants of Attica, divided them into tribes, and founded the Acropolis. Nothing of importance occurs in the history of Athens among the successors of Cecrops, till the time of Theseus (A.C. 1300), who united in himself the attributes of legislator and warrior. The reins of government descended in his family, without any occurrence of historical importance, till Codrus (A.C. 1088) heroically sacrificed his life for his country. At this time an aristocratical was substituted for the monarchical form of government, and the title of "king" was exchanged for that of "archon." On its first institution, the office of archon was hereditary, and for life; but after the lapse of two centuries, it was limited to ten years, and after passing through six hands on this footing, was finally changed to an annual office. When the last change took place, a farther alteration was made by dividing the duties of archon among ten persons, selected by the people from the class of the nobles, in whom were vested all legislative and judicial powers. Such a form of government was peculiarly exposed to party spirit and contentions for power, and pressed heavily on the people; and a strong desire for a definite code of laws arising, Draco was chosen as the lawgiver (A.C. 694). The severity of his code, however, which awarded the punishment of death at once to the most venial offences and the most flagrant crimes, soon rendered it incapable of execution; and Draco lost the public favour and died in exile. To quell the disturbances which continued to distract the city, the people (A.C. 594) had recourse to Solon, who had already distinguished himself as a general, and invested him with the office of archon. The code of laws which he framed, was admirably suited to the exigency of the times: for though its tendency was decidedly democratic, a counterbalancing check was given to popular encroachment by the establishment of the assembly of 400, and by the prerogatives vested in the court of Areopagus. Indeed, the freedom of spirit which Solon introduced and rendered durable, and the liberal education of which the whole system of his laws made indispensably necessary to the noble and wealthy citizens, soon rendered Athens the central point of illumination to all the republics of Greece. Nor were the consequences of Solon's measures at all retarded by the subsequent domination of Pisistratus (A.C. 561). For notwithstanding his assumption of the regal power, his administration was characterized by an assiduous cultivation of the arts and sciences; and it is to him that posterity is indebted for the collection of the Homeric poems in their present definite form. That the spirit of the Athenian freedom was not extinct, was proved by the expulsion (A.C. 510) of Hippias and Hipparchus (the sons of Pisistratus), whose tyranny became oppressive; and from this

## ATHENS.

time the constitution of Solon was gradually melted down into a pure democracy, until Cleisthenes gave the last blow to the aristocracy by the institution of ostracism.

The petty internal contests which had agitated Athens, were now however to be swallowed up in others of far greater magnitude. With rapid strides the Persian monarchy had been encroaching upon Greece, and most of the Grecian states had already sworn fealty to Darius, when Athens and Lacædæmon raised the banner of defiance, and the battle of Marathon (A.C. 490), under the conduct of Miltiades, at once achieved the liberty of Greece, and established Athens in the centre of a glory. We can do no more than allude to the subsequent invasion of Greece by Xerxes, his alternate successes and defeats, the seizure and confiscation of Athens and its citadel, the stratagems of Themistocles, the memorable battles of Salamis, Platea, and Mycale, and, lastly, the defeat of the Persians. Among other consequences that resulted to Athens from the Persian invasion, was the impetus given to its naval affairs.

Themistocles, who was eminently imbued with a naval spirit, caused (A.C. 479) a new and more commodious harbour to be built at the Piræus, which in process of time was joined to the city by the celebrated Long Walls. This precaution invested Athens with the command of the sea, and raised her commercial and military marine to an unexampled pitch of prosperity; a prosperity which was maintained in full vigour by the moderation of Aristides, so deservedly named the Just, and by the generous and martial spirit of Cimon, son of Miltiades (A.C. 466). Before the Persian invasion, Athens had contributed less than many other cities, her inferiors in magnitude and in political importance, to the intellectual progress of Greece. She had produced no artists to be compared with those of Argos, Corinth, Sicily, Egina, Lacædia, and of many cities, both in the eastern and western colonies. She could boast of no poets so celebrated as those of the Ionian and Eolian schools. Her spirit hitherto had been decidedly martial; but her peaceful glories quickly followed, and outshone those of her victories and political ascendancy. After the termination of the Persian war, literature and the fine arts began to tend towards Athens as their most favoured seat, for here, during the age of Pericles, above all other parts of Greece, genius and talents were fostered by an ample field of exertion, by public sympathy and applause. It was during this age that painting, architecture, and sculpture, reached the highest degree of perfection; and that Greek poetry was enriched with a new kind of composition, the drama, which exhibited all the grace and vigour of the Athenian imagination, together with the full compass and the highest refinements of the language peculiar to Attica. The drama was indeed the branch of literature which peculiarly signalized the age of Pericles; and the intellectual character of the Athenians is vividly portrayed by the sublime and impassioned strokes of Æschylus, the graceful and elegant touches of Sophocles, the elaborate philosophy of Euripides, and the caustic rally and moral power of Aristophanes. And though time has effaced all traces of the pencil of Parrhasius, Zeuxis, and Apelles, posterity has assigned them a place in the temple of fame beside Phidias and Praxiteles, whose works are, even at the present day, unrivalled for classical purity of design and perfection of execution. But it was not alone to works of art and the embellishment of the city by splendid architectural decorations, that the efforts of Pericles were directed. For at the period in question, the whole of Athens with its three celebrated harbours, Piræus, Munychia, and Phalerum, connected by means of the Long Walls begun by Themistocles, was made to form one great city, enclosed within a vast parabolus of massive fortifications, extending to no less than 174 stadia, of which the circuit of the city amounted to 43, the Long Walls taken together to 75, and the circumference of the harbours to 76. But the advantages that flowed to Athens from the administration of Pericles were not without alloy. The splendor which he introduced exhausted the public revenues; and to supply deficiencies, recourse was had to the infliction of religious imposts upon the allied states. Hence a spirit of disaffection was engendered; and Sparta, who had long viewed with jealousy the magnificence of her rival, seized the opportunity of fanning the discord into a flame. This issued in the Peloponnesian war, the various fortunes of which have been so ably recorded by the pen of Thucydides. After the lapse of 27 years, during which period the movements of the conflicting parties were characterized by various success, victory at length declared for the Spartans, and the Athenians were forced to submit to the dominion of the Thirty Tyrants; a humiliating period in the history of Athens, over which we would willingly throw a veil. It was reserved, however, for the skill of Thrasybulus (A.C. 403) to restore to Athens its former constitution; a revolution which he was able to effect without much severity, or effusion of blood. Perhaps in the whole history of the Athenians, there is no feature more remarkable than the vigorous clas-

sicitude of spirit which they displayed in recovering from disasters; and never was the truth of this remark so strikingly illustrated as at the present period. One generation had scarcely passed away, since she was groaning beneath the Thirty Tyrants and the reign of terror—her native energies prostrate, her external resources swept away—and now we find her on a lofty eminence. Seventy-five cities hail her as the head of their confederacy; the Ægean Isles are numbered among her foreign settlements; Lacædæmon recognises her dominion of the sea; she is confederated, and without a rival, once more the first of the Grecian communities. Nor is this all; hitherto we have seen her producing and fostering legislators, warriors, statesmen, painters, sculptors, poets, historians, and orators; we are now to behold her in another aspect, as the mother of that philosophy at once subtle and sublime, which even at the present hour exerts a powerful influence over the human mind. This important era in the history of Athens has been beautifully alluded to by Milton:

\* See there the olive grove of Academe,  
Plato's retirement, where the Attic bird  
Trills her thick-warbled notes the summer long;  
There flowery hill Hymettus with the sound  
Of bees industrious murmur oft invites  
To studious musing; there Hyæna rolls  
His whispering stream; within the walls thou view  
The schools of ancient sages; his who led  
Great Alexander to subdue the world,  
Lycoun there and painted Stoa next;  
\* \* \* \* \*  
To sage philosophy next lead thine ear,  
From Ilia's descended to the low roof'd house  
Of Socrates; see there his tæmant,  
Whom, well inspired, the oracle pronounced  
Wisest of men; from whose mouth issued forth  
Melodious streams that water'd all the schools  
Of Academe old and new, with these  
Surround Pyrrhætic, and the sect  
Epicurean, and the Stoic covers."

From this time a new era begins in the history of Athens. Philip, king of Macedonia, by dint of dissimulation and bribery, contrived first to embroil the different states of Greece, and then to trample on their independence. The Athenians, roused by the thunders of Demosthenes, made a vigorous defence (A.C. 338); but the battle of Chæronea proved adverse to their hopes, and on this field sunk the supremacy of Athens. And if the last sparks of her heroism do not expire with Demosthenes, the fitful gleams they throw out from time to time, serve but to "mark the ruins they adorn." It is true that under the sway of Alexander the Great, and the different generals who succeeded him in the government of Athens, she made various efforts to throw off the yoke; but these efforts resemble more the spiteful ebullitions of a pusillanimous slave, than the glorious aspirations of a noble spirit struggling to be free. In this state she continued, the sport of every tyrant who chanced to draw a prize in the lottery of war, till the Roman eagles soared over the Acropolis, and the victorious Sylla proclaimed Athens a tributary of Rome (A.C. 86). But while Athens thus saw every trace of her political existence vanish, she rose to an empire scarcely less flattering, to which Rome itself was obliged to bow. Her conquerors looked to her as the teacher and arbiter of taste, philosophy, and science; and all the Romans who were ambitious of literary attainments, flocked to Athens in order to acquire them. This tribute of respect to Athenian taste and genius was paid by various Roman emperors in succession. Under Adrian (A.D. 117) she even regained much of her former internal splendor; and his example was followed by several of his successors, though on a less magnificent scale. The description of Athens by Pausanias belongs to this period. In the third century, according to Zosimus, Athens was taken by Gothic invaders, who, however, did not long retain their acquisition, having been expelled by the inhabitants under the command of Cleodemus. In the year 398, it was again taken by Alaric, king of the Goths, who is said to have laid in ruins its stately structures, and to have stripped it of its ancient splendor. After this dreadful visitation, Athens sunk into insignificance, and became as obscure as she had once been illustrious. We are told, indeed, that the walls of Athens were put in a state of defence by Justinian; but from the time of this emperor, a chasm of nearly seven centuries ensued in its history, except that, in the year 1130, it furnished Roger, king of Sicily, with a number of artificers, who there introduced the culture of silk. Doomed, apparently, to become the prey of every spoiler, Athens again emerges from oblivion in the thirteenth century, under Baldwin and his crusaders, at a time when it was besieged by a general of Theodorus Lascaris, the Greek emperor. In 1427, it was taken by Sultan Murad; but some time afterward was recovered from the infidels by another body of crusaders, under the Marquis of Montserrat, a powerful baron of the West, who bestowed it on Otto de la Roche, one of his followers. For a considerable time it was governed by Otto and his descendants, with the title of duke; but this family

## ATHENS.

was afterward displaced by Walter of Brienne. The next rulers of Athens were the Accioli, an opulent family of Florence, in whose possession it remained till 1455, when it was taken by Omar, a general of Mohammed II., who settled a colony in it, and incorporated it completely with the Turkish empire. In the year 1687, it was captured by the Venetians under Morosini, after a short siege, during which the Parthenon, then in an almost perfect state, and the other buildings of the Acropolis, sustained great damage. After a short interval, it again fell into the hands of the Turks, under whose jurisdiction it remained, until the treaty of Adrianople in 1830, following up the provisions and the stipulations of the treaty of London in 1837, established the new kingdom of Greece, of which Athens is now the capital.

Such is a brief and necessarily imperfect sketch of Athens and its inhabitants. To have investigated the causes that led to its rise, progress, and decline; to have analyzed the character of its people, and to have traced it through its varied phases in their love of glory, in their refined taste, in their fickleness and injustice on the one hand, and, on the other, in their generosity and gratitude, in their courage and cowardice, haughtiness, and humility (*Pride, de Parthes*), would have involved us in discussions to which volumes alone would have been adequate, even if the vastness of the subject had not precluded the attempt. Plunged for centuries in barbarism, and subjected to the galling yoke of a foreign despotism, it is not surprising that the modern Athenians should have inherited little but the vices of their forefathers. But now that their nationality is restored, and the light of civilization has again dawned upon their country, it may, we trust, be inferred that the few seeds of the ancestral character which still linger in their constitution, exhibiting themselves in pride, stubbornness, and susceptibility, will ripen into such qualities as may render them worthy denizens of the soil, *unde humanitas, doctrina, religio, fruges, jura, leges orta alque in omnes terras distributa* *pulsantur*.

ATHENS, p. l., Somerset co., Me., 49 m. N. Augusta, 644 W. Watered by a branch of Kennebec river, and contains four stores, seven grist-mills, three saw-mills, one fulling-mill, ten schools, 603 scholars. Pop. 1,427.

ATHENS, p. l., Windham co., Vt., 109 m. S. Montpelier, 447 W. It has three schools, 119 scholars. Pop. 378.

ATHENS, p. l., Greene co., N.Y., 5 m. N. Catskill, 99 S. Albany, 341 W. Bounded E. by Hudson river, and contains eighteen stores, one flouring-mill, one distillery, three schools, 80 scholars. Pop. 9367. The village is on the W. side of Hudson river, opposite the city of Hudson, and contains five churches, one Episcopal, one Dutch Reformed, one Lutheran, one Baptist, and one Friends' 900 dwellings, and about 1300 inhabitants. Incorporated in 1805. Over twenty slopes are owned at this place and ply between it and New-York city. A steam ferry-boat connects it with Hudson.

ATHENS, p. b., Bradford co., Pa., 152 m. N. by E. Harrisburg, 263 W. Situated at the junction of Chemung river with the Susquehanna. It was formerly called Tioga Point. It contains a Presbyterian church, an academy, eleven stores, sixty dwellings, and 433 inhabitants. The North Branch canal of Pennsylvania terminates here. The t. contains two fulling-mills, one woollen factory, two grist-mills, 14 saw-mills. Pop. 1532.

ATHENS, L. Crawford co., Pa. It contains one grist-mill, five saw-mills, three schools, 80 scholars. Pop. 406.

ATHENS county, O. Situated in the S.E. part of the state, and contains 740 sq. m. Watered by Hockhocking r. and its branches, which afford good water-power. Bituminous coal is abundant, iron ore is found, and several wells have been sunk, from which excellent salt is manufactured. Two townships in this county, containing 46,090 acres were granted by the Congress of the United States to the Ohio Company, for the use of a university. The surface is broken and hilly; soil productive. It had in 1840, 15,871 neat cattle, 92,590 sheep, 34,459 swine, and produced 175,894 bushels of wheat, 337,077 of Indian corn, 153,346 of oats, 63,740 of potatoes, 108,878 pounds of tobacco, 98,902 of sugar, 92,800 bushels of salt, and 84,800 of bituminous coal. It had fifty-four stores, eighteen grist-mills, fifty-two saw-mills, three oil-mills, six tanneries, one printing-office, one weekly newspaper, one university and one academy, eighty-eight schools, 3063 scholars. Pop. 19,109. Cap. Athens.

ATHENS, p. v., capital of Athens co., O., 73 m. S.E. Columbus, 339 W. Situated on the N.E. side of Hockhocking river, on a beautiful peninsula, formed by a bend in the river. Athens t., in which it is situated, is the northernmost of two townships granted to the Ohio University. The village is pleasantly situated and handsomely built, mostly of brick, and contains a court-house, county offices, a jail, a Presbyterian and a Methodist church, thirteen stores, three grist-mills, three saw-mills, three schools, 120 scholars, over 100 dwellings, and 710 inhabitants. Exclusive of the v., the t. contains two saw-mills, six grist-mills, nine schools, 208 scholars. Pop. 1593. The Ohio University, located in the

## ATHLONE.

village, was founded in 1821, has a president and five professors or other instructors, 145 alumni, of whom 34 have been clergymen, 165 students, and 2500 volumes in its libraries. The commencement is on the first Wednesday in August. The funds yield about \$5000 annually. The college edifice is four stories high, of brick, and pleasantly situated. An academy is connected with the institution, with a handsome brick edifice, two stories high, containing 40 students.

ATHENS, L. Harrison co., O. It has seven schools, 268 scholars. Pop. 1439.
